So I and Stokes started. We soon reached a large field and Stokes pointed. I made him "hie on," and a tremendous covey rose up and I banged away with both barrels, but didn't touch a feather. Loading up I sent my dog on, and before he had gone twenty yards Stokes came to a stand beautifully. I thought, of course, it was a single bird, but instead a whole covey arose with a whirring sound, and the old gun roared out a salute, but the birds must have been made of cast iron, for not one dropped. Old Stokes, as he trolled off to find the birds, cast back a reproachful look, and I loaded up. This time I increased the charge of shot, and poured a handful of jagged pellets in each barrel. Soon my trusty pointer was standing, over a quarter of a mile away, and going at double quick, I soon had up a fresh covey. This time the gun nearly kicked my shoulder off; where this immense amount of shot went I can't tell, but not a bird dropped, and Stokes deliberately walked off home with utter disgust written in his hanging head and drooping tale. "Well, never mind," I said, "I'll get my hand in presently, and then I'll kill every bird." There was no need of a dog—the birds were too thick for that—and I fired as fast as I could load. I tried every way; I made snap shots and long shots, cross shots and single shots; I fired with one eye open, then both, and finally in desperation I trusted to blind fortune and pulled trigger with both eyes closed tight. Vain hope! Not one bird filled my bag, and I then got superstitious, and feared the devil either was in me or the quail, and that it was useless to shoot any longer. However I persevered, and late in the evening, after shooting innumerable covies, I got only one partridge, and he flew against a pine tree and killed himself. The topography of this section is entirely of a flat coun-

try, covered by large forests of pine mostly, and a little oak, with here and there a mill pond of several miles in extent. These ponds are the most desolate, weird, and utterly forlorn places I ever was in. They are the Dismal Swamp over again on a small scale. As you paddle up one you can easily imagine it was a fitting entrance to one of the hells in Dante's "Inferno." The water varies from five to twenty feet, and looks as black as ink. Huge cypress trees raise their gnarled trunks from the water and tower at an altitude of five-score feet. The silence is intense and profound; not a sound breaks the dread stillness, save perhaps the dip of the fish hawk in the unruffled water, or the splash of a sliding turtle in the calm depths. There is good fishing in these ponds in the Summer, both by line and bobbing, for chub. The darkies kill many pike in the moonlight nights by prowling along the shores and cutting them with an old sabre as the fish lie in the shallow water. These mill ponds are surrounded by swamps and lowlands, and it is extremely difficult to reach them on foot. There is no game to be shot within them; they are the haunt of the coot, the crane, and the heron, whose nests can be seen on the tops of the lofty cypress, and whose shrill cries can be heard as the boats advancing startle them from their patient watch after fish. The wary fish hawk breed in these inaccessible haunts, and turtle known as the snapping turtle or "loggerhead" are here in countless numbers. I have counted hundreds of them basking in the sun on the fallen trees on a Summer day, many of them as large as a bread tray. They can be caught in any quantity by tying to a stout cord of about three feet in length a stout hook baited with a toad frog—that kind of sociable toad which we see at twilight hopping around our houses. Many epicures prefer them for soup to the large salt water turtle. In these ponds and marshes are more snakes than the worst patient afflicted with the *mania a potu* or delirium tremens ever dreamed of. They are as numerous as the turtles, and are the water moccasin; some of them are monsters, fully five feet long; every fallen tree is covered by them, and their bright, gleaming eyes are all around you, and their forms are seen glancing in the sunbeams hanging to every bush, and you feel as you paddle up the black waveless waters that you are really in the land of shadows. These swamps were the great rendezvous for the slaves before the war, and many a stolen banquet of hog, hominy, and chickens have they witnessed. In these wildernesses, it is surmised, that the great "Negro Insurrection," organized by Nat Turner in 1832, was concocted. Nat was an ignorant cornfield hand, but he was a fanatic, and so secretly was the plot carried on that not a single suspicion was aroused until the cloud burst, and then Nat, with a score or so of followers, mounted on stolen horses and armed with guns, knives, pitchforks, and scythe blades, commenced their bloody work. Neither age nor sex was spared, and they rode rapidly from house to house committing their murderous deeds. Their first check was at the house of Mr. Blount, who was away, but his eldest son, a lad of sixteen years, defended his home and drove off the gang, after killing the leader with a double barrel shot gun, for which gallant act he was presented with a cadetship at the Naval Academy, and rose to the rank of Captain in the United States Navy. Nat Turner was, as I said, an ignorant slave; the secret of his power was that he was a preacher, and induced the credulous blacks to believe that he had, like Mohammed and the Mormon Smith, received his command direct from heaven, and that his mission was to slay all the whites. Just about that time a most wonderful natural phenomena took place. One night the very heavens seemed ablaze with shooting stars that crossed and recrossed and left long lines of light in their trail; it was, in fact, a great meteoric shower, and Nat told his superstitious followers that this was the sign that he was waiting for, and so the insurrection began. In twenty-four hours the rising was put down, and the actors fleeing for their lives; but several families were massacred, and the country rose as one man. A large reward was offered for Nat Turner, and as he was not seen it was thought he was lying concealed in a swamp. Hundreds and thousands of citizens were searching for him night and day, and he was found near his home hid in a cave in the ground. Of course all the conspirators met speedy and prompt punishment.

There was more excitement over this in Virginia and in the Southern States than over the John Brown raid. It was thought that this was but the muttering of a tremendous storm that was to burst in all the Southern States, and throughout the South for many long days afterward the citizens kept watch and ward over their homes, and mothers pressed their children closer to their breasts and trembled in the night at the bark of a dog or any unwonted noise. This rising took place in Southampton county, a short distance from where I write, and around every hearthstone you will find some venerable member of the family who will bring the conversation around to the old times of Nat Turner's insurrection, and narrate with never-failing garrulity the traditions of that terrible epoch. The swamps I have described seem a fitting place for the hatching of such dark and damnable plots, more worthy of the bloody and merciless projects than even the wasted heath where the witches met Macbeth. I hope if any sportsman comes in this vicinity he will spend a couple of days in these swamps, especially the Dismal Swamp, and then say if my description is overdrawn. They will doubtless agree with the words of the poet—

"If there's a place that's hell below,
More damned and full of horri-ness,
Where devils stay and villains go,
That place must needs be this."

The great sport of this section is deer hunting, and as strange as the assertion may seem, it is nevertheless a true one, that there are more deer now than ever before. There are many theories to account for this, but the two principal, and certainly the true ones, are that the farmers are too poor to keep a pack of hounds; nor have they time to hunt them, and then again two-thirds of the cultivated lands have since the war and the emancipation of the slaves been turned out to run wild, for with their limited means and impoverished condition under a new régime the farmers have had to concentrate their labor on a limited area, and the land left uncultivated has speedily grown up in pine thickets that are impassable, and in these safe retreats the deer breed and bring forth their young in undisturbed security. The country fairly swarms with them. The owner of Tower Hill is Capt. Blow, and he is the only one around here that has a pack of hounds. The Captain used to be an inveterate sportsman in the *ante bellum* days, but now he hunts only when out of meat, and generally kills between twenty-five and thirty every season; his porch is covered with scores of antlers, the fruits of his prowess of

the chase. When he puts his hounds out he is as certain to start a deer as he is to jump a jack rabbit. I went out the other morning to a drive and was placed on a stand alongside a road with a dense pine wood on either side, and within one hour four deer were started and crossed the road in plain sight, but too far away for a shot. Waiting on a stand for deer is not my idea of sport, and I infinitely prefer shooting over my pointers, but to those who choose big game let them come up here and hunt with the Captain and they can shoot deer in abundance. The only method ever practiced here is by driving the deer with hounds, and as they either cross the road or river at certain points, the chances are always in your favor of bagging the game.

Fox chasing is the sport of this part of the world. About Christmas there is a grand meet, and the farmers rendezvous at some mansion and bring their hounds, and the whole of the holidays are generally spent in this most exhilarating sport; it requires the hunter to be well mounted, Capt. Blow has a fine pack, and as I write their lithe, sinewy bodies are stretched around the blazing fire, dreaming probably of many a dashing run. Do dogs ever dream? I often watch them growling and starting in their sleep, and wonder if the brutes have imagination. Sir Walter Scott, in the "Lady of the Lake," embodies the idea beautifully:—

"The stag hounds, weary with the chase,
Lay stretched upon the rushy floor,
And urged in dreams the forest race
From Teviot's Stone to Eskdale's Moor."

The gray fox is the most common kind, and they have so increased that they have nearly destroyed the rabbits.

In the Nottoway River there is an abundance of beaver and otter, and there have been, I am told, no professional trappers in the vicinity for a long time. There is a fine opening for such a class.

In conclusion I will say that I have written up this section just as I found it, and I believe it is the paradise of a sportsman who is willing to rough it. Capt. William Blow, whose Post Office address is Littleton, Sussex county, Va., will cheerfully answer all inquiries. He has lived in Sussex county all his life, and what he says can be accepted as the frozen truth. The Captain is a genial gentleman, a true sportsman, and a gallant soldier, being a graduate of West Point, and he can probably be induced to take as boarders a few gentleman sportsmen, who either want quail shooting, deer hunting, or fox chasing. The route here is by Petersburg to Stony Creek Station, on the Petersburg and Weldon Railroad, from there twenty miles by private conveyance. CHASSEUR.

Fish Culture.

MASSACHUSETTS ANGLERS' ASSOCIATION.—The regular fortnightly meeting of this society was held at their rooms, in Boston, on Wednesday evening, 17th inst. The routine business having been attended to, Hon. Daniel Needham addressed the members upon the question and importance of the inland fisheries. He referred to the fact that there were 200,000 acres of ponds in the State of Massachusetts unprotected which, under the influence of proper protection and cultivation, might be made sources of income and benefit to the people of the State. He urged the importance of educating the people to the fact that there should be a close time during their natural spawning season for all fish, and that during that season they should have the full protection of the law. He believed the work of the association to be an important one, and that it should be their aim so to create public sentiment as to result in the early accomplishment of its worthy objects. A special committee was appointed to appear before the Legislature and ask the enactment of laws for the further protection of our fisheries, composed as follows: Hon. Daniel Needham, B. P. Ware, and S. W. Hathaway. Remarks were also made by Walter Brackett, Esq., and others, after which the meeting adjourned.

THE YONKERS GAME AND FISH PROTECTIVE SOCIETY intend, if the citizens of Yonkers give sufficient support, to introduce the artificial culture of fish wherewith to stock the streams and ponds of the country. Permission can without doubt be obtained to stock their reservoirs, when built, and allow fly-fishing therein under certain restrictions. The fish would also tend to purify the water by removing impurities, vegetables or animal, which might otherwise collect. The processes of hatching and rearing the fish would also be open to public inspection, affording entertainment and instruction.

This is one of the most vigorous and active associations in the country, and is doing much work of real practical value. The Yonkers Gazette, which is edited by one of its officers, Mr. J. G. P. Holden, lends most efficient aid to their efforts, and should be read by every one in Westchester who is interested in Game and Fish Protection.

SALMON HATCHING IN CONNECTICUT.—The Westport Advertiser states that the 500,000 California salmon eggs received at the trout ponds in that town are entirely hatched out and are looking finely. At other hatching places in this country they are very fortunate if they succeed in hatching 60, 70 or 80 per cent., but in Westport more than 95 per cent. of the eggs are hatched and the young fry sent away. These California salmon will be a great success. They are ready to go into the large rivers about the middle of December. Being placed down in the middle of Winter, when all fresh water fish that might otherwise devour the young fry are in a state of torpidity, they escape a thousand dangers, and when the warm weather comes they have become acclimated and are able to take care of themselves.

—A good work has been done the past week by Sheriff Shaffer, in destroying some hundreds of nets and fish baskets on the Susquehanna and Juniata Rivers.

FISH CULTURE IN KENTUCKY.—Earnest efforts are now being made to stock the waters of Kentucky with fish. Foremost in the good work are Hon. Jas. B. Beck, of Lexington; Gov. Robinson, of Georgetown; Lewis Sublett, of Versailles; Col. R. W. Woolley, of Louisville; Col. Owens, of Maysville; Judge Hines, of Bowling Green, and Judge Duvall, of Frankfort. Mr. Beck is President of the Kentucky State Sportsmen's Association. It is expected to lay before the Legislature this Winter bills looking to the protection of game and the propagation and protection of fish. Much correspondence has passed in quest of information as to the best mode of procedure in all matters relating to the subject in general. Prof. Baird has furnished his assistance, as the subjoined letter shows:—

UNITED STATES COMMISSION FISH AND FISHERIES.
WASHINGTON, November 4th, 1875.

My Dear Mr. Beck: Yours of the 2d is received, and in reply I beg to say that it will give me great pleasure to do all I can to assist in the laudable enterprise of stocking the Kentucky waters with fish. I have not had much to do with the enactment of laws for the regulation of the interior waters, although my forthcoming report will contain a very elaborate discussion on this subject, showing the measures adopted in foreign countries towards this same object. I send you a draft of a law prepared for regulating the ponds on the New England coast, which may, perhaps, give some hints in regard to the matter of police, but will not be much other help to you.

I will write to one or two of my brother commissioners of the State, asking them to send you anything that they may have in the way of legislative enactment.

If there is any particular part of the State of Kentucky whose waters you wish provided with the California salmon, please write to Mr. James W. Milner, Wankegan, Ill., at once. I have had large numbers of California salmon hatched out in Michigan for distribution to the interior of the country, and now is the time to take action on the subject. Yours very truly,
SPENCER F. BAIRD, Commissioner.

Hon. James B. Beck, Lexington, Ky.

ENGLISH SOLES IN AMERICA.—A public-spirited citizen of Boston, Mr. J. G. Kidder, has offered to be at the expense of attempting to introduce the English turbot and sole into American waters, and Prof. Baird has written to Frank Buckland for information in regard to the habits of these animals, that will throw light upon the subject, as to the best season and method of accomplishing this important enterprise. Mr. Buckland gives little encouragement, though he thinks success not impossible. He says:—"I am afraid that the task of introducing and naturalising turbot and soles in America is very problematical, but it should be tried, and I shall be glad to assist in any way I can."

—The new Dominion fish-breeding establishment has recently been completed at Bedford, near Halifax, Nova Scotia, and is already in operation, under the superintendence of A. B. Wilmot, who has charge also of the hatching houses at Gaspe and Miramichi.

FISH AS FOOD.—As a source of nutriment, as a field of profitable industry, extending enormously the area of food production, admitting of vast expansion, which can be worked at every season of the year, requiring no outlay in seed or tillage, and no artificial stimulants to renew their harvest (for the fisherman reaps where he has not sown and gathers where he has not scattered), the British sea fisheries deserve the consideration of all who feel how largely the comfort and well-being of a people rest upon that humble but solid basis—abundant and low priced food. It may be roughly estimated that London actually consumes 800,000 fat cattle, which at an average of 600 weight each would amount to 90,000 tons of beef. At the present time there are certainly not less than 900 trawling vessels engaged in supplying the London market with fish; and assuming the annual take of each vessel to be only ninety tons, this would give a total of 80,000 tons of trawled fish; but this computation is irrespective of the vast quantities of herrings, mackerel, sprats, and fish caught by lines, drift-nets, and seines. An acre of land properly tilled will produce every year either a ton of corn or three hundred weight of mutton or beef; but an area of good fishing ground of the same extent at the bottom of the sea will yield to a persevering fisherman a considerably greater quantity of nutritious food every day in the year. It was computed by the late Mr. Mayhew, in his work on the "London Poor," that during the months of October and November, or what is termed the costermongers' fish season, 800,000,000 herrings are disposed of in the streets of London alone, providing a cheap and wholesome meal for thousands and tens of thousands of the humble classes of the metropolis. The prejudice against a fish diet, which was long current, was based upon the assumption that it yielded but little nutriment. The result, however, of an analysis of various kinds has proved that they contain nearly as much albuminous matter as the flesh of quadrupeds—hence, as flesh producing, fish is nearly equal to beef. The herring contains, moreover, a large quantity of oleaginous matter in addition to its albuminous principle, by which its nutritious properties are considerably increased. It is evident, therefore, that fish were designed to occupy an important place in the sustenance of mankind, and it certainly contributes agreeably to that variety of diet by which the human frame is maintained in its highest degree of vigor and health. Nitrogen is a well-known and important vital stimulant, and the proportion of nitrogen relatively to carbon, estimated in grains, is in flesh meat as 160 to 2,580, and in herrings 217½ to 1,435. Fish is a flesh and muscle, not a fat, producing aliment, as is obvious from the appearance of our seafaring population, who are spare, sinewy, and strong, and free from those mountains of flesh and masses of blubber which characterize the prosperous beef eating Englishman, and have from time immemorial typified the traditional John Bull.—*Blackwood.*

FISH HATCHING HOUSE.—The first specimen of salmon made its appearance on Sunday morning. Prof. Mather presided at the accouchment, with Dr. Pater as consulting physician. This representative of California made his debut in marching order, with haversack and six weeks' rations in it. He has been joined by several of his confederates, all similarly accoutred and provisioned. These are the *avant garde* of a grand army one hundred thousand strong, which will the coming Spring populate our streams.—*Lexington (Va.) Gazette, 5th.*

THE HATCHING HOUSE.—About the 1st of November the trout are preparing to spawn in many localities, and if the house has not yet been put in order for the season, no time should be lost in doing it. Dry out the troughs, clean them thoroughly, and coat with coal or gas tar thinned with spirits of turpentine and applied with a paint brush. If the troughs are new, give two or three coats; if old, one may be sufficient. Treat the wire-cloth spawn-frames in the same manner. No one uses gravel now-a-days, and if you have been reading the older publications on fish culture that recommend its use, abandon it and use the frames. Make them about thirty inches long and a half inch narrower than the trough; let the sides be of inch stuff and the ends only half an inch thick, so that when placed on top of each other there will be a flow between them; tack wire-cloth, No. 10 or 12, on the bottom, first tarring the frames; have the wire-cloth in a long strip and well tarred on some fence or out-building, and when dry put it on a roller, with ends projecting for handles; tack one end of the wire to a frame and stretch tightly with the roller, tack it, and cut off at the end; see that the frames for flannel filters, if you use them, are in good order; look to the spawn-pans and see that they are free from rust or grease; examine the Ainsworth screens, if you take spawn that way, and treat them as recommended for spawn-frames; look for rust in the sprinkling pot, cribbles, and all tin ware; lay in a stock of feathers, and at spare times whittle out egg-nippers. We prefer the home-made wooden nippers to steel ones, bulb syringes or spoons. To make them, get a piece of straight grain pine or cedar seven inches long and an inch square, slit it up five inches, and with a pen-knife work it out so that the points will stand open a quarter and the upper end half an inch; work the points down to suit, and round them or whip on loops of fine brass wire with waxed silk; a feather can be inserted in the head. These, if properly made, will have a delicate nip, and a live egg can be picked up by an expert without injury. We have not mentioned the Coste tray nor the new glass jars of Ferguson's, because the first is a glass toy, made by substituting glass rods for wire-cloth, and the latter we regard as only suitable for experimental or fancy work. But for business, one man will do more work in taking care of eggs on wire-cloth than in any other manner.—*Live Stock Journal.*

SETH GREEN'S WORK.—Seth Green has just returned from a month's stay at Cape Vincent, where he superintended the taking of 3,000,000 spawn of the salmon trout, the season having proved an unusually successful one. The eggs are now all at the State hatching house at Caledonia, and the fry will be hatched and delivered during the Spring. There will also be distributed at that time 1,000,000 brook trout. These will be placed in public waters only.—*Syracuse Standard, 14th.*

Natural History.

[This Department is now under the charge of a competent Naturalist, endorsed by the Smithsonian Institution, and will henceforth be made a special feature of this paper. All communications, notes, queries, remarks, and seasonal observations will receive careful attention.]

A NEW VARIETY OF QUAIL.

MR. JOHN KRIDER, of Philadelphia, has been fortunate in securing for his ornithological collection a magnificent specimen of a hybrid quail, or one misnamed by a freak of nature. The bird is a male, and has a dark band half an inch in width running from the base of the lower mandible over the white patch on the throat, ending at the top of the breast; the curved pencilings on the breast are much darker and broader than on the common quail, and the colors are more brilliant in every respect. When killed by Mr. Foster, of Philadelphia, from whom Mr. Krider obtained the bird, it weighed seven and one-half ounces. It seems to be a cross between our common quail and the California variety, as a number of the latter have been let out in both Maryland and Delaware. Mr. Krider has given his new quail the name, *Ortyx Hoopesii*, black-throated quail, a variety of *Ortyx Virginianus*. The bird will thus bear the name of Mr. Bernard Hoopes, President of the Philadelphia Sportsmen's Club.

"Homo."

[This appears to be an accidental abnormality of plumage of the common quail, *Ortyx Virginianus*. The general tendency in this species is to darker colors toward the South, as instanced in the recognized *Ortyx Virginianus*, var. *Floridanus*, (Coues). The extreme of this case is witnessed in the *Ortyx castaneus* of Gould, so that Mr. Krider's bird, being not a distinct species, is probably already provided with a name. We have seen some other variously blackened examples of this species in the collection of Geo. N. Lawrence of this city.—Ed.]

EAGLES ON THE SUSQUEHANNA.—"Audubon" writes to us from Harrisburg, Pa., that the bald eagle (*Haliaeetus leucocephalus*) is still found in that section, especially along the mountain spurs of the Kittatinny and Blue Ridges, skirting the eastern and western shores of the Susquehanna River, north of that city, where several of these birds have their eyries. It is not unusual for them to stray down the river as far as the city, especially on sunny days, and our correspondent graphically describes an incident in which a bald eagle figured. He was observed hovering over Independence Island, nearly opposite Harrisburg, moving in slow and measured circles over a certain spot. The island is directly opposite the city water works, about 600 yards from the eastern shore of the river. Suddenly making a swift circle, the bald-pated hunter dropped with the velocity of a falling stone, and striking the water sent up a sheet of spray. A powerful field glass in the hands of one of the spectators disclosed the fact that the eagle had seized a black duck, and skimming leisurely over the surface of the water, reached a broad rock some 200 yards off. Holding the writhing duck in one of his talons, the eagle thrust the other talon into its belly, tearing out the entrails and causing the hot blood to spurt out over the surface of the rock. Each thrust he made with his powerful beak tore away a shred of quivering flesh; and so the hungry bird kept on until disturbed by the approach of a skiff. The duck had been more than two-thirds consumed before the eagle took wing and sailed leisurely northward to his eyrie on the Kittatinny.

A MODEL MUSEUM.—Mr. Booth of Brighton, England, has built a spacious hall of brick, lighted entirely from above, around which are being placed 306 cases of birds shot by himself and Mrs. Booth in Britain. One point about the fixing of the cases is worthy of mention. A framework is constructed about three feet from the wall, into which the cases fit. This prevents any damp from the walls, too frequent in museums, and allows of the easy moving of the cases. As the cases are arranged in three tiers and there is abundance of light, every bird can be well seen, and the width of the hall is sufficient to admit of viewing the groups from different positions. The most important feature, next to the careful stuffing of the birds, is the fidelity with which the characters of the habitat is reproduced. Various stages and changes of plumage in the same birds are also presented. *Nature* says that, "as a collection illustrating our British birds in their native haunts, this is probably unique."

If a similarly well and intelligently mounted suite of American birds, with their characteristic surroundings and by the side of their nests, could be exhibited at the Centennial next year, how gratifying it would be to every naturalist, and how much it would do for the advancement of the beautiful study of ornithology in this and other countries! If such a collection, complete or partial, showing a fauna wide-spread or local, is forthcoming, we will guarantee a place for its exhibition.

DEPOSITS IN THE STOMACH OF THE MOOSE.—Some time ago there was published in *FOREST AND STREAM* an account of concretions found in the stomachs of horses. Dr. J. D. Caton, well known for his studies upon the deer family, informs us that similar deposits are sometimes found in the stomach of the moose, and refers us to page 72 of Capt. Hardy's "Forest Life in Acadia." Capt. Hardy says: "I have often heard it asserted by Indian hunters that a large stone is to be found in the stomach of every moose. This, of course, is a fable; but a few years since I was given a calculus from a moose's stomach, which I had sawed in two. The concentric rings were well defined, and were composed of radiating crystals like needles. The nucleus was plainly a portion of broken molar teeth which the animal had swallowed. A short time afterwards I obtained another bezoar taken from a moose. The rings were fewer in number than in the preceding, but the nucleus was a very nearly perfect and entire molar." Dr. Caton thinks that it would be interesting to know what were the nuclei of the calculi found in the stomachs of the horses mentioned.

SINGULAR BOLDNESS OF A PARTRIDGE.—The story of the sparrow which was bred up by the servant maid in England, and became so much attached to its benefactress, which was printed in our issue of Nov. 11, has called out the appended letter from B. F. S. Carde, of Flint, Mich. The facts therein stated may cause a strain on the credulity of ornithologists, but they are vouched for by our correspondent and his references as literally true, and we give them on his authority. Matters of intelligent observation are always desirable; but it is important that we do not allow ourselves to be deceived. The narrative is as follows:—

"Willie Ackerman, a boy in the employ of Mr. George Bolster, started from his employer's house to go to the wood lot for a load of wood. While on the way a partridge (ruffed grouse?) alighted on the wagon, rode some distance, and then flew off, but returning, alighted upon the shoulder of the boy, who then caught it. The bird at last escaped. Willie got his wood and returned for another load. Some distance from where the partridge first made his acquaintance the same bird came and again alighted on the wagon, showing not the least fear, and again on his return to the house Willie caught it. This time he took the bird home and built a cage for it. The bird ate well from the first, and on the approach of the boy would fly and endeavor to get out to him. It was found dead several mornings after. Mr. Bolster thinks its head was caught between the bars and that the bird received injuries in the night which caused its death. You know too well how wild a bird the partridge is for me to comment upon the singularity of this circumstance."

—Paragraphs have appeared in several New England newspapers lately mentioning the occurrence of "white partridges" at several points. It would be interesting to know whether these were all albinos of the common ruffed grouse, or whether some were ptarmigans. The latter, which is white in winter, can be easily told from an albino grouse by the fact that the whole of its toes are warmly feathered, while the foot of the grouse is naked; and by the absence of any tufts of broad soft feathers about the neck. F. W. M. writes us from Boston that a ruffed grouse perfectly white has been shot by Henry F. Thayer at West Bridgewater, Mass. This albino will be mounted. The shooting of an albino partridge in the North of England lately, is mentioned in the last *Lund and Water* as a noteworthy circumstance.

—*Nature* announces that Mr. Gould will shortly issue the second part of the "Birds of New Guinea," an important work, which will supplement "The Birds of Australia" by the same author.

—*Nature* for November 4th opens with a flattering review of the work done in Colorado by the United States Geological Survey under Dr. F. V. Hayden. It is from the pen of the eminent geologist, Prof. Arch. Geike.

—A general scarcity of birds has been remarked during the past season in England, collectors finding only about three-fourths as many nests as usual. At the same time the breeding and departure of numerous species has been extraordinarily late. The hard frosts of last Winter are mentioned as a possible reason.

The Kennel.

CARE OF SPORTING DOGS.

IN our last issue we made some suggestions as to the proper food and time to feed dogs when in use during shooting season; and now let us say that, in order to keep our dogs in good health and condition during close time, much more attention should be given them than they generally receive. After a dog becomes fully grown, he does not require much more than half the amount of food to keep him in good condition as it would require to keep a youngster while growing. Those persons who keep but one or two dogs are very apt to let them get out of condition by giving them too much or too little food, and not sufficient exercise. When dogs are allowed to get over-fat their usefulness in the field is, in a measure, destroyed; and then again they are constantly subject to skin diseases, mange, canker, etc., particularly if they are fed too much

Buckell's letter as a matter of courtesy, but should much prefer that the subject should be transferred to the side of the water on which it properly belongs.—Ed.]

"WHISKY."

We print this week an excellent likeness and the pedigree of this capital specimen of a pointer. Whisky was broken by her owner, Dr. W. S. Webb, and has proved to be thoroughly staunch on game. Her breeding, as will be seen from the pedigree, cannot be excelled, her father, Flash, being the son of the celebrated dogs, George and Peg, whose pictures, taken from the painting by Bispham, in the possession of Dr. Russell Strachan, have already appeared in these columns. Whisky took first prize in her class at the Springfield Bench Show in April last, and will be entered at the Chicago Show to be held in January. She is now with pup by Mr. Schuchardt's Jim, and is expected to litter this week. We could have printed a much more extended pedigree but for want of space.

brush and briars. As for water, we had no difficulty in sending her across a stream that was too deep for our boots, and even though the mercury indicated several degrees below the freezing point, she took the water like a spaniel. Her training reflects great credit upon her owner, who has given her the only lessons she has ever had, and she seems to set about finding birds in a more matter of fact way than any dog I have ever shot over."

IMPORTATION.—On the Inman Line steamship City of Chester, arriving here Monday, the 22d inst., Mr. Raymond received the three-quarters Laverack setter bitch, Flash bred by Mr. Wm. Wardlaw Reid, of Peckham-Rye, England. She is orange and white, very shapely and blood-like, and is by Brierley's Fred, out of a full sister to Mr. Reid's pure Laverack, Sam. This bitch was selected by our correspondent "Viatores" while in England last Summer, and is imported for Mr. Dudley Olcott, of Albany, New York.

meat. In a family where there are scraps enough from the table to feed one or two dogs, no better food can be given them. Every person owning a good dog (no others should be kept) ought by all means to have a proper kennel or other arrangement prepared for their comfort and cleanliness. During the Summer we give our dogs no bedding, but in cold weather they are not allowed to suffer with the cold; neither are they allowed to sleep near the fire. Many fine dogs are injured and become permanently superannuated by sleeping and basking their brains near a hot fire, where they will lie if they are allowed to have their own way about it. When it is necessary to keep dogs chained to their kennels, in order to keep them from straying away and frequently hunting on their own hook, they cannot be kept in perfect health and condition unless they are freed from their chains at least twice a day for a few minutes, in order that they may relieve themselves by a little exercise; and then again, let us caution our brother sportsmen against allowing their dogs to lie too long upon the same bedding. From neglect of this matter most of the diseases in dogs arise. Horses are generally fresh bedded every night, while dogs are generally allowed to lie upon the same bed for weeks, and sometimes months. If dogs are fresh bedded, say once in two weeks, given a little exercise morning and evening, and a supply of pure water kept near their kennel, they will always be in good health and ready for the field. We have kept a kennel of setters and pointers since—well, our friend Col. Skinner says "ever since the Declaration of Independence,"—and we can thankfully say we have never had a single case of mange therein.

ENGLISH SETTERS IN AMERICA.

November 4th, 1875.

EDITOR FOREST AND STREAM:—

A person signing himself A. V. V., Jr., in your paper of October 21st, tells you, in contradiction to statements of mine, that Mr. Llewellyn never owned Fairy. He gives Mr. Laverack as his authority for saying so, and assures you that what he says is fact. I have no doubt that he (whoever he may happen to be) believes it to be fact, but he takes care to put the responsibility of the contradiction on Mr. Laverack's shoulders instead of giving his own name with his statement.

Mr. Pucell Llewellyn gave Mr. Laverack \$50 for Fairy, on the understanding that he was to name the dog she should be first put to, and have half her puppies. Mr. Laverack afterwards wrote to Mr. Llewellyn, complaining that Fairy had not been sent to his dog. Upon this, Mr. Llewellyn replied that, rather than bandy words with him, he would be glad to let him have Fairy back at the same price she cost. Mr. Llewellyn sent her back in charge of his head keeper, instructing him to receive the money before parting with the bitch, which he did.

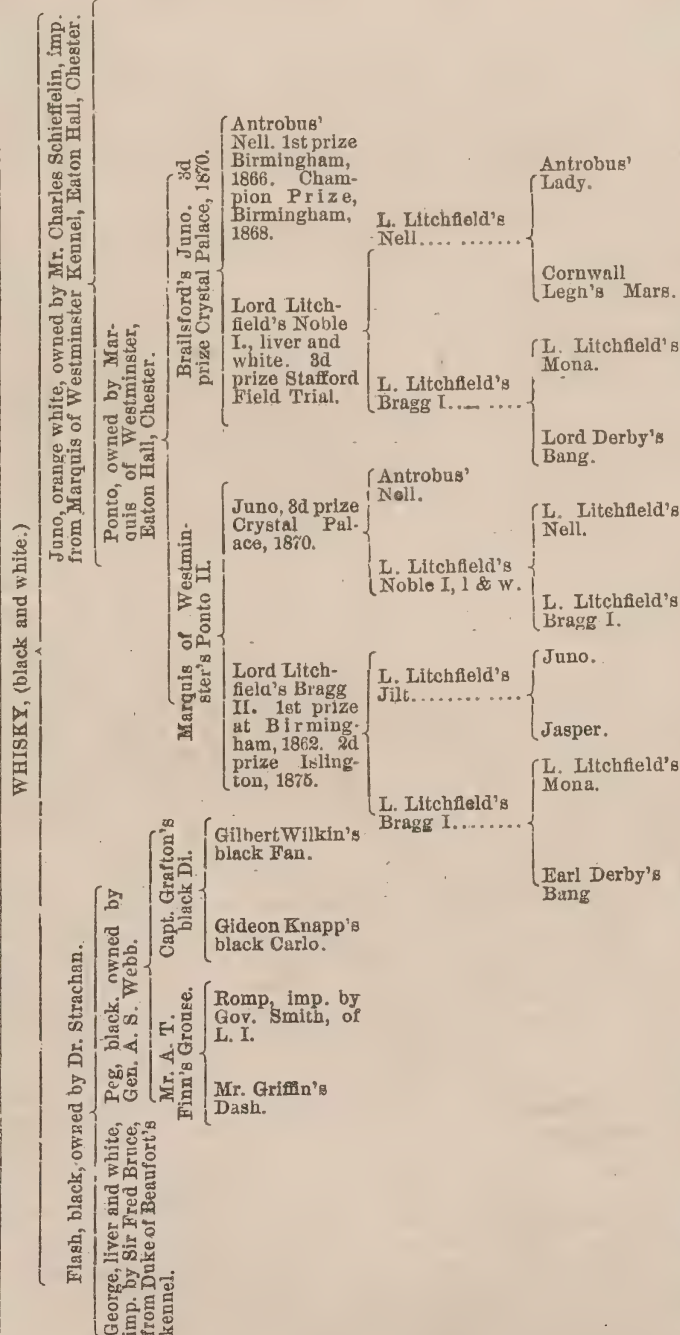

Fairy is called Fanny in the first volume of the Kennel Club Stud Book (a mistake which is corrected in the second volume), and her number is 1,497. She is entered as Mr. Llewellyn's, with the record I gave in my letter to you.

These, sir, are facts which Mr. Laverack will not deny in the face of the agreement and his letters on the subject, however envious he may feel and speak in private.

G. T. TEASDALE-BUCKELL.

[We last week printed a letter over Mr. Laverack's own signature confirming the statement of our correspondent, "A. V. V., Jr." We now print Mr.

Pedigree of black and white pointer bitch Whisky, winner of the first premium cup at the Springfield Bench Show, April, 1875. Owned by Dr. W. S. Webb, of New York. Whelped July 14th, 1874.

A gentleman who shot over Whisky this Fall writes: "I have never yet seen a young dog—and I may add, very few old ones—who seemed so thoroughly to understand her business, and who seemed to enjoy it so keenly. She covers her ground perfectly, and even with her fine coat and skin, will show many a heavier coated setter how to go through

THE NEW YORK KENNEL CLUB.—This club are advertising some of their surplus stock. The puppies are by Dr. Strachan's Dan II, son of the Duke of Beaufort setter in Mr. Bispham's picture, reproduced in this paper some time since, and should be good ones.

THE GILDERSLEEVE SETTERS.

PHILADELPHIA, Pa., November 15th, 1875.

EDITOR FOREST AND STREAM:—

The following letter from Mr. Jonathan Gildersleeve of Camden, Del., the owner of the once famous setter bitch, Tip, from which the Gildersleeve setter strain derived its name, I think will prove interesting to you and the readers of the FOREST AND STREAM. As you have been the owner of one of the dogs he speaks of, once in the possession of Mr. Kay, of Philadelphia, it may carry you back to the time when Bruce was looked upon as a setter among setters. The information Mr. Gildersleeve does not possess of Tip's descendants, and which he says Mr. Abbott, of Philadelphia, has, you have already published through myself, Mr. A. kindly furnishing it to me.

CAMDEN, Del., November 4th, 1875.

C. S. WESTCOTT:

DEAR SIR:—Your favor of 25th ult., inquiring in regard to Old Tip, as she was commonly called, being directed to Canterbury instead of Camden, causing some delay in its delivery, is this day in hand, and I hope the answer may be in time for your uses.

I think Old Tip was pupped in the Spring of 1843, in the town of Frederica, Kent county, Del., and given to me by the owner of her mother, W. Sipple (a great sportsman). She was about five weeks old—a pitiable, bad-looking object indeed, but by careful attention was soon brought out, and at a very early age showed signs of becoming a valuable dog, which she did, as all persons that ever followed or shot over her testified. She was white colored, with pale yellow spots. I have been told that both her father and mother were entirely black. She was close built, heavy body, short legs, short, light tail, and hair not very long, fine head and nose, and never reported as being of imported blood. For carefulness, industry, ingenuity in the hunting up of birds after once scented, obedience, and I may add, affection, with durability for continued hunting, she could not well be surpassed. Was always (when well) willing, and ready to go, but would not follow or pay attention to anyone but me her master; seemed not to tire, running with great ease, though not fast or far off, and if missed only for a few moments over a hill top, persons would say, "Old Tip has birds, or else she would come and look over the hill for her followers." I could not teach her to retrieve, but never knew her to kill or even crush a bird, always holding them in her paws until taken from her. She seemed to know from the first that her duty was to lie down until the gun was loaded; but as soon as the hammer was driven back for capping, she would proceed again. She was very firm in all her points, and very rarely stood on her feet. She lived about eight or nine years, and suffered much from cancer in dog, caused from the bite of a large hound whilst eating. All the pups sent out from her were got by a dog colored and marked the same (nearly) as herself. He was called Don, and his mother, Otto, was of imported stock. Don was of great bottom and speed, which unfitted him for hunting single birds, he never having been properly broken, and he died at the age of twelve years. Old Tip required but little teaching, as all her knowledge and qualities seemed natural. I have never known of a bad pup from poor Old Tip; neither have I known her equal, though I have hunted many dogs, some of them crack ones, until taken into field with her. The Fitzgerald pup I sent to M. M. Mastin, the importer, who turned her over to Fitzgerald. Of her reputation I have often heard. She was several months old when sent to Mastin, and promised well. Kay, the gunsmith, of Third street, had two of Old Tip's descendants, for which large sums were offered. I think he told me \$175 was offered for one of them. One of the finest of her pups was bought by a Captain Bavington of Green street, from Bonwell, near Canterbury. His name was Nero, and he was killed by one of the watchmen, the

cause and particulars of which you may have some knowledge. I do not remember any of the stock getting into the hands of Robinson of Wilmington; if so, it was through other hands. I have a dog now about the same build of Old Tip that was given me (a pup) by Massey, and is related to Old Tip. He has some of her qualities, but cannot hunt long at a time. Old Tip often took her little ones, two to four months old and three or four in number, out hunting, as though wanting to teach them what to do. If you know Redman Abbott, who has shot many birds over her, he perhaps could give you some ideas, he being a great sportsman, or used to be.

Having been disturbed in mind from affliction lately in my family, I am hardly prepared to give you all the points I would like to remember, and presume I have forgotten some. You may, from what I have said, think that I still remember Old Tip—poor old dog!—as among the best and most valuable dogs I ever knew; and so I do.

Hoping the above may be of service to you, as well as satisfaction, I am, very respectfully,
JONATHAN N. GILDERSLEEVE.

THE MONTREAL DOG SHOW.

MONTREAL, November 13th, 1875.

EDITOR FOREST AND STREAM:—

I inclose you a list of prizes, etc., given at a Dog Show here a few days ago. I am sorry I could not get time to arrange the list properly and give you a short description of it, but will look out and do so the next time. The show was a perfect success, both as regards the attendance, it being said that no less than 6,000 tickets were sold, and the variety and class of the dogs shown. The Rink was nicely decorated, the platform near the centre being ornamented with piles of stacked rifles with protruding bayonets and shields, around which gleamed a formidable row of glistening bayonets, which might well represent the motto, "Armed at all points." At the end of the Rink was a stage, from which during the evening tableaux were exhibited. The dogs were all fine, and those that obtained prizes were really first class. The following was the prize list:—

For greyhounds, three entries—P. Hogan, 1st, fawn color; A. Strathy, 2d, lemon and white.
Scottish deer hounds, two entries—F. Torrance, 1st, a large brindle dog; Andrew Allan, 2d, fawn color.
Fox hounds, two couples entered—Both prizes taken by the Montreal Fox Hounds. The huntsman, Wm. Drysdale, entered a pair of kennel terriers, and got an extra prize, which was well deserved.
Setters, five entries—Charles Boyer, 1st, with red Irish setter; W. H. Masterman, 2d, lemon and white.
Pointers, two entries—William McGibbon, 1st, and J. M. Perrin, 2d.
Irish water spaniels, three entries—Miss Annie Cuthbert, 1st, with very handsome brown dog; A. Stenhouse, 2d.
Cocker spaniels, eight entries—Joseph Hickson, 1st; H. A. Galarneau, 2d. All these dogs were of good class and caused much difficulty to award the prize.
Newfoundland, seven entries—George Kinnear, 1st; F. A. Jackson, 2d.
St. Bernard's, six entries—Andrew Allan, 1st, dark brindle dog, very large; Mrs. Brydges, 2d. The latter dog was the largest dog in the exhibition, and must have weighed 150 pounds. Mr. Joseph Hickson obtained an extra prize.
Mastiffs, two entries—W. Gaherty, 1st, large fawn colored dog; T. E. Beaver, 2d.
Scottish colley, three entries—Andrew Allan, 1st; Edgar McDougall, 2d.
Bulldogs, three entries—George Anderson, 1st, with very handsome brindle dog; R. Springle, 2d, with a white dog. The latter's dog appeared as if he had just come from the wars.
Bull terriers over 15 pounds, six entries—John Hyland, 1st, very handsome white dog; E. Auld, 2d.
Bull terriers under 15 pounds—John Hyland, 1st and 2d.
Fox terriers, seven entries—J. S. Allan, 1st; W. E. Esdaile, 2d, very handsome black, tan and white.
Black and tan terriers under 6 pounds, ten entries—George Anderson, 1st; A. Grant, 2d.
Black and tan terriers over 6 pounds, five entries—R. A. Allen, 1st and 2d.
Skye terriers, nine entries—Miss Maud Winfield, 1st, with a very handsome imported dog; Miss Annie Shaw, 2d; James Renohen, extra prize.
Scottish terriers, twelve entries—Henry Starnes, Jr., 1st; J. Toner, 2d; W. H. Brehaut, Esq., extra prize.
Poodles, six entries—James Renohen, 1st; A. Kay, 2d; Mrs. C. Robb, extra prize.
Pomeranian or Spitz, six entries—Mrs. C. Boyer, 1st; Dr. Major, 2d.
Ladies' toy dogs, nine entries, consisting of a miscellaneous collection—S. Dobby, 1st, pair of fawn colored pups; William Pickering, small white poodle; Mrs. Dickinson received an extra prize for a Japanese dog, the only one of the kind exhibited.
Best bitch and litter of pups, six entries of six different kinds—J. S. Allan, 1st; fox terrier with four pups, J. J. Russell, 2d; bull terrier, five pups; a very handsome black retriever, owned by Frank Redpath, received an extra prize.
White English terrier—Miss Lizzie Shaw, 1st.
The judges were Messrs. F. W. L. Penton, A. W. Alloway, and A. M. Esdaile, who appear to have given satisfaction on the whole, although in the much disputed question of "best dog" it was impossible to please all the owners. Yours, etc.,
R. A. ALLOWAY, M. D.

ENGLISH DOGS ON OUR GROUND.

MORRISTOWN, N. J., November 6th, 1875.

EDITOR FOREST AND STREAM:—

I seldom write to the papers, but I see my name occasionally in the sporting press, coupled with Jersey lightning and out door sports among the old hills of Morris county. I also observe many familiar names of sportsmen and what they have done with their dogs. I have had the good fortune to kill many woodcock this Fall, mostly over my old bitch, Gyp, the meanest-looking dog bred, but one that never takes a back seat with any of better looks; and her offspring, by Mr. Salter's Dash, now six months old, will trouble some of the crack dogs to beat. I have never had a very high opinion of English or Irish setters, as all imported dogs over which I have shot did not amount to much in our cover. After seeing the imported Laveracks, Pride of the Border and Fairy, and hearing much gossip about them, I applied to that clever old bachelor, Mr. Raymond, their owner, for permission to shoot over them, just to satisfy my curiosity. Much to my surprise I was beaten for once, and badly, considering the condition of the dogs. In company with Mr. Banks, of New York, I took out Pride, Mr. Banks having with him his fine dog Don, and we found the Englishman on his bird every time. He backed well, found well, pointed dead bird, and was very staunch. The first trial was in cover, and it is not necessary to explain to a sportsman who shoots Fall woodcock in New Jersey what cover means. On one day in October I shot sixteen woodcock and three partridges (ruffed grouse) over Pride and Gyp, and I must say that the former made some of the finest points I ever saw. Pride's style of pointing makes you feel good; hunts with his head well up in the air, and if that dog had been broken in this country and to our game and cover, I doubt if he could be beaten. The close season for quail having expired on the 1st of November in our State, although it was a cold, raw day, with an inch of snow on the ground in the morning, I went out with three friends and a trio of setters, and we killed a number of the little whistlers. The Englishman took first prize. Pride, like most English dogs, is headstrong, but I think so well of the dog that I think we cannot fail to improve our American stock by crossing with him—at all events I shall try it. It will pay every lover of dogs to call at Fox Farm and see these fine English dogs and their genial owner. Yours truly,
E. M. QUIMBY.

KIRBY'S PROGENY.

LEESBURG, Va., November 20th, 1875.

EDITOR FOREST AND STREAM:—

Stepping into Capt. J. W. Foster's office this morning to wait for the mail I found that his new Field Trial bitch, Kirby, (purchased from "Mowhawk," and in whelp by Raymond's Pride of the Border,) had been safely delivered of five beautifully-marked puppies, and the cry was "still they come" when our friend, with the solemnity of a midwife, would stalk in from the kennel with a new one carefully wrapped up in his arms.
T. W.

LATER.—Kirby's litter consists of five dogs and four bitches.

EUREKA NUT.

EDITOR FOREST AND STREAM:—

I think you have found it. I mean the balm for canine ills and ails in the areca nut. Col. R. H. Gallaway's fine pointer, Savoy, had been given up for a "dead dog" by him; he reported the case to me. We gave two doses, one of thirty and the other forty grains of powder, and the dog is to-day as well as ever. The cure was effected in three days. The dog seemed to be suffering from paralysis; was unable to move himself, and did not stir for days at a time. Col. Gallaway says you should call it Eureka nut, and requests me to extend his thanks to the "Squire." S.

A SNAKE TERRIER.—The following singular statements come from a most trustworthy source. No similar case has ever come under our notice:—

"AQUADALE," Wenonah, N. Y., November 21st, 1875.

EDITOR FOREST AND STREAM:—

I notice in your Philadelphia correspondence, under the head of Natural History, a reference to the oft repeated assertion that mother snakes swallow their young for protection, &c. One of the institutions of "Aquadale" is an exceedingly sharp little English terrier named Joker. Now Joker is as inveterate an enemy of snakes as if he were sprung from the other island. Although water is as repugnant to him as to a cat, still if he spies a water snake in the stream or ponds of the premises the snake rarely escapes. A few months ago I saw him make a spring into the stream, and come out with a water snake fully four feet long, which he instantly had snapping through the air like a frantic whip lash. Noticing what I took to be pieces of intestines dropping in all directions, my eye followed one which dropped near my feet, when I discovered it to be a young snake about six inches long, and upon looking about I discovered several of them, which the mother had reluctantly disgorged. But as shrewd as Joker is, he does not know the difference between a snake and an eel, or if he knows he makes no discrimination, for he must have caught at least forty the past season. During the few weeks that they were making their annual up stream excursions, Joker would watch the stream for hours together, and when one attempted to pass a shoal he would pounce upon him and take him to a safe place upon the grass plat. After giving him a few vigorous shakes he would return to his watch. I saw him take out three large ones within a space of ten minutes of time. Fifty dollars is the valuation placed upon Joker by his mistress, but he is not for sale.
M. P. P.

Good Dog!—A friend writing from the New Dominion, and remarking on the anecdotes of dogs which have appeared from time to time in FOREST AND STREAM, relates an instance of remarkable sagacity shown by a common cur, and of which he was an eye-witness:—

A sportsman by the name of Guinard, accompanied by his dog, was sent out shooting one day on Morrison Island opposite Berthier, P. Q., and noticed a large flock of black ducks feeding in a field. There being no object between the hunter and the ducks behind which he could conceal himself to approach them, he laid down and motioned the dog to get on his back, and while dragging himself along, the dog kept in motion, attracting the attention of the ducks until his master got within range, when he blazed away and bagged eleven of them. The dog at the time was old and deaf as a post.
JEAN.

Woodland, Farm and Garden.

WINDOW GARDENS AND WINTER FERNERIES.

A LADY correspondent desires some practical hints about window gardening, and more especially about growing ferns in-doors. A window garden may be very readily made by fitting a box twelve to eighteen inches wide and eight inches deep across a window having a sunny exposure. Cover the bottom with charcoal, to secure drainage, and fill the box within an inch of the top with half garden earth and equal parts of well-rotted manure and leaf mould. Let this compost be well baked for an hour to destroy all embryotic life. Peter Henderson, in his "Gardening for Pleasure" gives the following list of plants suitable for the parlor or sitting room, requiring a moderate temperature at night, say 50°:—Azeleas, abutilons, carnations, cinerarias, callas, chorizemas, geraniums, hibiscus, hyacinths, myrsiphyllum, (smilax), mobernias, primulas, stevias, roses, violets, and many varieties known as greenhouse plants. Hot house plants require a higher temperature, say 60°, at night; of these the above authority names bouvardias, clerodendrons, euphorbias, epiphyllums, fuchsias, heliotropes, poinsettia, roses, tuberoses, etc. More or less of these, with many others, may be selected by the aid of a reliable seedsman's catalogue. The mignonette makes a pretty window plant, and is easily grown in winter. Sow the seeds carefully and cover by sifting a little white sand over them. Thin out to three or four inches apart, and support with neat stakes, as their growth demands. Don't water too much. The lily of the valley makes a showy winter flower, and is at home in the moist atmosphere of the Wardian Case, to which reference is made below.

It is not absolutely necessary to maintain the ranges of temperature stated, but they are given as according with the experience of those who have been most successful with winter garden culture, and the best, where a special fire is kept for the conservatory.

Winter ferneries require a more moist atmosphere, and we again draw from Mr. Henderson, who recommends the form commonly known as the Wardian Case, which has a base or tray about six inches deep, lined with zinc, with glass sides and top. This may be of any size desired, to occupy a window, table, or a niche in a bow window. A small and less expensive form is made of terra cotta, or earthen ware, round or oval in shape, covered with a glass vase. The top of the Wardian case is on hinges, to admit of the escape of excessive moisture; the vase may be raised from the bottom for the same purpose. The ferns may be gathered from the woods—the green crested lastrea, prickly polystidium, red-veined wild caladium, etc. A great variety may be purchased from the florists, such as the dracenas, the gay-leaved eranthemums, begonias, etc. The soil for the fernery should be kept light,

moist (but not too moist) and porous; leaf-mould gathered from around rocks and trees—the native haunts of the fern family-being the best.

PLANTING FOREST TREE SEEDS.—Plow a furrow two or three inches deep, straight as an arrow; drop the seeds into it every four feet; turn a furrow over them, and repeat every four feet. By so dropping that the rows are straight both ways some crop may be cultivated between the young shoots next year. The trees should be cultivated the same as any other crop, cutting off the lower shoots and branches so as to give the trees as much sap as possible, and secure a straight and comely growth. In this way, at a very moderate expense, a thrifty forest growth may be secured in a very few years. The hickory nut, black walnut, butternut and chestnut are perhaps the most convenient as well as desirable trees for forest cultivation. Any time in the late fall before the ground is closed with frost, is a suitable time for planting. On almost every farm there are rough, unsightly spots, rocky hillsides, etc., where the seeds of forest trees could be profitably planted.

—Experiments in Germany on frozen potatoes prove that the freezing in nowise alters the chemical composition of the tubers. The change is simply physical, and even if frozen hard they are still fit for distillation, or they may be pressed to get rid of the water, and then ground into very good meal adapted for feeding cattle.—Scribner.

—Among the most useful plants of New Mexico is the soap weed, the roots of which are used as soap. The Mexicans prefer it to soap, claiming that it extracts all dirt and grease and restores the lustre of the goods.

Sea and River Fishing.

FISH IN SEASON IN NOVEMBER.

Striped Bass, <i>Roccus lineatus</i> .	Weakfish, <i>Cynoscion regalis</i> .
SOUTHERN WATERS.	
Pompano, <i>Trachynotus carolinus</i> .	Grouper, <i>Epinephelus nigritus</i> .
Drum (two species), Family <i>Sciaenidae</i> .	Family <i>Sciaenidae</i> (black bass), <i>Centropristis striata</i> .
Kingfish, <i>Menticircus nebulosus</i> .	Striped Bass or Rockfish, <i>Roccus lineatus</i> .
Sea Bass, <i>Sciaenops ocellatus</i> .	Tailorfish, <i>Pomatomus saltatrix</i> .
Sheepshead, <i>Archosargus probatocephalus</i> .	Black bass, <i>Micropterus salmoides</i> .
Snapper, <i>Lutjanus caesus</i> .	<i>M. nigricans</i> .

[Under the head of "Game and Fish in Season" we can only specify in general terms the several varieties, because the laws of States vary so much that were we to attempt to particularize we could do no less than publish those entire sections that relate to the kinds of game in question. This would require a great amount of our space. In designating game we are guided by the laws of nature, upon which all legislation is founded, and our readers would do well to provide themselves with the laws of their respective States for constant reference. Otherwise, our attempts to assist them will only create confusion.]

FISH IN MARKET.—The slabs continue to be fairly supplied with most varieties, but fish cannot be said to be abundant. About this time large catches of striped bass are usually expected from the south side of Long Island, but so far only small takes have been reported. Bluefish have made their appearance in large numbers off the coast of North Carolina, and are in splendid condition, on many of them the flesh on the belly being an inch in thickness. Among the novelties at Mr. Blackford's we saw some Virginia hog fish, considered by the F. F. V.'s to be the best of pan fish. They resemble porgies in appearance. The white perch now coming from Centre Moriches, L. I., are splendid fish, many of them weighing two pounds. Our quotations are as follows: Striped bass from L. I., 18 to 20 cents; smelts from Maine, 20 cents; bluefish, 12 to 15 cents; salmon, frozen, 50 cents; mackerel from Massachusetts, 10 cents each for small and 25 cents for large; white perch, 15 cents per pound; Spanish mackerel, refrigerated, 50 cents; green turtle, 20 cents; terrapin, \$12 per dozen; frost fish, 8 cents; halibut, 20 cents; haddock, 8 cents; codfish, caught off Sandy Hook, 8 to 10 cents; blackfish, 12 to 15 cents; flounders, 8 to 12 cents; sea bass from South Carolina, 20 cents; eels, large, 18 cents; lobsters, Boston, 10 to 12 cents; sheepshead, frozen, 25 cents; scollops, \$1 per gallon; soft clams, 40 to 60 cents per 100; whitefish, 18 cents; pickerel, 18 cents; yellow perch, 12 cents; salmon trout, 20 cents; hard crabs, \$5 per 100; pompano, \$1 per pound.

BROOK TROUT IN SALT WATER.—A few days since some fishermen found in their fyke, which had been set in Coney Island Inlet, a fine brook trout—a genuine *Salmo fontinalis*—in capital condition, and weighing three-quarters of a pound. Although it is not unusual to find brook trout in salt water, it is generally near the mouth of some estuary. In the present instance it is rather a problem where the captured individual came from, as there is no trout stream in the vicinity. We trust the energetic officers of the New York Society for the Protection of Fish and Game will overlook this infraction of the close season.

—A large mullet, weighing 5½ pounds, was taken a few days since at Noank, and word sent to Mr. Blackford, who will secure it for Prof. Baird.

—Smelt fishing in Massachusetts waters has lately shown some good sport, twelve to twenty dozen per man having been caught.

WHITEFISH.—The catch of whitefish on Detroit River and the adjacent lake shores last season netted over \$60,000, besides finding employment for 260 men and 60 horses. So far this season the catch has not been nearly so good, which fishermen attribute to high winds and low temperature, but which experts say can be traced to a course of gradual extermination, resulting from greatly increased demand, and, to some extent, to the impediments to the deposit of spawn and the growth of the young fish, which exist at the pres-

ent day. Mr. Gauthier of Sandwich, has in operation on the bank of the river a considerable establishment for freezing whitefish, and this season, unfavorable as it is, he will dispose of \$12,000 worth in that way. They are sent to market frozen, and may be taken from the package next March as fresh as when drawn from their native element. The other fishermen preserve theirs alive until the season is over by placing them as soon as caught in "pounds," or enclosures in the rivers, through which the water flows freely, but which is made too tight for the fish to escape from. Whatever may be the facts as to quantity, the size of the fish brought to our market during the present season exceeds anything seen previously.

—Last week we were pleased to examine some magnificent rods which Thad. Norris, Esq., of Philadelphia, has just completed for the Centennial Exhibition. One is a salmon rod of greenheart, with combination tip of bamboo, weighing thirty ounces, and valued at \$80. Its length is 17 feet 3 inches. The other is a split bamboo trout rod, with cedar but, 11 feet 3 inches in length, and weighing 4½ ounces. One could not ask for more beautiful or better working rods than these. Most professional anglers have their favorite makers, but Wm. C. Prime, Esq., swears by the Norris rod. One peculiarity in their construction is the tip, which, in the salmon rod, is made in three sections, the lower part being of greenheart, the middle one of split bamboo, and the extremity of wrought bamboo, unsplit. In his split bamboo rods the lower section is fish-jointed into a handle of cedar.

—The seiners on the beach below Norfolk, Va., have given up fishing for the season.

SETH GREEN ON NEEDLE POINTS.—This veteran angler has given us a new wrinkle as respects fish hooks. We should like to put his views to a practical test. Who of our readers has ever tried needle points without beards? Many of us tried pin-hooks in our boyhood; these had no beard, and our success in fingerlings was most gratifying. Seth saith:—

Agreeable to your inquiries as to the best kinds of fish hooks for tying flies on, my opinion is that there never were any made right except those that I have made of needles. There was a time when I made nearly all of my hooks for trout fly fishing. I annealed the needles and bent them the proper shape, tempered them, and tied nearly all the flies I used for years on them. I could take twice as many trout with the same number of rises as I could with any hook with a beard on it. When I used the common hooks I used to take a pair of pincers and break the beard off to get a better point, and to get rid of the shoulder; but then I did not have a needle point. A fly hook does not need any beard, and no fly fisherman should ever use one. Keep a steady strain on the fish, and the rod will not let him get slack enough to unhook himself. A fly hook for salmon or trout should have a needle point, and they can't be made if there is a beard on the hook. The great cause of missing so many rises when fishing for small trout is dull hooks. Another reason why fishermen miss is the quick stroke when the fish makes the break. The needle point overcomes that, for there is no need of scarcely any stroke. The fish will hook himself, and if it gets away it is the fault of the man and not the hook. All fly hook makers are more than twenty-five years behind the times. Any man with ordinary skill who once uses a fly tied on a hook with needle point and no beard will never use any other. If he does there is something wrong in his upper story. That is, if he can get them. I can't get the hooks. SETH GREEN.

GILL NET AND SEINE FISHING.—Fred Mather, Esq., in the piscatorial department of the *Live Stock Journal*, thus discourses wisely of the waste of fish life caused by seines and gill nets:—

"The idea that our fisheries were inexhaustible, and that the sea, the lakes, and the rivers would forever furnish a supply of food under any circumstances, has proved fallacious, as can easily be seen by a comparison of the statistics of the catches of the past ten years and those of any previous decade. Yet improvident fishermen, while acknowledging and lamenting the fact, still pursue the old course of destruction, and often wantonly destroy immature and unsalable fish on the shiftless principle of letting 'to-morrow take care of itself.'"

Our attention has been particularly called to this matter the present season while in the service of the United States Fish Commission. We were sent to Virginia to try to increase the future supply of shad in the Pamunkey River, and were warmly welcomed by the fishermen, who, appreciating the necessity of having the river restocked, afforded us every facility, and showed by their kindnesses that they had faith that their river could be made to swarm again with fish as had been done in the case of Northern ones; but our surprise at their criminal carelessness (that is the proper name for it) in allowing hundreds and even thousands of young fish to die on the shore for want of thought or care enough to return them to the water, was so great that we could not help remonstrating against it.

Although the seines used were two-inch mesh measured the largest way (which is the only correct method), yet there would be hundreds of small fish not over an inch long on the shore at each haul. These fish could have gone through a mesh one-quarter this size, but on the low, sandy flats would be kept in shore by the presence of the larger fish who kept close to the net until they were all huddled together in the bag and quickly landed. The small fish were largely of the *Chupeidae*, and probably consisted of shad, herring, (*Pomolobus pseudoharengus*) and "winter shad" (*P. medocensis*) but too small to be identified with certainty. The large shad, herring, winter shad, catfish, rockfish, striped bass of the North, *Roccus lineatus*, sturgeon and eels were taken up in baskets, leaving a living mass of gars, rockfish, yellow and white perch under five inches long, as well as the small shad, catfish, silver perch, (or strawberry bass, *Pomoxis hexacanthus*) and sunfish (*Pomoxis*).

After handling the shad for eggs, we would sort over this mass and return such as were living to the water. We handled many rockfish, but found none ripe, and when the proprietor of the fishery expressed a wish that the "rock" could be increased by artificial means, we showed him the young ones dead on shore, and plainly told him that we did not care for those already growing, and that each fish there four inches long, which had passed the critical period of babyhood, now represented at least a hundred hatched a year ago. Of the waste occasioned by the use of gill nets, we have not space now to speak, but would refer those interested to the paper prepared by Prof. Milner, on the "Fisheries of the Great Lakes," and published in the

report of the United States Commission for 1872-73, where he shows how nets which have broken loose in storms have kept on fishing until sunken with the weight of fish caught, and that when the men are dragging a grapnel for nets recently lost, they often find one that has been missing for a year or more, filled with the skeletons of fish.

There are perhaps places where no other net can be profitably used, as in the great lakes, but it does seem to be too destructive a mode of fishing in many other places, as so many fish are killed that never are utilized. Fish taken in gill nets are often dead twenty-four hours before being taken from the water, and Prof. Milner states that in stormy weather it is often impossible to visit the nets for several days, when the entire catch is unfit for food.

This mode of fishing is illegal in many small inland lakes and streams where there are but few fish, and these mainly protected for sporting purposes, and we raise the question, why not forbid them in the commercial fisheries?"

—An English magazine remarks in this sensible way as to the best method of angling for trout:—

"The best trout in a pool is always in the best place. The strongest fish in a pool will invariably lord it over the others, and hold the 'coign of vantage' against all comers. Should he be caught, then the next strongest fish will take his place—will succeed to the throne and become king of the pool. If a man, therefore, have wit enough to judge which is the choicest bit of water, whereabouts the securest lurking place, and where the most insect food comes floating by, he will know where the very heaviest fish is lying; and it is always good to try for such a fish in a pool first, and before the water has been disturbed. Now, in the case before us, a single glance tells us where these conditions are fulfilled. A broad belt of water descends vertically a little to one edge of the pool, within a yard of a huge slab of stone half covered with water. Just where the water falls its turbulence is too great for any living thing to exist, but between the actual downpour and the stone the water ceases to boil and bubble, and, where the eddy slackens a little at one spot, a thin sheet of foam bubbles lies on the surface. Throw exactly on this frothy scum. Let it be rightly done, and there is not merely a chance of tempting a good fish, but a certainty. The flies rest a moment on the froth, then fall through and disappear. At this instant a broad, fan-like tail breaks the surface for a second, and in the next the rod is bent double, and the winch is revolving with the most satisfactory rapidity. What has happened is this—the monarch of the pool has taken the fly as it sank, he has turned to dive below, and in doing so has discovered his tail above the surface. This has constituted the 'rise,' which the angler has seen only, for the noise of falling waters has not let him hear the splash. He strikes a little late, but scarcely too hard for so heavy a fish, and his quarry is now making his first desperate rush into the watery abysses."

✕ **THOSE TROUT AMONG THE WHITE HILLS.**—A correspondent, who is naturally inclined to be critical in all matters relating to angling, opens the following mathematical broadside upon a statement recently printed in this paper: EDITOR FOREST AND STREAM:—

There is a well written article in your issue of November 11th entitled "Trouting Among the White Hills." I say "well written," for the author has an eye for the beautiful in nature and knows how to describe it. But let me ask you and your readers, is he a sportsman? Fisherman he may be, but not in its true sense an angler. On his second day out he comes to Jefferson Brook, and concluding "that whatever fish were taken from it must be with something other than a fly," resorts to his worm box. "Oh, but it was lively work!" he writes. "The fun grew hotter and hotter, without any sign of abatement, but the lengthening shadows warned me to get out of the bush. Emptying my creel on a mossy bank I found that my catch had yielded me 237 fish, * * * many of them running up to ten inches in length. Now, Mr. Editor, and any of your readers who profess to be anglers, let us halt here, although not on a 'mossy bank,' and do a little sum in arithmetic. Suppose "J. G. M."—over these initials the author writes—had a creel of the largest capacity, say one that would hold fifteen pounds, or two hundred and forty ounces, and emptied from this creel "on a mossy bank" 237 "fish," as he calls them, what would be the average weight? I think the answer is *one ounce and 3-237*. He goes on to say: "They were a handsome mess of trout, many of them ranging up to ten inches in length." Let us assume that there were a dozen and a half that measured ten inches and call that number *many*, and as trout of ten inches average about three to the pound, let us deduct six pounds and eighteen fish and see what the remainder of his catch averaged—i. e., 219 "fish" to nine pounds, or 154 ounces. Why, just three-quarters of an ounce! "Oh, shade of Walton!" J. G. M.'s "catch the succeeding day was only one less, making in the two days 473 of these fingerlings. Is it any wonder our streams are depleted when young gentlemen are let loose from the cities to commit such havoc among the infantile troutlings? And then record it in print. I have seen the picture of "The Murder of the Innocents," and now I read about it. X. Y. Z.

✕ **THE FISHERIES.**—There have been 26 arrivals of the fleet this week as follows: 9 from St. Lawrence, 6 from Georges, 11 from the Banks. The receipts are 142,000 pounds Georges codfish; 262,000 pounds Bank codfish; 45,000 pounds Georges halibut; 135,000 Bank halibut; 840 barrels Bay mackerel; 400 barrels of shore mackerel. The catch of mackerel is over for the year, and the stock on hand is very light for the season. Georges and Bank codfish are firm at \$5½ and \$4½ per qtl., with a good demand. The herring fleet are getting ready, while the other vessels are being hauled up for the winter.—*Cape Ann Advertiser*, Nov. 19th.

✕ **CONNEAUT, Ohio, November 15th, 1875.** EDITOR FOREST AND STREAM:—

To give you an idea of sporting facilities at this place, I will say that fishing is excellent six or more months in the year, either in Lake Erie or in the river that enters it here. Black bass, pike, and perch are the principal kinds caught with hooks; but it is not unusual for several tons of whitefish to be taken off this harbor with gill nets in a single day. Conneaut River abounds with fish, and large mascalonge are caught in it many miles from its mouth and above several mill dams. Judging from the quantity of fish in this stream, it was rightly named the Conneaut over a century ago by the Seneca Indians, which means in their language many fish. At the date of my letter, some parts are fairly swarming with fish from one to four inches in length. They are in such countless numbers that a barrel could be filled with them in five minutes by using a small minnow scoop to catch them with. Duck shooting has not been good this fall, on account of very low water in the marshes. Squirrels have been quite plenty, and a few miles south of here any quantity of partridges can be found. They are reported as unusually plenty this fall. Conneaut is on the Lake Shore and Michigan Southern Railroad twenty-eight miles west of Erie, Penn. H. C. A.

—What is the next thing to a hen stealing? Why, a cock robin, of course.

Yachting and Boating.

All communications from Secretaries and friends should be mailed no later than Monday in each week.

YACHT CRUISE TO THE WEST INDIES.—Our Salem, Mass., correspondent, "Teal," informs us that "the famous yacht Julia, built in 1852 by Geo. Steers, has just cleared from that port for a cruise South, and possibly to the West Indies. After being altered many times and passing through various hands she is at present owned by a Mr. Tudor, (of Nahant, I think,) who, with a party of four others in the cabin and six to work the yacht, completes the list of those on board. The party, I understand, are well fitted with sport ng implements, and I should think were bound for some sport both 'on the wing and wave.' She is a fine yacht though an old one, and, judging from the hasty inspection I made of her last Thursday A. M., was as well fitted for sea as could be. She is the hands of her old sailing master, Capt. Lloyd, who will do her justice. The party expect to return in four or five months."

PROSPECTUS OF THE INTERNATIONAL REGATTA TO BE HELD NEXT YEAR.—The Schuylkill Navy has issued a prospectus of the projected international regatta, to be held on the Schuylkill River next year, containing the following programme, which has been approved by Director General Goshorn:—

First. An international race will be held, open to all regularly organized boat clubs throughout the world, to be rowed in accordance with the rules of the National Amateur Rowing Association of the United States; the prizes to be a piece of plate each for fours, for pairs, for doubles, and for single sculls, and in addition, medals to be presented to each man rowing in the race, to be of gold for the winning crew, for the second crew of silver, and the remainder of bronze.

Second. An international college race for four-oared shells will be held, the prize to be a piece of plate, with a gold medal to each member of the winning crew, open only to under graduates.

Third. An international graduates' race will be held for four-oared shells, open only to graduates of colleges or universities, the prize being a piece of plate, and a gold medal to each member of the winning crew.

No person will be allowed to row in both the international college race and international graduates' race.

Fourth. Professional races will be held, open to all crews throughout the world, for four oared and single sculls for suitable purses, the amounts of which will be announced by the 1st of May, 1876.

The races will be held between the 20th of August and the 15th of September, and the entries shall be closed on July 15th.

An entrance fee of \$25 will be charged for fours; \$15 for pairs and doubles, and \$10 for singles. This fee will be returned to all boats starting on the races, and is demanded as a guarantee of good faith in making the entry, and to justify the committee in making the necessary arrangements for properly housing the boats of the entering crews.

The amateur races will be rowed in heats one and a half mile straightaway. The professional races will be rowed three miles, one and a half mile and return.

Besides the above prizes the "Jury on Rowing" of the United States Centennial Commission, who will have an oversight of all the races, will award the diploma and medal of the commission to the victors.

The National Amateur Rowing Association will hold their annual regatta over the same course (the national) either previous to or immediately after the above international races.

The following definition of an amateur oarsman, with the required pledge, will be strictly enforced for all entries in the regatta:—

The president or presiding officer and secretary of each club entering either of the amateur races or regatta controlled by the Schuylkill Navy will be required to certify on honor, in writing, that each member of the crew entered is strictly an amateur, and is not paid, directly or indirectly, for his services either by place, emolument or office, as a member, or by reason of his being a member of the club; that he "does not enter in open competition for either a stake, public or admission money, or entrance fee, or compete with or against a professional for any prize, and has never taught, pursued or assisted in the pursuit of athletic exercises as a means of livelihood, or has been employed in or about boats or in manual labor on the water."

These races, while under the control of the United States Centennial Commission, will be under the management of the Schuylkill Navy, a boating organization composed of nine clubs, whose boat houses are on the east bank of the river within Fairmount Park. The leading boating organizations of the country have consented to co-operate.

The Schuylkill Navy, besides furnishing quarters for the boats of visiting crews in their own boat houses, purpose erecting temporary boat houses in the park, and will thus be enabled to accommodate all who may accept this invitation to take part in the races. The following is the Regatta Committee:—A. Krumbhaar, Philadelphia Barge Club, Executive Committee National Association, Chairman; E. S. Miles, University Barge Club; W. R. Tucker, Undine Boat Club; G. W. Parker, Quaker City Barge Club, Executive Committee National Association; F. W. Murphy, Pennsylvania Barge Club; Isaac Bedichimer, Malta Boat Club; H. R. Barnham, Crescent Boat Club; H. V. Stillwell, West Philadelphia Boat Club; Dr. Daniel Bray, College Boat Club. JAMES M. FERGUSON, Commodore. JOHN HOCKLEY, Jr., Vice Commodore. JONATHAN GILLINGHAM, Secretary.

SCULLING AT NEW HAVEN.—An interesting and long anticipated match was rowed on Lake Saltonstall on the afternoon of the 17th inst., the contestants being Mr. Julian

Kennedy, Professor of Physics in Yale College and Mr. R. B. Bainbridge the well known amateur of this city. The two distance was two miles. The men were started by Mr. James Watson, the referee, at a little after half past four, Bainbridge getting away first with a lively stroke that carried him ahead of his opponents. Kennedy, however, was rowing a slow but powerful stroke that soon carried him even, and at the turn he was several lengths ahead. He made a bad turn however, and Bainbridge catching him before he was around they started on the homeward journey together. Kennedy, however, soon went to the first again and passed the line amidst the most enthusiastic demonstrations of the Yale students, some fifteen lengths ahead. Time, 14m. 57s. Bainbridge's time was 15m. 42s. Kennedy rowed a slow stroke throughout while Bainbridge pulled as high as 35 or 36.

ACROSS THE OCEAN IN A DORY.—Two men, Eben McAuley and Oluf Henrikson, of Gloucester, Mass., propose in June next making the attempt to cross the Atlantic in an open dory, such as is used by the Bank's smacks in their fishing expeditions. They advertise in the Cape Ann Advertiser for subscription to assist them in carrying out the feat. The first name has the familiar whaler's ring to it, and the speaks of a Norse origin. The combination should be successful in almost any undertaking where salt water is concerned, but we doubt the wisdom of even encouraging these foolhardy experiments. A similar trip with a life raft, or some new life saving invention, might be productive of some benefit, but the present trip is likely to end as did that of the three Gothamites.

—In the academic part of Michigan University the students have organized a boating association, and purpose giving a series of entertainments during the Winter to raise the necessary funds for the maintenance and proper training of a navy.

BOATING AT HALIFAX.—A race was rowed in Halifax Harbor last week between Obed Smith, of the Smith Nickerson crew, and George Beazeley of Purcell's Cove. The race was an easy one for Smith who had his man safe the entire distance, Beazeley finally rowing into Market Slip and complaining that his wrist had given out.

DARTMOUTH.—Mr. E. C. Carrigan who was previously elected to act as senior delegate to the Intercollegiate Rowing Association, has also been elected President of the Dartmouth Boating Association. All six of the crew of '75 will be upon the University crew of '76 and it is probable that five at least of the crew will consent to row. Mr. Barron of the Twin Mountain and Crawford Hanns was tendered the '75 crew and the Boating Association a complimentary dinner.

Billiards.

THE LATE TOURNAMENT.—The billiard tournament which commenced at Tammany Hall on the evening of the 15th has closed. The ushers, in their gay ribbons, were very polite and obliging to all strangers, and especially so to members of the press. A remarkable feature of the tournament was the surprise created by the excellent playing of the two youngsters, Slosson and Sexton, both of whom did wonders, although the former did not play within fifty per cent. of his game, as a few weeks ago in St. Louis, playing for a wager he made the astonishing run of 285, and averaged 55 6-7 in 500 points. Being questioned in regard to his low averages in the present tournament, he answered by saying that the cushion he played on in St. Louis was entirely different from the one in use at Tammany, and he felt as if a heathen-Chinee had hold of him whenever he struck a ball. However, it is our opinion that if Slosson had come on from St. Louis sooner, and had had more practice, instead of being down among the dead men he would certainly have been first or second in the grand race, as his run of 104 proves to our satisfaction that he was improving in his play and getting the cushion down to a nicety. Sexton, the not-known, is a prodigy and a curiosity as a billiard player, this being his first bout with the stars, and having a nerve of steel and an abandon that looks almost careless. Sexton is without doubt a "wonder," and before many moons pass over will make others wonder why the ducats leave their pockets so very fast. Another most remarkable circumstance connected with this tournament is that one of the artists fainter after winning a game, and another is laboring under the idea that he has the disease of the heart. The fact is that the young ones made the place too hot for their older competitors, and the strain upon the nerves was more than some of them could stand. Cyrille Dion covered himself with glory by maintaining the title given him in days gone by, his superior judgment making him a general indeed. Maurice Daly played in bad luck throughout, and, of course, gets nothing, while the first and second prizes go to the representatives of Montreal. Financially, the tournament is not much of a success, the depressed times no doubt being one of the principal causes. Appended is the summary of the tournament giving the number of games won and lost, with the highest run and the best average of each player:—

Players.	Games won.	Games lost.	Highest run.	Best Average.
Cyrille Dion.....	5	1	89	30
Joseph Dion.....	5	1	122	14 2-7
Maurice Daly.....	2	4	124	23 1-13
Albert Garnier.....	3	3	119	30
William Sexton.....	3	3	136	15
George Slosson.....	3	3	114	16 2-3
A. P. Rudolphe.....	0	6	62	0

THE CHAMPIONSHIP CONTEST.—The fourth match for the championship of America, the Delaney badge, and \$1,000 was played on Tuesday night in Tammany Hall, the contestants being Maurice Daly, the champion, and Cyrille Dion, winner of the first prize in the Garnier tournament. The interest evinced by the spectators showed that the popular love for billiards had suffered but little from the tournament just past. Dion won by 3 points. Dion's average, 124; Daly's average, 11 29-48; Dion's largest run, 52; Daly's largest run, 104; time of game, 3h. 28m.

BREVITIES.—Clake E. Wilson at 57 Cedar street, lately performed the unparalleled feat of pocketing fifteen balls after the break in their numerical order. Ralph Benjamin of Portchester, and Gersham B. Hubbell of Hartford, were in town last week. Charles A. Frink is temporarily in the city. At Chris O'Connor's on Saturday night last, Sexton and Rudolphe played two games (French) for \$25.

and \$100. Sexton won both, getting back his losses on his game with Garnier. Dan. Strauss was very jubilant at the result of the late tourney. James Kernarr, after an extended trip, is back to Gotham. George F. Slosson attributes the poor show he made in the tournament to the fact that he was unable to obtain a table to practice on. D. S. Giralds has opened an eating house in Montreal. A three-ball tournament is to be inaugurated at Rochester, N. Y. There will be three prizes—\$100, \$60, and \$40. The entries are Kinney of this city, Eugene Sprague of Danville, N. Y., Frank Twitchell, Eugene Kimball and Ferguson of Rochester. Simon Burns left for Texas on the 20th. instant. The party or parties who arranged the order of playing in the late tournament, would have displayed great diplomacy, if Sexton's play had been as anticipated. Joe O'Connor is now mine host of the Queen's Hotel, at Guelph, Canada. Our exchanges speak of some tall pigeon shooting done by genial Joe. John O'Connor represents his interest with Capt. Tom Murphy at the Columbia Rooms, this city. M. H. Hewins is now reported at the Hot Springs, Ark. The match for the championship of the Northwest and Southwest, between Maggioli and Barleigh, will take place January 8th, the day on which the celebration of the battle of New Orleans takes place. What has become of the one-armed tournament that was to be held at A. R. Samuels', Brooklyn? It is about time some of the billiard men in that city got out of their lethargy. John Keane went to New Orleans Nov. 23d to set up J. A. Walker's tables. Joe Martin is in Philadelphia. Billy Goldthwaite expects to open a room at the South End, Boston, with six tables. The "Red Room" at the Palais Royal, Boston, is again used for billiards. Since John J. Murphy added a gymnasium to the Hub Billiard Palace, he is kept constantly employed. When does that fifteen ball tourney come off? The Centennial tournament, instituted by the *Clipper*, is now pretty freely canvassed among billiardists, and we should not be surprised to see the purse swelled to the tune of \$10,000. George Slosson can be found at Thomas Bros. room, 1239 Broadway. J. A. Walker, of New Orleans, had shipped to him on Saturday eighteen standard American tables from the factory of H. W. Colender. Mr. Walker has recently purchased the old Crescent City room, originally opened in that city by the late Col. Merriam. Pool selling was very brisk at Maurice Daly's during the past week. Sexton can be backed for \$1,000 each game against any or all the contestants in the late tourney.

Rational Pastimes.

BICYCLING.—Stanton, the English long distance champion, to whom we alluded last week as having undertaken the task of riding 650 miles in seven days, successfully accomplished the feat with over an hour to spare. The following table shows the time of starting and the distance ridden each day:—

	Started.	Stopped.	Distance.
	H. M.	H. M.	Miles. Yds.
Tuesday, October 26th.....	6 20	5 0	100 1,200
Wednesday.....	7 15	5 23	94 1,128
Thursday.....	7 15	5 6	100 1,120
Friday.....	7 13	5 13	90 1,080
Saturday.....	7 3	4 51	90 1,080
Sunday.....	7 12	5 0	85 1,020
Monday.....	6 57	4 47	87 323

SKATING.—Preparations are already being made for the skating season of 1875-6, and the first in the field to prepare facilities for the sport are Messrs. Weed and Decker, who now have their ball grounds flooded with water, ready for the advent of Jack Frost. The programme for Winter sports at the Capitoline Lake this season will include carnivals, ice boat regattas, races on skates, children's festival days, and several novelties. A coasting track is talked of, to extend from the rising ground at the northeast corner of the enclosure and to continue to the opposite corner, with a turn extending to the west side of the lake. This will be quite a feature. In fact, the Capitoline Lake will be a public resort for all kinds of winter sports this season, and, as usual, the Ladies' Hall, heated and made cosy for the fair sex who do not participate in the sports on the ice except as spectators, will be a feature.

COLUMBIA.—A match game of football was to have been played on the St. Georges Cricket Grounds at Hoboken on Saturday between Columbia and Rutgers Colleges, but the latter college could not get a team together. In order not to disappoint the spectators, Mr. Price, Captain of the Columbia team, selected an eleven to play an eleven selected by Mr. King. Mr. Price's side, proved victorious by two goals against one gained by Mr. King.

PRINCETON.—Princeton College and Stevens Institute had a game of football at Princeton on Saturday. Princeton won six straight goals in one hour and seven minutes.

CHOKE BORES.—We are glad to perceive that our statements with regard to the fallacy of choke boring guns are indorsed by our American sporting contemporaries. The New York FOREST AND STREAM thus speaks on the matter: "We notice that in all the reports commendatory of the new system chilled or hard shot is spoken of as being used; and if the wonderful results of pattern and penetration claimed can only be obtained by the use of this hard shot, the choke bore is not the gun for general work in this country. For pigeon shooting it certainly possesses advantages, but we believe a modification or abandonment will be the result of another year's experience." What does our contemporary the *Field* think now of its new "toy"?—*Illustrated Sporting and Dramatic News.*

A PROPER ASSERTION OF DIGNITY.—From the *Volunteer Service Gazette* we take the following;—

"As we have lately noticed, many matches have recently taken place between Regular and Volunteer soldiers, in which officers have shot on both sides. Hitherto it has been rather the custom for the Volunteer team to be made up of all ranks, while the Regulars sent none but non-commissioned officers and rank and file. This may of course be accidental in some cases, but it is not a desirable state of things, and we believe that Volunteer commanding officers would act prudently in making a rule that none of their officers should take part in a match firing against a 'Regular' team, unless at least one officer formed part of the latter. At a recent match at Brighton there was no officer in the Scots Grey's team, though there was one in the Volunteers."

New Publications.

Augusta Evans' new novel, "Infelice," bids fair to rival "St. Elmo" in advance orders. Carleton & Co., the publishers, are negotiating with a large dealer for the enormous number of 50,000 copies, including "the market."

T. B. Peterson & Bros., Philadelphia, announce that they will publish next week a new novel by the popular and well-known Western authoress, Miss Eliza A. Dupuy, entitled "A New Way to Win a Fortune." It will be published complete in one large duodecimo volume, bound in morocco cloth, gilt back, price \$1.75.

THE LANGUAGE AND POETRY OF FLOWERS.—Mrs. Martha Ewing, the gifted poetess of Rochester, N. Y., has issued a little hand book with the above title—a book, indeed, for the vest pocket, and filled with sweet thoughts suggestive of the fragrance of the rose and the fragrance of the lily. It is illustrated, also, and the glowing words depict the flowers in radiant colors which no pigment can supply.

Mr. Wm. L. Stone has just published his "Reminiscences of Saratoga and Ballston" in a handsome volume. It is filled with entertaining accounts of those popular watering places, and of the noted characters that have frequented them.

Answers To Correspondents.

No Notice Taken of Anonymous Communications.

SNRPE, Monroe, Mich.—The weight of the grizzly bear in Central Park is 800 pounds.

YOUNG SPORTSMAN, Waterville.—Please inform me where I can obtain a pair of carrier pigeons, and the price? Ans. Address Jos. M. Wade, Philadelphia, Pa.

F., New Haven.—Where can I obtain female wood ducks in exchange for males of same species? Ans. Possibly from Fred. Mather, Honeoye Falls, N. Y.

H. B. S., Chestnut Hill, Mass.—You can get a second-hand Remington gun by addressing Dr. Henry Schoenfeld, Miamisburg, Montgomery county, Ohio, or H. Morgan Jones, 30 1/2 North Fifth street, Philadelphia.

J. H., Auburn, N. Y.—Will you have the kindness to inform me if there is such a gunmaker as Harlow in Birmingham, and if so, what is his standing as such? Ans. The name of John Harlow is not on the list of gunmakers of Birmingham.

C. W. W., Charlestown, N. H.—What book can I get to post me up on poultry houses and best breeds of poultry to raise for market and eggs? I want to go into raising on a large scale. Ans. Address *Fancier's Journal*, Philadelphia, Pa.

C. S. R., Niagara Falls.—Will you please tell me if there is any danger of pin-fire shells not being manufactured and not obtainable, and if so, how long before they will run out? Have been told there are no more pin fires manufactured. Ans. The supply will last as long as the guns.

A. F., City.—Please give me the address of a good manufacturer of muzzle loading guns and rifles. Ans. You can have a shot gun or rifle made to order by most any of the gunmakers of this city, who advertise in this paper, or by John Krider, corner of Second and Walnut street s, Philadelphia.

RAQUETTE.—Write to Dr. R. A. Alloway, 30 Radigonde street, Montreal, for information respecting Megantic district of Canada. Theophile Beauchamp, St. Hyppolite de Richemey P. O., Providence of Quebec, is a good guide. There is good fishing and shooting in season, salmon trout, brook trout, and bass in abundance, with plenty of small game.

A. H. K., New York.—Is there good rabbit shooting in the vicinity of Holmdell, N. J.? Are there any quail or partridge in same locality? Could you tell me of any better place for rabbit shooting nearer New York? Ans. You could find some rabbit and quail shooting in the vicinity of Holmdell, also near Old Bridge and Spotswood, in Middlesex county, N. J.

R. R., Jr., New York.—How do you give the pepper recommended to canaries in your issue of November 11th? Ans. Mix with some favorite food, such as soaked cracker or the yolk of an egg, boiled hard, a little red pepper, and keep it where the bird can eat of it as much and as long as it likes, but be careful at the same time to provide plenty of other food, so that the birds need not be confined to a pepper diet.

L. L., New Haven.—1st. Which of the two London gunmakers—Scott or Tolley—turn out the most serviceable breech loader for \$35? 2d. Which of the three States—Arkansas, Missouri, and Iowa—afford the best general shooting the year round, and what part of the State decided upon is the best? Ans. 1st. We are at a loss to say which is the best gunmaker; both are first class. 2d. Missouri and in the vicinity of Jefferson City.

SPARKILL.—1st. What kind of a dog is the best for rabbits, a common hound or a beagle? 2d. Where can I procure one or two good pups, and the cost of the same? Would like to get them in a month or two. 3d. What is the cost of ferrets apiece. 4th. Is the improved Dittmar powder as good as ordinary black powder, and as safe? Ans. 1st. We prefer beagles or harriers for rabbits. 2d. Address Mr. H. Bergen, Road Hall, Middlesex county, N. J. 3d. From \$4 to \$8. 4th. The Dittmar powder is much used in the West and Northwest and approved of. We cannot speak of its merits as compared with black powder by our own experience.

C. B., Philadelphia.—Will you inform me what is the proper charge of powder, amount and No. of shot, size and distance from target which is in common use by gunmakers as a standard to test guns by (breech loaders)? How many shot should a No. 10 bore breech loading shot gun put in a target of proper dimensions, with correct load, etc., as a test of its shooting qualities? What is the standard of penetration? How do you try a gun in that respect? What should a No. 10 bore gun do in regard to penetration? Ans. Four drachms of powder, 1 1/2 oz. No. 7 shot. Target 30 inches in diameter; distance 40 yards; 290 pellets, evenly distributed, is good; thirty-five sheets of hardware paper, usual thickness, is good penetration.

T. C., Brainerd.—You speak in an editorial of the Evans repeating rifle. What is it like and where is it made? Ans. Most modern magazine guns, of which character is the Evans, have the cartridges introduced in a tube parallel with the barrel. The Evans carries its thirty-four charges in a short tube in the stock, so that the weight is against the shoulder and not at the extremity of the gun. The feeding mechanism is highly ingenious, consisting of an archimedean screw, which revolving, places the cartridges in the chamber. The rifle functions comprise a down movement of the lever, the cock striking upward. When the lever is used the old shell is ejected, the new cartridge is chambered, and the piece cocked. There are no spiral springs, all being direct lever and ordinary spring movements. Calibre is .44; centre fire; lengths, 26, 23 and 30 inches; weight, 9 pounds. The Evans rifle was perfected and placed in the market some six months ago. It will fire with great rapidity. The agents are Messrs. Merwin, Hurlbert & Co., No. 83 Chambers street, New York.

—As geese were the salvation of ancient Rome, so the perpetuation of our New England Thanksgiving Day rests on Turkey.

A WEEKLY JOURNAL.

DEVOTED TO FIELD AND AQUATIC SPORTS, PRACTICAL NATURAL HISTORY, FISH-CULTURE, THE PROTECTION OF GAME, PRESERVATION OF FORESTS, AND THE INSTRUCTION IN MEN AND WOMEN OF A HEALTHY INTEREST IN OUT-DOOR RECREATION AND STUDY.

PUBLISHED BY

Forest and Stream Publishing Company.

AT

17 CHATHAM STREET, (CITY HALL SQUARE) NEW YORK,
[Post Office Box 2832.]
127 SOUTH THIRD STREET, PHILADELPHIA.

Terms, Five Dollars a Year, Strictly in Advance.

A discount of twenty per cent. allowed for five copies and upwards.

Advertising Rates.

In regular advertising columns, nonpareil type, 12 lines to the inch, 25 cents per line. Advertisements on outside page, 40 cents per line. Reading notices, 50 cents per line. Advertisements in double column 25 per cent. extra. Where advertisements are inserted over 1 month, a discount of 10 per cent. will be made; over three months, 20 per cent; over six months, 30 per cent.

NEW YORK, THURSDAY, NOVEMBER 18, 1875.

To Correspondents.

All communications whatever, whether relating to business or literary correspondence, must be addressed to THE FOREST AND STREAM PUBLISHING COMPANY. Personal or private letters of course excepted.

All communications intended for publication must be accompanied with real name, as a guaranty of good faith. Names will not be published if objection be made. No anonymous contributions will be regarded.

Articles relating to any topic within the scope of this paper are solicited. We cannot promise to return rejected manuscripts.

Secretaries of Clubs and Associations are urged to favor us with brief notes of their movements and transactions, as it is the aim of this paper to become a medium of useful and reliable information between gentlemen sportsmen from one end of the country to the other; and they will find our columns a desirable medium for advertising announcements.

The Publishers of FOREST AND STREAM aim to merit and secure the patronage and countenance of that portion of the community whose refined intelligence enables them to properly appreciate and enjoy all that is beautiful in Nature. It will pander to no depraved tastes, nor pervert the legitimate sports of land and water to those base uses which always tend to make them unpopular with the virtuous and good. No advertisement or business notice of an immoral character will be received on any terms; and nothing will be admitted to any department of the paper that may not be read with propriety in the home circle.

We cannot be responsible for the dereliction of the mail service, if money remitted to us is lost.

Advertisements should be sent in by Saturday of each week, if possible.

CHARLES HALLOCK, Editor.

WILLIAM C. HARRIS, Business Manager.

THANKSGIVING.

THE present issue of our paper goes to its many friends on an auspicious day, and adds, we trust, its mite towards the attractions and enjoyments of the festive occasion. Our daily contemporaries will so fully do the historical that we refrain from all allusions to the Pilgrim Fathers, pumpkin pies, or even roast turkey. Suffice it to say that the custom which originated in New England has now become truly national, and from Maine to Georgia, from the Atlantic to the Pacific, the occasion will be observed, families will be re-united, and general peace and good will prevail. "May good digestion wait on appetite and health on both."

THE CENTENNIAL.—We have already referred to the preparations in progress at the Smithsonian for making a satisfactory display of the animal and fishery resources of the United States at the Centennial. Specimens are continually arriving at the Institution from all parts of the country to be suitably prepared for the purpose. Some idea of the magnitude of this work may be gathered from the fact that almost on the same day were received in the flesh a white whale and ground shark from the Gulf of St. Lawrence, each about fifteen feet in length; a noble elk with a superb pair of antlers, from Cheyenne; a seal weighing three hundred pounds, from Boston, and a considerable number of fishes from New York, contributed by Mr. Blackford, besides numerous minor articles.

CHOKE BORES.—We shall publish next week an interesting article by Mr. Thomas A. Logan ("Glean") on choke bores. Mr. Logan writes: "It is time that this effort to make a gun put its whole load into a saucer, was checked."

* * * You are doing good work with the paper, and you have—more and probably greater than you dream of—the good wishes and God-speed of the gentlemen of the gun."

—Visitors to Florida who dread the sickness of a sea voyage can avail themselves of the very liberal excursion tickets to Jacksonville, Fla., and return, now being issued by the Pennsylvania Railroad. These tickets are good until May 31st, 1876, and are sold very low. For sale at all ticket offices of the company.

"CAMP LIFE IN FLORIDA" is now ready for distribution. The first edition nearly exhausted. See advertisement.

TRESPASS.

IT is an unfortunate circumstance that our laws of trespass in contiguous States are as much at variance as the laws governing close seasons in the same localities, and uniform regulations are as much to be desired in the one instance as in the other. In New York, for instance, the land owner is compelled to post notices of specified dimensions in conspicuous positions, to protect his premises from trespass and to preserve the game thereon for his own purposes. In New Jersey the mere going upon land with a gun constitutes trespass and renders the trespasser liable to a fine; while in Pennsylvania a notice published in a local paper is all sufficient, and the luckless stranger may at any moment be rendering himself liable to a fine and perhaps the confiscation of his gun.

Of course it is to be presumed that the sportsman visiting a State other than his own, will place himself under the guidance of some one well posted as to the locality; but a general law such as that in force in this State, would, while amply protecting the farmer, also save innocent persons from much annoyance and mortification. Numerous instances have been reported to us where the fines have been inflicted apparently solely for the gratification of petty malice, or for the sake of pocketing a few wretchedly earned dollars.

Where farmers are themselves sportsmen and desire to preserve their game for their own shooting, not an atom of fault can be found with them; but such as possess the sporting instinct themselves are generally the first to grant the required permissions, and the refusers are frequently curmudgeons and misers. In the neighborhood of large cities, where every hoodlum who can muster a gun starts on a crusade after the luckless robins or bluejays, we can sympathize with the farmer, who takes the most vigorous measures for protecting his property, since, to the average robin killer, when out of luck, a good fat fowl offers a temptation scarcely to be resisted; but the genuine sportsman, when in game districts, has the right to expect the courtesy of a notice to leave before either being summarily ejected or dragged before a country magistrate. Unless one has a friend in the neighborhood it is really difficult at the present day to find a spot within easy distance of the city where it is safe to gun, without a fair prospect of meeting with the unpleasant results before mentioned; and a principal cause which has led to this result is the fact that farmers have found it exceedingly profitable to snare their quail and grouse and ship them with their other home products to the nearest market.

York and Lancaster counties, in Pennsylvania, must be at the same time the paradise and purgatory of sportsmen, as a correspondent writing from Columbia, in the latter county, states that, while game is very abundant, the farmers, most of whom are well to do, strictly preserve the birds for trapping and sale in the York and Lancaster markets; and he mentions as one among many similar occurrences how one Keeler had a man arrested for merely crossing his premises, although he had not fired a gun, and mulcted him to the extent of seven dollars and fifty cents. The same correspondent, however, relates another case, where the tables were turned, and the would-be gun seizer was soundly thrashed. All this unpleasantness might be avoided, if notices—such as one seen on Long Island, for instance—were posted in conspicuous places. Nor can we blame the farmer so much, when he is actuated by other than such selfish and even lawless motives as snaring and trapping. Many Western land owners are awakening to the fact that their prairie chickens are great destroyers of grasshoppers and noxious insects, and whether from this or other causes are becoming close preservers. A correspondent writes us from Lawrence, Kan., very pertinently on this subject as follows:—

"The laws of this State prohibit shooting on any one's preserves without the consent of the owner. While this does not so much affect grouse shooting early in the season when the birds are principally on the prairies, it does give a great deal of trouble later, when they are on stubble or in the corn, and almost results in putting a stop to quail shooting entirely. Owing to our visitations of grasshoppers last Fall and Spring, a large number of our farmers are taking strong grounds against allowing any birds to be killed on their premises; so much so that in some sections it almost amounts to total prohibition. I mention this that parties coming here from the East to shoot may be forewarned, and be led to shape their course accordingly. In some localities permission to shoot is cheerfully accorded to gentlemen sportsmen, if they will take the trouble to ask for such favors; but very often either permission is refused entirely, or parties not making the request are summarily ordered off the premises. There is less trouble on this score in the southern and southwestern parts of the State, than in this and the other older settled portions, but there is enough anywhere."

Assuming that the question of protection to crops by game birds is really being agitated at the West, it may be interesting to know that in England the value of the peasant to agriculturists is being appreciated. It is stated that upwards of twelve hundred wire worms have been taken from the crop of a hen pheasant, and if this were but a single meal, what must the total for the season amount to? Indeed it has been complained that in some districts they have entirely extirpated the grasshoppers. We find it stated in an exchange that a farmer's boy in Ohio, observing a flock of quails in his father's cornfield, and finding that they were pursuing a very regular course of foraging, first up one series of rows and then down the next, feared that that they were destroying the corn, and fired into them. But one bird was killed, and upon opening this one he found in its craw one cut-worm, twenty-one vine bugs and

about one hundred chinch bugs—but not one grain of corn.

Before leaving this subject we should like to call attention to another kind of trespass, far worse than any unauthorized shooting over a farmer's land. We allude to the indiscriminate and wanton destruction of game by strangers in localities where the residents have been trying to preserve and increase the number of their birds. The Norfolk *Virginian* claims that recently a party from New York camped near Suffolk, and were slaughtering quails wholesale for shipment to and sale in this city, shooting over relays of dogs, and fairly exterminating the birds. We join with our contemporary in calling upon the county supervisor to put a stop to this slaughter. To make the matter worse the heavy rains destroyed nearly all the first broods, and the others are scarcely half grown. For our part, we should not regret a law which would limit the killing of birds by one person to a certain number on each day.

AMERICAN ARMS ABROAD.

THERE are two reasons why such large quantities of arms for military purposes are manufactured in this country for foreign powers. Of course, the principal reason is the paramount excellence of the arm, its cheapness, and the facility with which it can be produced. The second cause—a minor one, it is true—nevertheless exerts a certain influence. The United States, free from all entangling alliances, can take contracts for arms with any foreign government. In times past, a New England arms company has been known to manufacture, at the same armory, pistols and carbines, identical in form and pattern, to be used by two belligerent powers then in active strife. It has been stated, and with reason, that warlike movements, likely to occur thousands of miles away from us, are first heralded in Maiden Lane or on Broadway before they are even rumored abroad. The purchase of a few thousand stand of arms from the Remingtons, Winchester, Sharps, Colts, Whitneys, or Peabodys, ordered in a quiet way by some foreign purchaser, usually portends the breaking of the peace somewhere. In fact, it is by no means out of the way to assert that to-day, wherever the crack of the rifle is heard, no matter in what part of the world it is fired, whether in sport or in anger, to lay low the bounding deer or to slay one's fellow-man, some bullet chambered in an American breech loader, and speeding from an American barrel, flies on its errand of death.

There are some novel points which are now apparent when we consider this important subject of arm manufacturing in the United States. In the late Rhode Island contest at the What Cheer Range, our correspondent took special notice of the Peabody and Martini rifle, used there in public competition for the first time, and their performance was highly commended. Here we have a peculiar phase of American arm production. A foreign gun was taken in this case, improved upon, turned out in large quantity, and its manufacture absolutely diverted from England to America. This special arm, now being made in Providence for the Turkish government, may be pointed some day by the soldiers of the Ottoman Empire against Russia or the Khedive. It was curious to notice that quite lately, on the occasion of a visit of a gallant English admiral to Newport, R. I., he was presented with an elegant Peabody and Martini rifle, made in Providence. This was indeed a case of sending coals to Newcastle.

France, Spain, Egypt, Denmark, Turkey, Sweden, Greece, China, Japan, Russia, and all South America buy our arms. It may be safely stated that for the last fifteen years there never has been a minute when American tools, with American brains and hands to manage them, have not been employed in manufacturing arms for other countries.

In a comprehensive article on this subject, published in the *New York Commercial Bulletin*, we find it stated that "the first large contract for American small arms by a foreign power was made in September of 1870 with the Provisional government of France, which negotiated with Mr. S. Remington, the head of a private armory in Ilion, in our own State, for 50,000 stand of the approved calibre of 11-millimetres, or 0.43 of an inch. Before the lot was completed a second contract for 70,000 stand of arms was awarded, while occasional purchases were made of smaller lots. The aggregate of service rifles manufactured and shipped to France by the Remington Company alone since the date mentioned reaches 154,120. To this may be added 18,777 carbines and 40,850 army revolvers, making a total of arms furnished to France by the Remingtons of 214,247." Prior to this, however, we are cognizant of the fact that Colt carried out a large contract for arms for both the English and Russian governments during the Crimean war. Spain, with her constant troubles at home and abroad, is a heavy purchaser of arms, and 250,000 breech loaders have just been delivered to her, and she is likely to want more. The Khedive, seeing the possible dismemberment of the Turkish power, is well stocked with American small arms and artillery, and has always a contract in hand. There are some cases, as in Denmark and Sweden, where American patents for arms have been purchased, and a royalty is paid for the production of such weapons when made in foreign arsenals.

But it is not in arms alone that we lay a heavy contribution on other countries. The cost of ammunition is an important item which has to be added. It is pretty certain that, taking the average of years, this expense of ammunition per annum will about equal the first cost of the arm. The Winchester, Remington, and Metallic Cartridge Com-

panies export annually no less than 50,000,000 cartridges. Now, taking 600,000 arms to be about the yearly exportation, and setting them down at the exceedingly low figure of \$15, we have the large amount of \$9,000,000 paid to us for the arms alone. In ammunition, taking the 50,000,000 rounds at even three cents each, which is fully within the limit, we have the amazing sum of \$1,500,000 to be spent in powder, ball, primer, and metallic case. We may then be prepared to state, within bounds, that the military arms and ammunition business is worth to the United States fully \$10,000,000 per annum, and that this demand is more likely to be increased than diminished.

The following are the principal manufacturers in this country: The Remingtons, at Ilion; the Winchester company, of New Haven; the Sharps, at Philadelphia and Hartford; the Colt company, at Hartford; the Providence Tool company, the Brown Manufacturing company, at Newburyport; the Smith & Wesson, at Springfield, various companies at Chicopee, and, in addition, special manufacturers, such as the Ward-Burton, Choate, Evans, and many others too numerous to mention.

In this necessarily brief article we have endeavored to give some slight insight into the magnitude and importance of the arms and ammunition business of the country, for we certainly are the largest private producers of perfected weapons in the world. It is impossible not to draw a manifest corollary from this most indisputable assertion of ours. It stands to reason, then, that since we can make and sell military arms of the best patterns to the world, the time will not be far distant when our sporting guns will be as freely in use in other countries as are our warlike weapons. All it requires is the same attention and the same inventive facility. The tools we have already at hand.

GUNNING ACCIDENTS.—Mr. James Ritz Burns, of Lewistown, Pa., while last week in company with Mr. J. F. Steiner of Phillipsburg, Rev. Wilson, Rev. Gearhart, and one or two other gentlemen, in the mountains about twelve miles from Phillipsburg, was fatally shot in the head by an accidental discharge of his gun. He was standing on a runway at the time. Mr. Burns was a highly respected member of the Methodist Episcopal Church, and his funeral was attended by a large number of friends.

Our occasional correspondent, Emlen Cresson, Esq., of Philadelphia, while duck shooting last Thursday on Bush River, about twenty-five miles from Baltimore, was accidentally shot in the head, but it is believed the wound is not fatal. He was unable to be brought home. He has our hearty sympathy and earnest desire for his speedy recovery.

Elijah S. Cassell, of Pleasantville, N. Y., ruptured his main artery while out hunting on the 13th inst. in company with Wm. Light, and died in a short time. Mr. Ward B. Cassell says. "He was well known as a dog breaker and breeder of setters, and was a warm friend of FOREST AND STREAM. He was Game Constable of the town of Mount Pleasant, and, prior to his election, there could be heard more guns on a Sunday in the woods and swamps than on week days. But now it is a rarity to hear the report of a gun on the Sabbath in that vicinity." He was regarded as authority on all matters by his brother sportsmen, by whom he was much esteemed. His dog had to be dragged away from the friend's house where he died, and has noticed no person since.

—The Surveyor General of Washington Territory, who sends a club of five subscribers, writes, saying: "I consider that your journal has done more to properly educate the sportsmen of this country than all the other publications put together. I shall induce every true sportsman to become a subscriber that I can."

—Our old friend Justus Roe, late of Roe's Hotel, Long Island, with whom we have had many pleasant fishing excursions, is about to publish a hotel guide for the benefit of both hotel keepers and travelers, that seems not only quite novel in itself, but must be of service to all concerned. We regard Mr. Roe as entitled to the confidence of all landlords and hotel keepers with whom he may correspond, and trust that he may be successful in his peculiar undertaking.

—Holabird's Hunting Suits are essentially waterproof. One old sportsman does not carry a canteen any more; he merely dips a couple of quarts of water into the pockets and then pushes into the bush. When he is thirsty he makes for the nearest spring or branch and takes a long drink of cool pure water.

—The steamer Hampton, of the Old Dominion Steamship line, has been placed on the St. Johns River, Florida, for the coming season. She is an elegant day passenger boat, with plenty of cabin room, is swift, and is in charge of Capt. Starke, a good sailor, a thorough student, and a gentleman. He is a man of universal talent, and will be appreciated by genteel sportsmen and tourists.

THE NEW PAPER STEM PIPE.—This is a pipe designed to do away with the unpleasant accumulation of nicotine in the bowl. The stems, which fit outside of the projection on the bowl, are made of paper, and absorb all saliva and nicotine. Being changed as often as desired, a fresh, agreeable smoke is always obtainable without the necessity of cleansing. See the advertisement.

THANKSGIVING MEANS SATISFY.—Once each year every resident of New England is supposed to be happy on a plethora of good victuals.

THE FOX HUNT.

"Bright chanticleer proclaims the morn,
And smiling breaks the dawn;
The lowing herds now leave the vale—
Hark! the huntsman's horn."

THIS is as near as we can remember the opening of the famous old hunting song, and Mr. Joe Donahue and his friends must have heartily echoed the chorus, when, on Monday morning last, they stepped into the crisp morning air and felt the frosty breeze blowing from the Hackensack hills. But the frost looked as though hunting would be doubtful, unless a warm sun should thaw the ground into condition for holding scent. Notwithstanding, the hounds were put into Tom Robinson's big rockaway and the "Master" followed by his *clientelle*, who had passed the night at the Mansion House, started for the Half-way House, between Paterson and Hackensack, where it was proposed to put the hounds into cover. Donahue and the veteran fox hunter, Col. Skinner, were comfortably settled in the former's buggy, their hunters being ridden to the meet by light-weight grooms to save them for the severe work ahead. Besides these, the party comprised "Young Joe," a chip of the old block, who acted as huntsman, first whip, and whipper-in; Capt. James McCullough, well known with all fast things in the "Midland," mounted on his war-worn gray; Mr. A. W. Clason, on the celebrated steeple chaser, Modoc, anxious for scalps; Mr. Belmont Purdy, on a good-looking nag; Mr. Harry Blasson, on Jack Horner, an old time winner on the flat; C. Levy, on Remorse; Mr. J. R. Carpenter of the American Jockey Club, on a brother to the celebrated Monarchist, and many others. After leaving the town the party was reinforced by several gentlemen from Englewood, all well mounted.

Reaching the trysting place, Old Joe took charge of the hounds, and crossing a couple of fields, cast them in a swamp that was thought to harbor a fox. There were seven couple of hounds in all, the bluest and best blood to be found on this side of the Atlantic. Round the swamps and in and out worked the hounds, encouraged by Young Joe; but all to no purpose. The swamp was blank, and a move was made for Garrison's wood, where the impatient fox hunters were not kept long in suspense; for soon the familiar notes of old Leander's bass were heard, and the music was taken up by hound after hound, until "the woods were full of it." The fox headed towards the road with the hounds close after him, and he would have made a straight break away over a good line of country, but the excited horsemen headed him—nay, surrounded him, until there were men to the right of him, men to the left of him, and he doubled back to the wood. Presently, however, he faced the open fields to the north, and after running a mile doubled back to the wood again. From here they soon routed him, and going away again the old fox headed for Saddle River, with only half the pack after him. Following the hounds closely were "Young Joe" and Mr. Blasson, the latter riding "like a bird," and soon the whole field were in close pursuit. The fences were stiff and not easily negotiated; five bars morticed into heavy posts do not afford the most attractive prospect, and in spite of "jumping powder," many declined; and where they did not the horses did, and frequently horses and riders occupied different fields. But on they went, a chosen few keeping fairly up until four hard miles had been covered and the hounds had disappeared over the hill. Arrived on its summit, the horsemen strained their eyes in vain for either hounds or fox—both had disappeared in the dark brakes below. Presently the hounds appeared one by one—all but Greeley, and where, oh! where, was he? Mr. Donahue looked for him until further search was useless, and the entire party, hungry and tired, returned to Hackensack. And now to sum up: That fox hunting is practicable in this country is beyond peradventure; horses and men to ride them will be found, and also hounds to hunt with. In the present instance the error was made of having one hound much faster than the others; so much so that he kept ahead of the pack and finally, having the fox all to himself, discouraged the others. A slow pack would be better to begin with. Both horses and men are also new to the country. We do not despair of seeing before many months a "run" that would do no discredit to an older and more practiced hunt. Our picture which we present to our readers on the first page of to-day's issue, will convey some idea of a meet.

AMERICAN AMMUNITION.

This subject will be thoroughly ventilated next week, and we regret that want of space prevents us from now publishing some letters from Mr. Hobbs of the U. M. C. Co. A Boston correspondent writes:—

BROMFIELD HOUSE, BOSTON, November 12th, 1875.

EDITOR FOREST AND STREAM:—

It is not the first time I have been surprised at hearing American ammunition berated, and now the ball is in motion I would like to give my experience. I have used various kinds of powder, both of English and American, and the difference is too fine a point for me to detect in ordinary shooting. I find the difference, if any, between some fancy grades and the Oriental at twenty-five cents per pound, and only be discovered with a series of careful experiments. I have used about three thousand paper shells of Bridgeport manufacture, and have yet to see the first miss fire. For guns, I use one of W. & C. Scott & Sons and one of C. H. Pemberton, London, neither of them fancy, but well made guns, and without hesitation I think miss fires are generally the result of some irregularity or misfit in the mechanism of the locks or firing pins, and it is not unusual to find inequality in the chambering of guns, so that the metallic shells used in one will not fit another of the same bore. These faults sometimes occur in fine English guns, but are perhaps most common in those gotten up by Americans to meet the demand for a cheap breech loader. One weakness in Yankee ingenuity is to invent something cheaper than his neighbor regardless of durability. I am an advocate of the rule that the best is the cheapest; but the simple fact that an article is "foreign" has no weight in my decision.

GAME PROTECTION.

INTERNATIONAL ASSOCIATION FOR PROTECTING GAME AND FISH.—A meeting of the Executive Committee of the International Association for the Protection of Game and Fish was held in Philadelphia on Friday at the hall of the College of Physicians. Dr. J. La Conte presided. Mr. Charles Hallock, the Secretary, read a report giving the origin, objects, and progress of the Association, which was ordered to be printed in pamphlet form for distribution among the members. Letters from President Robert B. Roosevelt and other members in Canada and the United States, regretting their inability to attend, were read. The following communication was read from W. F. Whitchee, Esq., the Dominion Fish Commissioner, illustrating the necessity of co-operate or uniform laws:—

OTTAWA, October, 1875.

Hon. R. B. Roosevelt, M. C., No. 17 Chatham street, New York:

MY DEAR SIR: Much as I would like to be present at the meeting of the Executive Committee of the International Association for Protecting Game and Fish, notified by your circular of 23d inst., it is impossible for me to visit Philadelphia, as the approaching Mixed Commission at Halifax, under the Washington Treaty, will engage my personal attention. There is, however, a subject of common interest to us which deserves active co-operation, and it seems to me as if the present association might quite properly, if not indeed very profitably, deal with it. I refer to the enforcement of some reasonable system of protection for spawning and young fish in our border lakes and their river links. Of course you are aware that in Canada these fisheries are worked under pretty severe restrictions. In both the Spring and Autumn fishings, and as affects the summer fry, our laws aim at securing four leading desiderata:—

1. That fish should be unmolested during periods of reproduction.
2. That they shall be afforded free access to breeding and feeding places.
3. That the young fish when not sufficiently grown to be a fair marketable commodity shall not be destroyed.
4. That the meshes of nets and the situation of them shall be such as to admit of the escape of immature fishes, and amount in practice to a reasonable and economic fishing.

Other minor prohibitions hinge on these main provisions of our fishery laws. They are enforced by a staff of fishery officers, exercising respectively magisterial functions and detective capacity.

The restrictions to methods and periods of fishing thus imposed on Canadian fishermen necessarily very much curtail their operations, restrict their trade, and reduce their profits. Such deprivations would, however, in the usual course and under ordinary conditions, be fully compensated by an increased supply and improved quality of fish, giving also assurance of permanence to their industry and investments. But in the case of those waters through which runs an imaginary boundary between the United States and Canada, across which the schools of fish pass to and fro at all seasons, the case becomes in many important respects quite exceptional. The fish which are bred and fed in our waters are captured in yours without any regard to their condition or growth. Thus, while Canadians are prohibited from catching spawning fish or injuring the fry of valuable commercial kinds, United States citizens are actually and continuously engaged in the immediate vicinity in catching the gravid fish and destroying the young of each previous hatching. They thus command their own market with fresh fish that pass and re-pass daily or nightly between us. This state of things you will readily perceive creates the strongest possible dissatisfaction among our own fishermen and other riparian inhabitants. In fact, we find ourselves at present obliged, as it were, in deference to the anomalous position in which these people have been so long placed, to relax the stringency of our system. Meanwhile, it is proposed to communicate with the Federal and State authorities to ascertain if any uniformity of conditions can be brought about by legislation or by assimilating and enforcing such laws as may already exist.

I inclose for your information a copy of the fishery regulations adopted last Spring, and of the modified regulations by which it has been found necessary to relax our otherwise stringent system. These alterations, to you who know how necessary and beneficial is every protection that can be afforded to breeding fish, will no doubt appear (as they also do to myself) cause of sincere regret.

I am, my dear Sir, yours very sincerely,

W. F. WHITCHEE, Commissioner of Fisheries.

Standing committees of the Association were appointed as follows:—

On Nomenclature and Geographical Distribution of species—Dr. Elliott Coues, U. S. A., Chairman; A. Agassiz, Cambridge, Mass.; Dr. J. L. Le Conte, Philadelphia; Prof. Theodore Gill, Washington, D. C.; Prof. E. D. Cope, Philadelphia; Rev. A. B. Lambertson, Rochester; Prof. G. B. Goode, Middletown, Conn.

On Habits of Species—M. G. Ellzey, Blacksburg, Va., Chairman; George A. Boardman, Calais, Me.; Fred. Mather, Honeoye Falls, N. Y.; Bernard A. Hoopes, Philadelphia; Nahum E. Ballou, Sandwich, Ill.; T. B. Ferguson, Baltimore; W. A. Newell, San Francisco, Cal.; S. A. Wilmot, Newcastle, Ontario, and Fitz. Cochran, Halifax, Nova Scotia.

On Law—Robert B. Roosevelt, New York city, Chairman; Manasseh Smith, Portland, Me.; J. P. Ordway, Boston, Mass.; Major T. W. Walker, Vineland, N. J.; Wright Rives, Washington, D. C.; Alex. Mosely, Richmond, Va.; I. E. West, Newbern, N. C.; Thomas A. Logan, Cincinnati, Ohio; J. E. Crosby, Houston, Texas; R. L. Ogden, San Francisco, Cal., and John Bertram, Peterboro, Canada.

It devolves upon these gentlemen to correspond with the persons named in the Auxilliary Committees hereinafter designated, and with such others as they may consider proper, with a view to gather and digest all the information that can be obtained upon the matters that come within their respective spheres of duty. The Law Committee will draft its plan for protective game and fish laws upon the information obtained respecting the habits of the creatures they aim to protect.

AUXILLIARY COMMITTEES.—FISH.—*Salmoides*.—W. F. Whitchee, Ottawa, Canada; Dr. R. A. Alloway, Montreal; Col. C. R. McMurdo, Westfield, Kings Co., New Brunswick; Everitt Smith, Portland, Me.; Walter M. Brackett, Boston, Mass.; Seth Green, Rochester, N. Y.; Charles Hallock, New York city; Thos. Williamson, Leesburg, Va.; George Clark, Ecorse, Michigan; A. Palmer, Boscobel, Wisconsin; Dr. D. C. Estes, Lake City, Minnesota; E. J. Hooper, San Francisco.

Percoids and other Northern Fish.—Robert E. Strickland, Peterboro, Canada; N. H. Parker, Nashua, New Hampshire; F. W. Messenger, Boston, Mass.; Albert A. Mowry, Putnam, Conn.; W. W. Hill, Albany, N. Y.; Charles W. Torrey, Yonkers, N. Y.; Milton P. Peirce, Wenonah, N. J.; B. W. Richards, Philadelphia; Asa Wall, Winches-

ter, Virginia; D. H. Fitzhugh, Bay City, Michigan; Dr. G. A. Stockwell, Port Huron, Michigan; George Hayden, Jacksonville, Illinois; A. B. Rockwood, Salt Lake City, Utah.

Southern and Coast Fishes.—Dr. John P. Ordway, Boston, Mass.; S. C. Clarke, Jamaica Plains, Mass.; Zelmar Goodsell, Bridgeport, Conn.; Richard T. Miller, Camden, New Jersey; W. H. Seabury, Norfolk, Va.; Dr. H. O. Yarrow, Washington, D. C.; Theo. F. Davidson, Asheville, North Carolina; Geo. C. Eyrich, Jackson, Mississippi; C. J. Kenworthy, Jacksonville, Florida; John E. Leet, New Orleans, La.; H. B. Metcalf, Montgomery, Alabama; Joseph Labadie, Galveston, Texas.

Mammals.—Archibald Munn, St. Johns, Newfoundland; Capt. J. W. Coventry, Nouvelle, Gaspe, Canada; Robert Morrow, Halifax, Nova Scotia; Rowland E. Robinson, Ferrisburg, Vermont; Verplanck Colvin, Albany, N. Y.; Isaac Hinckley, Philadelphia, Pa.; Warner Lewis, Lawrenceville, Virginia; Prof. F. V. Hayden, Washington, D. C.; Rawlings Young, Corinth, Miss.; Geo. A. Alden, New Smyrna, Florida; J. M. Buckley, Monroe, Michigan; L. M. Wyatt, Fond du Lac, Wisconsin; Ad. Paul, St. Louis, Missouri; S. B. Buckley, Austin, Texas; Dr. J. H. Janeway, Kansas; Wm. B. Blackwell, Washington Territory; J. M. Murphy, Portland Oregon.

Small Game Animals.—Prof. Robert Bell, Montreal; Manasseh Smith, Portland, Maine; W. H. Cowing, Boston, Mass.; Jacob Glahn, West Meriden, Conn.; Col. George A. Flower, Watertown, N. Y.; Henry S. Hollingsworth, Scotch Plains, N. J.; Chas. E. Coffin, Muirkirk, Maryland; Chas. M. McLaren, Weldon, North Carolina; Capt. Aug. K. Egbert, Atlanta, Ga.; G. V. Young, Columbus, Miss.; Frank Card, Flint, Michigan; Dr. C. A. Kitchen, Rockford, Illinois; H. C. Magoon, Monroe, Platte Co., Nebraska; Maj. G. K. Sanderson, Fort Sill, Indian Territory; D. O. Joice, San Francisco, California; J. W. Sprague, Kalama, W. T.

Gallinaceous Birds.—Thos. J. Eagan, Halifax, Nova Scotia; T. Herbert Marsh, Toronto, Canada; E. M. Stillwell, Bangor, Maine; J. Dwight Francis, Pittsfield, Mass.; Ethan Allen, Pomfret, Conn.; C. W. Hutchinson, Utica, N. Y.; Geo. Bird Grinnell, New York city; Edward S. Clarke, Philadelphia; G. S. Brown, Baltimore; Jacob Wagner, Wytheville, Va.; Dr. Geo. H. Moran, Marion, North Carolina; Col. James Gordon, Pontotoc, Miss.; Geo. E. Alden, Savannah, Georgia; George A. Alden, New Smyrna Florida; Henry Mather, Marquette, Michigan; G. H. Seward, Plano, Illinois; Richard Valentine, Janesville, Wisconsin; O. A. Crandall, Sedalia, Missouri; J. F. Crosby, Houston, Texas; Col. G. W. Schofield, Fort Concha, Texas; D. J. Staples, San Francisco, California; J. C. Ainsworth, Portland, Oregon.

Ducks and Wild Fowl.—John Ludgate, Peterboro, Canada; Rev. M. Harvey, St. Johns, Newfoundland; John H. Thompson, New Bedford, Mass.; F. W. Lawrence, Lexington, Mass.; H. B. Harrison, New Haven, Conn.; Fitz James Fitch, New York city; J. H. Batty, Bath, Long Island; Ed. Wheaton, Baltimore, Md.; Wright Rives, Washington, D. C.; W. H. Seabury, Norfolk, Va.; Hon. I. E. West, Newbern, North Carolina; C. J. Kenworthy, Jacksonville, Florida; John E. Leet, New Orleans, La.; Henry J. Allen, Schoolcraft, Mich.; P. R. Hoy, Racine, Wisconsin; D. L. Dickinson, St. Louis, Missouri; F. A. Ober, Florida; B. B. Redding, Sacramento, California.

Woodcock and Migratory Birds.—C. A. Post, Peterboro, Canada; Manasseh Smith, Portland, Maine; E. M. Messenger, Boston, Mass.; Albert A. Mowry, Putnam, Conn.; Dr. L. J. Peck, Lockport, New York; Dr. J. R. Romeyn, Keeseville, New York; Robert B. White, Shrewsbury, New Jersey; T. W. Walker, Vandalia, New Jersey; J. D. Sergeant, Philadelphia, Pa.; W. H. Clarkson, Bridgeville, Delaware; H. W. Henshaw, Washington, D. C.; Asa Wall, Winchester, Va.; P. L. Walters, Deer Park, Maryland; C. S. Russell, Weldon, North Carolina; H. O. Collins, Hillsboro, Ohio; W. B. Rosenbaum, New Albany, Ind.; Dr. J. A. Henshall, Milwaukee, Wis.; Dr. D. C. Estes, Lake City, Minnesota; S. B. Buckley, Austin, Texas; Dr. John H. Janeway, Fort Wallace, Kansas; R. L. Ogden, San Francisco, California; Charles E. Aiken, Colorado Springs, Colorado.

Legislation.—Hon. W. W. Fowler, Durham, Conn.; H. B. Harrison, New Haven, Conn.; G. W. Clinton, Buffalo, New York; Fitz James Fitch, New York city; B. W. Richards, Philadelphia, Pa.; John Lambert, do; Jacob Wagner, Wytheville, Va.; H. O. Collins, Hillsboro, Ohio; W. H. Holabird, Valparaiso, Indiana; C. G. Cole, St. Louis, Missouri; Chambers C. Davis, Denver, Colorado; Rawlings Young, Corinth, Miss.; H. C. Magoon, Monroe, Nebraska.

The committees, except that on Nomenclature, were empowered to add to their numbers at their discretion. On motion of Dr. Elliott Coues the Association expressed their sense of the energy and activity of their Secretary, to whom the Association owes much of its present efficiency.

The thanks of the Association were tendered to the College of Physicians for the use of their hall, after which an adjournment took place.

[Reported for Forest and Stream by Pinckney.]

PENNSYLVANIA STATE GAME ASSOCIATION.—This association for the protection of game and fish met in the Senate Chamber, at Harrisburg, last Thursday, Col. John H. Berryhill acting as chairman. Twenty-eight delegates were present from thirteen counties. The committee on permanent organization reported the following officers:—

President, A. B. Hughes, Philadelphia; Vice Presidents, Robert Dalzell, Alleghany; D. W. Seiler, Harrisburg; J. B. G. Kinsloe, Lock Haven; Dr. Geo. S. M. Bailey, Uniontown, Fayette county; Recording Secretary, B. F. Dorrance, Wilkesbarre; Corresponding Secretary, Amos G. Bonsall, Mifflintown, Juniata county; Treasurer, James D. Dougherty, Harrisburg; Committee on Rules and Regulations and Game Laws, W. W. Woolsey, Pittsburg; J. B. Samson, Indiana, and Adolph E. Ohls, Philadelphia; Committee on Fish Culture, Major J. Rohrer, Lancaster; E. B. Westfall, Sunbury; and H. C. Gates, Wilkesbarre.

The report of the committee on constitution and permanent organization was unanimously approved.

A motion was made that when the convention adjourns, it adjourn to meet at Harrisburg on the third Tuesday in January, 1876. Agreed to.

It was moved that the first annual meeting of the asso-

ciation be held on the first Tuesday in October, 1876, and that the first Tuesday in October in each and every year thereafter shall be the day for the annual meeting of the association.

Various resolutions relating to game and game fish were referred to the proper committees.

On motion (seconded) it was resolved that the association send two delegates—with power to appoint substitutes—to the national convention at Chicago at its next meeting, and that the President make the appointments of said delegates and report their names at the next meeting.

A motion was made, seconded (and carried) that the recording secretary be instructed to have 500 copies of the constitution and by-laws of the association printed to distribute among the various associations, and that copies be sent to each club of the association.

The thanks of the association were tendered to the President, Col. John H. Berryhill, and to Messrs. Jas. D. Dougherty, D. C. Phillips, and J. B. Speise, Esq., officers of the association, for valuable services rendered.

TRAPPING RUFFED GROUSE.—According to the Poughkeepsie Press, these birds are being trapped or snared unblushingly in that vicinity, over 2,500 having been shipped by the Erie Railroad to this market alone. It calls upon President Wittsie of the Hudson River Association for the Protection of Game, to notice the fact, and, if possible, inflict the penalty upon the offenders. In the present condition of the law this is almost a hopeless task. Make the possession of snared birds an offense, and call for the shot holes as evidence, and there may be some prospect of preventing extermination. Even then the poachers and pothunters might play one of Ah-Sin's tricks. Once upon a time, when foreign residents in the Flowery land declined to buy game that had been netted, the cunning Celestial would shoot his iron shot into the dead carcasses, and thereby make the outside barbarian believe that his game had been fairly killed.

Game Laws of Connecticut.

November 13th, 1875.

EDITOR FOREST AND STREAM:—

An invitation extended by a kind and valued friend to try my ten choke bore Rigby at the ducks in the river and bay at Stratford, induced me to spend a day in that beautiful village. Accompanied by my butler, we reached the hospitable mansion of J. C. B. on Tuesday evening, the 9th inst., and after partaking of all the luxuries and enjoyments of a refined and happy home, the conversation was directed to our prospective sport the following day. My ardor was damped by a threatening rain storm and by the announcement of my friend that, owing to defective laws for the protection of game, the poachers and pothunters of the neighborhood had banished every duck from the river, inlets, and bays, and that we need not expect to see a bird. Having always entertained a favorable opinion of New England saints and Connecticut Yankees, and believing that they were not disposed to "kill the goose that laid the golden eggs," I learned, upon inquiry, that the law breakers were not more culpable than the law makers.

The ninth section of the laws of Connecticut of 1872, entitled "Protection of Waterfowl," provides: "Every person who shall kill, keep when killed, or expose for sale, any wild duck, goose, or brant, in May, June, July, August, or who shall kill or take any such fowl with any other gun than such an one as is commonly raised at arms length and fired from the shoulder, or who shall shoot at any such bird or other wild fowl from any vessel propelled by steam or sails, or from any boat or structure attached thereto, shall be fined five dollars."

This section is wholly imperfect and ineffectual, and the legislators by whom it was framed and made a law must have been unacquainted with the nature and habits of the birds it intended to protect. It opens the door and gives to the stealthy, prowling poacher unrestrained liberty by night to destroy all kinds of waterfowl on their feeding grounds, thus driving the game to sea or to more humanized localities. One shot at ducks on their feeding haunts after nightfall is more destructive to sport than a dozen battues by day. Between nine o'clock on Tuesday night and two o'clock on Wednesday morning volley after volley was heard on the marshes, and for one bird that is retrieved twenty escape wounded to decay and die, and thus the truth of my friend's remark, that we would not see a feather. If suitable and humane game laws were in force in Connecticut, there is no locality in that State superior to Stratford, where every honorable sportsman could enjoy the pleasure of duck shooting; but until the legitimate sportsmen unite in forcing from their legislators a wholesome code of laws, the reckless and thoughtless will have their sway, and duck shooting by day will be a thing of the past.

Stratford is but four miles from Bridgeport, where a body of gentlemen have formed a society for the protection of game. What have those gentlemen done? What have the gentlemen of Stratford done? Are they aware that the law of 1872, instead of protecting wildfowl, gives a carte blanche to the poaches to drive every bird from their waters? The poacher is naturally a thoughtless, improvident, drunken outcast, and nothing short of a rigorous, stringent law, rigidly enforced, will restrain the miscreant from evil. Almost every State in the Union, with the exception of the sanctified State of Connecticut, prohibits the shooting of wildfowl by night. A few lines tacked on, by way of amendment to the ninth section of the act of 1872, would cure the evil. I have always felt a deep interest in the protection of game of all kinds, and I suggest to my Connecticut friends, and to the Sportsman's Club of Bridgeport in particular, that they prepare such code of laws as may be easily understood, making them as brief as possible, and submit the same to their next Legislature; but the truth is, that all local State laws for the protection of game will never reach the desired end, and until the several Legislatures shall adopt a new and simple code of game laws, uniform in its application to all the States, as their general and climatic condition will permit, game of all kinds, whether fur, fin, or feather, cannot be properly protected. This plan of uniform, or co-operative game laws, has been most ably discussed in FOREST AND STREAM. It has worked to a charm in Great Britain, and in this country the advantages would be more conspicuous, not only in preventing the enactment of special laws, that invite transgression by their incongruity, but by putting an end to the shipment of game illegally killed in one State, and its open sale in another where the law does not forbid such sale.

It is not intended by these remarks to discourage our Connecticut friends from amending their present defective statute. Such amendment will prove an auxiliary to general and comprehensive uniform game laws. Let me suggest the following amendment:—"No person shall kill any wild duck, goose, or brant before sunrise, or after sunset, under a penalty of \$25 for each one bird killed before or after said time. In case of failure by any person to pay the penalty imposed upon him pursuant to this act, he shall be committed to the common jail of the county for a period of not less than five days; and at the rate of one day for every dollar of the judgment where the same exceeds five dollars. All penalties imposed by this act may be recovered, with costs of suit, by any person, in his own name, before a justice of the peace in the county where the offence was committed; or where the defendant resides, where the amount recovered does not exceed the jurisdiction of such justice, and

such penalties may be recovered in the like manner in any court of record in the State; but on recovery by the plaintiff in such case for a less sum than fifty dollars, the plaintiff shall only be entitled to costs to an amount equal to the amount of such recovery; and it shall be the duty of any district attorney in this State, and he is hereby required to commence actions for the recovery of the penalties allowed hereby, upon receiving proper information, and in all actions brought by such district attorney one half of the penalty recovered shall belong to the person giving information on which the action is brought, and the other half shall be paid to the treasurer of the county for the support of the poor. All judgments hereafter recovered by or in the name of any person, in pursuance of the provisions of this act, with the interest thereon, may be collected and the payment thereof enforced by execution; and any person imprisoned upon any such execution shall be so imprisoned for a period of not less than five days, and at the rate of one day for every dollar or fractional part thereof of such judgment and interest when the same exceeds five dollars. And such imprisonment shall not be satisfaction of such judgment. But no person shall be but once imprisoned upon any such judgment or execution. And any execution issued upon any such judgment against the body shall either recite the fact or have an endorsement thereon to the effect that such judgment was recovered for a violation of said act."

Amendments such as suggested, and a few convictions for infringement of the statute, will give to the honorable sportsman a successful day at the ducks on the waters of Stratford. If I failed in the immediate object of my visit, I did not fail in having a most enjoyable day in the society of a true hearted sportsman, who, unlike the great majority of hard-worked editors, merchants and lawyers, lives in the shadow of retirement, enjoying that *otium cum dignitate* the offspring of an honored business life, surrounded by loved ones, who adorn and enliven his happy home.

Protection Needed in Louisiana.

NEW ORLEANS, October 29th, 1875.

EDITOR FOREST AND STREAM:—

Being a constant reader of your excellent paper, I will take occasion here to say that I am an ardent sportsman, and would hail with delight any movement among our Nimrods here to bring about the enactment and enforcement of game laws such as you have in your section. The difficulty most to be dreaded is the fact that a large proportion of our fishing and hunting population—in short, those who make their living that way—are hidden in the swamps and bayous of the surrounding country, where they shoot and fish in season and out of season, and where it would be almost impossible to enforce the law. This is an obstacle, however, which might give way, as many greater obstacles have done, before the combined effort of enlightened and experienced minds; and it is to this end that I write you. Can you not, by reason of your popular and commanding position, induce our amateur sportsmen to take a livelier interest in this subject? There are numerous "knights of the trigger" here, who have the leisure and capacity to correspond with you intelligently on this subject, and who would, upon the proper hint, no doubt be glad to give you their views.

ADELBERT MURCHISON.

[Any information which our esteemed correspondent may choose to communicate regarding the subjects which we all have at heart, will be thankfully received, and we shall consider ourselves fortunate if others in his section will favor us in like manner.—Ed.]

ARRANGEMENTS FOR THE CENTENNIAL.

The Act of Congress which provided for "celebrating the one hundredth anniversary of American Independence, by holding an International Exhibition of Arts, Manufactures, and Products of the Soil and Mine," authorized the creation of the United States Centennial Commission, and entrusted to it the management of the Exhibition. This body is composed of two Commissioners from each State and Territory, nominated by the respective Governors, and commissioned by the President of the United States. The enterprise, therefore, is distinctly a national one, and not, as has sometimes been stated, the work of a private corporation.

The Exhibition will be opened on May 10th, 1876, and remain open every day, except Sunday, until November 10th. There will be a fixed price of fifty cents for admission to all the buildings and grounds.

The Centennial grounds are situated on the western bank of the Schuylkill River, and within Fairmount Park, the largest public park in proximity to a great city in the world, and one of the most beautiful in the country. The park contains 3,160 acres, 450 of which have been enclosed for the Exhibition. Besides this track, there will be large yards near by for the exhibition of stock, and a farm of 42 acres has already been suitably planted for the tests of ploughs, mowers, reapers, and other agricultural machinery.

The Exhibition buildings are approached by eight lines of street cars, which connect with all the other lines of the city, and by the Pennsylvania and Reading Railroads, over the tracks of which trains will also run from the North Pennsylvania and Philadelphia, Wilmington and Baltimore Railroads. Thus the Exhibition is in immediate connection with the entire railroad system of the country, and any one within ninety miles of Philadelphia can visit it at no greater cost than that of carriage hire at the Paris or Vienna Exhibition.

The articles to be exhibited have been classified in seven departments, which, for the most part, will be located in appropriate buildings, whose several areas are as follows:

DEPARTMENT.	BUILDING.	ACRES COVERED.
1. Mining & Metallurgy	Main Building	21.47
2. Manufactures		
3. Education & Science		
4. Art	Art Gallery	1.5
5. Machinery	Machinery Building	14
6. Agriculture	Agricultural Building	10
7. Horticulture	Horticultural Building	1.5
Total		48.47

This provides nearly ten more acres for exhibiting space than there were at Vienna, the largest International Exhibition yet held. Yet the applications of exhibitors have been so numerous as to exhaust the space, and many important classes of objects must be provided for in special buildings.

An important special exhibition will be made by the United States Government, and is being prepared under the supervision of a Board of Officers representing the several Executive Departments of the Government. A fine building of 44 acres is provided for the purpose, space in which will be occupied by the War, Treasury, Navy, Interior, Post Office, and Agricultural Departments, and the Smithsonian Institution.

The Women's Centennial Executive Committee have raised \$30,000 for the erection of a pavilion in which to exhibit every kind of women's work. To this collection women of all nations are expected to contribute.

The list of special buildings is constantly increasing, and present indications are that their total number will be from 200 to 250. Most of the important foreign nations—England, Germany, Austria, France, Sweden, Egypt, Japan and others—are putting up one or more structures each, for exhibiting purposes, or for the use of the commissioners, exhibitors and visitors. Offices and headquarters of this kind, usually of considerable architectural beauty, are provided by the States of Pennsylvania, Ohio, Indiana, Illinois, Michigan, New Jersey, New York, Connecticut, Massachusetts, New Hampshire, Missouri, Kansas, Virginia, West Virginia, Nevada, Wisconsin, Iowa and Delaware; and it is likely that others will follow the example.

A number of trade and industrial associations, which require large amounts of space, will be provided for in special buildings. Among these are the photographers, the carriage builders, the glass makers, the cracker bakers, the boot and shoe manufacturers, beside quite a number

—“Choke bores” for the Trap, and “Scatter guns” for the Field.

—The American Rifle Association will celebrate to-day, not only in the graver way, but in a manner both festive and gay. It is proposed that they shall slay the full, fat-bosomed turkey, and combine science and play. At Pelhamville, then, on Thanksgiving, in addition to the orthodox turkey shoot, there will be a subscription match, any

The total scores shot by 115 men was 1,348, averaging 58.6 per team and 11.6 per man. The Prescott Post team of five were on the ground and made 84. There were three prizes—a cup and two rifles—which were adjudged to the three leading teams, as indicated above.

Boston.—In our last issue we gave notice of a meeting of gentlemen in Boston who were desirous of forming an

association for practice with the rifle. The committee, of whom Dr. Hazleton and C. A. Sawyer, Esq., are members, have reported progress, and there is every reason to suppose that next year, as soon as Spring opens, Boston will not be without a rifle range. As it is, a preliminary match was held this week, at Spy Pond, perhaps to see what it was like. There are now forty names registered, a book having been opened for that purpose at the office of Messrs. Remingtons, No. 146 Tremont street. The rifle movement in Boston, is in energetic hands, and will certainly result in the establishment of a range.

—The fourth competition for the Hamilton, Rowe & Co. badge, by the Chicago Rifle club, took place at their range at South Park, on Saturday, Nov. 13th. The weather was very unpleasant, the wind blowing a gale, consequently the entries were very few and the attendance light. The badge was won by Capt. Shaffer, he making the highest score. The second prize—a life membership—was won by Mr. M. W. Lyman, he making the second highest score. Conditions, two sighting and seven scoring shots; distance, 500 yards:—

INGERSOLL RIFLE ASSOCIATION, CANADA.—Our valued correspondent, "Shooter," so well known as a leading Canadian rifleman, sends us the following: "The annual matches of the Ingersoll Rifle Association came off on Wednesday of last week and the following day, at the ranges on Hyslip's Farm. The day was anything but favorable for good shooting, it being cold, and opening in the morning with a snow storm, which made the target almost invisible at 200 yards. As a consequence no very large scores were made. The matches were, however, a success in every way. The gentlemen of the Ingersoll Association have the knack of managing their matches well, and make them very pleasant for all who attend. Some eighty competitors entered in matches 1 and 2. It will be remembered that the Hamilton team had the honor of winning the Association Cup at the matches last year, but which had to be won two consecutive years before becoming the property of the winners. This year they won the cup again, which now belongs to them. The following are the scores of the winners:—

First match—200 and 300 yards; five shots at each range; open to all; rifle, Snider Enfield.

Game Bag and Gun.

GAME IN SEASON IN NOVEMBER.

Moose, <i>Alce Americanus</i> .	Woodcock, <i>Philohela minor</i> .
Elk or Wapiti, <i>Cervus Canadensis</i> .	Plovers, <i>Charadrius</i> .
Red Deer, <i>Cervus Virginianus</i> .	Willetts, <i>Symphemia semipalmata</i> .
Caribou, <i>Rangifer caribou</i> .	Snipe, Godwits, Curlews, and Bay Birds, <i>Scolopacidae</i> .
Hares, <i>Lepus</i> .	Sandpiper, <i>Tringa</i> .
Squirrels, <i>Sciurus</i> .	Reed or Rice Birds, <i>Dolichonyx oryzivorus</i> .
Wild Turkey, <i>Meleagris gallopavo</i> .	Wild Ducks, <i>Anatina</i> .
Ruffed Grouse, <i>Bonasa umbellus</i> .	
Pinnated Grouse, <i>Cupido cupido</i> .	
Quail, <i>Oryzopsis virginianus</i> .	

GAME IN MARKET.—Game of all descriptions, if we except wild fowl, continue scarce. Ruffed grouse are worth from \$1.38 to \$1.50, the few in market coming principally from Connecticut. Pinnated grouse have also advanced in price and are had at the same figures. Quail are worth \$3.25 to \$3.50 per dozen; woodcock, 90 cents to \$1 per pair; the flight, however, has passed South. There are no English snipe in market. Canvas-back ducks are worth \$1.75 to \$2 per pair; red-heads, 75 cents to \$1; mallards, \$1 to \$1.25; widgeons, 75 cents; black ducks, \$1; teal, 75 cents; brant, \$1.25 to \$1.50; geese, 75 cents to \$1.25 each; rabbits, 65 cents per pair; venison, 30 cents per pound.

FURS AND SKINS.—The season for American Raw Furs and Skins does not open with very favorable prospects, as the Fall foreign sales brought large losses to our shippers, and the German markets hold large stocks unsold. For home consumption the demand promises to be limited, and dealers must look abroad for a market. For mink, especially Western and Southern grades, there is no hopes of improvement; only the choice grades of New York, Eastern

and Canada skins will find a ready market. All the poorer qualities of furs have been neglected in Europe, and large stocks held over. For the following quotations, which represent prime skins only, we are indebted to Messrs. C. G. Gunther's Sons of this city, who will hereafter furnish us with semi-monthly quotations:—

FROM C. G. GUNTHER'S SONS.		
BEAR—Northern, according to size and quality, prime.....	\$10 00a	\$15 00

—The agent of Mr. J. D. Dougall of London, manufacturer of the well-known "Dougall gun," is now in this city, and can be found daily, except Saturdays, from 2 until 5 o'clock, at the store of Messrs. Abbey & Imbrie, No. 48 Maiden Lane, where a number of specimen guns will be on view.

—The Babylon, Long Island, *Signal* complains that fire hunting ducks is constantly practiced in the bay opposite that town. The process consists of going on the roosting grounds at night with a light in the bow of the boat, which dazzles the eyes of the birds, and the gunner can come close upon them before they are aware of his approach. In this way large numbers of birds are annually killed, and those not taken are driven from the bay, it being a natural instinct with the wild fowl to give a wide berth to waters where they are disturbed at night. The law is very severe against this practice, imposing a fine, we believe, of \$25 for each offense. We hope to see this just provision of the law rigidly kept in force during the present shooting season.

—The Harrisburg *Patriot* says that at Cove Forge, Perry county, located about a mile and a half below Duncannon, two wild turkeys were recently captured while floundering in the river near the Perry county shore. The Susquehanna is about a mile wide at the above point, and the turkeys in undertaking the flight from the Dauphin county to the Perry county side of the river gave out and were easily captured.

—Messrs. Ditmas, E. H. Madison, and P. H. Duffy returned last Friday from a pretty successful trip to Pike county, in the neighborhood of Blooming Grove Park. They brought back one deer, the result of Mr. Madison's skill with the gun, besides some thirty-five ruffed grouse, rabbits, etc. The cold weather has set in pretty severely in Pike county, and the lakes will soon be bound in their frozen fetters and then good bye sport for this year. The open time for shooting deer in Pike county ends Dec. 1st.

—Deer shooting is now good at Cape Cod, and venison from that section is constantly served at the restaurant of Messenger Brothers, in Boston.

—A correspondent residing in North Adams, Mass., sends us an account of the killing of a large bear near East Pownall that has been for some time committing depredations upon the sheep folds in the vicinity. The brute was cornered in a large ledge of rocks, and died facing the enemy, no less than twenty-one rifle balls having been fired into his head and shoulders before he succumbed. He weighed 400 pounds. The hunters are in search of two more of the same tribe that are known to have been comrades of this one.

—Several Philadelphians and residents of New Jersey brought fair bags of quail last week from the vicinity of Cape May, but all complain of the traps that are set in all directions. Billy Young, of Philadelphia, had his setter hung up by the hind leg three times in a single day.

CAPT. BOGARDUS AND THE ST. LOUIS S. P. C. A.—It was supposed that the prosecution of the champion wing shot of the world for giving an exhibition of his skill at killing pigeons at St. Louis had been allowed to drop, but such it seems was not the case. On the 15th inst. the case was called in the Court of Criminal Correction and Capt. Bogardus put on trial. The Judge charged that the killing was unnecessary and cruel, and Capt. Bogardus was fined \$50. The St. Louis Sportsman's Club were represented by counsel, and the case appealed to a higher court, so it yet

remains to be seen whether or not this was a victory for Mr. MacDonald's association.

—A Nova Scotia correspondent writes: "Everybody, Indians included, concur in asserting that, for fishing and shooting, the season has been, and is, the most meagre known in Nova Scotia for forty years."

MASSACHUSETTS.—Salem, Nov. 21st.—Fifty-seven geese went south Friday. They were quite low; shot a pair of sheldrakes last Wednesday, the first this season. Whistlers, or golden eyes are along. No dippers yet; some coots yet left. Loons and other divers seem to be scarce. About loons, you say "it is an unusual feat to kill them with shot." Now I would say that I have shot a number of them, and always with shot and nothing over No. 4, and usually No. 6 or 8. My best string was in Nov. '72, when I shot five exceeding fifty-four pounds in weight, and one of them was shot at by others five times before I fired, at Boat Head, N. H. The killing of loons, as they fly over, is counted a regular thing in the Fall of the year. I think you will find at least on our eastern sea-board that certainly as many loons are killed with shot as with ball. In looking over these lines you may say I use rather small shot, but I tell you, take No. 6, backed up right, and they will "tangle a bird up nasty" most anywhere inside of forty yards, and often farther with close shooting guns held right. A friend killed a lone winter yellow-leg last week and saw a black-breasted; these are probably birds that have been hurt, and so stop later. Also have to report a chicken-bill rail with one wing shot off close and healed over; said bird was caught with an eel spear, and was very fat. Sportsmen about here are disgusted with the quail. Woodcock gone, snipe ditto; partridge are here, nine out of nine shots being lately shot at Rowley by a friend. How is that? Rabbits are scarce. TEAL.

NEW YORK.—Malone, Franklin Co., Nov. 19.—A son of Mr. W. R. Jones, of this village, was the hero of quite an exciting adventure, occurring last week near Wolf Pond, a body of water buried in the depths of the "wild woods," some twenty miles southeast. He was engaged alone in hunting for deer, and when putting out the dogs, discovered a large bear, upon which, in great trepidation, he immediately opened fire. The first shot missed its mark, and the second one also failed to take decided effect. Here bruin, awakened to a true sense of his situation, made a ferocious charge upon the young hunter, and approached so near that when his career was interrupted by a third discharge, he fell dead within a few inches of his destroyer. The boy, in this encounter, was fortunately armed with one of the Winchester repeating rifles, (a superb weapon, which carries eighteen charges, that may be fired in nine seconds) or he might not have returned to "present his report."

The Meacham Lake district may be classed with the very best sporting territory of the Adirondacks. Deer and trout, when scarce elsewhere, are generally plentiful here. E. R. W.

NEW YORK.—Babylon, L. I., Nov. 20th.—Wild fowl of all kinds are unusually plenty in the Great South Bay. A large number of geese have been shot, which is something unusual for this part of the bay and at this season. Oak Island, opposite this place, is a favorite resort for gunners. Rube Anderson can be found at the steamboat wharf, and his hut on the island will accommodate any number up to a dozen.

MARYLAND.—Snow Hill, Nov. 18th.—All kinds of game are scarcer this Fall than ever before, and the universal demand is for a more stringent game law. Rabbits are plenty on Elk Neck. Squirrels and partridges very numerous in Dorchester county.

VIRGINIA.—Norfolk, Nov. 17th.—We have had a very warm and pleasant Fall. Quail shooting has been poor, as the birds are scarcer than usual this season. We have a few snipe; they generally give us the go by in the Fall. Ducks arriving pretty freely from Currituck and the sounds. Some wild turkeys coming from James River.

Game of every description in this section is scarce this year. The partridges, of which we had a prospect about their hatching time of abundance, being drowned out in the heavy rains last Summer. Ducks seem to have been driven to other quarters by the incessant warfare on them, and comparatively few have been killed by our sportsmen. A number of gunners from New York were in the city last week, and before starting for the ducking grounds tried for partridges with poor success. J. C. A.

Chincoteague, Va., Nov. 18th.—This island, which belongs to Accomac county, is separated from the mainland by the bay of the same name, four to six miles in width and from twenty-five to thirty miles long. Although fishing and oystering are the principal occupations of the inhabitants, the island and contiguous waters furnish an abundance of game of almost every variety. Just now ducks are arriving in vast numbers, and during the Summer all descriptions of bay birds frequent the shores. There are two hotels on the island, and it is rumored that next season will see a first class watering place established under the auspices of the Old Dominion Steamship Company and some citizens of Maryland. Chincoteague can be reached by steamer to Lewes, Del., thence by railroad.

Leesburg, Va., Nov. 20.—Sportsmen report quail more easily found than at the opening of the season, though still far from numerous. A few pheasant (?) are killed here now and then. Breckinridge, who killed the biggest bass, (five pounds, six ounces,) killed a large cock pheasant in the ridge near our Fair Grounds; and several have been killed there by other men. If every man having game in his possession during the close season should be fined, pot hunters and their patrons would be flanked in their murderous practice. T. W.

NORTH CAROLINA.—Morgantown, Nov. 19th.—Quail are not abundant, but a good walker can get fair shooting. I have killed 170 since the season opened. Have not seen a woodcock this season. Rabbits are numerous, and I kill a good bag whenever I get anyone to carry them. I put up and killed a rail, *B. Virginianus*, in a little marsh last week. Was he not a little out of his reckoning to get so far up in the mountains? I stuffed and mounted him. By the way, a gull (don't know the species) was sent me last week, which was killed twenty miles from here. H.

LOUISIANA.—New Orleans, Nov. 15th.—Large flocks of ducks are passing over daily, their favorite stopping places being along the upper line of Canal street, the Lake Swamp, and Little Lake. The ponds around Miller's Bayou, on the Mobile Road, are favorite shooting grounds, and large numbers of teal, canvas backs and red heads are being killed there.

SMOKE VANITY FAIR.

It is shaved from the best Natural Leaf, for Meerschaum and Cigarettes. Does not make the tongue sore. Liberal sample on receipt of 20 cents. Highest award, Vienna, 1873. Send for circular.

WM. S. KIMBALL & CO.,
PEERLESS TOBACCO WORKS, Rochester, N. Y.

Does not make the tongue Sore.

SMOKE VANITY FAIR.—It is a wonderful solace, and the best proof that it works no injury is the refreshed feeling you awake with next morning, conscious that there is no reasonable task you could not perform.

For Meerschaums.

It has a permanent existence; again and again does it serve your turn, and still is ready for a fresh bout. That pipe is always ready for its fill of Vanity Fair.

For Cigarettes.

A cigarette is an interlude to the serious habit; a graceful make-believe for spare hours. For cigarettes Vanity Fair has no equal. Best dealers have it.

For Sportsmen.

Vanity Fair calms the brain, caresses the nerves, and as a semi-conscious act furnishes just sufficient nucleus for floating thoughts and fancies to crystallize about. Best dealers have it.

Best in the World. Ask your Dealer for it.

With Vanity Fair you can commune sweetly all the day long; incense for your success; mourner in ashes for your disappointment. Best dealers have it.

VANITY FAIR.—We wish those who hear of this tobacco the first time to ask some friend about it. Many people know it; they invariably praise.

C. STEHT, 347 Broome st., 3 doors from Bowery, under Occidental Hotel, recommends his large assortment of Meerschaum Pipes and Cigar Holders, suitable for CHRISTMAS and NEW YEAR'S PRESENTS. Monograms on Pipes and Cigar Holders artistically executed. Call and examine my stock and get Price List.

For Florida.

PHILADELPHIA AND SOUTHERN
Mail Steamship Company's line to Savannah, Ga., sailing every Saturday, from Pier 22, below Pine street, Delaware River, at 12 o'clock noon, making close connections through to all points South. The line is composed of the steamships JUNIATA and WYOMING. The Wyoming does not carry passengers. The Juniata is a favorite ship with the traveling public, having passenger accommodations of the most superb character. She has recently been refitted and elegantly furnished with everything requisite to the comfort and convenience of passengers.

Families en route for FLORIDA, Georgia, Alabama, and even as far as New Orleans, will find the Savannah route the most desirable for comfort, as well as the most economical. Through trains of the Central Railroad of Georgia, and Atlantic and Gulf Railroad, Florida, leave Savannah every morning and evening. The Florida steamers leave Savannah three days in the week for all points on the coast.

For through passenger tickets and bills of lading to all points in Florida, Georgia, Alabama, and Tennessee, apply to WM. L. JAMES, General Agent, 416 South Delaware avenue, Philadelphia.

TO YACHTSMEN VISITING FLORIDA.

SARASOTA, Manatee county.
TO SPORTSMEN VISITING FLORIDA
this Winter I will furnish a schooner yacht of eleven tons, that will accommodate about a dozen persons. I will let them have her and two men to run her, and a small boat, for eight dollars a day. I will meet them at Cedar Keys or Key West, whichever is most suitable to them; only let me know when to meet them.
WM. S. BENNET,
Capt. schooner Cary M.

WARRANTED.

Joints are connected by our Patent Sleeve Couplings, preventing all leakage.
Specimens can be seen and obtained on application at the Company's Offices, 8 Pemberton Square, Boston, and 78 William street New York. Oct2-12w

Sportsmen's Goods.

Orange Sporting Powder.

ORANGE LIGHTNING POWDER,
The strongest and cleanest Powder made. Nos. 1 to 7, packed only in sealed 1 lb. canisters. The coarser sizes especially are recommended to owners of fine breech-loading guns, giving great penetration with very slight recoil.

ORANGE DUCKING POWDER,
For water fowl. Very strong and clean. Nos. 1 to 5. Packed in metal kegs of 64 lbs. each, and in canisters of 1 and 5 lbs.

AUDUBON POWDER,
Very quick. For woodcock and quail Nos. 1 to 4. Packed in metal kegs of 124 lbs. and 64 lbs., and in pound canisters.

ORANGE RIFLE POWDER,
The best for rifles and for all ordinary purposes. Sizes F.g, FF.g, FFF.g, the last being the finest and most used. Packed in wood and metal kegs of 25 lbs., 124 lbs., and 64 lbs., and in canisters of 1 lb. and 4 pounds.

All of the above give high velocities and less resistance than any other brands made.

LAFLIN & RAND POWDER CO.,
21 Park Row, N. Y.
(OPPOSITE ASTOR HOUSE.)

DITTMAR POWDER
MANUFACTURING CO.

MY NEW IMPROVED POWDER
can now be loaded from an ordinary powder flask; grains hard. Use it now like Black Powder. No fear of overloading. Burns slow now. No fouling of the gun. Little or no smoke. Little or no recoil. Not very loud report. Less heating of the barrel in rapid firing. Good penetration and good pattern. Safe to keep, as it does not explode if set on fire, except well confined. Shells furnished loaded with powder only, if desired. None genuine without my signature on the can. CARL DITTMAR,
NEPONSET, MASS.

H. C. Squires, No. 1, Courtlandt st.
New York.

THE GREAT
London Gun Trial,
1875.

W. W. GREENER begs to inform his numerous clients in the United States that he has been very successful in the above trial, having secured the first prize, a silver cup, value 40 guineas—class 2 for 12 bores; also winner in class 1 for 8 and 10 bores, and class 4 for 20 bores. He has won in all the classes for improved boring, which is upon a different plan to any other maker, and is far superior in the three most essential points, viz., PATTERN, PENETRATION, and REGULARITY OF SHOOTING.

Mr. HENRY C. SQUIRES, of No. 1 Courtlandt St., New York, is now importing my DOUBLE CLOSE-SHOOTING GUNS to order, an invoice of which will be shipped to him on the 1st July, and can be examined about the 15th. All special orders given to Mr. Squires will be carefully filled. A full report of the GREAT TRIAL, showing the marked superiority of my guns over guns made by Dougal, Pape, Tolley, and others, will shortly be published, and can be had on application at No. 1 Courtland St.

W. W. GREENER,
Champion Gun Maker,
St. Mary's Works, Birmingham, England.

HENRY C. SQUIRES, of No. 1 Courtlandt street, has just received an invoice of these close-shooting guns, and from him any information in reference to the results of the Great Trial can be obtained on application.

Breech Loaders.
W. & C. SCOTT & SONS.

Winners of the "Turf, Field and Farm" Gun Trials.

(See issue October 3d, 1873.)

In which competition the committees have awarded our guns, First and Second for POINTS OF MERIT OF ACTION, MATERIALS, PROPORTION, AND SHOOTING QUALITIES combined, in all the four classes.

THE PREMIER GUN.

W. & C. SCOTT & SON call attention to their very FINEST weapon, combining all their recent improvements, marked on the rib between their name and London address the brand—"THE PREMIER QUALITY."

Medium and fine guns bear full name and address, and plain guns full name and "London" only.
Each gun is numbered and the actions are stamped with name and trade mark.

W. & C. SCOTT & SON, Sole makers of the Patent Top Lever, solid, Double Locking Bolt Breech Loader, bearing the full name of the firm. W. & C. SCOTT & SON caution sportsmen against imitations of their patent and name. Guns bearing the name abbreviated, or with different initials, are not genuine.
TRIAL OF SCOTT & GREENER'S NEW SYSTEM OF BORING, BY THE EDITOR OF "THE FIELD," LONDON.

(See The Field, January 30th, 1875.)

"From a comparison of the two tables it will be seen that with Walker's shot, Messrs. Scott guns showed a marked superiority over Mr. Greener's, both in average and in the highest score made. Indeed, with the left barrel, in his third shot, Mr. Scott got a selected group pattern of 239 and a penetration of 37, equalling the highest pattern made by Mr. Greener, and exceeding the penetration of that particular shot by eight sheets."

ONE HUNDRED CHEMICALLY PREPARED Circular Gun Swabs sent to any address on receipt of fifty cents. R. L. GRAVES, Sunderland, Vermont. Sep30t

J. D. DOUGALL'S

EXPRESS SHOT GUNS.

(Title registered.)

SHOWN by trials at Wimbledon by Editor of the Field to possess the GREATEST PENETRATION and therefore LONGEST RANGE—thus: Circle, 30 inches; 800 pellets; average, 1913 penetration, 37. The Editor's trial of Greener guns with 340 pellets of same shot and same charge of powder, gave 180, and penetration 30, although there were 40 more pellets in each charge. Should any controversy arise as to the durability of these new systems, we herewith warn all beforehand that our system is our own invention (though founded on the American idea) and is DURABLE, a fact remarked on by the Field, that the guns tried had been in use during last season, and references permitted to the owners. Send for Illustrated Circulars to

59 St. James's Street London.

W. W. GREENER'S

DOUBLE CLOSE-SHOOTING GUNS. Winner of the Silver Cup, value 40 guineas, at the Great London Field Trial 1875, beating 33 competitors with 68 guns; also winning in all the other classes for the Improved System of Boring. These guns will kill from 80 to 100 yards, loaded with large shot, and will shoot well with small shot with a less powder charge than guns bored upon the old system. For report of the Gun Trial apply to Messrs. McLaran, Williams & Co., Agents, St. Louis, U. S. A. Address

72 ST. JAMES STREET, LONDON.

WILLIAMS & POWELL,
Gun and Rifle Manufacturers,

Call the attention of the Sportsmen of America to the extreme SIMPLICITY, STRENGTH, and DURABILITY of their New Patent "SIMPLEX" Breech loader and INDEPENDENT EXTRACTOR.

The parts in this new action are so few (only two,) its mechanical soundness so thorough, and the strength and simplicity of the action so great, that W. & P. feel sure it will supercede all the complicated and manifold grips now in use, its one powerful grip being far stronger than any double, treble or quadruple grip now used. In this new action LEVER and GRIP ARE ONE SOLID PIECE OF STEEL and the ANGLE OF THE BODY is left in its ENTIRE STRENGTH.

Drawings of action and extractor will be sent on application, and orders may be forwarded through any of the best houses in the States for execution in the Spring.

Guns guaranteed to make patterns of from 160 to 230 with No. 6 SHOT AT 40 YARDS, as desired.

A Trip to the White Mountains.

WHO has not visited the White Mountains, except those who ought to visit them, and others who ought not? In writing on this subject I feel that I have to do with familiar things, and cannot hope to impart information, save only in respect to the peculiarities of my own visit and the impressions of personal experience. The mountains are evermore the same, as is also the granite of New Hampshire; but as no two individuals are alike, so neither are the circumstances of any two excursions. The elements which compose a lovely landscape are few and easily numbered; but the light and shade which fall on them are of infinite variety. The season, the object in view, the modes of travel, the disposition or occupation of the traveler, alike affect, and dissimilarly, the character of a visit to any locality. I propose only to review the peculiarities, or, if you please, eccentricities of my own excursion to the region named, to fix them more permanently in remembrance, at the same time inviting the company of your readers.

At the close of May, 1862, I left the city of my residence for North Conway, to pass a few weeks in that vicinity. It may be regarded as a peculiarity that I went alone. Not that I would not gladly have welcomed agreeable companionship, but that I long since learned the advantages of not being dependent. I have often gone alone on these excursions, not unmindful of the poetic truth—

There is society where none intrudes,

but also as one of two, of three, of four, of eight, of thirty. In circumstances and on all occasions I have gathered only delight, enjoyment, pleasure, health, abounding satisfaction; but it is not always practicable to secure companionship to go just where you wish to go, and when I frequently find congenial society, if not fraternity, at the place of destination, and never have felt the *ennui* in the woods of lonesome solitary hours. I pursued a ziz-zag course *en route*, proceeding by rail up to Rutland, then down and across Vermont to Bellow's Falls, then straight up the Connecticut to White River Junction, then east by rail to Lake Winnipiseogee, where I took private conveyance to North Conway. God and nature have done much for this delightful station, but man has accomplished very little. Fine prospects break upon the view in all directions. There lies the charming valley of the Saco in rich perspective, begirt with towering hills and granite curiosities. There is the lofty pyramidal Kearsarge Mountain, surmounted at the time referred to, with indications of an house founded on rock indeed, but given to the winds. There is the Crystal Horse and Diana's Bath, so called, not because "Great is Diana of the Ephesians," or because Diana ever bathed there, but because—I reconnoitered all these grounds to my heart's content, passing several weeks among them most enchantedly. I visited Diana's Bath and filled my basket full of her precious little trout. A stream comes down there over a granite base, which in the course of ages has scooped out large basins filled with water, ready for an humble washing. I ascended the Kearsarge Mountain to its very apex, first through the woods till I could look down on them, and then forward over bare rocks, and only rocks, till finally I had to climb almost perpendicularly upward; but I paused not until I stood six feet higher than the highest step of that bleak, demoralized, crazy building. Nor did I stop even there; for to my surprise and delight I beheld on the heights beyond, apparently accessible, a summit lake, which I thought to visit, and descended on the farther side for the purpose; but the more I traveled the farther off it seemed to be, till satisfied that as by an optical illusion I had miscalculated the distance, my sober second thought was to retrace my steps. Need I say that I felt abundantly repaid for all my effort and exertion? Looking down on the plains below, reposing in sunlight, the lovely valley of the Saco, like another Jordan, the quiet village of North Conway, and even on the surrounding peaks, excuse me if I thought of Moses on the height of Pisgah and the borders of the promised land.

There are various streams in this vicinity, and I fished several of them with success. Starting off in the morning with horse and chaise, and wading for six hours together at a time, surrounded with animating scenery, I would return with choice treasure and that cheerful happiness which only anglers know. I fished in the Saco and caught certain whitefish and nondescripts, but missed there my favorites. I fished at Jackson, some five miles north of Conway, where the Ellis River branches east and west, and there found special, great success, filling my basket to the brim not only, but with larger tenants than I had elsewhere found. This place received its name from Old Hickory, because all its voters voted solidly for him.

Mt. Washington, snow-crowned and attractive, was continually in view, and I looked forward, hoping for nearer and more intimate acquaintance. Bidding a reluctant farewell to Conway, on the 17th of June I rode onward to the Glen House, fascinated all the way with the sublimity of surrounding scenery, pausing at the Glen Ellis Falls and the Crystal Cascade, whose white waters descended leaping, laughing, exulting in their course, and noon found me at the base, not of the royal, but the republican Mt. Washington. It had been my intention to rest at the Glen House till morning, but looking upward I beheld the summit bathed in golden sunlight; and not willing to risk a certainty, as I regarded it, for an uncertainty with respect to the weather, I determined to make ascent the same afternoon; so at 3 o'clock I commenced the "going up." It was very warm below, but I knew well what rough cold breezes the evening shades and airy heights had in store for me; so wearing my lightest coat, but having on my arm the heaviest one, I proceeded slowly on. I was fully resolved to enjoy the occasion at all events, and as I was not ascending on a wager, would not be in a hurry. There was a good carriage way all the way, so that two carriages might pass each other or move abreast—but railroad conveyance was in the future: I discovered after awhile that the mountain was on fire, or that fire was on the mountain, and at one point heard a crackling at my right, which warned me of danger, I perceived that a large tree, burnt asunder near the roots, was about to fall directly across my path. Instead of retreating, I hurried up and forward for a space, when turning, I saw the tree lying at full length upon the road I was going up, and on I went, stopping at the springs which I was so glad to welcome, and other places, not only for rest, but to take a progressively higher view of the magnificent panorama which lay spread beneath. I met several parties and individuals coming down, and held converse with them respecting the realms above. In one instance we met where there is a sharp angle in the road. After scraping acquaintance for a few moments with each other, they descended while I went up, but in such directions that we repeatedly signalled to each other and exchanged salutations, waving handkerchiefs when we were a mile apart. Higher up my path lay through snow, which a dozen men were seeking with their shovels to remove. I could extend my hand without stooping and take up the snow. Long ere I reached this elevation I had felt the need of my other coat, buttoning it over the first, and had secured my hat so that no sudden gust should blow it far away. The route became steeper and more steep, colder and more breezy, darker, drearier, but still I struggled on, till five hours were passed, when at 8 o'clock, turning a short round, I dimly descried the Tip-Top House and a man entering it with wood. You may believe that I followed him.

After a friendly chat and supper I went to bed—but not to sleep, only to lie awake and listen to the superlative roar. Thinking what a terrible thing it would be to travel in the Tip-Top House to the bottom of Tuckerman's ravine, and all in the dark, I arose and sought the housekeepers for consolation. "Oh! this is not much of a blow," said one, and his calm assurance remanded me to my bed till morning. Then I thought it rained; but we were in the clouds, and fierce winds drove them against the fortified window panes with the effect of rain. When full daylight appeared I arose, opened the front door, and shut it again in a hurry. The adjoining ravine seemed, or steamed, like

an immense cauldron, whence boiling water was sending up hot vapor as from a hell. I inquired what proportion of those who attained the summit to see the sun rise were so gratified, and was answered, about one in nine. "Mount Washington," wrote Daniel Webster in the "Record Book," "I have traveled far and toiled to see you, and you have given me a cold reception." My experience was much the same. However, about 10 o'clock the clouds withdrew, and I was favored with an extraordinary prospect. For miles around I looked down on the summits of surrounding peaks, which appeared like strange excrescences on Mother Earth. I gazed in the direction where Portland lay, but did not see it satisfactorily, and recalled the Byronic sentiment,

He who ascends to mountain tops will find
The loftiest peaks most wrapt in clouds and snow.

There are, or were, two houses on this height; one the Summit, cabled down firmly and used only as a dormitory, the other a little higher, and so called Tip-Top, used chiefly for reception and a dining hall. I heard there of a projected barn, to the end that the house might be supplied with milk. These houses of course, or properly, were only one low story high. I climbed ambitiously to the topmost rock and stood the highest man in all New England—6,226 feet above the level of the sea! Having seen all that was to be seen and bade adieu, I made a descent upon the Glen House much faster than I came up, and reached it safely, having accomplished probably once for all in life, an eight-mile climb—a feat which I am not anxious to undertake again. There I learned that the guests had been entertained the previous night in gazing on the burning mountain below, all lighted up with fires, while we, in our serene elevation and retirement, heard or saw nothing of it.

How nature inclines to cluster her attractions. I have often thought of this in the Adirondacks. Where mountains are there are also lakes, islands, forests, deer and trout, and there the eagles fly. All these, with streams, falls, rocks and springs are clustered together, instead of being distributed. So here Mt. Washington, grand enough to stand alone, sustaining solitary dignity, is accompanied by other presidential heights but little inferior in their own majesty; Adams, Jefferson, Madison, Monroe and Franklin are well represented with classical monuments. Nor only so; for a pleasant drive, at times under beetling crags and lofty ridges, opens to view all the attractions of the Notch. Another leads onward to Franconia, and the natural wonders gathered around the Profile House; the high perpendicular Eagle Rock, the Old Man of the Mountains, with stern features set like flint; the Pool, the Basin, and the Flume. Who that has visited this favored region but has felt heart and mind expand, as well as lungs, under the influence of its inspirations, and realized with profound convictions, that God alone is great? AMATEUR.

Utica, Oct. 28th, 1875.

RACE BETWEEN A LOCOMOTIVE AND A DEER.—A few days since the engineer of a train on the Honesdale Branch of the Erie Railway saw a deer jump from the woods in front of the locomotive onto the track. Putting on steam a lively chase ensued, until, being too closely pressed the deer leaped over a ledge of rocks into the Lackawanna River. It escaped into the woods, but was followed by Ed. Malone, an old hunter, and his sons. Malone succeeded in killing it in Big Tink Pond, five miles from where it jumped into the river. Its saddles weighed over 200 pounds.

—In eastern North Carolina they make pine top and China berry and tangle-foot whiskey—three grades. The first enables one to see things as clear as he can see a fox squirrel in a tall pine; the second makes one mistake a pride of China tree for a grape vine, and the third enables one to go through a tangle of the densest cat briers without minding the mortification of the flesh or clothes.

—The Northern Railway of Canada is now open the whole distance, from Toronto to Gravenhurst, on Muskoka Lake. It will eventually be pushed to Lake Nipissing.

THE WEST TWENTY YEARS AGO.

To give the rising generation of sportsmen a glimpse of what the valorous old sportsmen of twenty years ago, when "Frank Forester" (Herbert) and other genial writers, contributed to the sporting press, I have compiled a sample sketch, showing Minnesota as a territory, and the resort of buffalo and elk. The suggestions of "Hal-a-Dacotah" are sound, and worthy of consideration. FRED.

MENDOTA, Minnesota Territory, Aug. 28, 1856.

My old Friend Porter:—

I have it from undoubted authority that you are about to sever your connection with the old "Spirit," with a view to the establishment of another sporting paper to meet the peculiar wants and wishes of that fast animal, "Young America." As one of your old friends and correspondents I greet you heartily, and wish you a full measure of success in the new enterprise; and although many long months have passed since "Hal-a-Dacotah" last paid his respects to your readers, he must now occasionally lay aside the cares of business and dress up for Porter's Spirit some of his experiences in the field.

It is high time that our sporting friends, who in days of yore were wont to commune together through the medium of the *Spirit of the Times*, should do their part in restoring field sports to their ancient popularity, and unite with their brethren of the trigger throughout the country in putting down the miserable pot hunting practices which, unless soon repressed, will result in the extinction of the game of America. True, the onward march of civilization, the heavy and ceaseless tramp of the tens of thousands of white men who are seeking a home in the far West, necessarily results in forcing the larger animals, such as the buffalo and elk, farther and farther toward the Stony Mountains, to be met and finally exterminated by the pale faces from the Pacific. But so much more desirable is it, therefore, that the deer and smaller quadrupeds and the feathered game should be protected from wanton slaughter by stringent laws, enforced by an enlightened public opinion. It is disgusting to every lover of fair play to witness the ravages committed by the pot hunter, who coolly murders the deer by torchlight from a dug out or canoe during the Summer months, or who entraps the grouse and the quail in his villainous nets for the sake of filthy lucre. Let the game, in the proper season, be open to every one alike, to be destroyed in a legitimate way, for I am in favor of the largest liberty in that respect, and opposed to all enactments in favor of any privileged class; but no member of the community should be permitted to slaughter wild animals the flesh of which, when in season, is designed for the food of man, at a period of the year when it is unfit for that purpose. I charge you, friend P., "and you love me," to rebuke and denounce the whole tribe of pesiferous animals who sport in the lives of little birds merely to gratify a propensity for useless shedding of blood, and who crawl stealthily upon a covey of grouse or bevy of quail which are huddling closely together on a fence rail on a cold December day, merely to boast of having massacred a host of his shivering and unsuspecting prey at a single shot. If chronicled at all, such a performance should be stigmatized as a disregard of manly sport, and as displaying on the part of the actor a total want of kindly and humanizing instincts.

Having now vented my wrath, which has been bottled up for a proper occasion, *je reviens a mes moutons*. In our happy and beautiful Territory, where we have no bloody Kansas scenes to deplore, there yet roam the buffalo and elk, but they are gradually retiring before the avalanche of white settlers who are precipitating themselves upon us. It is probable that many of your readers have but a faint perception of the process by which the mighty northwest is transformed from a wilderness into a populous State in an incredibly short space of time. Let them picture to themselves a magnificent prairie, studded with fine lakes and interspersed with luxuriant groves of oak and other timber, with a camp composed of conical skin lodges in the distance, and a troop of daring Dacotah horsemen, accompanied by a single white man (your friend Hal), urging the chase of a herd of buffalo. Let them regard that as a true scene of 1850, or even later, and then ask them to call up the same landscape in 1856, and from the picture will have vanished Indian men, women, and children, buffalo, dogs, and lodges, leaving the solitary white man to gaze with amazement, not untinged with melancholy, upon thriving villages, countless farms, teeming with laborers engaged in securing the abundant harvest, and all the other evidences of happiness and comfort which characterize the settlements of juvenile America. Let them conceive the whole vast area of 160,000 square miles, a very small part of which they have looked upon, as containing six thousand whites, all told, in 1850, and of that same area six years later with a population of two hundred thousand of the prime men, women, and children of the whole land, and they will be able to realize to some extent how Minnesota has been changed, as by the wand of a magician, and how it is that the infant communities of the "Great West" spring into full strength and manhood almost as instantaneously as armed Minerva from the head of Jove.

To an old hunter like myself, accustomed to the solitude of forest and prairie, these changes are, as I have before hinted, not unattended with the lingering regret which we feel when some fair but wild vision disappears suddenly from our enraptured view. The Indians with whom I lived and hunted for so many years—where are they? The powerful and haughty tribe of Dacotahs, who possessed the fair land, and boasted that they were, and ever would remain, its only masters—what is their fate? Turn to the history of the Six Nations, and of the other bands, whose graves are numberless on both sides of the Alleghanies, and you will need but little aid from the imagination to enable you to reply correctly to such interrogatories. Broken treaties and unperformed promises on the part of the Government, and the presence of a power which the Indians feel their inability to resist, these are but a repetition of the old story, and the humbled and degraded Dacotahs can look for no redress of their grievances on this side of the "spirit land." Their country has passed into the possession of a race who can appreciate its beauties and develop its riches, and my only regret is that the Government and its agents have failed to use the opportunities presented to them, to place the poor Indians in a position to be treated kindly and fairly, and to be protected in the possession of the rights secured to them by solemn treaty.

But I will no longer pursue a strain so lugubrious. Let us leave the settlement of these questions in the hand of the Great Father of all.

Since the removal of the larger game from my old hunting grounds, I have been obliged to content myself with

less exciting sport. I am now paying due attention to the grouse, which are full fledged and numerous. As they are deprived of life *secundum artem*, I imagine the poor things pass out of existence with a feeling of consolation that they have been dealt with scientifically and artistically, and not been subjected to the tender mercies of the mere pot hunter. The season for deer and water fowl is fast advancing, and I hope I shall be about when the time comes. Ducks of almost every variety are abundant in this region in the Spring and Fall. I recollect that when I was in your sanctum on one occasion several years ago, some wiseacre insisted, in my presence, that no veritable canvas backs were ever to be found so far inland as the Upper Mississippi. I intimated in my civil way that the gentleman was mistaken, and when I returned home I took some pains to prove my assertion by knocking over a few individual canvas backs and forwarding to our friend "Frank Forester" a male and female, duly prepared, and it is quite possible they are still to be found at "The Cedars." If you hereafter have the question mooted in your hearing whether we have or have not the simon pures, please refer the doubters to "Frank," who will carefully exhibit the proofs.

But this rambling epistle has already been extended beyond proper limits, and I close by repeating my hearty wishes for the full success of *Porter's Spirit*. Thine, as of old, HAL-A-DACOTAH.

N. B.—Since the foregoing was committed to paper, I have received the first number of *Porter's Spirit*, and have perused it clear and well printed pages with great satisfaction. Really, it "out Herods Herod," and I almost shrink from thrusting myself forward into so brilliant a galaxy of correspondents, with "Frank Forester" at the head. However, my modesty goes to the wall for the nonce, and I must try to do better by and by.

For Forest and Stream.

CANOE CRUISING.

A VERY pleasant episode, indeed, in the life of one who spends six of every seven days in the city is a seventy mile canoe cruise in the first week of November. Yes, November is the month; then all game is in season, the nights are cool and frosty, and one may sleep even in New Jersey bogs without fear of chills. Dead leaves are at hand to start a fire or make a bed, and mosquitoes are not, to make such a bed uncomfortable. Reader, if you have never enjoyed a canoe, cruise begin to make preparations for next season. It is now too late to be afloat. Choose some river that you are a little acquainted with. Take a good map and compass, and above all a good companion. Take a canoe of not over one hundred pounds weight, and start prepared to overcome all obstacles. You will never regret it. The Passaic River is not noted for its scenery. Running as it does most of its length through a low, level country, it is not particularly attractive to the sportsman. Living within three miles of this river, my friend Fred H. and I concluded to take a trip from Newark to Chatham. In February, 1874, we commenced to build our canoe; the last week in March saw it completed. It was thirteen feet long by twenty-eight inches wide, built of half inch pine, and would weigh about eighty pounds. In April, 1874, we cruised up the river to Chatham, a distance of about seventy miles, in four days. Three of these days were rainy, consequently little shooting was done, though we did bag a few snipe. On the 3d of November last we started on our return down the Passaic. About four o'clock in the afternoon we rounded a bend in the river and sighted our old camping place. The boat was run alongside the steep bank, the blankets and provisions hoisted out, and camp speedily prepared. Everything looked natural, and a fire was soon blazing in the old spot. We gathered dead leaves and covered a spot five by seven feet to the depth of a foot or more; over these we spread a large rubber blanket, putting logs along the sides to keep it in place. This was our bed, and a good one it was. A few strokes of the axe provided wood enough to last all night, as the weather had been dry and there was plenty of dead wood at hand. By this time darkness, which at this season of the year quickly follows the setting of the sun, had drawn a curtain round us, and the only things discernible outside of the circle of light were the branches and trunks of the great trees clearly defined against the blue sky. Then came supper—seasoned with fatigue and hunger—corned beef, bread and butter, chocolate and toast; not sliced bread, dried over a slow fire, but a chunk broken from the loaf and quickly roasted between two bright blazes. Toast made in this way, broken up and eaten with good butter, in the woods, is most delicious. Supper over, the provision chest is repacked, and all made snug for the night. The dogs are fed and told to lie down at the foot of the bed. The blankets are spread out near the fire to warm, and stories are told till sundry motions of the under jaw admonish us that it is time to turn in. The guns, in their waterproof covers, are laid alongside of the bed. The blankets are spread out, and we carefully get beneath them and tuck ourselves in. I had just fallen asleep when a slight shake and a low spoken "hist" awoke me. I turned to Fred for an explanation. He said, listen. I did so, and plainly heard some animal raking over the dead leaves in the vicinity of our provision chest. I looked at the foot of the bed—both dogs were there and asleep. Now, when in the woods, snug in bed, you do hate to get up, for you know that it will take at least fifteen minutes to get settled again, and ten to one if you can arrange the blankets then to your liking. Well, though we hated to, we got up. Fred took a large firebrand from the fire and I drew my revolver. As we made in the direction of the retreating animal, Fred said "call the dogs." I replied, "No, maybe it's a skunk, don't go too near." As I said this Fred was on the point of making a dart at the unknown with his firebrand. My words stopped him, but not the brand, which he hurled at the luckless skunk. The flaming stick tore through a small bush and landed in a pile of dead leaves, scattering them in all directions and setting them on fire. It was now a fire hunt, and we had some trouble extinguishing those dozen fires; but at last it was done, and the cause of the trouble consigned to the campfire. As we came up the dogs looked at us as if to ask what we had been about. More fuel was added to the fire, and we turned in for the second time. I for my part was soon asleep. I must have slept nearly two hours when I was awakened by a tremendous dig in the ribs. As I started up, Fred cried out, "Where's your revolver; quick." That useful weapon was at once produced. I raised myself on my elbows and

looked around. The fire was low and I saw I must have slept some time. "Fred," said I, "what's the matter." "Matter, why that confounded skunk has been here and woke me up by sticking his cold nose in my face. Hark! there he is now." I could plainly hear some animal making through the woods less than thirty yards off. On he came. I cocked my revolver, and determined to fire as soon as I got a chance. Out from the shadow of the great tree trunk he came. I saw him scarce twenty feet off. The hammer of my revolver came down and I was out on the ground in an instant. "Fred, you galoot, it's the hound; come here, Phil; lie down, sir. Why didn't you look for the dogs before you woke me?" "Well," said Fred, dryly, "let him try it on you and see what you'll look for. Put some more wood on the fire and come to bed." In I went again, and as we lay dozing something between a scream and a shriek came sharply through the woods. I had never heard anything like it before. It seemed to come from all sides at once. It lasted perhaps twenty seconds, and when it ceased it seemed as if all life went with it—nothing breathed, nothing moved, when suddenly the familiar who-who-who-o-o of an owl came loudly down from a lofty tree top. I knew then what it was, but never before had I heard the shriek the great barred owl gives over its freshly captured prey. For some time we lay awake discussing the singing powers of the barred owl, but finally dropped off, and slept undisturbed till morning. An hour before daylight we were astir. Coffee was made and we breakfasted. The first glimmer of daylight found us afloat. It was Fred's turn at the paddle, and mine at the gun. The east was growing rosy, and the heavy mist over the river beginning to lift. As I strained my eyes to see as far as possible, two ducks came out of the shadows of the left bank and swam quickly down stream about fifty yards in advance of us. I gave a slight hitch to the canoe, the signal for caution. The paddle is handled with skill—put well under the water before the force is put on, and withdrawn from the water so as to make no splash. All was quiet. Presently, about thirty yards ahead, appeared a solitary duck, swimming down stream. I tapped the starboard gunwale. A silent sweep of the paddle checked the canoe and pointed her bow to the right. Bang! The duck dove like a flash. The canoe started again. Here he is. Fred gave him a shot, but the nimble bird was under water before the shot reached him. He is headed down stream, and means to take his longest dive and then take wing. Down stream we go. There he is, and on the wing. Up went my breech loader, and at the report he fell into the water a dead duck. A long shot for No. 8—full forty yards. We picked him up, and he proved to be a pintail. After changing places, I taking the paddle, we proceeded down the stream. Just below the next bend we came upon the two ducks we had seen before, and Fred killed them both with one barrel. They proved to be wood duck, one a drake in full plumage. A little farther down stream we were each obliged to take a paddle, as there was a rapid to be run. Once over that we proceeded on down the river, getting no more shots at ducks until noon, when we landed, and after lunch went on a short shoot. We separated and started up a hillside. Soon "mark-mark" from Fred and a yelp from Phil, then bang, and I heard Fred's voice saying, "I've got that guifer." A little farther on, in a thick hazel copse, Flash put up some quail, but no shots were fired, as the thick cover reached three feet above our heads. In the next field I whistled up Flash and sent him into a suspicious looking clump of bushes. Ha! I thought so. Out pops a rabbit, and jumping a stone wall, takes across the open field, while the dog stands with his fore paws on the wall looking after him. Bang, bang! and at the second report Mr. Bun turns a double somersault and strikes the ground dead. I discovered the bulk of my first load of shot lodged in a fence rail, which satisfactorily accounted for my miss. We returned to the boat and proceeded on down the river. At four o'clock we selected a place, and, drawing the boat upon shore, took our guns and looked up a good spot for our camp. We had scarcely gone twenty yards when Flash put up a black duck near Fred, who dropped him in good style with my gun, which he happened to have in his hand at the time. As the weather was threatening, we decided to sleep in our canoe. It was accordingly filled with leaves, over which a blanket was spread, while over the whole, boat and all, the rubber blankets were arranged by the help of two crotches and a sapling, so as to form a pretty good roof. A supply of firewood was cut, then taking our guns, we went prospecting. We got a good supply of birch bark for torches, but no game. We ate a hearty supper and turned in. The night passed without incident. At daylight the next morning we had a warm breakfast, after which we launched the canoe and proceeded on our voyage. We reached Pine Brook at eleven o'clock without seeing a duck. We went to the little store and post office combined, mailed our letters, and obtained a fresh supply of bread. At one o'clock we went ashore. After lunch we tried shooting. Though we were more than an hour we saw not even a meadow lark. Down the river again. As we rounded a bend Fred drew in his paddle and seized his gun. A mallard duck was coming up the river on the wing. Fred gave him a shot, but old mallard had seen us in time and got away with a whole skin. I fired a shot into a passing flock of blackbirds and killed three, which we ate for supper. At the lowlands opposite Horse Neck I went ashore with Flash. He put up two black ducks from a swale. I marked them down in a similar place about five hundred yards away. Fred and I started to stalk them, but a farmer was before us, so we took positions behind stumps and awaited further developments. The farmer crept cautiously along, but the ducks were wild, and though he fired where they got up he did no harm. As they passed me, at about eighty yards, I sent them my compliments in the shape of an Ely gun cartridge, which produced no effect. We reached our old camping place (where we spent a night on the way up) at half past four o'clock, and worked hard to get camp ready before dark. We slept in the boat, rigged as before, and passed a very comfortable night, though Fred complained in the morning that Flash had laid on his foot all night and twisted his big toe. It was half past six next morning before we were fairly off. We went down to Two Bridges, where we were obliged to run a rapid, the worst we had yet passed. About a mile below Two Bridges I went ashore with Flash. I sent him into the bushes along a fence, when out flushed a woodcock, which, at my shot, fell into the river and was picked up by Fred. Fred came ashore, and we proceeded to beat out the cover thoroughly. We put up two more woodcock, one of which Fred killed. I fired a double shot at the other and missed. On down

the river to Little Falls. I went ashore after some cider, and while I was gone Fred dropped a grey squirrel from a tree on the river bank. After disposing of the cider we went ashore and caught a red squirrel alive. We placed him, for want of a better place, in my gun cover, and the young rascal gnawed several holes through the waterproof cloth. As we could not keep him, we let him go. We carried our canoe and baggage to the top of the high river bank, and then ate a hearty dinner. Dinner over, we embarked on the Morris canal with a pull of twenty miles before us, including a portage around Stonehouse Plain. We passed through Paterson at half past two. It was dark when we got over Stonehouse Plain. On the canal I shot a kingfisher and a bat to stuff. It was nearly eight o'clock, and pitch dark, when we reached Sunfish pond, the end of our trip by canoe, though we had a three mile tramp before us. We reached home before nine o'clock, rather tired. The next day we agreed in saying we should like to try it again.

MAGUA.

Fish Culture.

FISH CULTURE IN CHINA.

THE following interesting account of the Chinese mode of collecting fish fry upon the Yang Tsze Kiang, although a contribution to the columns of our contemporary, *Land and Water*, is from the pen of a valued friend of our own, Mr. H. Kopsch, for many years past an officer of the Imperial Maritime Customs service of China. In addition to a long residence in the empire—our own acquaintance with him dating back to the first opening of the Yang Tsze in 1862 or thereabouts—Mr. Kopsch possesses that rare accomplishment, an intimate acquaintance with the Chinese language—an advantage which enables him to acquire information not merely superficial, but of a positive and valuable character. In fact, it is a "consummation devoutly to be wished" that our knowledge regarding all branches of industry in a country so remote, so ancient, and so strictly conservative as China, could always be obtained through sources equally authentic. The Abbé Huc, to whom Mr. Kopsch refers, although accepted as authority upon matters relating to that portion of the "Middle Kingdom" but recently opened to foreigners, has been found repeatedly to be in error, to put it mildly, in points wherein accuracy of statement was most to be desired:—

"Fish culture having attracted much attention of late years in Europe and America, a few notes on the manner in which it is conducted in this part of China, the province of Kiang-si, may be of interest.

It is well known that the Chinese have long bestowed more attention on pisciculture than other nations, and with them it is truly a branch of economy tending to the increase of the supply of food and the national wealth—not merely as it seems to have been among the Romans, an appliance of the luxury of the great.

Fry fishing commences here (Kiu-Kiang, on the Yang Tsze), about the middle of May, and lasts from ten to fifteen days. The preliminaries for this kind of fishing are not numerous. The net, which is of course gauze, dyed brown, is fixed on to its proper frame, and the whole cast longside the river bank, where there is a moderate current, sufficient, however, to keep the net in position, and sweep the fry into the trap.

A single frame as it floats upon the water represents our letter V, and measures about fifteen feet long and eight feet across the mouth. The net attached to it is submerged about a foot, thus serving to collect the fry as they are lifted by the current into the trap at the end of the frame. The bottom of this V-shaped frame is not closed together, little space being left to allow the spawn to pass through the throat of the net leading into the trap, which floats perpendicularly, and to prevent its collapsing is tied to stints run through the four corners of its frame.

As many as four and six of these V-shaped frames are attached to a long bamboo moored close to the river bank, rows one above the other, at distances of from fifteen to twenty feet apart, where they are left all night and day. But let us look into one of these traps. The net tender, who lives in a mat hut on the river bank hard by, or in a sampan (small boat) used to visit the nets, readily gratifies our curiosity.

Taking an ordinary sized rice bowl he dips it into one of these cages, which it should be noted appear to require emptying every hour, and hands us about a quart of muddy water, perfectly alive with wriggling transparent-looking fry measuring from an eighth to two-eighths of an inch in length, with heads and eyes greatly out of proportion to size of their bodies. Even in the muddy water there is no difficulty in discerning them, as one would be led to suppose from Abbé Huc's statement, 'that it is possible to distinguish the smallest animalculæ with the naked eye.' Experts are said to be able to detect the diffident fry as soon as they are caught, but as they would be too small to handle their knowledge would be of little practical value; in a week or so they become large enough to distinguish one from the other. After the fry collected from the small traps they are put into a float-reservoir made of net, where they are kept until pursued for conveyance inland.

Those sold for breeding in the neighborhood are carried on the shoulders of coolies in water-tight baskets to the ponds and lakes, of which there are a great number in this district. Along the Yang Tsze fry is sold by the jar or vat, according to the quantity of fish it contains, and at from five to six hundred cash (equal to 50 to 60 cents,) appears to be the average price per jar, according to the state of the boatmen.

Most of the fry is conveyed inland by boats, which come from the interior for the especial purpose of loading with freight. These peculiar looking craft generally hail from Kan-chow-fu, a large town to the south of the province, on the Khan River; also from Kuei-hsi-hsien, in the northern department, to the east of the province; and the boat load here generally rendezvous at Kuan-pai-chia, a small village about a mile west of Kiukiang, on the south bank of the river. Tea boats are likewise used to carry fry, but not so extensively as those from Kan-chow. For residents on the Yang Tsze are too well acquainted with the craft to need any description.

The Kan-chow boats or *Yu-Miao-Chuan* (spawn boats) are of much larger carrying capacity, and measure about seventy-eight feet long, fifteen feet beam, eleven feet from bottom to top of mat cover, and draw when loaded from three to four feet. They are built in water-tight compartments, and are propelled by sails, tracking, or yuloeing—that is, by long sculls rigged out about eighteen inches or two feet from either side of the boat, on outriggers forward of the mainmast, and worked parallel to the side of the boat by four or six men at each scull. About twenty men comprise the boat's crew, who also attend to the fish in turns, their wages averaging two thousand cash (equal to \$2) per month, with food. The boats are worth from 450 to 500 taels* each (\$600 to \$666.) Their cargoes brought to this port consist chiefly of timber (hewn as if for railway sleepers) wood for making coffins, planks, water chestnut, water chestnut flour, grass cloth, and sundry sweet-smelling flowers; probably small speculations of the crew, such as *Kewi hua* (*Olea fragrans*), *Mo-li hua* (*Jasminum*), *Lan hua* (*Epidendrum*), and *Tag-lai-hsiang* (*Stephanotis*) etc., which fetch a good price here.

But as several of these boats are nearly laden it will be curious to see how they stow their freight.

From the bottom boards of the boat to the level of the gunwale would find the hold filled with red earthenware jars (made of flower-pot clay) each measuring eighteen inches in diameter and twelve inches deep, arranged in tiers one above the other five high, and as we counted eleven jars on the top row amidsthips of the two tiers put into a compartment, between which room is left for a man to pass, we may roughly estimate one hundred jars in each compartment, or five hundred jars in the five sections into which the hold is divided. A stout plank about five inches broad is laid across the wide mouthed jars to support the upper ones, and to spread the weight more evenly, but the plank is not so wide as to interfere with the bailing out of the vessels. The jars are fastened to the sides of the compartment by a little splint of bamboo, made fast to an eye in the bulkhead, and which is made to catch under the turned rim of the jar, on the same principle that a small-mouthed vessel is lifted by a piece of wood being put crosswise into the opening. To strengthen the rim it is sometimes bound round with a bamboo hoop. On the upper row of jars another plank is laid to receive the water-tight baskets, which, being much lighter than the jars, are placed on the top, and piled up from the level of the gunwale to the roof of the boat. The baskets are securely lashed to poles braced athwart the boat to prevent their sliding out of position, as at such a height a slight knock would capsize them, although they are placed in a wicker-stand to steady them and ease the strain on the sides of the baskets. As the number of these baskets appear to be about the same as that of the jars we have a total of, say 1,000 jars and baskets of fry in one boat. After all the internal arrangements are completed the fry are poured into the jars and baskets, and when all are full the boat proceeds on her voyage. Kan-chow-fu, as I have remarked, is the chief market for spawn, but much of it finds its way into the Canton, Fu kien, and Chekiang provinces, when it has to be carried across the boundary range of mountains, about a day's journey, before gaining the water-ways of the neighboring provinces.

The water is changed day and night, and after the muddy Yang Tsze and Po-yang Lake have been left the young fish require feeding, chopped yolk of hard-boiled egg being the food administered to them, with a certain amount of bread paste. A cargo of fry is estimated to be worth from 400 to 500 taels (\$533 to \$666,) but on arrival at its destination realizes fully 1,000 taels, or \$1,400, the fish being then sold at so much apiece instead of by the jar.

Reliable information as to the mortality *en route* could not be ascertained, but all agreed that it was considerable, though chiefly dependent on the 'good luck' accompanying the boat. The distance by water to Kan-chow is 1,055 li, or 350 miles, and occupies from ten to fifteen days, according to the weather; the navigation is against the stream all the way after entering the Po-yang Lake. During the journey the fish are separated into different jars; the most important thing to be observed is to keep the 'wild fish' (*yay yu*) from the domestic fish (*chui yu*), the former, said our informant, being of a restless nature, will not live peaceably in confinement, but commence to prey on the others.

The *Kan yu* or pike appeared to be the 'wildest fish,' and most to be dreaded. The fry caught here and conveyed inland is chiefly that of the *Pang tou yu*, *Kuei yu* (perch,) *Lien yu* (bream,) and *Huen yu*.

The *Pang tou yu* often attains a weight of 20 to 24 pounds, and 4 feet in length. Its flesh is rather coarse and flavorless, which is the chief complaint of most Yang Tsze fish. It is sold here at this season of the year (May,) for 40 cash, say 4 cents per catty, equal to a pound and a third. This is, of course, river-caught fish. *Kuei yu* (perch,) or 'mandarin fish,' as our 'boys' often call it, from the fact of its being the best fish to be found in the market almost at all times of the year, grows to a large size, and is of excellent flavor, and very firm if full sized. Those of average size measure 23 inches in length, 18 inches round the body, and weigh between 7 and 8 pounds. The price ranges from 40 to 60 cash, equal 4 to 6 cents per catty (1 1-3 pounds,) according to season and time of day, but even at the latter price 'mandarin' fish would not be a very expensive luxury, yet the lower classes seldom indulge in it. After the *Kuei yu* the *Lien yu* ranks next, being a rich and firm fish. It often grows three feet long and 20 pounds in weight. The *Huen yu*, though a coarse looking fish, has an excellent flavor, and in the proper season is a very acceptable change at one's table, after the everlasting perch with which our cooks continually supply us. The fry of the *Shih yu*, or shad, which ascends the river in May to spawn, does not appear to be caught or bred in ponds or lakes. It is greatly esteemed by the Chinese, and is undoubtedly the best fish of their rivers. The season for it is soon over, lasting from about the middle of May to the third week in June. In former years this fish used to be taken from Nanking to Peking for the Emperor's table, but the labor of getting it there fresh was so trying to the people engaged to carry it that the Emperor was induced to forego this luxury, and the practice was discontinued.

The pike of these waters grow to a very large size, the dimensions of one specimen being 49 inches long, 21 girth, and weight 36 pounds. All attempts made by Europeans at fishing with hooks appear to have failed, few even being rewarded with as much as a bite, nor are Chinese often seen angling with rod and line on the Yang Tsze. The

* A tael of sycee (silver) is equal to one and a third dollars (gold,) bearing the same relation to the dollar that the catty weight does to our pound, viz., one-third more.

system of taking spawn by forcible parturition as practiced in the United States—a long description of which was given in *Harper's Magazine* for June, 1874—does not appear to be known along the Yang Tsze, and it is a question which fish culturists can decide, whether the Chinese method of spawn collecting, or that adopted in America and Europe, is the most effective.

It is said that at Canton fish are caught and their spawn expelled, and afterward impregnated with the milt of the male fish, as described in the magazine quoted, but the statement has yet to be verified. H. Kopsch."

ARTIFICIAL HATCHING OF WHITEFISH.—Mr. Wilnot, who is not inaptly termed the father of pisciculturists in Canada, appears to be almost ubiquitous in the Dominion. Now we hear of him at the newly erected hatchery of Petite Cote, a few miles below Windsor, on the Detroit River, superintending the hatching of whitefish in the buildings which were erected at his suggestion. The *Windsor Record* says that a good deal of difficulty, owing to various causes, has so far been experienced in procuring female fish from which to take the eggs; but it is believed that from this date they will be supplied as rapidly as needed. The process is this: A female ready to spawn is relieved of its eggs, which are placed in a vessel and impregnated with milt taken from a male, after which the eggs are spread evenly, one layer deep, in sieves, containing each 10,000, and submerged in vats beneath river water, which, by clever contrivances, is kept continually running in regular quantities over and between them. Once in twenty-four hours the tray or sieves are taken out and the eggs carefully examined and the faulty ones removed, in order that the most perfect cleanliness—an imperative condition of success—may be observed. This routine is continued until the month of April, when the delicate, transparent fishlings will burst their shells and emerge into their future element, to be retained in a suitable tank only long enough to acquire strength with which to provide for themselves, when they will be deposited in the river. In three years they will attain full growth.

The house will be capable of receiving and hatching 100,000,000 eggs, but it is questionable if more than half that number can be put down this season. Eggs that are deposited in the rivers and creeks in the natural way suffer dreadfully from natural enemies before hatching, only from four to six per cent. escaping, whereas about 80 per cent. of the artificially hatched eggs yield mature fishes.

Away out in the river an induction pipe is laid, connecting with a large well under the building, by means of which the well is filled with pure, filtered water up to the level of the river. From this well the supply required is pumped by a little upright steam engine, built at the Watrous Engine Works at Brantford, into reservoirs, raised so that the bottom is slightly higher than the top of the troughs or vats in which the eggs are placed. A pipe connects the reservoir with the vats, and a faucet enables a greater or less flow to be let on. The headway allowed is just sufficient to create a steady current and constant change of water, just as would be the case naturally. The vats are all connected by pipes, and the water entering at the upper end passes through the multitudinous compartments into which the vats are divided, and emerges into a tub at the lower end, from which it escapes back to the river. Pure fresh water of a particular temperature, plenty of light, and scrupulous cleanliness are all that is necessary to make success a certainty; and the Petite Cote establishment is as well designed and situated to ensure these as could be desired.

PRIVATE AQUARIA.

LITTLE FALLS, N. Y., Nov. 21, 1875.

EDITOR FOREST AND STREAM:—

A most interesting, and but for accident a most successful experiment, in domesticating various members of the *salmo* family has lately come to an untimely end in our village. Some six years ago Mr. James M. Smith, druggist, arranged a commodious aquarium on one of his counters, which was fed by a stream of pure spring water, which was supposed and hoped to be unfailing, and which in Summer or Winter varied but little from a uniform temperature of 50° Fahrenheit. The stock put in consisted of nine small brook trout. These thrived fine, and the largest from a five-inch troutling had become a noble trout of nearly two pounds weight, and the others followed him up so closely that the aquarium, ample at first in its accommodation, seemed crowded. A broken glass lost nearly all the water and but two, the largest, survived the mishap, and the aquarium was restocked with small trout, and the big ones, which, well cared for and fed with minnows, did not molest them.

Not long after the water stopped and the trout were shifted to a tank in the cellar and kept there two weeks. The darkness of the cellar, the want of clean gravel, and perhaps the deleterious odors likely to occur in the cellar of a drug store, sickened the fish, and when they were replaced in the aquarium they were sickly and were affected with a blue mould, and soon died.

In January, 1875, Seth Green presented Mr. Smith with three California and two Kennebec salmon, all yearlings, and about five inches long. These, with several brook trout of about the same size, were put in the aquarium which was again started. All thrived well and kept healthy, the brook trout outgrowing the others. In about two months one Kennebec salmon jumped out and was found dead on the floor; three months after the water was found in the morning to have stopped during the night, and the remaining Kennebec salmon was dead; the others recovered. But a month ago, after several days low water, during which the water was kept well iced, the supply gave out at night, and in the morning the whole lot were found dead.

The experiment had been so well carried out, and the fish had furnished so much entertainment to all trout lovers, that it was felt to be almost a calamity. Mr. S.'s facilities are good, and he is a thorough fisherman. I think a new supply, including grayling, would be most advantageously placed in his depopulated aquarium. PISCO.

DEPARTMENT OF INLAND FISHERIES,
WINCHESTER, MASS., Nov. 27, 1875.

EDITOR FOREST AND STREAM:—

In the *Rod and Gun* of Nov. 13 is the following statement attributed to Fred. Matlier: "This expensive affair (the Holyoke fishway) seems to be condemned by everybody except the inventor, who sticks to it and growls at suggestions for its improvement with 'Yes, I've thought of all; you can suggest nothing but what I have considered.'" Regarding Mr. Matlier as a gentleman and a man of veracity, and knowing the above statement so far as regards me to be utterly untrue, I feel bound to believe, until otherwise informed, that he has been misrepresented.

The statement in regard to the fishway is equally incorrect. The plan was adopted by a unanimous vote of the Commissioners of the four States interested, and I am not aware that any of the Commissioners have met with any one whose experience in such matters entitled his opinion to any consideration who has found fault with the fishway proper, which alone constitutes its value as an invention. That the surroundings at the foot of the fishway may be improved, the Commission-

ers of this State, probably long before Mr. Mather saw it, were fully aware of, but with the limited means at our disposal everything cannot be done at once. Shad went over the Holyoke fishway during the last season, and it is the only fishway yet built over a dam of any considerable height where shad have positively been known to pass.

R. A. BRACKETT, Commissioner of Inland Fisheries.

—Iowa's Fish Commissioner, Haynes, states that 300,000 salmon have been hatched at Anamosa, and are now ready for distribution. By January 1,500,000 trout will be ready to distribute among the Iowa streams.

Natural History.

[This Department is now under the charge of a competent Naturalist, endorsed by the Smithsonian Institution, and will henceforth be made a special feature of this paper. All communications, notes, queries, remarks, and seasonal observations will receive careful attention.]

THE ORNITHOLOGY OF THE BLACK HILLS.

IN the report of Mr. George Bird Grinnell, of New Haven, upon the birds observed by him during Capt. Ludlow's expedition to the Black Hills in 1874, we have a valuable contribution to our knowledge of the ornithology of the Territories. One hundred and ten species are catalogued, which is a large number for such a trip, considering the other duties which Mr. Grinnell also had to occupy his time; and nearly every species has attached notes of very great interest. The birds about Fort Lincoln have already been well described by Dr. Coues, Prof. J. A. Allen and others, and we shall only have space to review the notes made in the hitherto almost unknown hill-region which culminates in Harney's Peak.

The robin and Rocky Mountain blue bird, (*Sialia arctica*) were common throughout the Black Hills. A single specimen of the dipper was seen on Elk Creek, which is probably the eastern limit of their range. The long-tailed chickadee and the slender billed nut-hatch were common in the timber, and a single family of the red-bellied nut-hatch was seen. The house wren bred everywhere, but the rock wren (*Salpinctes obsoletus*) only occurred among the bad-lands along the little Missouri. A single specimen of Audubon's warbler was taken near Harney's Peak, August 1st. The purple martin, and the cliff and violet-green swallows, and the lead-colored vireo, (*Vireo solitarius* var. *plumbeus*), were found abundant in the Hills. A single one of the *Vireo gilvus* var. *Swainsoni* was also taken near Bear Butte. The cedar-bird, white-winged shrike (*Collurio ludovicianus* var. *excubitorides*), and Louisiana tanager—the latter in three stages of plumage—were also collected. Mr. Grinnell's account of the Fringillidae abounds in valuable observations. Thus he says of the chestnut-collared bunting, or longspur, (*Plectrophanes ornatus*), "the male sings sweetly on the wing;" but McCown's bunting is considered the more melodious songster. "It rises briskly from the ground after the manner of the lark bunting, until it attains a height of twenty to thirty feet, and then, with outstretched wings and expanded tail it glides slowly to the earth, all the time singing with the utmost vigor. The male and female exhibit an unusual degree of attachment for one another. * * * I noticed that they kept close to one another, generally walking (not hopping) side by side. If one ran a few steps from the other to secure an insect or a seed, it returned to the side of its mate almost immediately." The nests and eggs of these two species, and of the lark bunting (*Calamospiza bicolor*), are also described. It is a curious circumstance that only in the nests of the latter bird were cow-bird's eggs ever found. *Coturniculus passerinus* var. *perpallidus*, *Chondestes grammacus*, *Junco hyemalis* var. *Aikeni*, *Spizella socialis* var. *arizonae*, *Spizella pallida*, *Cyanospiza amena* and *Pipilo maculatus* var. *arcticus* were more or less common west of the Little Missouri. The male of the lazuli finch is represented as sitting all the morning on the topmost limb of a dead tree, at short intervals uttering a screaming little song, much resembling that of *C. ciris*. It probably raises two broods at Fort Lincoln. The arctic towhee also breeds around the Fort. Its song is a monotonous trill. The nests of the characteristic shore larks were found early in July. A few Canada jays, which were seen on Elk Creek, are described as very shy; a new feature in that bird, which usually shows anything but timidity in finding its way to the scraps about the camp fire.

Among the flycatchers, the Arkansas, Say's, and the olive-sided are noted; and the western wood pewee (*Contopus virens* var. *Richardsoni*) was very common in the pines on the mountains. The black-billed cuckoo, Lewis' and the red-headed woodpeckers, and both the flickers were also observed. The long-eared, short-eared and great-horned owls were common, and many dresses of the Sioux were ornamented with their feathers. *Falco lanarius* var. *polyagrus* was abundant everywhere on the plains, feeding on the buttes, but was not seen in the Black Hills. A most entertaining account of the habits and haunts of this lonely falcon is given, which we wish we had the space to quote.

Other hawks peculiar to the region, and breeding on the buttes were noticed in considerable numbers. The golden and bald eagles occur all through the country between the Missouri River and the Rocky Mountains. The tail feathers of the former are so much prized by the Indians to adorn their war head dresses that two golden eagles are worth a horse, or \$40 to \$60, among the Sioux.

Among the game birds: Dusky grouse (*Canace obscurus*) and sage cocks were rare; the sharp-tailed grouse (*Pediceetes phasianellus* var. *columbianus*) was found in all the river bottoms and throughout the Hills; and the western ruffed grouse, (*Bonasa umbellus* var. *umbelloides*) was also abundant among the mountains. Plovers, sandpipers, curlews, cranes and rails in good numbers bring the catalogue down to the geese and ducks, which were numerous late in August on the streams and lakes. The three mergansers, the ring-billed gull, loon and horned grebe complete a valuable and very pleasantly written list of the birds west of Fort Lincoln.

REMARKABLE SUCCESS IN TAMING WOODCOCKS.—It has heretofore been found extremely difficult, in fact apparently impossible, to keep woodcocks long alive in confinement, although they have frequently been captured, and have seemed to become tame. A letter upon this subject from T. R. W., of New Brunswick, N. J., is therefore of great interest. He describes a case where several of these birds had been brought up from the nest by a farmer, and had become well domesticated. These birds (four in number) their owner said he had found in a nest and brought home with him, not expecting that they would live. But he found that by holding worms before their bills they would swallow them, although they would not pick them off the ground. In a few days they became very tame, and as they grew older and acquired their full plumage, they would take short flights about the farm, but always returning to the house and roosting beneath the stone slab forming the kitchen door-step. When the tamer and our informant went into the garden, the birds, attracted by their owner's voice, came hopping out of the brush and flew upon his shoulders, manifesting not the slightest fear, but not permitting his companion to approach them. After taking food from his hand they again flew away. Watching the birds feeding, it was observed that they would rapidly drive their bill into the soft ground, constantly boring until they found their worm; they would then give a peculiar twist, draw it out its full length and gulp the worm down.

HABITS OF THE WHITE PELICAN.—Thomas H. Estey sends us some interesting notes from Nicasio, Marin county, Cal., on the habits of the white pelican (*Pelecanus trachyrhynchus*). These birds are to be seen in immense numbers circling about in long irregular lines, and the question arises as to how they manage to obtain sufficient food, as they do not, like the gray pelican, (*P. fuscus*) dive for it. In the shallow lakes below Sacramento, after alighting in the centre of the lake they spread out in the form of a half-circle, just as a fisherman would fix his seine. After approaching within ten or fifteen yards of the tule, each bird beats the water with its wings until the line has driven all the fish before it into water only a few inches deep. Then a number swim inside the circle and feed, catching the fish easily in the shallows, until they are satisfied, when they fall back to stand guard and others take their places, until the whole flock has had its meal. Mr. Estey says he has many times seen them feed in this way on Mead Lake, twenty-two miles south of Sacramento, where he shot from 1849 to 1861.

—The *American Naturalist*, which has heretofore been published and edited by Prof. F. W. Putnam and Dr. A. S. Packard, Jr., has passed into the hands of H. O. Houghton & Co., of Boston, who will continue its publication. Dr. Packard will remain its editor, and the first number under the new arrangement will be issued in January. It is to be hoped that it will not be so heavy a financial burden to its owners in the future as it has in the past. There seems little hope of making a strictly scientific periodical even self-supporting in the United States at present. "Tis true 't is pity, and pity 't is 't is true."

—We shall begin publishing in the next, or a following number, a series of occasional papers on North American Oology, embracing the latest facts which have been brought to the notice of ornithologists.

IS HYBRIDITY IN DUCKS INCREASING?

EDITOR FOREST AND STREAM:—

Some months ago a friend, who is an ardent sportsman and acute observer, mentioned to me as a remarkable fact, that hybrids among our species of wild ducks were much more frequently met with now than in former years. If it be so, it is not only a remarkable fact, but a most important fact, in its philosophical bearings. Although, *a priori*, from the views I have formed from careful study in other branches of natural history, I am prepared to believe that at the present time, and in past geological time, certain genera have been addicted to 'miscegenation,' a confirmation of such views by careful notice of the progress of the mixture of species can hardly be overestimated in the actual condition of speculative science.

I would, therefore, pray you to ask your correspondents, many of whom are now in active pursuit of water fowl, to transmit to you any opinions they may have formed upon this subject from their past experience. I would also beg that they may send you, for record in your journal, any instances that they may observe of the occurrence of hybrids. Very truly yours,

JOHN L. LE CONTE.

[We feel assured that the appeal of our distinguished correspondent will be heeded by our naturalists, some of whom we know have made hybridism a special study. The question is most interesting, and the facts of increased hybridism, if ascertained, will help to explain how new species are evolved and how certain genera become extinct, and are succeeded by others analogous in their anatomical structure and habits, but distinct in new characteristics.—ED.]

SNOWY OWLS—*Strix Nyctea*.

HARRISBURG, Nov. 29, 1875.

EDITOR FOREST AND STREAM:—

Will you please inform me where the species of large snowy owl (*Strix nyctea*) belongs? One or two have been shot here on the ice two years ago, one of which was prepared and mounted, and is still in the collection of an amateur ornithologist. Saturday, Nov. 27th, a large specimen was again seen on the river front in the vicinity of McClay street, but the say Nimrod who was after it failed to get a shot at it. It crossed over the Susquehanna River to Bunker Hill, on the Cumberland county side of the river. Mr. Reckord, keeper of the toll-gate at Harrisburg Bridge, has a pair of full-grown birds (the common large variety found in all forests in Pennsylvania,) which were captured when very young. They roost among the fowls, but will not attack them. They destroy rats readily.

AUDUBON.

ANSWER.—It is exclusively a northern species. It is met with in the United States only in midwinter, and is much more abundant in some years than in others. Individual specimens have been occasionally noticed, as far south as South Carolina, but very rarely. It has been observed in nearly every part of the United States.—*Coues' North American Birds*.

SCAUPS.

BROOKLINE, Mass., November, 1875.

EDITOR FOREST AND STREAM:—

Speaking of ducks, I am glad to see that one or two of your correspondents speak of the black heads as scaups. Although not a very euphonious name, it could and should be used all over the country, so that a Chesapeake Bay man would understand that his black head was spoken of, a Long Islander his broad bill, and a Westerner his bluebill. This is but one instance out of hundreds which will come before your International Committee on Nomenclature. Yours truly,

F. W. L.

Woodland, Farm and Garden.

ERGOT.

LETTERS recently received from the regions bordering the western slope of the Rocky Mountains, but especially from Idaho, state that a disease has appeared among some of the indigenous grasses that causes animals eating them to be taken seriously ill, and in some cases to lead to their death. It has, in a few instances, attacked fields of rye and barley also, with destructive effect. Its presence is the cause of much trouble to the farmers, as they do not understand its nature, nor do they know even what it is. Judging from the description given of its results, it seems to me to be ergot, as the first plants that it attacked were the rye, brome and festucca grasses, the species to which it seems most attached, and these are the most abundant in that section.

If it is ergot, the fact can be readily learned by examining the seeds of the grains and grasses on which it appears, for it is much larger than the normal seed, and more corneous or horn-like in composition. The outer portion is scaly and seamed with cracks that expose the inner surface; and it varies in hue from a purplish black on the exterior to a whitish or purple on the inside; the latter portion being very compact in appearance. It contains a very large proportionate quantity of oil composed of oleic and palmitic acid, with a small quantity of butyric and acetic acid, and some glycerine. This oil has a peculiar odor, and an inky taste; its ordinary color is a brownish-yellow, the coloring being produced by ergotine and ammonia. The origin of ergot has been clearly proved, and it is now known to be a parasitic fungus. In a few days after it attacks plants it exudes from between the glumes, and enveloping the whole seed prevents it from attaining scarcely any size by excluding the air and spreading its penetrating, choking oils over the whole surface.

As each ergot cell has the power of free germination, it takes only a short time to ergot an entire field, or even a neighborhood, especially if rye or the grasses mentioned above are abundant. It frequently attacks barley and wheat, but the latter is less subject to its attention than any of the cereals, and if care were used by farmers it might be checked entirely in many instances. Ergot can be propagated in two ways, that is, either by the spores of the matured fungus, produced by the ergot, or by the spores of its earlier life when in a sphaceliate condition. When the ergot falls to the ground in the harvest season it lies dormant during the Winter, but as soon as the bright, vivifying rays of Spring appear, it sends forth its contents, and the result is a large crop of the perfect parasitic fungus. As it does not ripen until the cereals and grasses are in bloom, it can fasten on the flowers immediately through the action of wind and rain, which carry it about in showers large enough to spread over an extensive area of country. Even if a small portion of the parasite obtained a foothold amongst grain or grass, its power of free germination—for every spore acts as a producing pod—would scatter it over the country in one or two seasons. When the fungus attacks a field of cereals no power can remove it, as it would be an extremely difficult matter to select the grain which it assails, and even if it were found, it would be impossible to pick it, owing to its extensive range. The first effort of the farmer who desires exemption from its pestilential presence should be to secure perfectly clean seed, if he is planting cereals, and this he can readily tell by its freedom from dark or brownish spots. Although this will not always save his crops, as the ergot may be imbedded in the grasses that skirt the fields, yet it will aid him materially, and he will have the satisfaction of knowing that he exercises proper discrimination in preventing its presence. If the grasses bearing it were carefully cut down, so as not to let it fall on the ground, the grain crop would be assured; but wherever it appears one year, care should be taken that the same field is not cultivated the following, as it would be only a waste of time and money. By noticing the condition of the graminæ and cereals early in the season, the presence of the fungus will be detected, and by keeping cattle from them the farmer will save his stock, for if they eat of it they will assuredly be attacked by a gangrenous disease that may cause their death. Even persons eating ergotted grain are liable to the same malady, hence prudence would dictate that its appearance among cereals be carefully noted.

The grasses which it seeks are the brome, festucca, conch, rye, barley, and timothy, and one or two other varieties; but as few of the higher graminæ, which it seldom visits, grow wild in the Rocky Mountain district, especially on its western border, the stock-raisers of that region should note the appearance of their cattle, and when they find cows and mares suffering from abortive births, or gangrenous diseases, they should drive them to some other grazing fields, as it is evident that they are suffering from the effects of ergot.

It may be possible that the disease from which the cereals in Idaho suffer, is bunt or pepper-brand, but from its effect on animals, I should deduce that it was the deathly fungus, and to get rid of that, no way is known except the exercise of the precautions given.

J. M. MURPHY.

A WORD FOR THE HORSE.

EDITOR FOREST AND STREAM:—

Will you let us give you an article on horses? Much has been written and said in their praise, but can we overestimate them? We say, no. A horse is the noblest beast upon earth. We fancy some friend who dotes upon his beautiful dog will say, "Hold! You must except the canine race. Our setters, pointers, shaggy Newfoundland, and even the tiny black and tan, are not they all equal to the horse in intelligence?" We are a dear lover of dogs, and consider some of them almost marvels of intelligence, but the horse, in nobility, certainly excels. The Book of Books speaks everywhere of the former in terms of contempt, but listen to the glowing description Job gives of the war horse: "Hast thou given the horse strength? Hast thou clothed his neck with thanks? Canst thou make him afraid as a grasshopper: the glory of his nostrils is terrible. He paweth in the valley and rejoiceth in his strength. He goeth on to meet armed men. He mocketh at fear, and is not affrighted; neither turneth he back from the sword. The quiver rattleth against him, the glittering spear and the shield. He swalloweth the ground with fierceness and rage; neither believeth he that it is the sound of the trumpet. He saith among the trumpets, 'Ha, ha!' and he smelleth the battle afar off, the thunder of the captains, and the shouting." Among the Orientals the dogs ran in troops, hungry and without owners, but the horse has always been held in high esteem. We know people who have a great antipathy to dogs, but have never known a person who really disliked the horse. Many fear him, and he is certainly "a vain thing for safety," but oh! how many cherish a strong affection for him. We know a gentleman who has had great success in training horses and have noticed his mode of management. It is firmness mingled with kindness. His love for this animal is almost intense, and he believes that its intelligence is but little inferior to man's. He helps the beast over hard places by speaking persuasively and in a reasoning tone to it; tells it of the necessity of the case, and that he loves it, and will do all he can to aid in the matter. When the animal will not yield to kindly treatment it is whipped, not because the master loses his patience, but because he is obliged to conquer the stubborn will; and it is wonderful to see the effect of his very voice upon a horse accustomed to its sound. "Three years ago when the epizootic prevailed this friend had the misfortune to lose a beautiful horse that he had trained from colthood upward. 'Ah!' said the mournful man, 'to me this is losing a friend, and he was my friend; we understood and loved one another;' and the tears trickled down his cheeks as he spoke to tell the sincerity of his grief. The horse to which we refer was of choice breed, a sorrel in color, with a handsome head, clear, bright eye, which seemed to speak of knowledge, an arched neck, and graceful form. He was a great favorite, and was taught many curious tricks, such as taking off his master's hat with his teeth and replacing it again, shaking hands, following a person round and round in a ring, and other tricks. He was raised on a farm, and many a time when a colt has been walked into the large farm kitchen, helped himself to some bread from the table, lifted the cover from the boiling pot upon the stove, and then walked out again, not at all disturbed by the commotion he had created. When driven before any sort of vehicle he was lively and pleased to go, but has been known to stop and stand stock still in the road because his master was eating an apple behind him, and no urging would induce him to start on until he was given a piece of the same. This is no fiction, but a fact.

The horse, as well as the dog, is a social animal. He loves company, is fond of his own kind, but will associate with other brutes rather than be alone. One poor old beast who was kept because of its former usefulness, would anxiously watch when the other horses were driven away, and trot joyfully to meet them when they espied them returning. The memory and affection of the horse are very strong. Our own dear father told me of a friend, who has since visited us, driving the said horse. It is curious to see the delight of this animal when brought to his old home, and also curious to observe his memory. He knows the old stable, the pasture, the spring where he has been wont to slake his thirst, the tall oak under which he used to stand, and even distinctly remembers the road to and from church. He needs no guiding, but takes the right turns without hesitating or making a mistake. That the horse is a faithful steed is a well-established fact, and when we see the great, strong, beautiful creature bending his neck to the burden we are often touched to the heart. There are, it is true, what we call balky horses, but how few they are; the many will try and toil with a faithfulness and perseverance that is wonderful to see. Tramp, tramp, tramp, go their iron-shod feet over the hard roads. If well kept, they are grateful; if ill kept, they are uncomplaining; and many a poor, faithful beast suffers martyrdom from starvation and neglect. Great men of all ages have had their favorite steeds, which goes to prove that the horse is worthy of love and esteem. Let us give this beast his due of praise and love. Feed him well, caress him (for he is very fond of caresses), and tenderly care for him, for "he is worthy for whom we should do this." A. D. W.

FOND OF HORSES.—The Contra Costa Cal., *News* tells the following: "Little Charley Van Anden, who is not quite three years old, resides in San Francisco, and is occasionally brought to Pacheco on a visit. He betrays an extraordinary fondness for horses, and when at home can hardly be kept away from them, where he plays with a pet horse without fear, and, as it seems, without danger. He delights in crawling beneath the horse and between his legs, while the animal moves only his head and extends his legs as he watches the child's gambols. Charley was in the stable the other day and tottled off surreptitiously. When his absence was discovered he was sought for in alarm, and as finally found in a stable stall with an unbroken and truly colt. The child had fastened a short rope around a leg of the colt, and when found was 'playing hoss' with the utmost glee. 'I wouldn't have tried that trick for 100,' said the hostler. 'If it wasn't a baby that did it he'd have been kicked to death, sure.' Well, now, it does seem if horses, like dogs and good-hearted men, are fond of children."

—A surgical examination of the body of Lexington, the Kentucky race horse, has disclosed a singular cause of his death. That part of the skull under the left eye, where the ailment of the animal seemed to be, was filled with at least a quart of masticated food, which had been forced into the cavity through an opening in the upper jaw, caused by the loss of a tooth.

INDIAN SUMMER.—The question arises, "What is Indian summer?" The Rev. John Lyon has expressed himself on the subject as follows:—"The leaves generally begin to fall in October, after the first frost, and continue to so during the month. Then very generally, when all the leaves have fallen, there comes a cold rain and a bitter frost, fermentation and decomposition of vegetation. Great heat is produced by decomposition, which adds warmth to the earth, causing that warm, misty atmosphere which continues until nearly the end of November. And it is during this warm spell in November that tradition says, in this latitude, the Indians laid up their corn for the Win-

The Kennel.

SETTERS, POINTERS AND SPANIELS.

IN regard to the relative merits of setters, pointers and spaniels for ruffed grouse and woodcock shooting, we can say, that many years ago, while residing at Trenton, N. J., where game was very abundant and we were doing much shooting, we secured a brace of thoroughbred cocker spaniel pups of a choice strain, from the kennel of the late Samuel Forman, Esq., of Philadelphia, a gentleman who gave more attention to the importation, breeding and breaking of such dogs than any one in his day. Those pups we raised with the greatest care, and broke them merely with the view of ascertaining practically their usefulness.

The opinion we then formed, after a full and fair trial, and which we still retain, is, that for ruffed grouse and woodcock shooting no variety of spaniel is to be compared with a good, steady, well broken setter or pointer. The only places we found where our spaniels were better than setters was in coverts where the shooter could not follow his dog. A properly broken setter will do anything in the way of hunting that any spaniel will do, except giving tongue when the game rises; but we consider that the pointing of the setter is far more important and satisfactory to the shooter than the noise of the bark, and then, the setter being much the stronger dog, will do much more hard work.

For those persons who reside in a section of the country where impenetrable "thickets" abound, a strong, well broken spaniel is an exceedingly useful dog to have; and then again, for those who use dogs to tree ruffed grouse and shoot them sitting, a spaniel would be the best dog for the purpose—but it has always been a question with us if such a shooter will reach the "Happy Hunting Ground." We cannot agree with our correspondent below that the spaniel is the coming dog for this country.

NEW YORK, Nov. 22, 1875.

EDITOR FOREST AND STREAM:—

My experiences in shooting this Autumn have confirmed me in the opinion that, for covert shooting in the Middle and Eastern States, where the undergrowth is usually thick and often very briary, we require a dog more of the spaniel breed, or better still, a cross of the spaniel and setter. I think that "Viatores," (in your issue of 4th inst.) is correct in his remarks concerning the employment of clumber or Sussex spaniels in ruffed grouse, woodcock, and all covert shooting. Unless very well kept in hand, which can only be maintained by daily training in the field, a setter ranges too widely and fast and puts up the birds too far off, while a slower dog with a good nose, as the cross above would have, can be kept working nearer the gun without so much exercise of restraint and command, and thus leave the sportsman more at liberty to use his own eyes and ears. This is especially the case with ruffed grouse, who take alarm so easily and get up so far off; so that sometimes in partridge shooting I would almost prefer to walk the birds up myself, reserving the dog for retrieving, etc. I am persuaded by what I hear from brother sportsmen that the spaniel, or a cross between clumber and Sussex spaniels and the setter, is the "coming" dog. In regard to snaring birds in Connecticut, can't it be stopped? It is bad enough anywhere, but in that State it is becoming more and more prevalent and unendurable, and is openly practiced. I think you are wrong in the use of glue or mullage over wads in cartridges. The heat of the discharge melts the gum or glue, and thus fouls the barrels with stickiness as well as accumulation from the powder.

MANHATTAN.

BISMARCK.—We noticed recently the death of this well-known dog, through the carelessness of the Express company who were transporting him from the West. The first of the series of suits likely to arise from the loss was decided in Philadelphia a few days since, it having been brought by the Society for Prevention of Cruelty to Animals against Jacob Brailer, the messenger who had the dogs in charge. The result was that Brailer was fined \$10 in each instance and costs, making in all \$25. This decision is important, and indicates that Mr. Brooks will have no difficulty in recovering the value of his dogs. We understand that the Express company tendered him the amount of freight paid at the point of shipment, which he very properly declined. This is a case in which all sportsmen are interested, and Mr. Brooks has the sympathy and warm support of the entire fraternity.

HOW TO FEED DOGS.

WEST TROY, N. Y., November 26th, 1875.

EDITOR FOREST AND STREAM:—

Being greatly interested in reading anything pertaining to the care and comfort of sporting dogs, and believing much good comes from the suggestions of different persons of experience, if in order I will give your readers my way of feeding, both in and out of season.

We all know vegetables are a healthy diet when mixed with something more substantial. Out of season I feed exclusively potatoes, carrots and cornmeal of following proportions: I take an iron pot and put in about three gallons of water and a little salt, cut up six large potatoes and one large carrot, set the pot on the stove until the potatoes and carrots are well boiled; then take them out and mash them, put them back in the pot, and while boiling stir in enough coarse meal to make it stiff; then set aside (uncovered) to cool. Feed once a day, at night, all they will eat. Dogs are very fond of it, and it costs but two cents a day for a good feeder.

In season, when hunting every day, get a beef's head, put it in a large tin kettle with a little salt, and let boil until the flesh falls from the bone and to pieces; then stir in cornmeal until stiff. Feed at night, after day's work.

I learned this from an old sportsman, an Englishman, with whom I have traveled many a hundred miles, and made many a handsome bag. This was years ago, when I had no home of my own and a family of young sportsmen growing up. I used to leave my traps at his house, and his kind lady used to do the cooking for his own and my dogs, and never failed to have it ready for them upon our return at night after a day's tramp. I always see my dog attended to before myself. A good way to get dogs in condition for work, is to commence about two weeks before season and give them a run each day behind a wagon on a hard road, and also exercise them in a newly cut field; this toughens their feet and fits them for field work. The reason of so many dogs giving out is, their feet become sore by being soft, the pads wear down thin, and the grass cuts them between the toes. If taken in a stubble field for exercise, they soon become tough. If their feet should become tender, wash them each night with brine and old beer.

If your dog should show lameness in either foot, look thoroughly for a thorn. I have taken them frequently from my dog's feet an inch long after hunting for it a long time, in consequence of being broken off close to the pad and difficult to discover. Attend well to these matters, and I assure you no human being would appreciate the kindness more than your canine friend. Yours truly, J. H. FITCHET.

—We are in receipt of a line from Mr. F. W. Lawrence of Brookline, Mass., owner of the famous setter, "Flip," who secured the FOREST AND STREAM Cup at the Springfield Bench Show, saying that he has kept a brace of orange and white pups by Flip, out of Kate, a very fine, high bred setter, both from the kennel of our Field Editor, and that the youngsters are very beautiful and promise to be equal to their illustrious predecessors.

—The "Squire" indignantly denies that the pup mentioned in the following paragraph was an offshoot of his kennel:—

"A Covington lady desired a setter pup. Her husband bought her one and she named it Ed. Ed has been at the lady's house just two weeks. Up to this time he has killed nine chickens, chewed up one mattress, carried off two pairs of shoes, and destroyed one parasol and two pairs of stockings. The pup has also run every cat from the place and eat the pig's tail off, besides poking its mouth into every dish and plate of eatables which has been cooked on the place. No eggs have been found since the first day the dog arrived. In a month Edward will be large enough to kill sheep, and then the good lady will have a few hours of peace."

KENNEL PRODUCE.—Dr. Webb's black and white pointer, Whisky, whose portrait and pedigree were published in our last issue, whelped on the 27th inst., the produce being four dogs and two gyps, sired by Mr. Schuchardt's Jim. Four of the puppies are marked like the mother, and two are dark liver-colored.

Game Bag and Gun.

GAME IN SEASON IN DECEMBER.

Moose, <i>Alce Americus</i> .	Wild Turkey, <i>Meleagris gallopavo</i> .
Elk or Wapiti, <i>Cervus Canadensis</i> .	Ruffed Grouse, <i>Bonasa umbellus</i> .
Red Deer, <i>Cervus Virginianus</i> .	Pinnated Grouse, <i>Cupidonia cupido</i> .
Caribou, <i>Rangifer caribou</i> .	Quail, <i>Ortyx Virginianus</i> .
Hares, <i>Leporine</i> .	Wild Ducks, <i>Anatine</i> .

GAME IN MARKET.—The cold snap is apt to bring game to this market in abundance, and the effects are already noticed in increased receipts of Western quail. Ducks are being received in vast numbers from the Chesapeake and Currituck regions, and from Long Island, and prices have been materially reduced. Our quotations are:—Ruffed grouse (partridges), \$1 25 per pair; pinnated grouse (prairie chickens), \$1 25; quail, \$2 75 for Western birds, and \$3 25 per dozen for State; no English snipe, and only refrigerated woodcock in market. Canvas back ducks are worth \$1 75 to \$2 per pair; red heads, \$1 to \$1 25; mallard, 85c. to \$1 per pair; black ducks, 75c. to \$1; teal, 75c. to \$1; brant, \$1 25; wild geese, 50c. to \$1 each; rabbits, 55c. to 60c. per pair; gray squirrels very abundant at 10c. to 12½c. each; venison, 30c. per pound for steak, and 15c. to 20c. for carcasses.

—Canada is frozen solid from end to end; navigation wholly ceased last week. Snow lies several feet deep in many parts, and pot hunters are having lively times among the "yards." While the open season continues, venison is likely to be cheap and abundant. The only practicable locomotion is on snow shoes. Bird shooting is essentially over, and unless Venator goes to Florida his occupation is gone. Among our correspondents who have recently returned from the hunting grounds are Messrs. Colin Campbell and Rutherford Stuyvesant. The latter gentleman is owner of the beautiful yacht *Palmer*, and, while at home on the ocean brine, is not the less a backwoodsman for all that. He is one of the most thorough and persevering hunters we know of. He spent some portions of the angling season at the Bay of Islands and other localities in Newfoundland, catching salmon and sea trout, and has but now returned from the Megantic district of Canada, which lies back of the Northern Vermont and New Hampshire boundary lines. He has much to say of illicit and unseasonable hunting in that section, which, however, is not as fruitful in game as he had expected to find it from hearsay. Mr. Campbell is also a "thoroughbred." He is interested in some mines on the north shore of Lake Superior, in the Nepigon region, and came through the Sault Ste Marie just in time to escape the nipping ice. We are indebted to him for a bunch of ruffed grouse and several pounds of dried venison, prepared by the Indians on Lake Huron. This meat is cut down the grain, so as to keep the natural juices in, and then cured by being dried on basswood poles laid over a fire. It is very nice provender when one is starving and cannot get anything else to eat.

Snow lies deep in the northern part of New York State and in New England. We can predicate an unusually severe Winter upon the very large number of Arctic or snowy owls that have been seen and captured lately in low latitudes. The weather up north is too severe for them, destroying the game they feed on and compelling them to come south for comfort and subsistence.

—Major H. W. Merrill, of New Rochelle, has just returned from Illinois, Wisconsin, and Northern Michigan, where he committed fair havoc among the ducks and black squirrels. The Major is convinced that there are black squirrels in Illinois.

—Mr. Emlen Cresson, of Philadelphia, who was accidentally shot recently by a companion, will soon recover, it is said. The result was from gross carelessness. We sincerely hope for a speedy restoration.

—It is asserted that more geese have been shot this season in the Great South Bay, Long Island, than during any season for ten years past.

—Our correspondent, Fred Pond, of Montello, Wisconsin, regrets that the lakes and streams in his section froze so suddenly as to prevent his sending the editor of *FOREST AND STREAM* a goodly bunch of ducks, as he had desired. If warmth of good feeling and earnestness of purpose on our friend's part had prevailed, the water would have remained open to this day. There shall be no coldness between us on account of this disappointment, that is certain.

—The loudest complaints of scarcity of quail seem to come from those who do not know where to go, or, having found the right locality, do not know how to find the game or point their guns when found. Gunners who have visited Chesapeake or Delaware Bay have brought back lots of ducks, while big bags of quail repay the visitor to Maryland and Virginia.

—Daniel W. Lindsay, Esq., is now in charge of the hotel at Poplar Branch, Currituck county, N. C., and is prepared to entertain duck shooters, having live decoys and every appliance that may be required. This house was formerly leased by a Boston club. The marshes afford some of the best shooting on the Sound, and join the premises of the old Currituck Club.

—We believe that W. H. Holabird, of Valparaiso, Indiana, was the first to introduce the water-proof linen shooting suits to the notice of sportsmen. Since he began to advertise in *FOREST AND STREAM*, his business has rapidly increased until he can scarcely supply his orders. Those who once use these garments will not be satisfied to take the field without them.

—In reply to several inquiries put to us respecting the Connecticut Lakes that lie in the extreme northern border of New Hampshire and Connecticut River, we say: To reach these lakes, take Grand Trunk Railroad to North Stratford station, stage to Colebrook, and wagon twenty-six miles further. Second Lake is the largest, being about three miles long by a mile wide. It lies four miles from First Lake. There is a good bark shanty there. Third Lake is still two or three miles further. One correspondent says:—

"Game of various kinds is abundant in this region. Moose are numerous in some localities, and deer without number range the hillsides. Some of their runs are beaten hard. Also otter, mink and sable are in such numbers that the trapper gets well paid for his time and labor. The lumbering business has not been carried on in this locality, consequently it is the paradise of hunters and trappers. We made this delightful place our home for ten days, and succeeded in capturing about four hundred speckled beauties, from one-fourth of a pound to two pounds in weight. I think we could have caught as many more, if we had given more time to fishing."

We have printed one or two sketches in previous numbers of our paper giving much information of this section. Besides the Connecticut Lakes, there is the Unknown Pond, near Stewartstown, N. H., at the head of Diamond River, which empties into the Megalloway, reached by wagon from Colebrook. These waters are filled with trout.

NEW YORK—Schroon Lake, Essex county, Nov. 26th.—This charming locality seems to be rising into prominence, not only as a beautiful Summer resort within striking distance of the grand Adirondacks, but as a very fruitful sporting territory. Deer hunting is all the rage at this time. In fact, deer have not been so plentiful about here for several years, and no doubt there will be a rejoicing among them on the 1st of next month, as the law will then protect them from the unerring rifles of such sportsmen as Capt. Russell, George Pardo, George Wickham, and others. For the benefit of those who are victims of that distressing malady, hay fever, I would call attention to the fact that a few weeks sojourn in the season in this section invariably proves an infallible remedy that disorder. Ye who are thus afflicted will wisely make a note of this. The hotels of Schroon Lake are exceptionally excellent. The island and the Ondawa are admirable establishments, of whose superior accommodations and management any town in the State might be proud. Besides their charges are hardly half as high as those of the perhaps more fashionable, but certainly less desirable watering places.

THE ADIRONDACKS.—Mr. Frank Bolles of Springfield, has favored us with a letter from C. Fenton, Esq., residing at "Number Four," Lewis county, N. Y., which states that "the ground in that region has been covered with snow since the 30th of October. I think that this is the earliest Winter I ever knew. It has been so cold that the leaves on the ground under the snow have been so frozen that there has not been any still hunting, save one day, and that was last Friday. It thawed that day, causing the snow to fall from the trees, and I thought I would see if I could find a deer. After hunting some time I came upon a large doe and two fawns. I could only see the legs of the doe, while the body was entirely hidden by spruce brush. I took aim and fired through the brush, but missed her. At the report of my rifle one of the fawns jumped out in full view and halted. I turned the second barrel upon the fawn and killed it. The doe now walked out from behind the bush and halted. Oh! how I wanted another charge in my rifle. I fell to loading with all possible speed, casting covetous glances at her splendid proportions meanwhile. All is ready but capping, and still she stood; five seconds more and she would have been a dead doe, but as I was bringing my rifle to my shoulder she raised her flag and darted off into the woods. I followed her for two hours, but it was of no avail, so I had to be satisfied with my fawn."

NEW YORK—Pen Yan, Nov. 26th.—But comparatively few ruffed grouse and woodcock have been bagged by us in Yates county so far this season. They don't seem to be here. Of quail there is a pretty fair show. A good many black and gray squirrels have been killed. Everybody shoots them.

Sayville, L. I., Nov. 20.—Wild fowl were never more plentiful in our bay than during this Fall, and battery shooting has been very good, considering the weather. Some visitors, however, have carried away from forty to

seventy birds. My bag for the last few days has been—18th, 9 broadbills, 1 grouse, 3 old-wives; 19th, 10 quail; 20th, 7 broadbills, 2 sheldrakes, 5 trout and 1 whistler. Expenses, board, one dollar per day, battery and decoys with man, eight dollars; for two batteries with two men, twelve dollars.

MASSACHUSETTS—Salem, November 27th.—Since my last week's report I have shot both whistlers and dippers, so that the Winter quota of the fauna of our coast is about full. Geese are going by us, off an on. Grouse and quail are shot occasionally.

NEW JERSEY—Kinsey's Ashley House, Barnegat Inlet, November 27th, 1875.—Brant, geese, and black ducks never more plenty. Quite a number of broad bills, but they decoy poorly. The score for the week ending the 27th footed up 71 brant, 24 geese, and 32 ducks.

PENNSYLVANIA—Harrisburg, Nov. 26th.—Two well known gunners returned from a gunning excursion up the Cumberland Valley Railroad yesterday with sixty-seven quail and three rabbits, the result of one fair day's shooting. They captured a covey of forty-five birds on one farm. Deer are not as plenty in Clinton county. John Tyson has captured three bears on Shade Mountain, near Mifflintown this year. A wild cat five feet long was killed near Titusville a few days ago.

WISCONSIN—Montello, November 26th, 1875.—Duck shooting is now over. The rivers and lakes are frozen, and the few ducks still with us linger around the spring holes and water channels. Before, or rather just after the first hard freeze, which closed up Puckaway Lake, excellent shooting was enjoyed for a few days in the open river, and one gunner killed seventy-five ducks, mostly canvas backs and mallards. Deer hunting is fine in Northern Wisconsin, and a few sportsmen are now enjoying the manly pastime.

TEXAS—Gainesville, Nov. 22d.—A. E. Dodson, of the Gazette, has just returned to town from a trip to the buffalo range. Two others accompanied him with a wagon. They were gone ten days, killed four buffalo and many turkeys. Capt. Rowland and a large party are now in the Indian Territory after deer. I learn from a gentleman who was with them two days that they killed thirty deer in that time. We who are left behind have to content ourselves with quail, pinnated grouse, and an occasional turkey.

MISSOURI—Jefferson City, Nov. 20th.—Game scarce here; quail small, all late broods. Several flocks of turkeys in this vicinity. Ducks will not stop with us this Fall, I think—at least they have not so far; not much venison brought in yet, but what we have has been very fat.

PIGEON SHOOTING.—A couple of marches were shot on Ira Paine's grounds on Thanksgiving day. The first, between Capt. Nat Clark, the well known sailing master of the yacht Magic, and Sol Saxton, resulted as follows:—

Saxon..... 1 1 1 1 1 0 1 0 1 1 1—19
Clark..... 1 0 1 0 1 1 0 1 0 0 1—6

The match was for \$25 a side, the winner to pay for the birds. There were sixteen birds killed, and Mr. Paine's bill for birds was just sixteen dollars. If the men had tied and it had taken about ten more birds to shoot the tie off, how many dollars would the winner be to the good? The second event was a sweepstakes match, won by Mr. Jones, who killed five birds without a miss. The Babylonians were on hand in force, and many carried home reminiscences of the event in the shape of shot pellets in various portions of their anatomy.

The members of the Long Island Shooting Association held the monthly contest for their challenge cup on the same day, with the following result: There were fifteen entries, to shoot at seven birds each, with twenty-five yards rise. Following is the score: Wingate, 7; Wynne, 2; Hartshorne, 4; Posten, 3; Van Buren, 6; Eddy, 5; Ridden, 7; Captain, withdrew; Fendick, withdrew; Bayliss, 4; Gildersleeve, 3; Walton, 3; Stauffeld, 1; Aten, 2; Parks, withdrew. The tie between Wingate and Ridden was then shot off, each shooting at three birds. The former killed one, the latter won the cup, securing two. Some sweep-stake matches, participated in by nearly all the members, followed, the shooting in which was much better than that for the cup.

EDITOR FOREST AND STREAM:—

On the 18th inst. a few sports indulged in a trap shoot here under the New York State rules—21 yards rise, 80 yards boundary, 1½ ounces shot. This was the result:—

Sheldon..... 13 out of 14 Slayton..... 7 out of 10
Smith..... 4 out of 14 Amadon..... 5 out of 10
Gilbert..... 9 out of 12 Conklin..... 4 out of 10

Also on the 11th of last month the same sort of a performance was done here with the following result, ten birds being shot at:—

Pratt..... 9 Conklin..... 5
Smith..... 8 Tompkins..... 5
Sheldon..... 7 Elmendorf..... 4
Gilbert..... 6 Wyckoff..... 6
Capell..... 5

EDITOR FOREST AND STREAM:—

On the 19th our quarterly match came off at this place. It was a club affair, and for the club badge, a gold medal with appropriate engravings. Everything was as pleasant and enjoyable as could be, with exception of the weather, it being very cloudy, and most of the time a misty rain falling. All was in readiness at two o'clock promptly at Major John R. Viley's, about three miles from the city, (and in whose honor the club is named.) The contestants and their scores are as follows:—

F. W. Woolley..... 6 D. Knoble, Jr..... 5
S. W. McChesney..... 7 C. W. Bradley..... 6
H. P. Kinkead..... 4 C. Y. Peck..... 5
C. M. Johnson..... 3 J. W. Headley..... 2
R. Gilmore..... 3 Thos. Martin..... 8
J. H. Davidson..... 1

Mr. Thos. Martin won the badge. The event of the day was a leather medal, to be awarded to the most humane shot (according to Bergh.) and was tied for by your humble and Mr. C. Y. Peck, who would have it and did get it, missing his first bird in the tie. Our judges were Messrs. A. G. Morgan and Major Joel Higgins; referee, Dr. B. W. Dudley, (all of the Hunters' Club,) and to them the thanks of the Vileys are due—with "hats off"—for the very satisfactory manner in which they discharged their duties. Mr. J. T. Viley and Dr. T. J. Clay acted as scorers. If all our meetings are as pleasant as this one the club will be a success.

Yours respectfully, R. GILMORE, Secretary.

MARSHALLTOWN, Marshall county, Iowa, Nov. 23, 1875.

EDITOR FOREST AND STREAM:—

A pigeon match took place this afternoon on our Fair Ground, the participants being members of our club. The weather was not favorable, being dark and cloudy. Birds "strong flyers." The following in the score:—

H. P. Williams..... 4 Perry Woodruff..... 6
J. T. Blackburn..... 7 S. L. Smith..... 6
Wm. Mason..... 8 JOHN T. BLACKBURN.

"GLOAN" ON CHOKE BORES.

EDITOR FOREST AND STREAM:—

You are entirely correct in stating that the "Roper gun" was the first public application of the choke bore system in this country during the last twenty-five years. The plan, however, was known to local gunsmiths here for years before the Roper. Soldering a rim of lead inside the muzzle and beating in the muzzle itself were temporary equivalents resorted to by the early shooters of the West, and marvelous tales are told of the performances of their guns.

Mr. Pape claims to have invented it, and the *Field* awarded him a prize for the invention. He was not entitled to it, and the paper afterward excused itself by saying he was the only claimant in England. Pape says he invented it and practiced it years before the *Field* gun trial, and offered to produce guns bored by him then on that plan. He abandoned it, not because of its superlative shooting, but because he did not consider it fit for the field. I notice three things in this connection—first that the gentlemen to whom he says he sold these early guns have never testified over their own signatures nor produced the guns for inspection; second, that albeit he must have had confidence in the system when he was using it, he never used it when he was competing for the gun trial. He had everything at stake there which a man can possibly have at stake, and it will not be believed that he forbore at that time to shoot a choked gun when fame and fortune waited on its use; third, although he says that the choke bores which he made and sold so many years ago are still extant, and did then and will now beat Greener's winners at the last *Field* trial, yet no gunmaker in England ever heard till lately that Pape was boring extraordinary shooting guns, nor did any owner of one of them ever make known the fact that he possessed a gun better than the ordinary run of guns in those days. Every man who knows anything of English sporting matters knows that every gun which is an unusually good one immediately acquires a reputation all over the island, and is deemed a treasure by the owner. The fact in regard to the introduction of the choke bore in England is precisely as stated in the article from the *Illustrated Sporting and Dramatic News* which you quote, and that is, Mr. Dougall introduced it there.

In the Fall of 1872 I saw a Roper used daily for weeks, and witnessed its incredible shooting at long ranges. As the sudden contraction of the cup piece screwed on at the end of the muzzle seemed to me to be in defiance of all theories of shooting, I wrote to Mr. Dougall in regard to it. In the Spring of 1873 Mr. Dougall was in this country, and we discussed the question in every aspect. Upon his return he set about making those experiments which are referred to by the editor of the *News*. From time to time he wrote me in regard to his progress, as embodied in a gun which he was then building for me—a gun which, by the way, has exceeded all that was done by the winner of the last trial. This gun was the first one which Mr. Dougall turned out with his "modified choke." As the editor of the *News*, "Mr. Dougall, like a sensible man, had found out when the 'choke bore,' pure and simple, was a failure, i. e., 'balled' or 'clubbed' the shot on the target, and he developed the system into the modified choke bore." Those who are aware of my views, as published frequently, are aware that I am opposed to excessive choke boring. We are running to excess on that point, and while the *Field* trial has served to make it fashionable, and while the winner of the trial will make a fortune from it, yet there will come a necessary reaction for field guns. Then the "modified choke" of Mr. Dougall, which retains all the virtues of the new system and discards all its vices, will be properly appreciated, and as Mr. Dougall has not patented it but left it free to all, it is not too much to predict that it will be generally adopted in both countries.

GLOAN.
We are glad to find that the stand we have taken on this question is endorsed by so eminent an authority as our correspondent above. We shall keep our readers posted on the choke bore question, and report its progress, whether retrograde or advance, from time to time.—Ed.

TO FASTEN WADS IN PAPER SHELLS.

SARATOGA SPRINGS, N. Y., Nov. 19, 1875.

EDITOR FOREST AND STREAM:—

In your issue of the 11th I notice that a correspondent asks how he can keep the wad over the shot (in shells for breech loaders) from falling out. I use a kind of punch which tears small holes in the paper of the shell, and the small pieces of paper hold the wad. If your correspondent would go or write to J. & W. Tolley, Maiden Lane, he could get exactly what he wanted. I am very sure that he could get the punch from any gun dealer or sporting goods house.

MEASUREMENT FOR TIME ALLOWANCE.—We noticed in our last issue the formation in England of a Yacht Racing Association, the object of which is to adopt a universal code of regulations, and to place all yacht racing under the jurisdiction of a committee, which shall exercise the same powers as those devolving upon the committee of the Jockey Club in horse racing. The project appears to meet with much favor, and is likely to prove a success. Many of the leading yacht owners of Great Britain have become members, among whom we find our old antagonist, Mr. James Ashbury, M. P., and most of the owners of prominent racing yachts. There is one rule proposed, however, which seems to us as arbitrary and likely to lead to complications, that is, one causing forfeiture of membership on the part of the yacht sailing in any regattas or matches where the association rules are not in force. We are led to notice this at this time more particularly from the fact that a Centennial International regatta is now under serious consideration, and, if properly managed, likely to be brought to a very satisfactory conclusion. In this event it would be a very serious drawback if English yachts were allowed to compete only at the risk of a loss of membership in their own home association. For an event so very much out of the common a dispensation could probably be procured, and the races might be sailed under regulations of a give and take or meet-me-half-way nature, to be decided upon by those having the matter in charge.

Certainly no better occasion will ever be offered for revising our own standard of time allowance, or for adopting some general system of measurement which shall overcome the numerous objections to the many now in vogue.

In this connection we have been struck with the simplicity and feasibility of the plan advocated by Mr. O. F. Burton in the last issue of "Manning's Yachting Annual." In this plan time allowance is based upon the sum of the dimensions of a yacht, as the disposition of so many lineal feet into length, breadth and depth in the best proportions produces also the greatest capacity for speed and buoyancy, and designers are untrammelled in their efforts to build the best yacht by considerations which require certain proportions in order to obtain the best allowance of time. By Mr. Burton's plan, in measuring for dimensions the extreme length on deck, extreme beam and extreme depth to garboard stroke are taken, leaving keels to offset centreboards. The maximum time in which the race is to be made being given, the difference between that and the time made by the first yacht in is taken as the basis for determining the time allowance of all the yachts. A scale of graduated corresponding with the dimensions of each yacht is used, which, being multiplied by the difference of time as above, reduced to minutes, the product will be the allowance in seconds and decimals for each yacht respectively to be deducted from their actual time. The great advantage of this plan is, that whatever the condition of the wind, the yachts are placed nearer upon an equality; in a calm, where a small yacht would drift as rapidly as the larger one, the smaller vessel gains no undue advantage, nor in a strong breeze would the larger and heavier yacht have the advantage over a smaller vessel in the same class.

With regard to the Centennial regatta, we trust that the direction will be placed in the hands of persons who have the confidence of the yachting community, that no jealousy or bickering may mar its perfect success.

THE SCHUYLKILL EIGHT-OARED RACE.

PHILADELPHIA, NOV. 29, 1875.

EDITOR FOREST AND STREAM:—

The Schuylkill rowists have come to look forward to an eight-oared shell race as a sort of a fixture for Thanksgiving Day, and as these races have without exception been very exciting, their announcement needs but the dawning of a pleasant day to secure a good attendance. The steamer Rockland, which left the Undine's slip at 10:15, had on board the umpire, timekeeper, and a goodly array of guests, among whom I was glad to see Mr. Wm. C. Harris, of the FOREST AND STREAM.

Closely following the steamer were the two crews, who, upon the arrival at Rockland, at once got into line, and were given a splendid send off by the umpire. Before the spectators were hardly aware that the race was begun the boats were "striving mightily" to make the bridge first. It was almost a repetition of the race in the Spring, the Crescents proving themselves the better starters, but they lack stay. The pulling of both crews was better than in the last race, the "time" in the Albion being almost perfect from beginning to end.

THE RACE.

Crescent Boat Club—Eight-oared shell Longfellow; position, east—Geo. Milliken, Jr., (stroke), 145 pounds; O. D. Tatman (2), 155 pounds; H. K. Hinchman (3), 142 pounds; F. W. Lewis (4), 165 pounds; Chas. P. Tasker (5), 144 pounds; H. W. Perry (6), 110 pounds; C. E. Steel (7), 141 pounds; Al. Sperring (8), 153 pounds; coxswain, W. C. Brown, 124 pounds.

Undine Barge Club—Albion—I. M. De Haven (stroke), 154 pounds; J. D. Baker (2), 145 pounds; Wm. C. Allison (3), 158 pounds; B. M. Ewing (4), 173 pounds; De Witt C. Smith (5), 153 pounds; Geo. Bright (6), 151 pounds; W. C. Madeira (7), 147 pounds; P. Heiser (8), 153 pounds; J. Gillingham, coxswain, 135 pounds.

Course—One and a half miles straightaway, from Peter's Island to Turtle Rock. Umpire—Alex. Krumbaar. Timekeeper—W. R. Tucker. Judge—Robt. C. Skinner. Prize—A flag.

The Crescents, as usual, got away first, but the advantage was not great. On nearing Columbia Bridge by a spur they gained a quarter length, and got under the bridge first. The heavy current catching the stern of the Undine boat as it rounded the pier, threw the bow on, and came within a shade of going into the Crescents, but a free use of their rudder saved the foul, although it lost several feet. From here to the Goose Pen the racing was beautiful, Crescents leading, but with a slow but regular and telling stroke. Well backed up by his whole crew, De Haven forced his boat up level, and after passing the rolling mill wharf the Undines without any great effort took the lead. In shooting the Connecting and Guard Bridges the Crescents were forced to row in the wash of the leaders, who were increasing their lead until at the finish the clear water between the boats was about four lengths. Time—Undine, 9 minutes 25½ seconds; Crescent, 9 minutes 43 seconds. **SOULS.**

Billiards.

ALL SORTS.—It has been suggested, in order to avoid the unpleasantness that at present prevails in billiard circles, that in the future all tournaments be decided by the grand average of the players, instead of the highest number of games won. This would be well enough, if the first prize is sufficiently high, and there were no pool boxes in the immediate vicinity.... Slosson is willing to play Sexton for \$500 and back himself.... We are authorized to state that Sexton can be matched for \$500 or \$1,000 against Joseph Dion.... Rudolphe recently, at Dan Strauss', recovered \$175 from Sexton at the three ball game.... After every tournament high-ball has the call at Flynn & Maron's. C. Dion is reported to have won \$1,500 there on the 27th, while Sexton's purse was diminished \$200.... Messrs. Riley & May of the Revere House, Toronto, Canada, are getting up a billiard tournament, to be held in that city next January. The entries are to be confined to players living in Canada, and the winner of the majority of games is to be titled Champion of the Dominion. Money and other prizes are to be given. Mr. Samuel May, the proprietor, is a veteran player, and participated in the first tournament in Canada, held at Music Hall, Toronto, from Nov. 21st to 26th, 1864. He received the second prize, and also that for highest run, among seven contestants.... At the Rudolphe and J. Dion game in the late tourney holders of tickets on Rudolphe, while sitting in their seats awaiting the result of a game which they thought would determine their money, were told that the money was in pockets of the opposite bettors.... John Bessunger of Philadelphia, is playing very strong billiards. He has made several ineffectual attempts to enter into tournaments.... If the charges of collusion made against some of the players in the late tourney are not satisfactorily explained away, billiard tournaments will no longer have their former patronage. We trust the management will rise to explain.... The scarcity of billiard people at the late tourney was particularly noticeable. The professional billiard players are in a position to know the true value of the modern tournaments.... Billiard receptions are again becoming very popular in the City of Churches. In the interest of the fair sex, gentlemen players should give them all the encouragement possible.... Capt. Tom Dean has fully recovered from the effects of his late accident, and exhibits a "star" on the top of his

head as a memento of the parade of the Second Division at Brooklyn. The Dean Brothers threaten the citizens of that city with some new and novel attractions this Winter.... The proposed Boston and Chicago tournaments are yet in embryo. Alderman Tom Foley, of Chicago, and John J. Murphy, of Boston, are the men to take them in hand.... A match between Clarke E. Wilson, of this city, and Ned Bryan, of Providence, is being again agitated. The game to be fifteen-ball pool.... At the opening of the Clifton House Billiard Parlor at Niles, Mich., on Nov. 19th, Wm. Burleigh, Henry Rhines, John Dunncombe, and J. Shafer exhibited their skill with the cue. Burleigh is practicing very assiduously for his coming match with Maggiol.... The veteran player Ralph Benjamin is in quest of some position. He is almost in as good condition physically as when he played his memorable game with the late Michael Phelan for \$2,000 in Philadelphia, Dec. 30th, 1867.... Some of the speediest amateur players in this city may be found nightly at the Columbia Room, corner of Broadway and Twenty-second street, where Sexton presides.

FASHIONS IN FURS.—Sable skin, king of furs many years ago, has become obsolete, and mink, which held sway later, is now but little used. Even ermine, called royal from its high favor with European rulers, rules no longer. Seal is king, and sealskin saccos the most fashionable article of fur for ladies' wear. Saccos are longer than they were, and, although the raw skins are higher in value on account of the great demand, the made up articles are sold at a somewhat lower rate because of the competition in this branch of business, and in view of the depressed state of commerce. The price of seal saccos ranges from \$60 to \$500. Of light colored furs, the silver fox is among popular skins, and the soft gray chinchilla of long ago has been revived. Black silk saccos, lined throughout with the poorer parts of squirrel skins, are worn in Autumn and early Winter, but they are not sufficiently warm or heavy for the freezing and inclement days of midwinter.

—Mr. T. S. Newhouse, of the Oneida Community, a well-known manufacturer of traps, and author of "The Trapper's Guide," is now in Brunswick county, Va., making a raid on the beavers and other fur bearing animals of that region. Mr. Newhouse took a large number of traps down with him, and informed us that he was prepared to trade as well as trap. During the past year he has sold about \$20,000 worth more traps than last, and as many as he ever sent out in any one year previously.

New Publications.

WEST INDIA PICKLES. By W. P. Talboys; G. W. Carleton & Co., New York.

If there is one event more rare than that of a foreign trip by an American yacht owner, it is a readable description of the same by himself or one of his guests. Lord Dufferin's "Letters from High Latitudes" has heretofore held the highest place among narratives of this description, but Mr. Talboys' exceedingly pleasant and readable little book is well worthy to be placed on an equality with the production of the noble Governor of the Canadian Dominion. Most of our home readers are aware that the good schooner yacht Josephine, of the New York Yacht Club, is the property of Mr. Lloyd Phenix. It was in this vessel, under the command of her owner, that the voyage was made which forms the subject of the work. Sailing from New York in November the Josephine shaped her course first for St. Thomas, but owing to heavy weather having set her to leeward, Porto Rico was made the first stopping point, and from thence Santa Cruz, St. Thomas, and through the Leeward Islands, stopping at many points until the South American coast was reached at Laguayra. Landing here the yachtsmen proceeded to Caracas, in Venezuela, and thence up the Caribbean Sea to Cuba. The whole story is told in a bright gossipy manner, and the description of the places visited are excellent. The vein adopted is exactly suited to the character of the trip itself, and Mr. Talboys develops rare faculties as a raconteur. It should be noted as well worthy of imitation that throughout the voyage Mr. Phenix was his own captain and navigator.

Answers To Correspondents.

No Notice Taken of Anonymous Communications.

STOOLS.—M. W. Clark, of Danville Junction, Maine, raises wild geese. **MORRISTOWN.**—"Camp Life in Florida," just published, and for sale at this office, will tell you all you wish to learn.

MAJOR.—Thos. P. Cantwell, of Brainerd, Minn., will furnish you with live pin tail or sharp tail grouse at \$2 per pair.

A. J. T., Catskill, N. Y.—Where can I get "Chapman on the American Rifle?" Ans. Book out of print, we think. Ormstead was the publisher.

W. F., Hannibal, Mo.—Of whom can I purchase English chilled shot, and the price per 25 pounds? Ans. W. R. Schaefer, No. 61 Elm street, Boston. We do not know the price.

MITCHELL, New York.—How is Bellport, L. I., for ducks and quail? Ans. Fair for ducks; quail pretty well killed off by this time, although they were plenty early in the season. A good hotel has been built at Bellport.

R. W. H., Newark.—A and B are throwing dice. A throws 11 and bets B that he cannot beat it. B throws three trays and claims that he has beat 11. Please inform me who is the winner. Ans. A wins; the three trays count only for 9 in throwing with three dice.

W. L., Middletown.—How could I obtain a cadetship at West Point, and what studies would I be examined in, and what is the age necessary to go there? Ans. Cadets at West Point are appointed by Members of Congress and the President. Apply to the Representative of your district.

C. S. R., Niagara Falls.—Will you please tell me the name and properties of bulb which I inclose. It grows around stumps, and has a slender stem with small berries on it in the Fall, and when tasted produces a choking sensation. Ans. It is a corm of the Indian turnip (*Arisema trifolia*).

N. H., Jr., Fall River, Mass.—Have the kindness to inform me the price of Orange powder manufactured by Lallin & Rand and oblige a constant reader. Ans. Orange lightning, \$1.25 per pound; Orange ducking, in pound canisters, \$1 per pound; Orange ducking, in 6½ pound canisters, \$3.45.

Rust, Fulton, N. Y.—Mention is made in FOREST AND STREAM of the Nouvelle River, in Canada, (which empties into the Bay of Canada.) Please give location of the same. Ans. The Nouvelle River is in Bonaventure county, P. Q., and empties into the Bay Chaleur, near the extremity of the peninsula of Gaspé. Port Daniel is at its mouth, to which place a coastwise steamer runs from Dalhousie in the Summer, beginning about 7th May.

TRAR, Gardiner, Me.—1st. I have a dog who is troubled with small worms. Please inform me where I can procure some powdered areca nut, what dose should be given (the dog weighs about eighteen pounds,) with directions and effect on system. 2d. Where can I get a couple of strong nosed, good sized, pure bred, well broken fox hounds, say one to two years old? Ans. 1st. Have sent you some areca nut, with directions for its use. 2d. Address Peter Knox, Newton, Sussex county, N. J.

VALENTINE, Janesville, Wis.—What is the best work on taxidermy for one who wants to learn how to set up birds, etc.? Ans. Cones' "Field Ornithology," Dodd & Mead, 763 Broadway, New York. Davies' "Practical Naturalists' Guide," and "Avis Bird Preserving" are useful little works, published in Great Britain and for sale here by importers. Apply to G. W. Ford, with Pott, Young & Co., Cooper's Union, city. He will import books at 20 cents, gold, to the shilling, or 35 cents, currency.

D. M. S., Rogers, West Va.—How can I tan wild cat and bear skins with the fur on? I wish to make a cloak of the wild cat skins. Should I cut a gore from the centre of the skin at the top or cut from the sides to give the cloak the circular form which it should have? Ans. To tan skins with the fur on put them into a pickle of alum and saltpetre until they become like leather; then dress the flesh sides, dry them slowly, and rub them with a little butter, and dry them by rubbing or treading them out in vaneer sawdust. We cannot tell you how to cut your cloak. Any dressmaker can give you a pattern, which is the same as for a lady's "circular."

W. A. L., Yarmouth, N. S.—1st. What make of rifle corresponds with your description of what a sporting rifle ought to be? 2d. What quantity and grade of powder should I use for ball cartridge in a 12 gauge, 8½ pounds, 28-inch double shot gun? 3d. Which would be best, a conical or round ball, for a shot gun, and should the ball fit tightly? Some one of your correspondents asks how to prevent displacement of wads in metal shells while in the gun. If he will fire the barrels alternately he will probably have no trouble from this cause. Successive shocks will start even large wads. Ans. 1st. See our issue of Nov. 4th for article on various kinds of rifles. 2d. Four drachms medium grain. 3d. Round ball, and it should fit tight.

W. H., Newburgh.—1st. Where can I go for a day's duck shooting in December within twenty miles of New York and find good shooting? If there is none within twenty miles, please tell me where the nearest is, and if I can go and return the same day. 2d. What would the cost be for the day? What is the right charge to use for duck shooting with a muzzled loader? Ans. There is no duck shooting of any consequence within twenty miles of New York. In order to get a day's duck shooting anywhere it is necessary to be on the point by daylight in the morning. Address W. N. Lane, Good Ground, L. I., where you would in all probability find good duck shooting. 2d. The proper load depends entirely upon the size of your gun, which you do not give us.

J. W. A., Boston.—Will you have the kindness to inform me how I shall take proper care of my pointer dog, viz., how often I shall wash him, and in what manner and what with; how I shall keep fleas, etc., from him; what I shall give him to eat? How long ought a pointer to be useful, and at what age do they play out generally? I have just purchased a good dog; I want to take proper care of him. Ans. You will find in our kennel column of this week an article upon the subject of the proper care of dogs. In order to keep your pointer clear of fleas wash him occasionally with common brown or carbolic soap, and keep him in a clean place. We have owned pointers which were serviceable until they were ten or twelve years of age, but they were properly fed and exercised.

Goose, Jefferson City, Mo.—Will you be kind enough to inform me the proper way of using live wild geese for decoys? The shooting is on a large bar in the river, where the geese come after feeding. Should the decoys be placed in the water near the edge of the bar, or should they be placed on the sand? How should they be fastened? I have a pair that I have tried for decoying several times, fastened with a cord by one leg, but they make such continued efforts to get loose that they do more harm than good. Ans. Your geese should have a leather strap attached to each leg connecting with a string, arranged in what the sailors call a bridle, tied to a stake. They should always be in water where they can touch bottom, in which case they can swim if so disposed, or stand on one leg. Some of our baymen teach their geese also to call at command.

A. K., Hannibal.—I want to go on the plains, and probably as far west as the mountains. Which would be the best to take, a muzzled loading double barrel shot gun or a rifle? If a rifle, which of those named would be the best, taking into consideration cheapness of ammunition, working of guns, etc.? 2d. Is 22 inches too short a barrel for good shooting and for general use? 3d. I have a Colt's revolver, five shots, using caps, .36 inch calibre; is that too small, or had I better trade it for a larger one, say a Colt's army? Is the new Colt's revolver the right kind for Western use? 4th. Can you give me the address of the maker of the Ballard rifle? Ans. We should prefer the first of the rifles you mention, but a breech loading shot gun, with metal shells for reloading with ball or buckshot, to either. 2d. 22 inches we consider too short for general use; 28 would be much better. 3d. The new army size revolver is the best for Western use. 4th. The Ballard rifle is not being manufactured now.

A WEEKLY JOURNAL,

DEVOTED TO FIELD AND AQUATIC SPORTS, PRACTICAL NATURAL HISTORY, FISH CULTURE, THE PROTECTION OF GAME, PRESERVATION OF FORESTS, AND THE INCUICATION IN MEN AND WOMEN OF A HEALTHY INTEREST IN OUT-DOOR RECREATION AND STUDY.

PUBLISHED BY

Forest and Stream Publishing Company,

17 CHATHAM STREET, (CITY HALL SQUARE) NEW YORK,
[POST OFFICE BOX 2832.]
127 SOUTH THIRD STREET, PHILADELPHIA.

Terms, Five Dollars a Year, Strictly in Advance.

A discount of twenty per cent. allowed for five copies and upwards.

Advertising Rates.

In regular advertising columns, nonpareil type, 12 lines to the inch, 25 cents per line. Advertisements on outside page, 40 cents per line. Reading notices, 50 cents per line. Advertisements in double column 25 per cent. extra. Where advertisements are inserted over 1 month, a discount of 10 per cent. will be made; over three months, 20 per cent; over six months, 30 per cent.

NEW YORK, THURSDAY, DECEMBER 2, 1875.

To Correspondents.

All communications whatever, whether relating to business or literary correspondence, must be addressed to THE FOREST AND STREAM PUBLISHING COMPANY. Personal or private letters of course excepted.

All communications intended for publication must be accompanied with real name, as a guaranty of good faith. Names will not be published if objection be made. No anonymous contributions will be regarded.

Articles relating to any topic within the scope of this paper are solicited. We cannot promise to return rejected manuscripts.

Secretaries of Clubs and Associations are urged to favor us with brief notes of their movements and transactions, as it is the aim of this paper to become a medium of useful and reliable information between gentlemen sportsmen from one end of the country to the other; and they will find our columns a desirable medium for advertising announcements.

The Publishers of FOREST AND STREAM aim to merit and secure the patronage and countenance of that portion of the community whose refined intelligence enables them to properly appreciate and enjoy all that is beautiful in Nature. It will pander to no depraved tastes, nor pervert the legitimate sports of land and water to those base uses which always tend to make them unpopular with the virtuous and good. No advertisement or business notice of an immoral character will be received on any terms; and nothing will be admitted to any department of the paper that may not be read with propriety in the home circle.

We cannot be responsible for the dereliction of the mail service, if money remitted to us is lost.

Advertisements should be sent in by Saturday of each week, if possible.
CHARLES HALLOCK, Editor.

WILLIAM C. HARRIS, Business Manager.

MR. BERGH AND TURKEY SHOOTING.—The American Rifle Association were to have had some old fashioned turkey shooting at their Pelhamville range on Thanksgiving day, but Mr. Bergh put a veto on that portion of the programme and it was omitted; the turkeys being first decapitated and their heads only put up to be shot at. We have been in accord with Mr. Bergh in many of his efforts at alleviating the condition and sufferings of the brute creation, but in this instance we must accuse him of most woful ignorance of the subject or a fresh outbreak of that meddlesome spirit which does so much towards neutralizing the effect of his better attempts. Mr. Bergh may not be aware that in a well conducted turkey shoot—and that the Pelhamville shooting was such is instanced by the subsequent proceeding—the head only of the turkey is exposed as a mark for the shooter. In this case regulation muskets were used, the ball weighing nearly an ounce. The effect of such a mass of lead striking a turkey's head would be much more decisive than hacking at it with an axe, and productive of much less pain to the bird. It may be remarked that those "dead heads" were struck by one rifleman five times in seven.

Now if Mr. Bergh had been traveling in the direction of Gravesend, Long Island, on that pleasant Thanksgiving day, he would have seen a specimen of turkey, or chicken shooting, which would have excited his wrath and commiseration to the highest extent. A large party of men were engaged in shooting at chickens with shot guns and fine shot at a distance of sixty yards. One unfortunate hen, valued probably at fifty cents, had yielded, at ten cents a shot, the handsome sum of eighteen dollars before she was pronounced defunct and handed to the winner. He must have found her armor-plated, and we trust his teeth paid for his sport. Here was a case of real cruelty, torture in fact, but in the turkey shooting we contend that no cruelty exists.

BROOKLYN REVIEW.—The success of the Brooklyn (N. Y.) *Sunday Review*, which started three years ago under auspices not the most favorable, has begun to astonish even its most sanguine projectors and friends. Its entire make up and appearance, typographical, editorial, and physical, have been much improved of late, and the pungent satire and humor which season its columns indicate the employment of talent of marked ability. Its principal owners are Amos G. Torrey, manager of the New York Colosseum, long known in local literary circles, and the Messrs. Sidebotham, father and son, the elder of whom was attached to the Brooklyn *Daily Eagle* for twenty-six years.

OPEN AIR EXERCISE VS. RUM.

IF our medical men, philanthropists, and we may add, alarmists, who are endeavoring to discover a remedy for the effects, and a cure for the evil of intemperance, would recognize, endorse and urge the beneficial influence of pure air upon the unfortunate, their efforts would probably be sooner crowned with success. Even as a substitute for liquor, ozone, when taken in proper doses and at proper times, is far superior to those preparations which, like opium remedies, have for their base, a disguised preparation of the drug itself. A trip to the lumber regions of Maine during the working season would convince any skeptic of the truth of this assertion. It is customary there for men to go into the woods after prolonged sprints, with shaky limbs and incipient horrors. Liquor is allowed for a few days only and then the pure air effects the cure. The surroundings, too, are of a nature calculated to draw the mind from the cravings of a depraved appetite. The desire for artificial stimulant is gradually lost in the excitement of healthy labor, and both brain and body resume their natural functions under the invigorating effect of out door life.

That the effect of stimulant upon the inhabitants of cities is far greater and more disastrous than upon the countryman will hardly be denied. Given two men, one of whom drinks his allowance while perambulating from one bar-room to another, or engaging between whiles at some sedentary occupation, and another who imbibes a similar quantity while following the plough, felling trees, digging stumps, or poling up stream, and the latter will show none of the marks of dissipation which are invariably fixed upon the city drinker. Constant activity keeps open the pores of the skin and the poison, or much of it, escapes in that way, instead of being carried in due course to the brain to finally result in a softening of that organ and an attack of delirium. We do not argue that farmers, lumbermen and voyageurs, because of their occupation, can drink with impunity; on the contrary, no class are more liable to the results of excess, as can be witnessed by a short study of any country bar-room. The very labor which would effect a cure in their case is abandoned, and broken fences, neglected buildings, old hats in the windows, and general decay and ruin, bring into more frightful prominence the destroyer's work. What we do argue is, that if those who find themselves giving way to indulgence and have still strength to form and keep resolutions, would fly to the mountains, indulge in sports of the field, and aided by natural stimulants, overcome their unnatural appetites, the probabilities of their being finally cured would be far greater than if they resorted to drugs, or one of the Asylums for Inebriates.

Keep busy! Idleness cloy: nature demands excitement; chance interviews with other loungers bring a temporary relief to the monotony of living, and liquor at the bars and tap-rooms supplies the temporary stimulant. Then comes the excess, and afterwards the reaction, total prostration, and a waste of vital forces which only long abstinence and careful diet can restore. The repetition of these excesses, increasing in frequency from month to month, brings wear and tear, decay, and premature wreck. Oh! the woes and bane of idleness and sloth! We have suggested the remedy. Let the victim of thirst follow it and be cured. Let him become farmer, trapper, hunter, bullwhacker, surveyor, chopper, anything that will keep his muscles in constant exercise, and send the stagnant and polluted blood through his veins and out of the system; cause all the secretory organs to resume their healthy functions, and perspiration to ooze from his dry and feverish skin. Thus will the system be cleansed. Once clean, it will crave no alcoholic stimulant, and manhood and self-respect will again assert themselves. Oh, the luxury of feeling oneself a man!

FLORIDA ITEMS.—The St. Augustine *Press* of November 20th publishes between sixty and seventy arrivals at the Magnolia Hotel.... The St. James Hotel, at Jacksonville, is now open.... The St. Augustine Hotel opened December 1st.... The steamer Huntsville, from New York to Fernandina, took eighty-eight passengers on her last trip. The Georgia, of the Quintard line, sailed full last Wednesday from this city. All the lines are pressed with business.... Green peas at Jacksonville sell for \$1 per peck.... Seventy immigrants reached Orange county last week.... St. Augustine is to have a first class market.... The hotels of Florida are now equal to those elsewhere, both in table and general appointment.... The colored man who sells "Camp Life in Florida" on the trains and steamboats at Jacksonville is making a small fortune on commission.

FLORIDA TRAVEL.—The steamer Urbana, to run in connection with the New York and Fernandina (Fla.) steamship line has just commenced her trips. She takes the inside route to Jacksonville, and thence up the St. John River to Enterprise. She is 168 feet in length.

—Bartolo Picetti, at Mosquito Inlet, mouth of the Halifax River, Florida, can accommodate two or three boarders this Winter. The house is neat and comfortable, his wife is a neat housekeeper and good cook, especially on fish, which with oysters and sea turtle, is the chief diet. Board \$10 per week. The fishing is full as good as that at Lowd's Hotel, four miles distant, and Bartolo is the best fisherman on the coast. Deer, turkeys, bear, and wild cats, can be found close by, to say nothing of rafts of ducks. This is the favorite stopping place of our correspondent S. C. Clarke, who will be there next month.

RABBITS AND HARES.

THE swamps of the more northern portions of the entire United States are now filled with the great hare, (*Lepus Americanus*.) An expert hunter, accompanied by a good dog, and armed with a shot gun, are all that is necessary to bag a goodly number. This species never burrows; it simply inhabits cavities beneath the roots of trees or under fallen brushwood, therefore a dog can readily find them. They nearly always travel in beaten paths, which are formed by them, and which are plainly indicated through the woodlands, so that the hunter, by standing in a favorable position near one of these spoor, may secure a shot as his dog drives the timid animal past him. As a frightened hare moves like the wind, the gunner must be able to snap short in order to catch him as he bounds through the bushes. At this time these animals are brown in color, but later in the season they become nearly pure white. This is only one of the many instances where Nature furnishes her charges with protective color. It is difficult to see the brown rabbit in Summer, as its hue corresponds quite nearly with surrounding objects; but it would be plainly visible when the snow covered the ground did it not put on a mantle similar in color to that of the garb assumed by the earth. To accomplish this change the hare moults twice annually, and when adopting a new coat is often parti-colored. This species is replaced in the West by the jackass, or mule rabbit (*Lepus callosus*), and in the Arctic region by the polar hare, (*Lepus glacialis*.)

The gray, or cotton tail rabbit (*Lepus sylvaticus*), is usually called a rabbit, whereas we have no species which should bear the name. The true rabbit, of which the domestic variety from Europe is an example, live in colonies, and bring forth their young in burrows, whereas hares are more solitary in habit, and simply construct a form or nest wherein their offspring are placed. The young of the rabbit are born blind and naked, while little hares are always covered with fur, and have their eyes open at birth. Rabbits are very helpless for several weeks, but hares are quite active when only a day or two old. The gray hare differs from the Southern species in living in burrows during Winter, and consequently they are not so easily run by dogs. They may be hunted quite successfully, however, on a day when there is a slight rain or snow which precedes a storm; they are then moving about in search of food, and the sportsman may secure many good shots by hunting along by the margin of swamps. This species is represented on the plains by the little sage rabbit (*Le. artemisia*), and farther West by two or three other species. There is also a swamp rabbit (*Le. palustris*) found in thickets along rivers and lakes of the South.

AMERICAN AMMUNITION.

We publish with pleasure the letter below from Mr. A. C. Hobbs, President of the Union Metallic Cartridge Company, of Bridgeport, on the matter of American Paper Shells; and we may add that after a careful examination into the subject we recognize the strength of his remarks regarding the necessity of uniformity in the chambering of breech loading guns. We commend this subject to English as well as domestic manufacturers of guns, feeling assured that when uniformity is observed the complaints of miss-fires will be largely reduced, if not altogether disposed of. It is conceded that our rifle ammunition is almost perfect, and the cause assigned, a perfect uniformity in the bore of rifles, may easily be applied to shot guns:—

BRIDGEPORT, Conn., Nov. 25, 1875.

EDITOR FOREST AND STREAM:—

The contradictory statements that for the past few weeks have appeared in the FOREST AND STREAM, the honest intentions and truth of which there are no reasons to doubt, tend rather to confuse than give any reliable information to your readers regarding the merits or demerits of American Paper Shells, as all the different results named by your correspondents are due to the difference in the guns that were used by the parties that shot them. Having been connected with the manufacture of American sporting ammunition from the early introduction of breech loading shot guns into this country, I will attempt to give what information I can regarding some of the difficulties connected therewith, and the cause of some of the complaints that are being made. In order to do so I will first refer to the guns in which the ammunition is being used.

In breech loading shot guns the cock or hammer, instead of striking the cap on a fixed anvil, as in the muzzle loaders, strikes a movable pin. These pins vary in both length and the form of the end which strikes the cap; the pins are also driven at an angle of about forty-five degrees; the counter bore of the chamber (that is, the recess in which the head of the shell is held) is so rounded that a slight variation in either its depth or diameter will allow the head of the shell to sink in the counter bore, and thereby carry the cap or primer, which is in the head of the shell, double the distance of the variation of the counter bore in consequence of the indirect motion of the firing pin. All the variations mentioned occur in different guns, and all tend to make breech loaders liable to miss fire, as the shells cannot be fitted to each particular gun.

The first attempt to supply the demand for breech loading shells in this country was the manufacture of the Berdan patent metallic shells. A gun of one of the best English manufacturers was selected as the standard, gauges were prepared conforming exactly to the dimensions of the chambers, and shells were made to fit the gauges. Hundreds of rounds were fired in the gun, and the shells, so far as any test in that gun could determine, were perfect. These shells were sold, and soon complaints came that they would not go in some of the guns. These complaints led to an examination of the chamber of different guns, and out of several hundred that were examined no two of different makers were alike, and in many cases the two chambers of the same double gun differed so much that a shell fitting one barrel would not go in the other. To provide against the difficulty of the shells being too large for the chambers of any of the guns that were already in the market, new gauges were made conforming in dimensions to the smallest chambers that could be found, and several sets of these gauges were sent to the different gunmakers in England by some of the largest importers, with orders to have their guns chambered to conform to the gauges. Having done all that was thought necessary to insure uniformity in the guns for the future, metallic shells were made to the new and smaller gauges, which prevented further complaints of the shells not going in the guns. As the metal shells are made of one piece, and the heads are turned, the

variations in the size and thickness of the heads are slight, but from the nature of the materials of which the paper shells are made and the number of thicknesses required, it is impossible to keep them as near alike as the metal shells, consequently there is much more variation in the diameter and thickness of their heads, and in order to have all the shells go in the guns that were selected as the standard, all the variation must be on one side—that is, smaller than the gauges. Starting on these premises the manufacture of paper shells was commenced. For the purpose of testing the shells in the course of manufacture two guns were ordered from New York without any special directions as to dimensions. The No. 10 has the name of P. Webley & Son, London, and the No. 12 W. Wellington, Birmingham. In these guns thousands of the paper shells have been fired, and during more than two years of constant use but one single miss fire has occurred.

Soon after the sale of the shells commenced occasional complaints were heard, and on the 7th of June last a letter from W. B. Hanworth, Quincy, Ill., in reply to an inquiry was received, which says: "Please find with this fifteen of your shells that would not explode. My gun is \$300 Foster & Abby, of Chicago; I think her one of the best ever made. The last time I was out I took two of the shells and snapped them twelve times to see whether they would go or not." I examined the shells, and although the caps appeared to have had a good blow, I saw that the pin struck below the centre of the cap, and on such an angle that the anvil in the cap was missed. I tried several of the shells in our gun, including one that had been struck twelve times; they all went promptly. I then returned the balance to Mr. Hanworth, telling him what the trouble was. On the 23d of June an answer came saying: "I had some fears all the time that some of the fault lay in my gun. At the same time that I sent you the shells that would not go I also sent my gun to Joseph Butler, gunsmith, Chicago, telling him to overhaul her and do as he thought best. I received the gun back a few days ago. He said there was too much play for the shoulder of the shell, and he bushed her out and let in new pieces into the breech of each barrel so that the shells fit snug. I have just tried the shells that you returned me that would not explode in my gun before, and they all went off first pop. I am satisfied that the fault lay in my gun more than in the shells." Since the above occurred I have investigated other cases, and all with the same result.

I have examined a great many guns, and any close-measuring mechanic would be astonished at the want of uniformity in the dimensions of the chambers and counter bores of breech loading shot guns, even of the highest price and otherwise the best finish, and in most every case the miss fires can be attributed to the excessive variation in the chambers of the guns. To avoid the chances of miss fires as much as possible the paper shells are now being made with *thick heads*, and when any *fixed standard* can be established for the chambers of breech loading shot guns, and all the gunmakers will conform to the standard, *American ammunition* for shot guns will take the same position that American ammunition now has for breech loading rifles, viz., *the best in the world*. But so long as some gun makers make holes in their gun barrels regardless of size and shape, your correspondents and other sportsmen may well congratulate themselves on having only "three miss fires out of every hundred shells;" while recently in the inspection of military cartridges over 160,000 consecutive shots have been fired without a miss fire.

No one better than the writer can appreciate the feelings of a sportsman at the butt of a gun with a canvas back, mallard, woodcock, or quail within thirty yards of the muzzle and a miss fire. Short words are excusable even when applied to the manufacturer of cartridges. If the *FOREST AND STREAM* and all sportsmen will join in demanding the same uniformity of dimensions in the chambers of shot guns that is required in Government rifles, the complaint, not unjustly but without knowledge of the cause, now being made, will be of the past. A. C. HOBBS.

The head of the unexploded shell alluded to by our correspondent below was reforwarded to this office, and exploded on one of our guns at the first trial:—

JACKSONVILLE, Ill., Nov. 23, 1875.

EDITOR *FOREST AND STREAM*:—

I am pleased to see that the sportsmen of this country have one paper that is not *used up* to any particular manufacturer. In relation to the shell question I will say, I have used about 180 of the Bridgeport shells since I wrote to you, and still not a single miss fire. I have used over a thousand of them, and never know the head of one to pull off, nor one to miss fire. I can say this, that the Bridgeport shell is good enough for me; my experience sustains me in saying so. That the experiences of sportsmen differ is undeniable. My relations with the Bridgeport company is no more than any other sportsman of this country, and I never write anything that I can't put my name to. Mr. Richardson Vasey, one of our best sportsmen, has brought me one of the Bridgeport shells that he had miss fire since he put his name to the testimony published in your paper. He says: "It is the first I ever had miss fire. I reload them twice, and sometimes three times. I have never known the head of one of these Bridgeport shells to pull off." I have sent the shell referred to above to Bridgeport. I hope you will continue to let all sportsmen that are honest and reliable express their views and experiences through your paper, and let it be seen that sportsmen have one impartial paper in this country. You shall have my support as far as it goes. GEO. HAYDEN.

—Another correspondent writes from Salem: "I never had a U. M. C. shell miss-fire; but for reloading they are next to worthless. English shot are not creating much of a sensation about here."

FOX HUNTING.—Mr. Donahue and a party from this city and contiguous Jersey towns were out with hounds on Monday, but met with but poor sport, Bears Nest and Big Swamp being both drawn blank, and the party were obliged to return to Hackensack minus a fox. We have several letters on the subject of fox and paper hunting, which are unavoidably left over for our next issue.

A GOOD RIFLE WORK IN BROOKLYN.—Mr. Robert Miley will have a rifle tournament at his gallery, to commence on December 3d and to be continued every Monday and Friday until the 7th of January, for the benefit of St. Peter's Hospital, under the charge of the Sisters of St. Francis.

—Wakeman Holberton, the artist and fish painter, has removed his studio to 1,193 Broadway, room 21. He is now engaged on a black bass picture from studies made among the Thousand Islands last Summer. We anticipate a charming and life-like result.

—Messrs. Freund Bros., of Cheyenne, W. T., have sent us the specifications of two ingenious patents due to Mr. F. W. Freund. One is an adjustable pistol grip to a rifle or fire-arm stock, which is exceedingly simple in character and we should think would speedily come into use. The other patent is for an improvement in sights on fire-arms. The serious objection to the clipped spring sights now in use being their liability to displacement, or moving under a shock or jar. Mr. Freund's improvement certainly does away with these troubles, and in a very easy and practical way.

GAME PROTECTION.

Boston, Mass., Nov. 20, 1875.

EDITOR *FOREST AND STREAM*:—

Your New Hampshire correspondent, "Quail," may be a very good shot, but I say a very decent kind of a shot can kill his quail at this season of the year in Massachusetts. My friend Brown and I were in the woods one day last week, when my setter made a point on a bevy of quail. Getting ready to fire I let the dog go in, but the quail refused to fly, and the dog succeeded in capturing one of them. On examination it proved to be but two-thirds grown and but half feathered. Therefore I say to "Quail," refrain from shooting them this month, hoping that next month they will be in better condition for shooting. The sportsmen in this vicinity hope to have a law passed at the next session of the House of Representatives that will prohibit shooting quail prior to the 1st of December. I fully indorse "Under Grip's" able protest against the killing of quail before the season opens. BREECH.

PITTSBURGH, Penn., Nov. 19, 1875.

EDITOR *FOREST AND STREAM*:—

The correspondence between "Check Cord" and Mr. C. H. Wild is calculated to awaken attention from all sportsmen from its personal nature and spicy quality, as well as the more important bearing it has upon a case of non-observance of the game laws. While we say all honor to Mr. Wild for the great interest he has taken, and the many substantial acts he has heretofore avowedly accomplished in the matter of sportsmanlike protection of game, yet we "more in sorrow than in anger" say that the slaughter of even two quail out of season cannot be extenuated on the plea of former good deeds done to the cause of protection. The free-to-shoot-at-woodcock, or the ready-winged pheasant, would have tested Ace's retrieving qualifications quite as well as the forbidden quail; and the permission of the friendly landholder to "fire away" can never alter the covenant that all true sportsmen have entered into to preserve the birds unharmed until a certain eligible date agreed upon, when all sportsmen may have an equal chance, and even the birds a fairer chance by their adult powers of flight, and in principle and effect any one of us assuredly takes an unfair advantage of the rest, who by anticipating the date agreed upon and rendered binding by act of Assembly, if even for the final examination and the award of a diploma to a favorite setter, we kill just two birds out of season. No, Mr. Wild, don't shield yourself behind the permission of your friend who owns the land on which the birds were shot. While the disposal or ownership of birds on one's own land is not a question that is legally settled; it ought to be settled that they are the sportsmen's property to protect, at least, and whether the sportsman be the landowner or his friend, there should not be a question of the propriety of letting the birds alone until the law permits them to be killed; and the landowner, whether he be sportsman or not, ought to be a law-abiding citizen in this as in all other respects.

Woodcock or pheasant were your birds, Mr. W., and your fair reputation would then never been the subject of the apparently friendly and well-meant badinage of "Check Cord," who must now, at least, lay claim to credit for having done something "for the protection of game." By the way in which Mr. W. kicks back it seems that he is vexed, not only that he did it, but that anything was said about it, but all will doubtless be right when "Check Cord" accepts the invitation to the Bird River shore to practically protect game by trying to shoot it. Then must the amusement afforded to Mr. W. more than compensate for all the chagrin he has endured from his friend "telling the truth too much on him."

To change this subject a little to one that is of the same character, but legalized and wrong in effect, I wish to add some testimony to the great need of making the opening season for quail to be at the earliest on November 1st, or better, the 15th. On the 15th of October a friend, an accomplished and observing sportsman, made a visit with me to the farm of a gentleman in Ohio for a day's quail shooting. Rain coming on after two or three hours we were obliged to desist, but before doing so we found three bevs of quail, the first nearly, if not quite, full grown, strong-flying birds, that could take care of themselves; the second bevy was little more than half grown, as was tested by one being killed for comparison; the third bevy was of birds so small as to be scarcely able to fly, and certainly not more than two weeks old, the old dogs pointing them almost under their feet. In brief, these facts, in conjunction with those set forth by "Mortimer" and many other of your correspondents, call at least for an extension of the close season in some of the more Northern localities. Yours, SOUTH FORK.

With respect to the soundness of the views advanced in the concluding clause of our worthy correspondent's letter, we wish to adduce the evidence of our observations during the entire month of last October in the middle and northern portions of Virginia, Tennessee, and North Carolina, which discovered not only the fact that the quail were not fully grown in either, but they prove the entire practicability of a uniform game law to apply to those States. Moreover, the data received from the Middle and New England States show that the law governing quail shooting there can very properly be made to coincide with the law to govern the three States first named. An enactment extending the close season to November 1st throughout the entire latitudinal range would meet all the contingencies of the case squarely, constituting in itself a constituent part of the proposed scheme for a general uniform law to apply to the several varieties of game that come within the sportsman's category. This problem is being gradually solved to the satisfaction of all interested.

—Bernard A. Hoopes, Esq., President of the Philadelphia Sportsmen's Club, was elected President of the Pennsylvania State Sportsmen's Association, at the late Harrisburg Convention. One reporter wrote "A. B. Hughes."

—The number of offences by summary proceedings against the English Game Laws in 1873-4 was 11,955, against 10,870 in the proceeding year.

—Col. Geo. W. Wingate, General Inspector of Rifle Practice, has issued an order directing the attention of Inspectors of Rifle Practice and regimental commanders to the necessity for thoroughly instructing their commands in rifle practice at their respective armories during the drill season. The course of practice at Creedmoor range, he remarks, is intended solely to apply the knowledge gained at drill. Each regimental commander, upon application to Gen. Knox, Chief of Ordnance, can obtain 1,000 solid headed shells, and 50,000 extra strong primers for candle practice. The returns of rifle practice of all organizations must be forwarded to brigade headquarters on or before December 1st to insure their publication at headquarters.

—The millionaire, Wm. B. Astor, died in this city on Wednesday of last week, aged eighty-four years. He owned 2,500 houses and lots and the total value of his property is estimated to be about \$150,000,000.

The Rifle.

CREEDMOOR.—This range was crowded on Thanksgiving Day, practice shooting and match competitions going on side by side. The day was delightful, there being just sun enough to be pleasant, and no wind. Two teams from the Fourteenth Regiment, companies A and B, contested for a handsome gold medal, the first named company winning by 13 points. We give the scores:—

COMPANY A.			
Name.	200 yds.	500 yds.	Total.
John Correy.....	21	22	43
Thomas Henwood.....	19	17	36
Thomas Askell.....	20	15	35
George W. Booth.....	18	15	33
Thomas Harvey.....	18	15	33
Fairtlough.....	17	14	31

Total.....211

COMPANY B.			
Name.	200 yds.	500 yds.	Total.
F. J. Fagan.....	20	21	41
M. L. McGwin.....	19	18	37
J. J. Clancy.....	18	17	35
J. C. Erkenmark.....	17	15	32
M. Smith.....	15	12	27
J. J. White.....	15	11	26

Total.....198

Members of C and D companies of the Ninth Regiment had their contest for three badges, which were taken by Captain Auld, Sergeant Engel, and Private Huggard, with the following scores:—

Name.	200 yds.	500 yds.	Total.
Capt. Auld.....	19	8	27
Sergeant Engel.....	17	6	23
W. Huggard.....	16	5	21

Company G, of the same regiment, also held a contest for an elegant badge. Captain Pryer and Private Hover tied on 18, when the Captain, without cavilling, gracefully awarded it to Mr. Hover.

The Eighty-fourth regimental rifle club has three prizes—the Conklin and the Boylan badges, and one other trophy, often merited but rarely called for, proudly designated as the Duffer's badge. Conditions—500 yards, fifteen shots. We give the four leading scores:—

Drum Major Nolte.....39 Sergeant Osborne, Co. C.....27
Sergeant Randall, Co. F.....38 Sergeant Levey, Co. E.....35

Drum Major Nolte took the Conklin badge, and Sergeant Randall the Boylan. Who gloried in the happy possession of the Duffer badge will, so far as we have anything to do with it, never be made known.

Three companies of the Seventy-ninth Highlanders, B, D, and E, shot for prizes. Ten shots at each range of 200 and 500 yards were the conditions, but owing to the lateness of the hour when the match commenced it remained unfinished, and was declared off for the present. Company B had offered no less than twenty-four prizes. A French clock was, however, won by Sergeant Duncan McPherson by the following very excellent score: 200 yards—4 4 5 4 4 4 4 4 5 4—42; 500 yards—4 5 4 3 4 5 3 4 2 4—38; total, 80. The first prize of Company D was won by Lieutenant D. E. Van Nett, and of Company E, a gold watch, by W. Stevenson.

In company G, of the Twenty-second, a medal offered by Private Herts was won by Private Scranton, who made 20 out of a possible 25 at 200 yards.

Among the many good scores made we may mention that of Sergeant T. J. Dolan, of Company D, Twelfth Regiment, who, at 500 yards, made 31 out of a possible 35.

In the afternoon a match was shot between the members of the Scotch-American Rifle Club for the Morrison badge, but unfortunately a protest was entered by Captain Clark. However, we give the scores:—

Name.	200 yds.	500 yds.	Total.
A. Pyle.....	37	40	77
Capt. W. C. Clarke.....	38	38	76
Thomas Duke.....	37	38	75
W. Stevenson.....	37	37	74
W. Robertson.....	38	23	61

—On Saturday, Nov. 27, the Hepburn match took place, which may be considered as the last engagement of the rifle season of 1875. The badge presented by Mr. L. L. Hepburn, who was the winner of the Remington Diamond Badge, was in fact a *quid pro quo* offered by him, with the very excellent idea of encouraging the formation of a new team outside of the former champions. The weather was rather cold, and a raw wind blew from XII right down the range. There were fifteen entries, but early in the match the scores of some of the leading shots were, without being very strong, sufficient to intimidate the weaker ones, who withdrew. Conditions—First competition for the Hepburn Trophy; open to all comers, excluding members of the American International team of 1874 and 1875; rounds, fifteen each, at 800, 900, and 1,000 yards; weapon, any breech loader, to be loaded at the breech only; prize to be won three times before becoming personal property of winner. The following are the best scores:—

Name.	800 yds.	900 yds.	1,000 yds.	Total.
W. B. Farwell.....	55	66	59	180
A. V. Canfield, Jr.....	63	63	54	179
F. Hyde.....	59	66	43	168
R. Rathbone.....	60	58	48	166
H. S. Jewell.....	64	61	37	162
H. Fisher.....	57	57	38	152
L. C. Bruce.....	51	56	33	140
A. J. Hennion, Jr.....				124
E. A. Perry.....				118
E. H. Raymond.....				114

During the shooting of the Hepburn match, another was in progress made up of the team who had won the silver trophy at the What Cheer range. It was decided to dispose of this by single competition to the team, and after a postponement from Goshen, in consequence of the stormy weather, the shooting came off at Creedmoor. The rounds were seven each at 600, 800, and 1,000 yards. Messrs. Bruce, Hyde, and Coleman retired from this, and Major Fulton, who was of the team at Providence, was not present. The scores give the prize to W. B. Farwell,

who tied on the grand total with A. V. Canfield, but beat him on the longest range, having 31 to Canfield's 25, and, according to the rule in use, took first place. The score stood as follows:—

Name.	800 yds.	900 yds.	1,000 yds.	Total.
W. B. Farwell.....30	25	31	25	81
A. V. Canfield, Jr. 30	31	25	25	81
G. W. Yale.....33	27	24	24	75
H. S. Jewell.....33	33	17	25	75

GLEN DRAKE RANGE.—It is especially agreeable for us to notice the progress the American Rifle Association has made, and how rapidly not only the many difficulties in the way of perfecting an organization, but of building up a range, have been accomplished. This association, which dates back in reality but a few months, has already achieved a marked success, and must draw the riflemen not only from those portions of the counties in its neighborhood, but their range will be used by many of the military organizations in the northern part of the city. There is abundant scope for both Creedmoor and Glen Drake, and the time is not far distant when other ranges in the neighborhood of the metropolis will be wanted. The officers of the American Rifle Association, from their worthy President, Col. John T. Underhill, to their active Secretary, G. O. Starr, Esq., deserve the greatest credit for the energy, tact, and patience they have displayed. On Thursday, Thanksgiving Day, the range was thronged, the military display having been remarkably fine. The day was superb, the sun just pleasantly warm, the wind being scarcely perceptible. Company G, of the Seventy-first Regiment, under Captain Webber, were the guests, Company B, of the Twenty-seventh Regiment, under the command of Captain E. Cardoze, receiving them. The New York company were accompanied by their band. Teams of twelve were selected from each company, and a match was shot for a superb trophy, presented by Colonel Vose of the Seventy-first, and Colonel Underhill of the Twenty-seventh. Conditions—200 yards, five shots. Company B, Twenty-seventh Regiment, were the successful contestants, scoring 151 to 149 made by Company G, of the Seventy-first, so the trophy remains in Westchester county.

The Subscription Match was then in order. Conditions—Distance, 400 yards; any rifle; trigger pull, three pounds; position, off hand; entrance fee, \$1. One half of entrance money to be for benefit of association, balance divided between three highest scores. The following are the best scores:—

F. Hyde.....3 4 5 3—20	A. F. Decker.....4 4 4 3—19
J. A. Gee.....5 5 4 3—20	F. Backofen.....4 4 4 3—19
Capt. E. Barker.....4 4 3 4—19	F. Hyde.....4 4 3 5—19

In the All Comers' Match the following were the conditions—Distance, 300 yards; any rifle; seven rounds; entrance, \$1 to members, \$1 50 to others. First prize, \$35 value; second prize, \$25 value; third prize, \$6 value, subscription to *Army and Navy Journal* free for one year; fourth prize, \$5 value, subscription one year to *FOREST AND STREAM* free. The following are the best scores:—

F. Backofen.....3 3 4 4 5 3—26	S. E. Condon.....4 3 4 0 4 5 3—23
P. Crookspire.....3 3 3 4 4 3—24	F. Hyde.....4 3 4 0 4 3—22
Col. G. D. Scott.....3 2 4 3 4 1—24	D. H. Teets.....4 2 4 4 0 4—22
W. A. French.....3 2 5 3 4 3—24	Capt. Barker.....3 4 4 0 2 4—21
J. A. Murphy.....3 3 3 4 3 3—23	

Mr. W. A. French secured the *FOREST AND STREAM* prize.

For the De Peyster badge, third competition, the conditions were—Distance, 300 yards; open to any bona fide member of the National Guard, military rifles only; seven scoring shots; contestants must shoot in uniform; badge must be won three times by one person before property passes. The interest taken in this match, the prize being a superb gold badge, was very great. It had been won first by Captain C. F. Robbins, Seventh Regiment, and a second time by Lieutenant J. A. Gee, Eighth New York Infantry. On this occasion it fell to Private F. Backofen, of the Forty-seventh Regiment. We append the ten leading scores:—

Name.	Score.	Total.
F. Backofen, 47th Regiment.....	4 3 4 3 4 3	25
Capt. E. Barker, 8th Regiment.....	3 4 4 5 2 3	25
T. R. Murphy, 8th Regiment.....	3 3 3 4 2 5	24
W. A. French, 7th Regiment.....	4 3 4 3 5 3	24
M. Cochran, 8th Regiment.....	2 3 3 4 3 4	23
S. E. Condon, 47th Regiment.....	4 3 4 2 4 4	23
E. H. Sanford, 7th Regiment.....	4 2 3 4 3 3	23
Lieut. J. A. Gee, 8th Regiment.....	4 3 3 2 4 2	22
Col. G. D. Scott, 8th Regiment.....	3 2 4 3 3 2	21
Lieut. O. C. Hoffman, 71st Regiment.....	3 3 3 0 4 3	20
B. Burns, 27th Regiment.....	4 0 4 2 2 3	18

A grand old-fashioned turkey shoot was in full blast almost all day. Early in the morning the good Mr. Bergh had issued his fiat that no live turkeys should be shot at. Obedient to the authorities, the Glen Drake turkey committee procured inanimate birds, all nicely plucked and trussed, instead of the feathered gobblers. By guillotining the defunct bird, and suspending the head, wattles and all, by means of a string on a post, a shining mark was made. In nothing has the gratifying improvement of our National Guard in rifle shooting been shown more brilliantly than by their skill in hitting this peculiar mark—a turkey's head instead of a bullseye. Whether the turkey shoot was remunerative to the association remains yet to be seen. We should rather think not. At fifteen cents a shot, and ten pound turkeys, not to be had for less than twenty cents a pound, the entrance fee was insignificant; but the skill was great. We saw one well made, handsome little National Guardsman, the embodiment of martial grace, step deftly to front with his military rifle, and at 100 yards in seven shots bag no less than five noble birds. Who will tell us now that skill with the rifle is not in the ascendant? In the evening a grand collation was offered by the Mount Vernon soldiers to Company G, of the Seventy-first, at the regimental armory. The room was handsomely decorated, appropriate toasts were given, and late in the night the festivities of the American Rifle Association were brought to a happy close.

Saturday last the Remington Sewing Machine Match was won by George O. Starr with a score of twenty-five, made with a Whitney rifle. Hereafter the range will be open for practice on Tuesdays and Thursdays. Saturdays member's matches will take place.

MORSEMERE.—Here, too, Thanksgiving was celebrated. Prizes were various, from a gold medal down to a cabbage. Shooting was at 500 yards, fifteen shots, with the following scores:—

D. Smyth.....71	J. S. Perry.....64
H. Quinn.....70	J. Clark.....49
G. L. Morse.....69	E. Connell.....44
F. Shonnard.....68	

Mr. Smyth's 71 in a possible 75 is very excellent shooting. On Wednesday the competition for the sporting rifle was held at Morsemer, when Mr. Quinn became the win-

ner, the match between himself and Mr. Shonnard being very close, the latter having made a full score at 500 yards. Conditions—Ten shots at 200 and 500 yards:—

H. Quinn.....	200—4 3 4 4 2 5 3 4 4 5—33	85
Fred. Shonnard.....	500—4 5 5 4 5 5 5 5 4 5—47	85
G. L. Morse.....	200—3 4 4 0 3 5 4 4 4 3—34	84
Douglas Smyth.....	500—5 5 5 5 5 5 5 5 5 5—50	75

—On Thanksgiving Day a rifle contest was held by the rifle club at Ellenville, Ulster county, N. Y., teams of four contesting. Distance, 500 yards. Score:—

FIRST TEAM—REMINGTON CREEDMOOR.	
E. H. Munson.....	47
N. Rockwell.....	45
Total.....	177

SECOND TEAM—SHARPS CREEDMOOR.	
G. H. Benedict.....	37
C. A. Van Wagener.....	46
Total.....	146

—Last week the rifle club at Middletown, Conn., had their match. The conditions were 200 yards, five shots each. Scores:—

H. Woodward.....23	Russell.....20
Alsop.....20	Harris.....19
Judd.....20	Lyman.....19
Coles.....20	

Mr. Woodward was the winner of the silver cup.

—The third contest for the *Turf, Field and Farm* cups took place at Conlin's Gallery last Thursday. Conditions—Ten shots, off hand, 110 feet, 200 yards miniature target reduced in proportion, Wimbledon rules. First cup to best score, second cup to nearest score to 35, third cup to nearest score to 25:—

Name.	Score.	Name.	Score.
L. C. Bruce (first cup).....	45	A. J. Pollock.....	34
Chas. A. Cheever.....	42	J. O. Wright.....	33
M. P. Lennon.....	42	Benj. B. Louder.....	33
W. J. Sherwood.....	42	H. A. Gould.....	33
W. B. Farwell.....	41	J. D. Cheever.....	32
Fred. Kosslar.....	41	C. E. Battersbury.....	32
T. E. Broadway.....	41	H. P. Morice.....	32

W. Seybell (second cup).....	34	F. C. Kunster.....	23
L. W. Sarony.....	31	A. C. Parsons.....	21

—The rifle match of the Taunton Sportsman's Club took place at Taunton, Mass., Thanksgiving Day. The day was clear, but the wind was uncertain and capricious. Conditions—200 yards; ten shots; N. R. A. rules. First prize, a gold badge, to be won three times; second, a field glass; third, a sportsman's vest; fourth, subscription to *FOREST AND STREAM*; fifth, Wingate's Manual. The following were the best scores:—

Names.	Total.	Names.	Total.
H. D. Atwood.....	36	W. P. Parmelee.....	33
N. C. Graham.....	36	J. A. Cushman.....	32
W. H. Bent.....	35	Hon. W. C. Lovering.....	32

Dr. S. D. Presbrey.....	35	Edward King.....	32
Lieut. Col. Fred. Mason.....	34	J. C. Sprout.....	32
Jas. Woodward.....	31		

THE CHICAGO RIFLE CLUB.—On the 20th of November the Chicago Rifle Club met at their range to compete for a prize and positions in the team to shoot at the coming Inter-State match, to be shot in Chicago at an early day between the same teams that shot at Jackson, Mich., on the 10th of last month. The prize for the first ten shots was for a handsome book. The total score was twenty shots for positions on the team, but owing to the darkness coming on before a number could finish their scores the match was unfinished till the following Tuesday, when those who had not finished their scores were allowed to do so. The first day the weather was very fair; the second, Tuesday, not quite so much so, the wind blowing quite hard. Conditions—Three sighting and twenty scoring shots; distance, 500 yards; N. R. A. rules. The following is the score out of a possible 100:—

J. A. Shaffer.....95	R. S. Thompson.....87
S. B. Sexton.....95	O. C. Blackman.....86
M. W. Lyman.....92	W. R. Allen.....81
A. G. Alford.....90	T. B. Williams.....84
C. Fuller.....89	J. K. Rodgers.....78
C. B. Prout.....88	T. Bradwell.....76
W. Burnham.....88	G. E. Adams.....75
Geo. Willard.....88	

Mr. Sexton not entering for the prize the same was won by Colonel R. S. Thompson, he making the highest score in the first ten shots. Owing to darkness, Colonel Thompson was unable to finish his score for position on the team, having two more shots.

A RIFLE RANGE IN BROOKLYN.—The members of the Division Staff are talking seriously of the institution of a short range for rifle practice in the vicinity of Brooklyn, and Bay Ridge and Fort Hamilton are mentioned as desirable locations. It is not improbable that steps looking to the leasing of lands and fitting up such a range will soon be taken. If no better plan presents itself, a range is spoken of to be managed and controlled by a joint stock company.

BOSTON RIFLE CLUB.

GRANTVILLE, Mass., Nov. 28, 1875.

EDITOR *FOREST AND STREAM*:—

At the meeting of our rifle club at Spy Pond, on Saturday, the 27th of November, the new targets, 5x4 feet, with bullseye, centre and inner of the same size as in Wimbledon targets were used. The club is gaining strength every day. The following scores were made, the gentlemen present being divided into three squads of ten each. Spy Pond Range—Conditions—Distance, 200 yards; rifle, any; position, standing. Wind, fresh from the targets:—

Sea and River Fishing.

FISH IN SEASON IN DECEMBER.

Striped Bass, <i>Morone lineatus</i> .	Weakfish, <i>Cynoscion regalis</i> .
SOUTHERN WATERS.	
Pompano, <i>Trachinotus carolinus</i> .	Grouper, <i>Epinephelus nigritus</i> .
Drum (two species.) Family <i>Scia-</i>	Trout (black bass,) <i>Centropomus</i>
Kingfish, <i>Menticirrhus nebulosus</i> .	Striped Bass or Rockfish, <i>Morone</i>
Sea Bass, <i>Sciaenops ocellatus</i> .	lineatus.
Sheepshead, <i>Archosargus probato-</i>	Tailorfish, <i>Pomatomus saltatrix</i> .
cephalus.	Black bass, <i>Micropterus salmoides</i> .
Snapper, <i>Lutjanus cactus</i> .	<i>M. nigricans</i> .

[Under the head of "Game and Fish in Season" we can only specify in general terms the several varieties, because the laws of States vary so much that were we to attempt to particularize we could do no less than publish those entire sections that relate to the kinds of game in question. This would require a great amount of our space. In designating game we are guided by the laws of nature, upon which all legislation is founded, and our readers would do well to provide themselves with the laws of their respective States for constant reference. Otherwise, our attempts to assist them will only create confusion.]

FISH IN MARKET.—The cold snap of the present week has interfered somewhat with the operations of the fishermen and temporarily lessened the supply of fish. We quote striped bass from Rhode Island, 20 to 25 cents per pound, according to size; smelts, from Maine, are abundant at 18 cents; bluish are still being caught in quantities in southern waters, and sell for 12 cents per pound; frozen salmon, 50 cents; mackerel, 20 cents each; white perch, 15 cents per pound; Spanish mackerel, frozen, 60 cents; green turtle, from Key West, 20 cents per pound; terrapin from Savannah, \$8 to \$12 per dozen; frost fish, 10 cents per pound; halibut, 20 cents; haddock, 10 cents; codfish, 10 cents; blackfish, 15 cents; flounders, 10 cents; eels, 18 cents; lobsters, 10 cents; sheepshead, frozen, 25 cents; pompano, frozen, \$1; whitefish, 18 cents; pickerel, 18 cents; salmon trout, 16 cents; brook pike, 10 cents per pound; hard shell crabs, \$6 per 100; scollops, 80 cents per gallon; soft clams, 40 to 60 cents per 100.

—We saw last week an old relic in the shape of a Castle Connell rod, which did duty seventy years ago on the Dee, the Liffey, and Shannon, when poachers and close seasons were unknown, and all the efforts of the anglers of the day could not deplete the populous streams of Ireland. It is a ponderous implement of greenheart, full twenty feet in length, in three sections, splice jointed, and looks as though it could lift a hundred yards of line if there were only muscular power enough at the butt. It is the property of T. C. Clarke, Esq., of Philadelphia, President of the Phenixville Bridge Company, and we regret that we have forgotten who was the original possessor. We know, however, that he was contemporary with the earliest disciples of old Izaak; and in contemplating the rod we are jealous that it cannot speak and tell of its victories won long ago, when fly-fishing was in its infancy, and the art coeval with its primitive excellences. It was the best of its day and generation, but must now take second place to the inimitable split bamboo, which, we are informed by friends on both sides of the Atlantic, is rapidly gaining favor with transatlantic anglers, who are constrained to concede its superior merits. A large number of split bamboo and trout rods have been exported to Europe within a few months, and no angler considers his repository complete without one; just as our sportsmen are fain to include an English gun in their field outfits.

—A great many whitefish are now being taken with spear and net in Keuka Lake, Yates county, New York. They are large and fat.

—Shad have made their appearance in the St. Johns River, Florida. The editor of the *Jacksonville Press* devaloured the first one caught.

—The city of Rochester is to be supplied with pure water from Hemlock Lake, situated twenty-five miles distant. A correspondent says this lake is noted for its fish and fishing; in the Summer months it is a favorite place of resort.

—At the foot of the lake is the Jacques House, a large and commodious building that is thronged during the Summer months with visitors, who ever delight in the kind hospitality of the proprietor, Mr. A. Kendall. On the western side is the Lake Shore House, a newly erected structure of modern style, under the immediate supervision of Gough Brothers, whose courtesy will ever be remembered by their many visitors. Situated also on this side are many cosy cottages, the property of private individuals. On the eastern side is located the Lima House, Mr. F. P. Bishop, manager, and Half-way House, made famous by the abundance of trout caught in that vicinity, and the regular stopping place for the steamer Seth Green, that plies its way regularly each day to the head of the lake.

—The Lancaster *Examiner* says: "Yesterday while a raft belonging to Mr. Weaver, at Marietta, was passing down the Susquehanna River, just at the Conewago Falls, above Collins Station, it was beset by a school of black bass numbering probably 200, all of which leaped up out of the water on to the raft. The raftsmen tried to secure the fish and succeeded in getting about twenty-one of them, which weighed in the average from three-quarters to two and a half pounds. Judge Libhart is our authority for this item, and he also informed our reporter that several boys who were lifting outlines, a day or two ago, in the Susquehanna River, were astonished somewhat when five black bass leaped into their boat."

Black bass have a propensity to jump over obstructions, and incidents are frequent where they have leaped into boats and been captured.

THE FISHERIES.—There have been 40 arrivals of the fleet the past week, as follows, 29 from the Banks, 9 from Georges and 2 from the Bay. They have landed 1,450,000 pounds of Bank codfish, 63,000 pounds Georges codfish, 116,000 pounds fletched halibut, 45,000 pounds Bank halibut, 2,700 pounds Georges halibut, 150 barrels of Bay mackerel.

There is one Bayman yet to arrive, the Abigail Brown, which will wind up the business. The Georgesmen are being hauled up as fast as they arrive. There will be about fifteen sail of vessels follow the La Harve Bank and Georges fishing through the Winter. Six of the herring fleet have sailed the past week, two for Newfoundland and four for New Brunswick. The shore Winter fleet comprising about thirty sail of vessels, have now commenced operations, and are doing a fair business in supplying the fish dealers.—*Cape Ann Advertiser, Nov. 27th.*

—Since January 1st up to the present date there have been one hundred and five men lost in the fisheries from the port of Gloucester. The entire loss in 1874 was sixty-eight. In 1873 there were one hundred and seventy-four lives lost.

—Our correspondent "Oconomowoc," of Milwaukee, who described the coming bass rod long ago, writes to offer the following testimony in favor of the Orvis reel in bass fishing. We take pleasure not only in acceding to his wishes, but in endorsing his opinion:—

"The angling fraternity will rate Mr. C. F. Orvis a true benefactor for the invention of his excellent reel. I have fully tested it, and have realized all that its inventor claims for it. It is simple, cheap, durable, and practicable, and as regards workmanship is neat, well finished, and comely. The perforations render it very light, and assist very much in drying the line and freeing it from sand and grit. Its price—five dollars—places a good and reliable reel within the reach of the most impecunious angler. For fly-fishing it is as good as any other click reel costing twice as much, while in fishing with the minnow for black bass, pickerel, pike perch, etc., it is eminently fitted. For bass fishers who find a difficulty in controlling a free-running multiplying reel in casting, the Orvis reel is the great desideratum; for as the reel, from its narrowness, takes up the line evenly without any guidance from the angler, so in casting the click exerts just enough of resistance in casting the minnow to prevent over-running of the line upon the reel. A minnow can thus be cast thirty yards with ease, while the reel, as it were, takes care of itself. This will be 'just the thing' for a majority of bass anglers. Being nickel plated, it will not rust or tarnish, and although not a multiplying reel, takes up the line quite rapidly on account of its extreme narrowness. Mr. Orvis has proven himself a true friend to his brother anglers by furnishing them with rods and reels of unusual excellence at mere nominal prices, and will no doubt be rewarded by large sales during the coming season. They would make very appropriate and acceptable 'holiday presents,' which our sportsmen's wives, sweethearts, and sisters will make a note of.

OCONOMOWOC."

SALMON FISHING ON THE NOYO RIVER, ON THE NORTHERN PACIFIC COAST OF CALIFORNIA.

SAN FRANCISCO, November, 1875.

EDITOR FOREST AND STREAM:—

On the 30th of October my nephew, P. F. Hooper, and I started from this city bound for the River Noyo, which flows into the Pacific Ocean about 200 miles north of San Francisco. We took steamer to Donahue Landing, and thence railroad to Cloverdale City. Here we remained for the night. From Cloverdale we went by stage to the North Fork of the Navarro River, which was one day's journey. There we slept, and the next morning proceeded by another stage—a journey of fifty miles—to the place of our destination—a small tavern on the banks of the Noyo, which we will speak of hereafter. The journey from Cloverdale to the vast forests of redwoods (*Sequoia sempervirens*)—a timber in great request for building purposes here—was through a most attractive and beautiful country, chiefly of softly rolling hills and rather lofty mountains, all covered with the lovely vegetation characteristic of the finest valleys of this State, such as the live oak, white pine, madrona, with its red berries and glossy laurel-shaped foliage, manzanita, with crimson bark, buckeye or horse-chestnut, and numerous other handsome trees, shrubs, and evergreens, mostly of fine shape, with natural pastures among them, parti-like, and appearing in many points of view as though planted with the most skillful art of the best landscape gardening, the chief features of the scene being a mixture of pastoral and agricultural. A portion of this region is called Anderson's Valley and Round Valley, affording splendid landscape views, such scenery as would certainly inspire a poet. Part of our traveling was through the redwood forests, which, on this north coast, extend about 150 miles north and south and about fifty miles east and west. In these immense woods there are many lumber camps and mills, though the latter are mostly at the mouths of the many rivers and creeks emptying into the Pacific. Many of these giants of the forest—the redwoods—are over 300 feet in height and from 12 to 15 feet in diameter at their base. In our passage through the forests we encountered some heavy rains, but on emerging from them on the shores of the ocean the weather cleared up delightfully, the sun shone brightly, and the grand Pacific, with its enormous breakers beating against the rocky shores, opened clearly and grandly upon our enchanted vision. We reached the Noyo River late in the evening, just about sundown, but with sufficient light to notice the numerous salmon, which had lately entered the stream, leaping and breaking the water in all directions. The next morning, you may be sure, before the sun made his glorious appearance above the horizon we were ready in our boat, armed *cap-a-pie* for our contest with the most valuable and highest esteemed of all our fishes—the lordly salmon. Our mode of warfare in these waters at this season was with the large red and silver spoon bait armed with a triangle of hooks, trolling with rod and reel from the boat's stern. One of us rowed alternately while the other fished. Our boat was rather too heavy to row very fast, which we found the best way to entice the fish to our spinning spoon bait. The first day or two we only took seven fish, but we soon discovered what was the most killing spoon, which was a rather large one with much red about it—that is, one side of the spoon red with a small bunch of red worsted between the triangle of hooks. In seven fishing days at this point we captured seventy-three salmon, weighing in all 642½ pounds, and averaging 8½ pounds each. They were of the hook-bill species, of good game qualities, but inferior for the table compared with the Sacramento River salmon, being rather dry and not near so tender in flesh. Their average weight is also far from being as large, as the biggest we took was only thirteen pounds, while the finer shaped and much better flavored Sacramento *quinnat* species average 27½ pounds each. Neither is the hook-bill kind so handsome in the mouth and head as the San Francisco market salmon from its bay and tributaries. The hook-bill has its upper jaw projecting under its lower, both jaws being armed at their ends with tusks or teeth, which are much larger in the males, as are also their hooked bills. Toward Winter the finer and more perfect Sacramento sort appear in the northern rivers after the hook-bills, as do also toward Spring the still more valuable salmon trout, that are longer in their bodies, more delicate and nice in their flesh, which is of a much lighter red color. They very much resemble the best species of our salmon in their silvery lustre, but their heads are slightly smaller, and the shape of their tails are nearly square compared with the forked ones of the former. These salmon will only take the fly in the Spring of the year, as we were informed and found by our own experience. If acceptable to you I will say something concerning the other game we saw as well as several kinds of vegetation.

I had nearly forgot to mention the excellent accommodations we enjoyed at the Noyo House or tavern, kept by Mr. John Byrnes, our most obliging landlord, who did all he could to make our visit pleasant and enjoyable. The fare was very good and varied, and was better than we have ever experienced in any part of California outside of San Francisco. The terms were only \$1.50 per day, with the use of boat. The whole amount of our expenses for two persons for the trip was a very little over \$100.

E. J. HOOPER.

ANGLING IN NORWAY.—Occasionally an American angler finds his way to Norway, but it is very seldom. Henry Harbeck, Esq., who is well known to sportsmen here, has spent two seasons there. He has recently returned to Paris, France, where he now resides, and has kindly favored us with a synopsis of his last summer's trip, giving routes, distances, fares, etc. Doubtless the information will be useful to some of our readers, whom his glowing accounts may induce to visit the Norway rivers for salmon and trout. Here is his log:—

No. 33 RUE DE LA PAIX,
PARIS, France, November, 1875.

EDITOR FOREST AND STREAM:—

I started from London and went to Paris, on to Cologne, about twelve hours and a half by rail; from there to Berlin, another twelve hours. From there to Hamburg, about five hours, but between Cologne and Berlin stopped at a beautiful city called Hanover, formerly a separate kingdom, but now included in Germany; from Hamburg to Copenhagen, about fourteen hours—five by rail—the balance from Keil to Koeson (Keil in Schlesweig, to Koeson in Denmark) by steamboat. Keil is quite an important naval port of Germany. It formerly belonged to the Danes—Schlesweig-Holstein. The friendly feeling between the two nations is not great or strong. One route, by which you can get quicker to Hamburg, is direct from Cologne to that place in about twelve hours. At Christiania, the capital of Norway, there are good hotels. It takes about sixteen hours, and by the best boat from fourteen to sixteen. They touch Gottenburg, in Sweden, on the way. These are small steamers, but one is a very fine boat which travelers, if they can spare time, should always wait a day or two for. Copenhagen will be likely to interest them anyhow, it being a fine city of old palaces, fine squares and a neat and polite people. The English language is spoken by many, especially at the hotels. You can make them easily understand you on the steamboats. From Christiania you get carriages, which are one-horse conveyances; you drive yourself, and horses are furnished you at from one to one and a half Norwegian miles; they make about seven of ours. The station masters are appointed by the Government. The price of horses is about two marks the mile, and four to six shillings for the post boy—that is, the boy that brings the horses back from one station to another. A mark is about twenty-six cents, twenty-four shillings to a mark. The average expense for lodging, horses, etc., is about a pound a day. Food and lodging can be obtained at almost all the stations. If they sometimes have no meat, they have bread, eggs, coffee, cream, and often trout. But this is only a little description of the best way to travel through the country. Now, as to the fishing. I leased a part of a river for salmon fishing in the Summer of 1874, for which I paid £10 sterling, or about forty-five Norwegian dollars; but that is cheap, as the best rivers frequently bring from £40 to £140. I believe I am the only American angler who visits Norway. The rivers are mostly fished by Englishmen. The climate is very fine, and I have never been troubled by mosquitoes, or black flies, or punkies. I arrived at the river the 20th of June, and it being very early in the season for that river did not get fast to a salmon for four days. That was in the morning. In the afternoon the river, or my pools, became very muddy, caused by a clay bank washing away, which had often taken place for many years. Then I stopped fishing and went away to another part of the country; came back in about a week and the water was too high, but it lowered in a few days, and in three weeks time I killed about 150 pounds of salmon and sea trout. The sea trout are different from the Canadian trout in their game qualities, they being the strongest fresh water fish I ever saw of their size. I caught none over six pounds weight, and as to the salmon in that river, I never saw such strong ones, although I have fished wild rivers in Canada and Ireland. They immediately take down stream and are like race horses. They are a long fish and terrific runners. I never saw their equals. The rivers differ, though; in some they are rather more gamey than in others. They were not large, the largest being only eleven pounds; but in game I never had more sport with a twenty pounder. They run small in that river, though. This Summer, being better acquainted with the country, I had much heavier fishing; but the river brought a considerable higher rental. If you have any brother of the rod going to that country I would be happy to give him any information I can, and if possible put him in the way of some angling. I will write you further at some future time. H. HARBECK.

—'Is thy servant a dog that he should do this thing?' The despicable meanness which is signified by the sentence quoted above, shows the odium in which dogs were held by the Jews about four thousand years ago. Have dogs, then, advanced in civilization with mankind? Undoubtedly they have; for as it must ever be, the higher nature raises the lower one. Dogs are the companions of men, and partake of their vices and virtues, seldom being more depraved than their masters, but often morally superior to them. If evil communications corrupt good manners, so do good communications improve bad manners; and thus the dog has been elevated by communion with human beings, although we must admit that the reverse seems to be the case. Perhaps, however, the elevation of the dog is not the least among the many reasons which may be given for humanity to animals. It is no small thing to achieve—the cultivation of a jackal, or wolf, or fox, until it has reached the high standard of a well-bred gentleman's dog. This alone would repay dog lovers for their devotion, because a nature has been developed capable of sympathizing with man under many varied feelings and circumstances of life, and is made available in times of danger for the protection of life and property. Some people say when a noble dog has saved a human life: "Well, he was a good dog; but he only followed his nature. Dogs of his breed could scarcely do otherwise. There is no proof of courage in the narrative, for the animal simply followed his instinct." When a human being has accomplished a daring and brave act, medals or other decorations are bestowed on him, poems are composed to his honor, and his friends assemble and embarrass him with extravagant laudation. No one thinks of saying to him: "You could not have done otherwise. Considering what your training and avocations have been, it would have given you pain to decline the daring exploit." However true such observations may be—and they are true in many cases—no one grudges a brave man the honor that is due to him, nor thinks of detracting from his achievement. It may be objected that the difference between a dog and a man risking their lives for the good of others resides in a consciousness in man, which is not present in the dog, that he submits himself to danger, even in the presence of responsibilities of a social and domestic nature; and that such consciousness provokes a struggle in his own breast which is finally overcome by a sense of duty. While we decline to vouch for the degree of consciousness present in a dog's mind when he performs a daring act, we dare venture to say that in many cases in this respect a noble dog is not inferior to many men. He rushes through flames which he knows will consume him; leaps from heights, attacks armed men, and in other ways exposes himself to death voluntarily in defence of his master; and what higher evidence can we find of fidelity and true courage in the human being?—*Animal Kingdom.*

Rational Pastimes.

YALE.—The *Record*, in commenting upon the recent sculling match, in which Kennedy won such an easy victory over Bainbridge, remarks that the event has a significance which has not been noticed, and considers that it should be attributed mainly to the merits of the English stroke, and not to Kennedy's greater endurance and physical strength, as Bainbridge had before met and defeated men who were greatly the superior in this respect to his late antagonist.

STEVENS INSTITUTE.—A match game of foot ball was played on Thursday last between a twenty of the Stevens Institute, headed by Kingsland, captain, and a twenty of Rutgers College, headed by Miliken as captain. Kent of '76, Stevens and Owen of '78, Rutgers, were umpires, and Price of Columbia, was referee. Stevens won the first goal on a splendid kick by Shippen. Stevens also won the second goal in 16 minutes and the third in 22 minutes. Rutgers won the final goal in the remarkable time of 3 minutes.

DARTMOUTH.—The Faculty of Dartmouth College are arranging a plan for representing the college at the Philadelphia Exhibition. Samples of student's work will be sent, and other methods of showing the workings of the college will be employed.

—A circular letter, signed by the Presidents of the Yale and Harvard Athletic Clubs, has been sent to all the colleges which were represented at Saratoga last year, inviting them to send delegates to Springfield on the 4th of December to form an athletic association.

SCOTTISH-AMERICAN GAMES.—The members of the Scottish-American Athletic club spent Thanksgiving day in deciding their first annual athletic competitions at Jones' Wood. The performances commenced with the light hammer throwing, in which there were twelve competitors; Charles McLetchie, allowed 15 feet, throwing it 93 feet 4 inches. Following this was a 100 yard race, run in heats, A. Tasker and L. D. Robertson tying in the first, F. Dykes, Jr. (8 yards) winning the second, J. Grassick, (7 yards) the third, and D. B. Fleming, (7 yards) the fourth. The final heat was won by Grassick in 11½ seconds.

The next was a one mile walk, which was won by Thos. McEwen. John Knox, Jr., in the running high leap, leaped 5 feet three inches, and won. The half-mile race was won by B. Greig, in 2 minutes 9½ seconds. In putting the light stone, John Gassick (scratch) was first, he throwing the stone 37 feet 7 inches. In vaulting with the pole John Knox, allowed 2 feet, vaulted 9 feet 3 inches; Frank Duke (scratch) 8 feet 4 inches. The quarter mile race was won by David F. Knox, who had an allowance of 28 yards, in 1 minute 1½ seconds; Thomas McEwen, allowed 20 yards, was second. In throwing the 56-pound weight, A. Thomson, allowed 3 feet, threw the weight 31 feet 3 inches; H. Graham, allowed 5 feet, threw it 20 feet 2 inches. The sack race was won by D. F. Knox, allowed 35 yards; L. D. Robertson, allowed 60 yards, was second. The one mile race was won by William Parker (scratch) in 5 minutes and 20 seconds; William Hume, second, allowed 50 yards. In tossing the caber, M. F. More (scratch) tossed it 37 feet 8 inches, and R. Williamson, allowed 1 foot 6 inches, 35 feet 8 inches. The three mile walk was won by Thomas McEwen (scratch) in 28 minutes; John Low, allowed 2 minutes and 15 seconds, was second.

The judges were George and Mathew Goldie, D. M. Sterns and Mr. Giles. The entertainment did not come to an end till long after dark.

—The gladiatorial tournament which was held during the past week at Gilmore's Garden, better known as the Hippodrome, was brought to a conclusion on Saturday evening last. The entertainment during each evening comprised fencing, boxing, bicycling, Græco-Roman wrestling, club swinging, and feats of purely muscular strength with dumb bells and cannon balls. In each instance a champion, selected by the house, was pitted against all comers, and bravely did they uphold the honor of the selection. Mike and Joe Coburn were respectively the house champions in light and heavy sparring, M. Regis Senac defended himself with the foil, Mr. R. A. Pennell was the Samson of the occasion, and "brought down the house," while Mr. J. Messenger played with cannon balls as though they were marbles. The bicycle races were unusually good, Mr. McClelland doing five miles in excellent time, and M. M. Christol, Bauer, Du Mortier, and Grace distinguished themselves as Græco-Roman wrestlers. In fact, this performance constituted the *piece de resistance* of the entertainment. Equally interesting, however, was the set-to on Friday evening between Chambers and Edwards, champion light weights of the P. R. Altogether the tournament was a grand success, affording gentlemen an opportunity of witnessing those contests requiring strength, agility, and science, without any debasing concomitants. Mr. Fred J. Englehardt, under whose supervision the affair was conducted, is entitled to much praise for the admirable manner in which it was managed.

THE RECORD FOR 1875.

As in 1874 we publish exclusively the full table of the championship contests of 1875, which gives the date and score, as well as the name of each of the contesting clubs in every match game won and lost as the championship scores of 1875. The table in question—see another page—contains the totals of won and lost games, but not the drawn games or those forfeited, neither being included in the table list of games played. The list of drawn games was eleven, which with the 333 games won and lost makes a grand total of 344 games played. The club names are placed in the order of the percentage victories. Thus Boston as 71-8; Athletic, 53-20; Hartford, 54-28, making them first, second and third on the list. Of the seven clubs which played their quota of six games with each other, the Mutuals stand last on the list. The following is the record of drawn games not included in the table:—

May 27—Boston vs. Athletic, at Philadelphia, ten innings.....	3	3
June 28—Boston vs. Athletic, at Philadelphia, ten innings.....	10	10
Aug. 3—Mutual vs. Chicago, at Brooklyn, five innings.....	1	1
Aug. 5—Hartford vs. Mutual, at Brooklyn, ten innings.....	1	1
Aug. 12—Mutual vs. Hartford, at Hartford, nine innings.....	1	1
Sept. 2—Boston vs. Philadelphia, at Philadelphia, ten innings.....	8	8
Sept. 14—Hartford vs. Chicago, at Chicago, nine innings.....	1	1
Sept. 27—St. Louis vs. Philadelphia, at Philadelphia, nine innings.....	5	5
Oct. 14—Hartford vs. Athletic, at Hartford, nine innings.....	10	10
Oct. 19—Athletic vs. Chicago, at Philadelphia, eight innings.....	1	1
Oct. 29—Mutual vs. St. Louis, at Brooklyn, seven innings.....	5	5

CHAMPION GUNS OF ENGLAND PAPE'S Unrivalled Sporting Guns

Stand unequalled in every contest. Their performance at the London Trials of 1875 beats the records of any maker in the world.

1875. 12-Gauge, Choke Boring. Exhibitor.
Maker of Gun. Greener.
1st—Pape. Davidson.
2d—Pape. Davidson.
3d—Pape. Pape.
Out of a class of 68 guns, 3 out of the 6 best were made by Pape. The Greener gun was protested against on the spot for having its score false counted, the fact proven there, and afterwards confirmed by same gun being shot for two days per week for six weeks in succession, when its average score only took 24th place, its very best score being greatly below the scores of the best six guns.

1875. 12-Gauge, Old Sporting Bore. Exhibitor.
Maker of Gun. Davidson.
1st—Pape. Davidson.
2d—Pape. Davidson.
1875. Long Range, 60 yards, Choke Boring.
1st—Pape. Davidson
60 yards, Long Range, Sporting Boring.
1st—Pape. Davidson
Those champion Long Range guns, only 7 pound weight, with a charge of 3½ dr. to 1½ oz. shot, beat the best 8 bore Greener gun at 60 yards; weight, 15 lbs.; 6 drachms and 2½ oz. shot.
1875. The Sportsman's Sub. Cup, valued at £45, was also awarded to W. R. Pape, for the original invention of choke boring. Winner of the London Gun Trials of 1858, 1859, 1866. Address

Miscellaneous

THE HAZARD POWDER CO., MANUFACTURERS OF GUNPOWDER.

Hazard's "Electric" Powder.
Nos. 1 (fine) to 5 (coarse). Unsurpassed in point of strength and cleanliness. Packed in square canisters of 1 lb. only.

Hazard's "American Sporting."
Nos. 1 (fine) to 5 (coarse). In 1 lb. canisters and 6½ lb. kegs. A fine grain, quick and clean, for upland and prairie shooting. Well adapted to short guns.

Hazard's "Duck Shooting."
Nos. 1 (fine) to 5 (coarse). In 1 and 5 lb. canisters and 6½ lb. kegs. Burns slowly and very clean, shooting remarkably close, and with great penetration. For field, forest and water shooting it ranks any other brand, and it is equally serviceable for muzzle or breech loader.

Hazard's "Kentucky Rifle."
FFFFG, FFG, and "Sea Shooting" FG, in kegs of 25 12½ and 6½ lbs. and cans of 5 lbs. FFG is also packed in 1 and ½ lb. canisters. Burns strong and moist. The FFG and FFG are favorite brands for ordinary sporting, and the "Sea Shooting" FG is the standard Rifle powder of the country.

SUPERIOR MINING AND BLASTING POWDER.
GOVERNMENT CANNON AND MUSKET POWDER; ALSO SPECIAL GRADES FOR EXPORT, OF ANY REQUIRED GRAIN OR PROOF MANUFACTURED TO ORDER.

The above can be had of dealers, or of the Company's agents in every prominent city, or wholesale at our office,

For Florida.

PHILADELPHIA AND SOUTHERN Mail Steamship Company's line to Savannah, Ga., sailing every Saturday, from Pier 23, below Pine street, Delaware River, at 12 o'clock noon, making close connections through to all points South. The line is composed of the steamships JUNIATA and WYOMING. The Wyoming does not carry passengers. The Juniata is a favorite ship with the traveling public, having passenger accommodations of the most superb character. She has recently been refitted and elegantly furnished with everything requisite to the comfort and convenience of passengers.

Families en route for FLORIDA, Georgia, Alabama, and even as far as New Orleans, will find the Savannah route the most desirable for comfort, as well as the most economical. Through trains of the Central Railroad of Georgia, and Atlantic and Gulf Railroad, Florida, leave Savannah every morning and evening. The Florida steamers leave Savannah three days in the week for all points on the coast.

For through passenger tickets and bills of lading to all points in Florida, Georgia, Alabama and Tennessee, apply to WM. L. JAMES, General Agent, 416 South Delaware avenue, Philadelphia.

TO YACHTSMEN VISITING FLORIDA.

SARASOTA, Manatee county.

TO SPORTSMEN VISITING FLORIDA
this Winter I will furnish a schooner yacht of eleven tons, that will accommodate about a dozen persons. I will let them have her and two men to run her, and a small boat, for eight dollars a day. I will meet them at Cedar Keys or Key West, whichever is most suitable to them; only let me know when to meet them.
WM. S. BENNET,
Capt. schooner Cary M.

Sportsmen's Goods.

Orange Sporting Powder.

ORANGE LIGHTNING POWDER.

The strongest and cleanest Powder made. Nos. 1 to 7, packed only in sealed 1 lb. canisters. The coarser sizes especially are recommended to owners of fine breech-loading guns, giving great penetration with very slight recoil.

ORANGE DUCKING POWDER.

For water fowl. Very strong and clean. Nos. 1 to 5. Packed in metal kegs of 6½ lbs. each, and in canisters of 1 and 5 lbs.

AUDUBON POWDER.

Very quick. For woodcock and quail Nos. 1 to 4. Packed in metal kegs of 12½ lbs. and 6½ lbs., and in pound canisters.

ORANGE RIFLE POWDER.

The best for rifles and for all ordinary purposes. Sizes F.g, FF.g, FFF.g, the last being the finest and most used. Packed in wood and metal kegs of 25 lbs., 12½ lbs., and 6½ lbs., and in canisters of 1 lb. and ½ pound.

All of the above give high velocities and less residuum than any other brands made.

LAFLIN & RAND POWDER Co.,
21 Park Row, N. Y.
(OPPOSITE ASTOR HOUSE.)DITTMAR POWDER
MANUFACTURING CO.

MY NEW IMPROVED POWDER can now be loaded from an ordinary powder flask; grains hard. Use it now like Black Powder. No fear of overloading. Burns slow now. No fouling of the gun. Little or no smoke. Little or no recoil. Not very loud report. Less heating of the barrel in rapid firing. Good penetration and good pattern. Safe to keep, as it does not explode if set on fire, except well confined. Shells furnished loaded with powder only, if desired. None genuine without my signature on the can. CARL DITTMAR, NEPONSET, MASS.

H. C. Squires, No. 1, Courtlandt st.
New York.

THE GREAT
London Gun Trial,
1875.

W. W. GREENER begs to inform his numerous clients in the United States that he has been very successful in the above trial, having secured the first prize, a silver cup, value 40 guineas—class 2 for 12 bores; also winner in class 1 for 8 and 10 bores, and class 4 for 20 bores. He has won in all the classes for improved boring, which is upon a different plan to any other maker, and is far superior in the three most essential points, viz., PATTERN, PENETRATION, and REGULARITY OF SHOOTING.

Mr. HENRY C. SQUIRES, of No. 1 Cortlandt St., New York, is now importing my DOUBLE CLOSE-SHOOTING GUNS to order, an invoice of which will be shipped to him on the 1st July, and can be examined about the 15th. All special orders given to Mr. Squires will be carefully filled. A full report of the GREAT TRIAL, showing the marked superiority of my guns over guns made by Dougal, Pape, Tolley, and others, will shortly be published, and can be had on application at No. 1 Cortlandt St.

W. W. GREENER,

Champion Gun Maker,

St. Mary's Works, Birmingham, England.

HENRY C. SQUIRES, of No. 1 Cortlandt street, has just received an invoice of these close-shooting guns, and from him any information in reference to the results of the Great Trial can be obtained on application.

H. L. DUNCKLEE'S

PATENT

CAMPING and MINING

STOVE.

PATENTED JUNE 22, 1875.

Outside dimensions, packed, 12x12x20 inches. Weighing only 25 pounds, very durable, will cook for ten persons, and is especially adapted for camping purposes. The ware consists of 8 qt. kettle, 6 qt. tea kettle, 2 qt. coffee pot, fry pan, round tin pan, 2 square pans, dipper, gridiron, tent collar, 8 ft. funnel, and an oven that will roast 15 pounds beef.

The ware is so constructed that it nests and packs in the oven, and the oven and funnel pack inside the stove, as represented in cut 2, leaving room for packing half a dozen plates, knives, forks, spoons, and drinking cups. Price, complete, \$15.

Photo-Lantern Slides a specialty. Manufacturers of photographic materials. Awarded First Premium at Vienna Exposition. aug-17

J. D. DOUGALL'S
EXPRESS SHOT GUNS.

(Title registered.)

SHOWN by trials at Wimbledon by Editor of the Field to possess the GREATEST PENETRATION and therefore LONGEST RANGE—thus: Circle, 30 inches; 300 pellets; average, 191; penetration, 37. The Editor's trial of Greener guns with 240 pellets of same shot and same charge of powder, gave 180, and penetration 30, although there were 40 more pellets in each charge. Should any controversy arise as to the durability of these new systems, we herewith warn all beforehand that our system is our own invention (though founded on the American idea) and is DUBBLE, a fact remarked on by the Field, that the guns tried had been in use during last season, and references permitted to the owners. Send for Illustrated Circulars to

59 St. James's Street London.

W. W. GREENER'S

DOUBLE CLOSE-SHOOTING GUNS. Winner of the Silver Cup, value 40 guineas, at the Great London Field Trial 1875, beating 33 competitors with 68 guns, also winning in all the other classes for the Improved System of Boring. These guns will kill from 80 to 100 yards, loaded with large shot, and will shoot well with small shot with a less powder charge than guns bored upon the old system. For report of the Gun Trial apply to Messrs. McLaren, Williams & Co., Agents, St. Louis, U. S. A. Address

72 ST. JAMES STREET, LONDON.

WILLIAMS & POWELL,

Gun and Rifle Manufacturers,

Call the attention of the Sportsmen of America to the extreme SIMPLICITY, STRENGTH and DURABILITY of their New Patent "SIMPLEX" Breech loader and INDEPENDENT EXTRACTOR.

The parts in this new action are so few (only two,) its mechanical soundness so thorough, and the strength and simplicity of the action so great, that W. & P. feel sure it will supersede all the complicated and manifold grips now in use, its one powerful grip being far stronger than any double, treble or quadruple grip now used. In this new action LEVER and GRIP ARE ONE SOLID PIECE OF STEEL and the ANGLE of the BODY is left in its ENTIRE STRENGTH.

Drawings of action and extractor will be sent on application, and orders may be forwarded through any of the best houses in the States for execution in the Spring.

Guns guaranteed to make patterns of from 160 to 230 with No. 6 SHOT AT 40 YARDS, as desired.

THE

PAPER STEM PIPE.

Just the Thing for Home and Camp Use.

Supplies a want which smokers have long felt—a pipe which shall give simply the taste and odor of tobacco smoke. This pipe never accumulates rank smelling liquid in stem or bowl, but is always clean and sweet. The bowl and mouthpiece are permanent, but the stem is of porous paper, to be laid aside after a few days' use and a new one fitted. Extra stems accompany each pipe. The price of extra stems, when not furnished with the pipe, is as follows: Four and a half and seven inches, 5c.; twelve inches, 15c. Sold by pipe and cigar dealers generally, or a complete sample sent by mail for \$1 by

JUST OUT!!

Camp Life in Florida.

By CHARLES HALLOCK,

AUTHOR OF THE FISHING TOURIST.

This is a most reasonable book for Sportsmen, Tourists, Invalids, and Settlers, and has been long needed by Winter tourists to Florida and persons seeking settlement there. It gives a full classification of the game and fish of the Southern Peninsula, routes of interior and coastwise travel, the agricultural resources of the country, and sites for settlement, hints for camping out, resorts for game, hotels, and such other information as will be of great benefit to visitors seeking Florida for health, pleasure, exploration, or permanent settlement.

A SPECIALTY.

AGENTS:

for the following celebrated makers:
W. & C. SCOTT & SONS (winners at the Interna-
tional Gun Trial of 1873); J. P. OLABROUGH &
BRO.; P. WEBLEY & SONS, and WESTLEY
RICHARDS.

HOLABIRD'S Shooting SUITS,
DIXONS & HAWKLEY'S SHOOTING TACKLE
STURTEVANT BRASS SHOT SHELLS,
BUSSEY'S PATENT GYRO PIGEON AND TRAP
WITH CASE, AND 100 BIRDS.

Black's Patent Cartridge Vest.

This Vest affords the best ar-
rangement yet invented for carry-
ing cartridges. The weight is
so evenly distributed that it is
scarcely felt. Cartridges can be
carried with the heads down in
this vest, which is of great impor-
tance when brass shells are used,
as when carrying them with the
head up the weight of the shot of-
ten forces the wad forward, when
bad shooting is the result. In
ordering send measurement around the chest.

TALLY-HO!

THE fox enjoyed a solemn grin
When all but him had fled;
The lanterns of the whippers-in
Shone 'round his little bed.

How beautiful and bright he came;
He scorned to be decoyed;
Gaunt was his frame, his tail aflame
Like Watson's asteroid.

"O keeper, may I now light out?"
Whispered the fox serene;
"You may;" and leading all the rout
A yellow flash was seen.

One bold, bloodthirsty huntsman took
An awful two-rail fence;
Another plunged into a brook
And has'nt been heard of "sence."

Another slew a Maltese cat;
Another banged his nose;
Another, hunting for his hat,
Broke down a line of clothes.

And one sagacious huntsman stood
Four hours beneath a limb
Of a big tree in Lodi Wood
He thought the beast had clim.

And then arose a pleading sound,
"O Reynard, where are you?"
Ask of the hounds that far around
Send up their "Ullaloo!"

For, ah, the dogs have lost the fox,
And riders lost the dogs,
While horses, minus riders, browse
Down in Passaic bogs.

To see the wounded all brought in,
The stragglers and the pack,
Calm Reynard waits with cheerful grin,
Out back of Hackensack.—Daily Graphic.

For Forest and Stream.

Middle Florida.

MIDDLE FLORIDA is one of the finest countries in the world. All along her sea coast are beautiful bays and inlets; through the country are fine rivers, beautiful lakes, and pearly brooks. She has grand and wonderful springs, whose medicinal virtues are known in all lands. She has magnificent forests of pine, cypress, and hard wood timber, ornamented with the beautiful magnolia and other flowering trees and shrubs. She has vales as delicious as Arcadia, and fields as fair as those of Enna—

"Where Proserpina gathering flowers,
Herself a fairer flower, by gloomy dis
Was carried off."

Her lakes, rivers, bays, and inlets are full of excellent fish. Her sea coasts have an abundance of oysters, fish, turtle, and sponges. Her forests abound in a great variety of game. Her gardens yield the finest vegetables, and have the most beautiful flowers in bloom all the year. Her orchards bear the most delicious fruits and berries, and her vineyards the finest grapes that make the best of wine. It is here the man with delicate constitution can escape from the cold, frost, ice, and snow and enjoy "sunny skies and soft and balmy breezes." It is here the poor consumptive finds relief that medicine cannot give. "Tis here the balm of nature's breath," borne on the soft breezes of the Gulf of Mexico, charged with the healing resinous exhalations of the pine forests, finds its way into the most remote tissue of the diseased lung, and by its mysterious power doing what no drug or medicine has yet done in reviving the blood and bringing to the pallid cheek the bloom of health.

BOUNDARIES, TOPOGRAPHY, ETC.—Middle Florida is bounded on the north by Georgia; on the east by the Suwannee River; on the south by the Gulf of Mexico, and on the west by the Apalachicola River. It is from 120 to 140 miles in length, and from 70 to 80 miles in width. The lands back from the Gulf of Mexico are rolling or undulating, with fine chocolate soil, supported and sustained by a magnificent clay subsoil, rendering them not only very productive but extremely durable. The country contains

a great variety of excellent hardwood timber, interspersed with pine. Much of the timber is very valuable for manufacturing purposes. The country along the coast of the Gulf of Mexico is level, with light sandy soil, covered with yellow and pitch pine timber and grass. It is interspersed with rich tracts or bodies of hammock lands. It is a good stock country, and when cleared up and put in good cultivation it produces fair crops. Peaches, grapes, sugar cane, and vegetables of all kinds grow very finely, and many think that it is equal, if not superior, to the stiffer soils for them. The soil is based upon limestone, commonly called rotten limestone, which, besides carbonate of lime, contains also salts of iron and sulphur. All through this region are found beds of genuine marl.

PECULIARITY.—A peculiar feature in Middle Florida is the great number of lakelets of clear pure water scattered all over the country, varying in size from half an acre to an acre or more in extent. They, as a general thing, are very deep, have no outlet, and contain an abundance of excellent fish. They seem to have been placed here for a wise purpose—to supply the wants of every family at their own doors, without hire or reward, with a splendid article of food.

Another striking feature is the number of creeks, streams and even considerable rivers, rising out of the earth, after coursing a short distance, and frequently many miles, suddenly disappearing in the earth and are lost to all further knowledge, while others are known to reappear and flow regularly to the Gulf of Mexico. Near Tallahassee there are several "sinks" into which small streams flow and disappear. These sinks vary in size, and many of them are of great depth. Quite a number have neither any inlet nor outlet, so far as anything visible is concerned, being no doubt fed by subterranean streams, and subject, in some instances, to sympathetic action with the tides of the Gulf of Mexico. Fourteen miles south of Tallahassee is the far-famed Wakulla Spring, "Ponce De Leon's Fountain of Youth," whose waters are so transparent that when a person is sailing over its surface in a boat he feels impressed as he gazes below that his frail bark is suspended in the air, the water having such an exact resemblance to the sky above. A silver five-cent piece on the bottom seems as plain as if in your hand. "The spring will," it is said, "fathom near one hundred feet by five hundred across its surface." It is situated in a dense forest of shrubs and trees, and in looking over it the color resembles the deep blue sky, except near the border, where it has a slight tinge of green from the reflection of the surrounding verdure, which hangs over it in drooping branches and waving festoons. "The beauty of the fountain, the luxuriance of the foliage around it, render this one of the most charming spots" that Florida affords, or that can be found anywhere. The spring is nothing more nor less than a mighty river gushing out of the bowels of the earth, large enough to float vessels drawing six feet of water into the Gulf.

MEDICINAL SPRINGS.—Nature seems to have destined Middle Florida to be a resort for invalids to recruit their health and repair broken constitutions. Scattered here and there all over the country are chalybeate and sulphur springs, whose medicinal waters, prepared in the deep laboratories of nature, give strength to the blood and color to the cheeks of the poor frail invalid. But little or no effort has ever been made to bring these springs into notice, or to let their wonderful curative powers be known abroad. No suitable buildings have been erected at any of them for bathing or for the accommodation of invalids. Persons have frequently come miles and camped by some of them during the Summer season to bathe and drink the waters, and in this manner wonderful cures have been performed.

THE CLIMATE.—Middle Florida has the finest Winter climate in the world, and the steady heat of Summer is not so prostrating as the short but frequent bursts of Summer heat in the Northern States. The thermometer rarely goes below 40° Fahrenheit in Winter, and in Summer it seldom indicates a greater heat than 90° in the shade. The heat is tempered by the almost constant sea breezes from the Gulf of Mexico. The nights are almost always pleasant. The so-called rainy season is in Summer, usually commencing

in May and ending in September. It commences by daily showers for one or two weeks or more, and then a week or two of dry weather, and then the rainy season will come on again. This rainy season is by no means one continuous rain for days without letting up. The rain comes in showers of from a half to one hour or more in continuance, and between the hours of 12 M. and 4 P. M. These showers come up quickly, it rains hard, is soon over, and then is sunshine. They are seldom attended with thunder and lightning. They cool the atmosphere and make the air pure and refreshing. They come up with such regularity that they need not interrupt business, labor, or pleasure only during their continuance, for timely preparation to avoid them can be made if desired. Fogs are seldom seen, and a damp, cloudy, drizzly, rainy day is of rare occurrence. Winter is the driest season, and Spring the next.

HEALTH.—From careful observation and diligent inquiry we are led to believe that in no portion of the Union are there as few diseases as there are in Middle Florida. The ratio of mortality is unusually low, and a remarkable exemption exists from all epidemic and contagious diseases. In Summer, bilious remittent fevers, usually of a mild type, show themselves, and intermittents in the Fall. The chills and fever prevail to some extent where persons expose themselves too much in the night air and in inclement weather.

FOR INVALIDS.—Middle Florida is superior to every other section of the Union for invalids. Its temperature is never too high nor too low to restrain the invalid from taking all the out-door exercise he is equal to. The country is less exposed to the frequently prevalent northern and north-eastern storms, and fierce, penetrating blasts, and having good roads for driving or walking, renders it the most desirable place for the invalid and the visitor to spend their Winters, or for the immigrant to settle in.

FOR THE SPORTSMAN.—In all the counties along the Gulf of Mexico, and in nearly all the heavily timbered lands in the others, are to be found all kinds of game, such as bear, deer, wild turkeys, panthers, catamounts, wild cats, etc. Deer and turkey are abundant. In all the lakes, rivers, and creeks are an abundance of the finest fish, such as trout, perch, jack or hake, catfish, blackfish, bream, etc. On the coast there is the finest of oysters, clams, turtle, and every variety of salt water fish. During the Winter all the lakes, ponds, bays, inlets, rivers, etc., have an abundance of every variety of water fowl. Sportsmen should visit Middle Florida by all means and take a hunt and a fish down on the coast.

PRODUCTS.—All the grains, fruits, and vegetables that are raised in the temperate zone can be cultivated with more or less success in Middle Florida. Cotton has heretofore been king, and the people seemed to care but little about raising any other kind of crops. Under the new system of labor planters are beginning to study more the nature of the soil and its productions, and are fast finding out that they can raise a greater variety here at a profit than in any other section of the Union. Sugar cane is one of the most remunerative crops that can be raised. It has less things to contend with than almost any other field crop. It is seldom injured by insects, dry weather, or frost. It takes about the same labor to cultivate as it does a crop of corn. The manufacturing is the most expensive. The mill, boilers, furnace, etc., cost about \$400. To manufacture ten acres of cane would require the work of six men for forty days, one pair of mules, horses, or oxen at the mill, and another pair to haul the cane from the field. The profit of ten acres planted in cane, from actual experiment, omitting capital required for boilers, mill, troughs for crystalizing, houses for draining, teams, etc., is as follows:—

Dr.—10 days' work of team to break up land at \$1.50 per day..	\$15 00
24,000 seed canes at \$10 per M.....	240 00
15 days' work planting, at 75 cents per da.....	11 25
10 days' work with hoe.....	7 50
15 days' work with cultivator and plow.....	23 50
6 men 40 days, equal to 240 days work, manufacturing, etc., at 75 cents per day.....	180 00
2 pair of oxen 40 days, at \$3 per day.....	120 00
Barrels, etc.....	60 50
Total.....	\$656 75
Cr.—By 3,700 pounds sugar per acre, or 87,000 pounds, at 7 cents per pound.....	\$2,590 00
Showing a net profit of.....	\$1,933 25

Some of the best planters have raised as high as 4,400 pounds from a single acre of land. Cane requires natural strong land, or well manured light land, the latter making a better quality of sugar. After the first planting there is no more expense for seed cane.

Cotton does well everywhere in Middle Florida. The caterpillar is its worst foe, and some years the crop is severely injured by it. Like cane, it requires about the same cultivation as corn. A man can easily cultivate ten acres in cotton and raise enough of other things besides to keep himself, family, and stock on during the year. The profit of ten acres of cotton is as follows:—

Dr.—10 days' work of team to break up the land, at \$1.50 per day	\$15 00
Seed.....	20 00
Planting.....	6 00
Hoeing and thinning.....	20 00
15 days' cultivating.....	22 50
Picking and ginning.....	75 00
Bagging, baling, and strap iron.....	21 20
Total.....	\$179 70
Cr.—By 5,000 pounds of lint cotton, at 12½ cents per pound.....	625 00
Showing a net profit of.....	\$445 25

Upland rice is a very remunerative crop, and yields from forty to sixty bushels per acre. The tobacco raised in Middle Florida commands the very highest price in market, being considered fully equal to the Cuban article by competent judges. The peanut grows very finely, and yields one hundred bushels per acre. Castor bean grows luxuriantly. Irish potatoes grow nicely all winter, and are ready for market in March, April, and May. By care and attention they can be made to grow all the year. Sweet potatoes grow almost spontaneously and very large.

GARDEN VEGETABLES.—All varieties of garden vegetables grow to greater perfection in Middle Florida than in any other section of the Union without doubt. They grow at all seasons, and there is not a month but what a family can have vegetables fresh from the garden to put on the table. The raising of vegetables for Northern markets is already becoming quite a business, and is very lucrative. The demand is getting greater every year with our increased railroad facilities.

FRUIT.—For fruit growing Middle Florida is equal, if not superior, to any other section. Almost every variety can be cultivated with success. From February to December there is one succession of ripening of fruits. Bananas, oranges, lemons, limes, citrons, shaddock, and some other varieties require a little protection in winter from frosts. Every variety of grape does well, and the day is not far distant when this section will excel California in grapes and wine. It is stated that two thousand gallons of sparkling wine have been made from a single acre of grapes, worth at present prices \$2.50 per gallon. Strawberries grow very large and fine, and ripen in February. Dewberries, whortleberries, blackberries, plums, crab apples, etc., grow wild in the woods in the greatest abundance.

GRASSES.—There is quite a variety of wild grasses growing in the woods and in the fields suitable for pasturage and for hay. They contain a good deal of nutriment, and stock keep in as good order as they do anywhere on the wild grasses. Tame grasses have never been tried to any extent, and it is not known whether clover could be raised here or not.

STOCK RAISING.—One great trouble with Northern people who come South, is they expect to find a perfect paradise of fruits, vegetables, cereals, and tame grasses of every kind, and that man and beast will have nothing to do but eat and sleep, moving only now and then for the purpose of circulating the blood, etc. When they do not find things as they were in the Garden of Eden they complain bitterly of the country. Some of them wonder how cattle, horses, and sheep can be raised without timothy and clover hay and blue grass pastures. They should recollect that stock in all new countries subsisted on the native grasses and on coarse wild hay in winter. It is the same in Middle Florida, only here the stock live the year round in the woods on the wild grass without any other food or shelter. The mildness of the winters, together with the abundance of pasturage afforded by the forests and numerous reed branches (wild canes) make the raising and keeping stock a matter of little expense and trouble. It is stated on the best of authority, and it is a well ascertained fact, "that live stock of every kind—horses, cattle, sheep, and swine—are less subject to epidemic diseases in Middle Florida than in the more northern latitudes."

POULTRY RAISING.—Fowls of every kind do well, and the raising of them for Northern markets could be made a very lucrative business.

BEES.—This is the country for the apiarist. The great abundance and variety of flowers that are always in bloom afford fine pasturage for bees, and the raising of honey for Northern markets could be made very profitable.

TIMBER.—Timber is abundant everywhere. In the forests are the walnut, red bay or Florida mahogany, ash, beech, every variety of oak, cherry, olive, kickory, magnolia, gum, yellow and pitch pine, cypress, etc. The manufacturing of all kinds of wooden ware, agricultural implements, furniture, and lumber could be carried on extensively anywhere in Middle Florida.

RAILROAD FACILITIES.—The Jacksonville, Pensacola and Mobile Railroad passes through the centre of the northern tier of counties of Middle Florida. It is completed from Jacksonville to Chattahoochee, on the Apalachicola River. There is also a road from Tallahassee to St. Mark's, on the Gulf of Mexico, a distance of twenty-one miles. The great need of the country is a road from St. Mark's and Tallahassee due north to Louisville, Ky., so the planters could ship early fruits and vegetables direct to the Louisville, Cincinnati, Indianapolis, and Chicago markets; also fish and oysters.

WATER COMMUNICATION.—A steamboat runs up the Suwannee River from Cedar Keys to Troy in Lafayette county once a week. It could run up to Ellaville, Madison county, if business demanded. The Apalachicola River is one of the finest navigable rivers in the world, and boats run from its mouth up to Columbus, on the Chattahoochee River, and Bainbridge, on the Flint River, in Georgia. There are a number of other rivers that are navigable a short distance up from the Gulf of Mexico. Along the coast of the Gulf of Mexico are several bays and inlets where sloops and schooners could lie at anchor in safety and deliver and receive freight. St. Mark's is at present the principal seaport. It has not recovered from the effects of the war, consequently but little business is done there. Men of energy and capital could make it a fine shipping point, and the location in a good one for a commercial city. Near the west end of James Island is a fine harbor for the largest vessels; some say it is the best on the Gulf of Mexico. The British

fleet during the war of 1812 hovered in there. The largest seagoing vessels can enter in safety.

PRINCIPAL TOWNS.—Tallahassee (the capital of the State and county seat of Leon county,) is the largest city in Middle Florida. It is nearly 300 feet above the level of the Gulf of Mexico, and twenty-one miles from it. The streets are wide and adorned with the most beautiful live and water oak shade trees, which add much to the picturesqueness and beauty of the city. A person as he wanders along the wide streets or loiters under some grand old oak, with the long Spanish moss hanging from its branches, feels almost like he was in the fabled land of the gods. There is a beauty about these grand trees that is indescribable, and one loves to lounge under their wide-spreading branches. Scattered all over the city are beautiful squares full of these splendid trees. The State House stands on a large square near the centre of the city, and is surrounded by a beautiful grove of the native trees of the forest. It is a plain three-story brick building. Three squares to the north is the Leon county Court House, a three-story brick building. The business houses are located principally on one street, and are all built of brick. The dwellings are principally frame, painted white, with green shutters, and have nice yards in front, adorned with the most beautiful flowers, that are always in bloom, and back are splendid gardens. The city contains about 3,000 inhabitants, a great number of stores, two newspapers. The *Floridian*, published by C. E. Dyke, Sr., & Son, is the oldest and ablest newspaper in the State, and is doing more for immigration than any other. The Catholic, Episcopal, Methodist, and Presbyterian denominations each have nice church edifices and able and talented ministers. There are good schools for both white and colored children. The City Hotel is a large and commodious building, capable of accommodating 200 guests. There are a number of excellent boarding houses in the city. Society is as intelligent and refined as can be found anywhere. There is a cotton factory near the city. The Jacksonville, Pensacola and Mobile Railroad passes through the city. There is a railroad to St. Mark's, a seaport on the Gulf of Mexico, twenty-one miles distant. The city is surrounded by a high, rolling, beautiful, and fertile country.

Quincy, twenty-four miles west of Tallahassee, on the Jacksonville, Pensacola and Mobile Railroad, is the county seat of Gadsden county. It is surrounded by a beautiful country, and has been a beautiful place, containing elegant public buildings and nice residences "before the war." The buildings now look old and dilapidated, but they show that refined taste was exercised in their construction. On entering many of them a person will see elegant libraries of old and standard authors, fine paintings, etc., showing that their occupants were persons of culture and refinement. The population is about 900. The village contains a number of stores, a hotel, and a boarding house, eight lawyers, a newspaper, (the *Quincy Journal*, whose editor has enterprise enough to print all his paper at home,) three nice church buildings—Methodist, Episcopal and Presbyterian—good public schools. Prior to the war there was an excellent and flourishing seminary there, but it is now closed.

Chattahoochee, forty-four miles west of Tallahassee, is on the Apalachicola River. It is the present terminus of the Jacksonville, Pensacola and Mobile Railroad, and has regular steamboat communication with Bainbridge, Ga., Eufaula, Columbus, and Apalachicola. The penitentiary is located there. There is a fine farming country around it.

Monticello, thirty-one miles east on a branch of the Jacksonville, Pensacola and Mobile Railroad, is the county seat of Jefferson county. There is a splendid country around it. It contains about 1,100 inhabitants. The Episcopalians, Baptists, Methodists, and Presbyterians have nice churches. There is a fine brick Court House and several fine business houses and residences. It has an able and well conducted weekly newspaper, the *Constitution*, refined and intelligent society and good schools.

Madison, fifty-five miles east of Tallahassee, is the county seat of Madison county. It has once been a beautiful and flourishing town, and the abode of wealth and refined society. The location is really beautiful, and surrounded by an excellent farming country. The population of the town is about 600. It contains Methodist, Baptist and Presbyterian churches and good schools. The town some years ago was nearly destroyed by fire, which has never been rebuilt. Many of the buildings have been neglected. The society is excellent. Labor and money could make Madison one of the most lovely places in Florida.

Ellaville, seventy miles east of Tallahassee, is the greatest lumber manufacturing town in Middle Florida. It is situated on the Suwannee River, and at the head of navigation, where the Jacksonville, Pensacola and Mobile Railroad crosses the river. Immense amounts of lumber are manufactured and shipped daily to Northern and foreign markets. The population is about 500.

Jasper is the county seat of Hamilton, the northeast county in Middle Florida. It is located on the Florida branch of the Atlantic and Gulf Railroad, and contains about 150 inhabitants. It is surrounded by a healthy and pleasant country.

Troy is the county seat of Lafayette county, is on the Suwannee River, and is at present the head of steamboat navigation. It contains about fifty inhabitants. It is near one of the finest regions for hunting in all Florida.

Crawfordsville, the county seat of Wakulla county, is twenty miles south of Tallahassee and twelve miles from St. Mark's, and situated in an oak grove and surrounded by a pleasant, productive, and healthy country. It contains three stores, a Methodist church, schools, etc. It is a small place.

Bristol is the county seat of Liberty county, and is located on the Apalachicola River. Near it are some splendid orange groves, which produce the finest oranges raised in the State.

New Port, on the St. Mark's River, six miles from the Gulf of Mexico, was once an important commercial place. Ships drawing twelve feet of water could come up there from the gulf, but it is now deserted, only a few houses remaining. Rev. Charles Beecher (brother of Mrs. H. B. Stowe,) resides there, and has a nice little orange orchard. Above the town is one of the finest sulphur springs in the State, whose waters contain great curative powers, and have performed almost miraculous cures. Before the war invalids from nearly all parts of the Union resorted there to drink of and bathe in the health-giving waters of the springs. Across the St. Mark's River, opposite, are the finest hunting grounds in the South in all probability. Bear, deer, turkeys, etc., are in the greatest abundance. It is the paradise for sportsmen.

Three miles below New Port is St. Mark's, once a flourishing commercial place. It has dwindled down to almost nothing. Vessels once in a while come in. It is at the junction of the St. Mark's and Wakulla Rivers, and is really a fine site for a city. We don't see anything to hinder it from being one of the best commercial cities in Florida. What it needs is capital and labor used judiciously to bring it out.

ORANGE CULTURE.—The orange, lemon, lime, citron, and shaddock can be successfully cultivated in Middle Florida, and as fine varieties are raised as in any section of the State. In Leon county there are 752 bearing orange trees. In Liberty county there are some very fine groves of the very best of oranges that bear bountifully every year. On what is known as the "Belmont Place," in Jefferson county, there was for near a quarter of a century previous to the late civil war a large orchard of the finest sweet oranges that bore bountifully every year, and many were shipped from it to Northern markets. When Gen. Taylor was in Florida during the Indian war his army was supplied with oranges from the Belmont orchard.

One advantage that Middle Florida possesses over the eastern portion of the State is that it has a rich and productive soil and a splendid subsoil (both of which are essential to make an orange orchard grow and bear bountifully), consequently no muck or manure are required to be put around the trees annually to make them grow or keep them alive. Trees sometimes require protection from frosts in winter, just as a peach tree does in the more Northern States. A grove of trees or a forest on the north side of an orchard to protect it from the north winds makes it bear much better. It is much easier to protect a tree from frost than to be constantly manuring it to keep it from dying. A person by bestowing the same care and attention to the culture of orange trees that the fruit growers of Ohio and Michigan do to their trees, could always have oranges in Middle Florida. Oranges require strong, rich land, and for that reason they can be more successfully cultivated in the rich lands of Middle Florida than in the sandy pine lands in East and South Florida. There is another consideration to be thought of. The lands of East Florida are not good for agricultural purposes, while those of the middle section are, and of the best quality, and the farmer can always have something growing ready for market besides his orange crop. Oranges are successfully raised in Portugal, Spain, France, Italy, and Greece, where it is colder than in any part of Middle Florida. Oranges and lemons have been cultivated in the open air in England. It is stated, "At Hampton Court there are many orange trees, some of which are said to be over 300 years old."

The banana grows very finely everywhere, and could be made a source of great profit if the people would pay more attention to its culture. One gentleman in Tallahassee has in his garden a few trees or shrubs, on which can now (Sept. 6,) be counted over 200 bushes. H. C. RIPPY.

Fish Culture.

REPORT OF THE COMMISSIONERS OF FISHERIES OF THE STATE OF CALIFORNIA FOR THE YEARS 1874 AND 1875.

THE first effort of the California Commissioners towards introducing the fish of the Eastern coast in 1874 was a repetition of the attempt of the year before, when, by the breaking of a railroad bridge their aquarium car and contents were entirely destroyed. The present attempt was made also under the supervision of Mr. Livingston Stone, who arrived in June with an assortment of black bass, glassed perch, catfish, hornpouts, silver eels, salmon, (*salmo salar*), and rock bass, of fresh water varieties, and a number of tautog or black fish, salt water eels, and lobsters, of which latter but three arrived alive. These fish were all placed in suitable waters and the commissioners are satisfied that the greater number have found congenial homes, and have spawned. Black bass have, during the present season, been caught in Napa Creek, and large numbers of the young have been seen. The black bass placed in Alameda Creek have been seen, but none have been caught. One of the glassed perch placed in the Sacramento River has been caught in a slough, to which it was probably repairing for the purpose of spawning.

The Schuylkill catfish and the Mississippi catfish, placed in the San Joaquin River, have grown rapidly and spawned, but several of the large fish, and many of the young ones, have been caught by the fishermen near the San Joaquin bridge, and have been returned to the river. By another year they will be so numerous that they may be caught with safety and shipped to market, as it would be impossible to exhaust the river by ordinary fishing. The hornpouts, a species of small catfish from Lake Champlain, which were placed in the lakes near Sacramento, increased so abundantly that nearly one thousand have been caught and transported to the various lakes and sloughs in the Sacramento Valley. Several hundred of them were placed in lakes containing brush and dead trees, in which it would be impossible to seine them. The acclimatization and perpetuation of these fish in the Sacramento Valley is assured, as they are now so situated that no amount of fishing will exhaust them.

Of the fresh water eels placed in a tributary of the Sacramento River, one was caught in Willow Slough, in Yolo county, which had grown to be more than a foot in length.

None of the Eastern salmon have been seen since they were placed in the Sacramento River. It is hardly to be expected that they should be, as yet, as without doubt they have gone to the ocean, not to return until the Spring of 1876. It will be interesting to learn, in after years, if they will cross with the Sacramento salmon and produce a new variety.

The rock bass, placed in Napa Creek, have not been heard from. The tautogs, salt water eels, and spawning lobsters, placed in San Francisco Bay, have never been

seen. Many crustaceans, resembling young lobsters have, during the present season been caught in the Bay of San Francisco, but it is not determined as yet whether any of them are the young of the Eastern lobsters.

During the past Winter the commissioners have received through Prof. Baird, 20,000 white fish eggs from Lake Michigan, which were deposited in Tulare Lake, the waters of that lake being of the proper temperature and containing suitable food, the eggs having been hatched at Berkeley on the grounds of the University of California. The cans containing the young fish were carried in a boat some two hundred yards from shore and the fry turned out among the tulles where they could not only find an abundance of their natural food, but protection from their enemies.

Sixty thousand eggs of the Eastern brook trout, which had been purchased at Charlestown, N. H., were also hatched at the same place with a loss of four per cent., and were distributed, 20,000 in the lakes and streams of Mendocino, Sonoma, Napa and Yolo counties; 10,000 in the North Fork of the American River, in Placer county; 10,000 in Prosser Creek, Nevada county, and 20,000 in Calaveras Creek, in Alameda and Santa Clara counties, and in other streams emptying in the Bay of San Francisco.

No shad have been hatched during the past two years, as the U. S. Government had none to spare. A supply is promised for next season, however, and the attempt to introduce this fish into the Pacific will be persevered with.

With regard to salmon, the commissioners have thought it to be of so much public importance to increase this valuable variety of fish in its native waters, that during the past year they considered it advisable to expend one thousand dollars in the hatching of a million more fish, to be placed in the Sacramento River. They therefore applied one thousand dollars of the small appropriation to this purpose, and the fish have been successfully turned loose.

The appropriation being about exhausted, it will this year pay for the hatching of but half a million more fish. Ex-Governor Stanford has requested the commissioners, however, to cause to be hatched at his expense, during the coming season, one million salmon, to be turned into the Sacramento River, and at his desire some hundred thousand have been placed in Kern River and Lake Tahoe. There were to have been placed in the waters of the State during the present season two million of salmon, and should the State receive her usual share from the Government, probably half a million more. Salmon were more plentiful in the Sacramento River during the season of 1875 than ever before since Americans had knowledge of the country. This is attributed to the close season which prohibits the taking of salmon between the 1st August and November 1st, as also to the quantities of young salmon turned loose from the hatching establishments. It is anticipated that after three years there will be found more profitable fishing than has hitherto been known. An appropriation of from six to ten thousand dollars yearly is asked for instead of the pittance of twenty-five hundred dollars granted.

Much attention is given to the Sacramento salmon (*Salmo gairdneri*) by scientists and by fish culturists in other countries, for the reason that it comes into rivers to spawn in latitudes much lower and in waters much warmer than any other variety yet known. Large numbers pass up the San Joaquin River for the purpose of spawning in July and August, swimming for one hundred and fifty miles through the hottest valley in the State, where the temperature of the air at noon is rarely less than 80° Fahrenheit, and where the average temperature of the river, at the bottom, is 79°, and at the surface, 80°. The salmon of the San Joaquin River appear to be of the same variety as those in the Sacramento, but average smaller in size. Their passage to their spawning grounds at this season of the year, at so high a temperature of both air and water, would indicate that they will thrive in all the rivers of the Southern States, whose waters take their rise in the mountainous regions, and, in a few years, without doubt, the San Joaquin salmon will be transplanted to all of those States.

The weight of salmon caught during the past season in the waters of the Sacramento and San Joaquin rivers is estimated at 5,098,780 pounds, in addition to 92,000 pounds of fresh salmon shipped in ice to the New York market. One of the most important paragraphs in the Report is that which contains the suggestion that the law protecting the sea lions and seals in and near the Bay of San Francisco, should be repealed. It is claimed that these cetaceans have increased a hundred fold during the past two years, and as they weigh from two to five hundred pounds each, their daily consumption of fish can not be less than ten to twenty pounds. As they exist in thousands the quantity of fish they eat is more than the total catch of the fishermen, and materially affects the supply. It is recommended that the law be repealed and again re-enacted after nine-tenths of them have been destroyed.

More stringent regulations are suggested with regard to the different modes of catching fish by traps, nets, etc. The Chinese, it is claimed, use in their shrimp catching a net of a mesh so small that hardly any of the young of the valuable varieties of fish escape. There must be several hundred Chinese fishermen engaged in fishing for shrimp in the Bay of San Francisco, for that market. When it is remembered that many of the most valuable varieties of sea fish come into the bay seeking for shrimp as their natural food, it is a question whether unrestrained and unregulated fishing for this crustacean will not, in time seriously effect the fisheries of the bay and harbor.

Under the existing law relating to trout, Indians are un-

restrained in their mode of catching them. Taking advantage of this, white men, for purpose of gain, employ Indians to catch trout from the various mountain streams with grab-hooks, baskets, and all the other methods which ingenuity has devised for the trapping and catching of fish, without regard to the season. Legislation should be had to prevent the Indians from taking fish, except in the manner to which they were accustomed before the advent of white men.

Sawdust, and mining deposits have so affected certain streams, such as the American and Feather rivers that no salmon frequent them now, certainly above certain points, where the spawning beds have been destroyed.

In Canada and other of the British Provinces where there are extensive lumber interests, by provision of law each sawmill is required to have a furnace attached, in which the sawdust as fast as made is consumed. The expense of such a furnace is but trifling, and in those countries the fish is preserved and the law obeyed without objection. A similar law is suggested for this State, and, while great objection is made to it on the part of mill owners, yet, probably, the millmen on the Truckee River and its tributaries have already expended more money in the publication of pamphlets, and in other means to defeat legislation on this subject, than would be sufficient to build furnaces for all the mills on that river.

The reports of Mr. Livingston Stone, with which the commissioners close their pamphlet, have already appeared in these columns.

—The grayling experiment, which created such a sensation among the pisciculturists and anglers a year ago, does not, the N. Y. Commissioners think, promise such results as to warrant its continuance.

GRAYLING IN EUROPE.—We have received the following letter through the courtesy of our correspondent in Munich:—

To the Hon. Secretary of the Fisherman's Club:—

SIR—The artificial breeding of grayling (*Thymallus vicillifer*, Agass.) was successfully carried out in Bavaria by Mr. Kuffer, Royal fisherman, in the year 1854 to 1856, in the garden of the Royal Veterinary School. Mr. Jhis, fisherman in Dachau, has also bred grayling in the year 1860, and continues to do so in the river Amper on his own grounds, which I certify as requested.

DR. MED. MAX GEMMINGER,
Custodian of the Zoological Museum, Munich.

FISH AND SEALS IN CALIFORNIA AND NOTES ON SALMON.

SAN FRANCISCO, November 26th, 1875.

EDITOR FOREST AND STREAM:—

I am happy to be able to inform you from good authority here, that the fish commissioners have petitioned the members of our Legislature to repeal the act or law protecting the very large number of seals which inhabit the Seal Rocks and the vicinity of the Cliff House, on the shores of the Pacific, about seven miles from the heart of the city. The Legislature owe this repeal of the law to their constituents and the people, in order to protect our fisheries, especially of our bay, as well as outside of it, in order that fish may be cheaper than they now are in our markets—particularly in the interests of the poorer classes. E. J. HOOPER.

TROUT AS VEGETARIANS.

GRAFTON, Vt., November, 1875.

EDITOR FOREST AND STREAM:—

In your issue of August 26th I noticed a letter from Dr. M. Goldsmith, one of the Fish Commissioners of Vermont, entitled "Trout as Vegetarians." Shortly after that, while on a visit to Rutland, Dr. Goldsmith invited us to visit the ponds. They are now owned by Mr. Frank S. Hale. There are about a dozen of them, all of small size. They contained at the time of our visit about 14,000 trout of good size, and all healthy. Mr. Hale informed us that he commenced feeding them with bread in December, 1874, and since that time he has seldom fed any meat or liver. The bread which he uses is composed principally of Indian meal, to which is added a small proportion of wheat and coarse sugar or molasses. We saw the trout fed on this bread in all of the ponds, and must say that we have never seen fish feed more greedily, scarcely a crumb reaching the bottom. Mr. Hale breeds some trout, but depends mostly for keeping up his stock upon purchases made from men and boys, who catch and bring them to him. When wild trout are received at the ponds they are placed into a receiving pond and remain there until they become accustomed to the bread diet, which they at first refuse, but in a few days are ready to adopt it, and thrive upon it. They are then transferred to the other ponds. Dr. Goldsmith, we believe, claims for the bread diet that trout are more healthy than with the meat. A wound on a bread-fed fish will heal soon, when on a fish fed exclusively on animal matter it usually results in death. We have with us a small trout pond where the trout have recently been fed on buckwheat cakes and thrive thereon.

The food question in trout raising appears to us to be the principal obstacle to raising them in any quantity. We have in Vermont many hill farms which have a good supply of water for this purpose; but the owners cannot go into the business, owing to the impossibility of procuring suitable food. If trout can be educated to eat a vegetable diet and thrive, this obstacle will be removed. The law protecting trout which was passed in 1868, has been pretty generally observed in this vicinity, and the result is a marked improvement in size and quantity of trout taken each year. S. W. G.

—Frank Cod was recently married to a Miss. Minnie Fish, somewhere in Connecticut. It is said the affair passed off swimmingly.

MIDDLE FLORIDA.—We beg leave to call the attention of our readers to the leading article in this paper entitled "Middle Florida," prepared from eminent authority. This journal has always made it one of its especial labors to develop the resources of Florida and settle up the State, whose products alone might be made to liquidate the public debt.

VANITY FAIR.—We have received from Messrs. Kimball & Co., of Rochester, some choice specimens of their celebrated "Vanity Fair" tobacco in neat metal cases holding a pound each; and after most thorough trial do not hesitate to concede to it all the good qualities which its manufacturers claim for it. It is a most superior article and a great comfort to discriminating smokers.

Natural History.

[This Department is now under the charge of a competent Naturalist, Indorsed by the Smithsonian Institution, and will henceforth be made a special feature of this paper. All communications, notes, queries, remarks, and seasonal observations will receive careful attention.]

For Forest and Stream.

THE LIFE OF WINTER BIRDS.

BY E. B. TOBER.

WHAT the birds do for food and lodging in the Winter, is a question that as often enters the child's mind as that of any of his elders. But the child is easily satisfied, as the old nursery rhyme bears witness. "What will the robin do then, poor thing?" is answered by imputing to red-breast a doze in the lawn to keep himself warm, with his head under his wing; and the child pathetically adds, "poor thing." And with this memory of childhood are often associated pictures of Robin—for he is not a shy bird when necessity gives him courage—knocking at windows for relief, disarming hostility and getting food by his confidence.

One would think that the birds that conclude, in their annual migrations southward, to stop in our latitude, would find it somewhat hard work to keep body and soul together. The swarms of butterflies and bugs that fluttered and buzzed through the summer days have disappeared. The caterpillars and grubs are safely ensconced in their cocoons, or have finished their crawling lives. With the leaves, the berries which men and summer birds may have overlooked, have nearly all dropped and decayed, and there seems to be a slim chance for the cold-weather birds. But these flutterers on the edge of Winter appear merry enough, nevertheless. The possibility of an empty larder never seems to strike them, nor does the cold weather seem to have any terrors for them. Their delicate bodies seem hardly fitted to come in contact with ice and snow and chilling blasts. Sometimes, however, in unusually severe weather, when the mercury loses itself away down below zero, the little ones appear to get disheartened. The sparrows that make their homes in large cities often suffer in this way. Many have been seen in New York, fluttering almost helplessly in the gutters, so benumbed as to find themselves hardly able to escape from predatory cats or mischievous urchins. Many have been picked up, after cold "spells," frozen to death.

Nature however looks after these smaller birds kindly—the larger ones are not in question here. With all the buffeting and frolic of Summer, their coats have become tattered and torn, and in many cases they doff their worn-out summer suits and put on more sober-colored, but warmer garments. Indeed many a one of them would not be recognized, in his dark overcoat, as the brightly colored bird of Summer. Perhaps one of the most surprising changes of raiment, is that of the goldfinch. When the apples are harvested and they are reduced to a diet of seeds, then they exchange "their gay uniform for undress suits of Quaker drab, so that their disappearance in Autumn and reappearance in June is only a change of plumage." The wild birds do not seem to suffer from the cold as much as the half domesticated sparrows. Possibly this is only in accordance with the rule that all animals, as they accept protection, need it. However, that may be, some of the Winter birds seem to revel in snow and ice. The snow bunting, aptly called "snow-flake," seems to choose the bleakest, coldest spots for its Winter haunts.

Next to the matter of feathers—probably before it, in the bird's eye—is that of food. Probably at first sight the city sparrows would seem to live luxuriously, feeding every day, if they choose, upon a bounteous manna of crumbs from charitable hands. Indeed we may readily believe that the birds would not stay here if they did not find plenty to eat. And they can be as dainty in their diet as the Summer birds. There is not the same evidence of plenty, for Nature, wise provider, has hidden much of it, that her guests may take needed exercise in searching for it. The dreary picture of possible famine fades away before the reality.

There are succulent grubs gnawing a path through trees and logs, and many of the birds know how to tap so that a door shall be opened to them, though they are unwelcome guests. The two little wood-peckers that stay with us all Winter, though perhaps they do not do as effective work as their larger brethren can, still keep up the ceaseless warfare against the insect hosts. If they cannot dig deep into the trees, and pick big stumps to pieces; they can peck into the crevices in the bark, or with their strong bills pry off the loose pieces, and find many a dainty morsel. So with many of the smaller birds—and larger ones, too, for that matter. They need not even go to that trouble. The moss is easily pulled from the rocks and the dry leaves can be turned over and reveal much more than Mother Hubbard's bare larder ever contained.

Indeed, in the matter of insects alone there is a plentiful store for the experienced bird, and they can be found in all their stages of life. Eggs are abundant, soldered in dozens on the naked twigs or on the backs of the dead leaves or under the bark, and the birds probably enjoy, as much as we do, deftly cracking the shell and mixing and eating the white and the yolk, even without salt or pepper. Then if they want a larger morsel, or have not the patience to open so many eggs, they can look under the stones or under the bark, and they will find many a drowsy caterpillar, snugly awaiting the approach of Spring and freedom. Even more successful would be the search for crystalids. They could hardly tear open the tough cocoons which many insects emerge from, but there are many less toilsome workers of that tribe that lie among the leaves, under moss or bark, or only a short distance in the ground, that only have thin shells to separate their juicy selves from hungry birds. Then many of the perfect insects hibernate. There is the mourning cloak, one of the first butterflies in the open woods in the Spring, and a few others which hide around in crannies of walls, in any place that offers concealment and moderate protection from the weather. Their wings may be damaged and colors faded, but their little bodies are soft and tasty. Then has not

every one who is given to poking around the woods in Winter often disclosed whole colonies of beetles by stripping off a layer of bark.

Still, though a meat diet is very good, and the Esquimaux find it the best Winter meal, it would alone be very cloying to us, and we can imagine that some of the more particular birds find it so, and want a change. It will not take very long to find it, though it is more in the nature of a dessert—the nuts and raisins of our own dinner table. Indeed, the sparrows in all their varieties, white throats, snow birds, crossbills, pine finches, and red poll linnets, seldom come in until the dessert and join the robins, cedar birds, and blue jays. It is not worth while to say much of the jays; they are regular gourmands, and eat anything and everything almost. A good variety is set out, too. All around the meadows, the dried stalks and leafless branches of Summer's weeds and flowers offer miniature walnuts and filberts to be had for the cracking. The berry pickers have not labored so thoroughly that a few dried blueberries do not yet hang from the bushes. The partridges and quail can find many a checkerberry under the leaves, or can look higher and pick off the seed vessels of the past season's roses. Then in the dark pine woods the crossbills and the finches, with their blushing breasts, tear open the cones and find hearty meals in the meaty kernels. All these are dainty birds compared with some, almost like the spoilt child who cried for plum pudding and would eat nothing else. No one would accuse the crow of being dainty. He might sit at table with them, but he would be liable to eat his hosts as well as their dinner. An old college song accuses him of an appetite for old horses and of holding confabs with other crows about their meals. His appetite, which craves anything, from an unfortunate mouse through the whole bill of bird's fare, justifies one part of the song; the other part needs none. A crow will even so far depart from the habits of his forest brethren as to dig clams or go fishing when necessity or appetite inspires. The owl and hawk, though too dignified and wise to adopt all the low tastes of the crow, sympathize with him in his taste for live food, rats and mice and such "small deer." Perhaps the owl goes further than the hawk, for a nice fat beetle never comes amiss to him. The butcher birds come in the same carnivorous set, serving their dinners of mice or birds on the point of some sharp thorn. And so the thoughtfulness of nature might be traced out almost indefinitely in the care for the birds of the forest, meadow, and stream. The woods do not seem so full of birds and bird music as in Summer, but those that follow the fortunes of Winter are just as light-hearted and careless of want, and twitter just as merrily as their warm weather cousins. Many of them, indeed, are taking their vacations, after the laborious cares of courting, house building, and rearing a family, and preparatory to the same loving work another year in a much more inclement climate. And so they spend their time, some gossiping together in the shelter of bushes or vines, or others communing with their own little selves, perhaps thinking of former mates, and still others sailing gleefully in the cold winds that make us shiver and retreat, and are contented and happy, for they need nothing.

HABITS OF BEES AND WASPS.—Sir John Lubbock has been experimenting upon ants, bees, and wasps, the results of which he has communicated to the Linnean Society. Previous experiments had satisfied him that bees did not always bring their friends to share stores of food which they had discovered. This was questioned by bee-keepers, and Lubbock repeated his experiments. He put a bee to some honey concealed in a flower pot so arranged that the bee had only a small orifice through which to enter. Under these circumstances, from early morning until dusk she made fifty-nine journeys, and during the whole of this time only one other bee found her way to the honey. He also discovered that bees soon accustomed themselves to look for honey on papers of particular colors. He placed a bee to some honey on a slip of glass on green paper, and after she had made twelve journeys to and from the hive, red paper was put where the green had been, and green paper with more honey about a foot away. The bee returned, however, to the honey on the green paper. He then gently moved the green paper with the bee on it back to the old place, and when the bee had gone he replaced the green paper by a yellow one and put the green again a foot off. She again returned to the green. He repeated the same proceeding with orange, white, and blue papers with the same result, but the reversed position of the similar colors, blue and green, slightly confused the bee. This adherence of the bee to the green was not because of any fondness for that particular color, as further experiments proved that the insect would return to any color where they had become accustomed to find honey. As regards wasps, similar experiments showed that for three successive days the secret store of honey made known to one wasp was not found by any other. In respect to color, Lubbock found that wasps were capable of seeing color, though they appeared to be less influenced by it than were the bees.

MORE ABOUT ALBINOS.—Several correspondents have been inspired by the mention of albino grouse shot in New England, to send us further notes. "Teal" tells us that he has seen at Goodale's, in Boston, three albinos of the ruffed grouse, none of which were perfectly white, but a pale flesh or cinnamon color with the characteristic markings, which no one would mistake for ptarmigans. "Audubon" (Harrisburg, Penn.) writes that several years ago a well-known sportsman of Harrisburg, Wm. J. Magloughlin, captured a white meadow lark (*Sturnella magna*) inside of what is now the city limits. A year or so previous Mr. Magloughlin shot an albino quail—perfectly white—on the premises of Mr. Eberly, Milltown, Cumberland county, Penn. The following is clipped from the Lancaster (Penn.) *Intelligencer* of recent date:—"Mr. G. W. Duchman, of East Earl, in this county, captured a very small and beautiful white squirrel while it was feeding in a corn-field. This small animal measured about seven inches from its nose to tip of tail; weighs about two ounces; it is entirely white and has red eyes; its countenance is sharp, and the animal is very neat, clean, and supple. Another of the same kind was seen but escaped."

—Some immense pairs of elk horns from Colorado have just been sent to J. Wallace, taxidermist, at No. 19 North William street, for mounting.

BARNUM'S SALE.—It is very rarely that an establishment founded on the mammoth scale of the late Hippodrome is brought to the hammer. Many speculations are rife as to the cause of the break up, and those who are, or profess to be, well posted, intimate that the bulk of the property will return to the possession of the veteran showman. The prices paid for the animals can scarcely be taken as the measure of their value, there being little or no competition, and were far below what they originally cost. The fox hounds, which were brought from England with some of the horses, with the exception of three reserved by Mr. Barnum and presented to Gen. Custer, brought but \$7 each. The elephants realized from \$3,000 to \$4,500; the dromedaries, \$200 to \$250; giraffes, \$1,000; ostriches, \$300; polar bears, \$575 and \$625; sea lions, \$400 and \$500; the gnu, or horned horse, brought \$1,250; a lion, lioness, tiger, and leopard realized \$2,400. Many other animals were offered but not sold.

—Mr. F. H. Storer has observed that in the neighborhood of Boston the common red squirrel (*Sciurus hudsonicus*) is responsible for much damage to the fruit crop, exceeding the most troublesome birds in the destruction of the flowers, especially of the cherry tree. The flower is bitten from its stalk precisely as a nut would be, and held between the paws of the little animal, while he eats the morsel of an ovary at the base of the flower. The flower is then dropped unutilized. A squirrel will thus destroy 200 flowers in the early morning of a single day. Freshly opened blossoms are preferred, and the destruction begins with the first of the season. When the flowers become mature they neglect them and wait for the ripened fruit. The squirrel has long been at enmity with the American gardener because of his depredations on pears, which he gnaws in two for the sake of the seeds alone. Mr. Storer also accuses the field mice of aiding in the devastation of the orchard by eating the flowers.

—The doctrine chiefly advanced by Lieut. Weyprecht, which we mentioned not long ago, that the aim of future Arctic explorers must be to make simultaneous scientific observations extending over long periods, on the natural philosophy, meteorology, botany, zoology, and geology of high latitudes, and only in the second place on the discovery of geographical details, has resulted in a decision of the German Arctic Commission not to recommend the sending of an expedition to the North Pole this year. They recommend instead that fixed observing stations be established, a principal one on the eastern shore of Greenland, and at least two secondary stations, one at Jan Mayen, and the other on the western shore of Spitzbergen. The co-operation of other countries in extending the circle of observers is asked for.

—In Wiedersheim's recently published book is described *Sala mandrina perspicillata*, a tailed amphibian, found only in the western half of Italy, which in its organization seems to connect the amphibia with the reptilia. It is a prettily colored, small and slender animal, which lives on land rather than in the water, feeds upon insects, and during the dry Summer months sleeps for the most part, but in Winter is very active. All the anatomical characters of its skull elevate it above the salamanders, and are such as characterize reptiles. The development of the vertebrae, the numerous bones of the wrist and ankle, and the divided kidneys, furnish additional support to the same view.

—The work of removing the collections belonging to the Philadelphia Academy of Natural Sciences from the society's old building to its new one is now going on. The delicate handling and slow motion necessary to the success of this undertaking will probably delay the arrangement of the cabinets in their quarters until some time in January.

—We have been assisting the Zoological Society of Philadelphia for more than a year in their efforts to obtain live moose, and are now informed by Mr. John Wagner, the superintendent, that he is now expecting soon to receive three moose calves, which are preferable to grown animals, as they thrive better if put into the Garden when young.

—There is in this neighborhood a cat which lost its left fore paw in a trap about four or five years ago. She has had innumerable litters since the accident, and none of her kittens have had any abnormal formation until the other day, when she brought two into the world, one of which had a left fore paw with only one finger to it, and the rudiment of a thumb without any claw. The case is remarkable in this—that no abnormality occurred in the offspring until the cat was aged, and her fecundity began to decline, as shown by the last litter being so small.—*Land and Water.*

HYBRID DUCKS.

BROOKLYN, December 6th, 1875.

EDITOR FOREST AND STREAM:—

In answer to Prof. Le Conte's question about hybrids in ducks, I would say I have found the dusky and mallard cross quite often; have now three or four mounted in my collection. I once found a cross between what looked like a red head and pin tail, and think perhaps such changes are now observed more than in former years. I have found no crosses within five or six years. I would like to ask if the male mallard does not change its plumage in Summer. They are not common with us.

GEO. A. BOARDMAN.

BOSTON, November 30th, 1875.

EDITOR FOREST AND STREAM:—

I have been sufficiently interested in your late account of the "singular boldness of a partridge" to tell some of my own experiences. Last year, when at Moosehead, I shot a chicken partridge (though in the night), and as I stooped to pick it up another, evidently an older bird, dropped its wings and came up within six feet of me, and then flew off. I once remember seeing one on a nest of eggs within half a gunshot of where men were blasting granite, and the bird hatched a brood.

Yours,

TEAL.

CENTRAL PARK MENAGERIE.

DEPARTMENT OF PUBLIC PARKS,
NEW YORK, Dec. 4th, 1875.

Animals received at Central Park Menagerie for the week ending December 4th, 1875:—

One Deer, *Cervus Virginianus*. Presented by Mr. W. B. Dinmore.

One young Panther, *Felis concolor*, from Central America. Presented by Captain S. G. Parker, steamship *Andes*.

One Black Bear, *Ursus Americanus*, from Madison county, N. C. Presented by Mr. Fab. H. Bushbee.

Two Lions, *Felis leo*. Bred in the menagerie.

W. A. CONKLIN, Director.

Woodland, Farm and Garden.

HOW TO SELECT A HOME IN FLORIDA.

THE first question to be decided by persons who propose moving to Florida, is the kind of business they wish or intend to pursue for a livelihood; if farming, what kind of crops they intend raising; if fruits, what kind or class of fruits; if vegetables, it must be to supply the demand at the North and West for our early products.

For the raising of corn, short staple cotton, oats and rye, the northern belt of the State, comprising that portion lying north of thirty degrees, covering a territory of 375 miles long from east to west, and having an average breadth of forty-five miles, should be selected, where there is heavy clay soil, rich in vegetable matter—more especially the western part. Labor is abundant, with railroad and steamboat facilities to carry the crops to a near market. This portion ought to supply all the demand in the State for corn and oats, and stop the importation from the North and West; and when properly developed will do so. Tobacco has proved to be a profitable crop in this section, and being a superior article, commands a high price.

Should the immigrant select fruit-growing as his occupation, then the portion of the State included between the parallels of twenty-eight degrees and thirty degrees north latitude, denominated Central Florida, comprising part of the peninsula, should be carefully examined, especially the southern tier of counties, as they are peculiarly adapted to the growth of semi-tropical fruits, such as the orange, lemon, lime, and grape-fruit, the fig, banana, pine-apple, and the more tender fruits. In this section the curculio never attacks the peach.

The settler need not confine his attention entirely to fruits. This is the country in which to plant sugar-cane, which proves a sure and profitable crop. Corn and oats do well, and our long staple cotton has a high reputation in market. Good wheat has been made on clay soils. In addition to these, we have arrowroot, cassava, jute, sweet potatoes, &c. Many portions of this belt possess steamboat and railroad transportation facilities. New railroad routes are being surveyed, so that ere long all points will be within reach of markets. The country is rapidly settling up with an energetic population, who are mainly devoting their attention to fruit-culture. Labor is scarce and high-priced.

Those who wish to raise early vegetables for market will find this belt well suited for such enterprise. They should locate at such points as will afford rapid and certain transportation of their products, as they must be placed in market as soon as possible after being gathered. Watermelons can be raised in the open air and be ready for market the latter part of April and first of May. Grapes, especially those belonging to the Scuppernon family, do well wherever they have been tried.

That portion of the State lying south of twenty-eight degrees is sparsely settled. The more tender semi-tropical fruits succeed, as it is but seldom that frost is ever seen there. Raising cattle is the most profitable business that can be entered into in that section. They require no feeding, as the large extent of savannas and prairies afford fine pasturage all the year. This is the paradise of the hunter and herdsman.

Probably there is no State in the Union that possesses so great a variety of soil and is adapted to the production of such a variety of plants and trees. From the stiff clays of the northwestern portion to the prairies of the south all classes and grades may be found. In the central and southern portion the general character is sandy loam, though some sections have a clay soil. Northern and Western farmers, when they first see our soils, think they must be worthless, forgetful that such a luxuriant growth as it produces could not grow in pure sand; it requires humus, alkalies and clay to do such wonders.

The first choice of land will be dry hammock; the soil generally contains a large amount of vegetable matter. Some of our hammocks have a light, sandy soil, are thin, and become exhausted in a few years, and require manure; while others, though heavily cropped, retain their fertility, and are apparently inexhaustible; these often have a marl subsoil. One great advantage possessed by these lands over pine land is, that as soon as cleared and broken up they are fit for the reception of any kind of crop, and produce well the first year.

To persons of limited resources the pine land offers a ready means of obtaining a healthy homestead and fair farming lands at a small cost, and the expense of clearing is much less than hammock. Fruit trees, sweet potatoes, cotton and peas can be planted on them the first year, but not corn, as the land requires to be sweetened for this crop.

The question is often asked by strangers, How am I to make a selection, where soil, climate, and productions are so different from those we have been accustomed to? When you come to look at the country do not be in too great haste to locate. If compatible with your plans, take time to look around, or rent land for the first year. See what kind of crops are raised, and what are the most successful modes of cultivation; converse with intelligent farmers; learn what are the indications of good land; ascertain what are the peculiar advantages or disadvantages of different localities; and when you have made your selection, you will probably be satisfied.—*Florida Agriculturist.*

THE LARGEST GRAPEVINE IN AMERICA.—We learn from an exchange that the famous grapevine from Santa Barbara, California, which is reported to be the largest grapevine in the world, has been taken up and securely packed, and will be shipped to the Centennial. The history of the vine is peculiar and romantic, and its age is placed at between 40 and 100 years, according to different traditions. It has grown in the court-yard of an old house, about three miles and a half from the town of Santa Barbara. The trunk is about four feet four inches in circumference at the largest part. It begins to branch six or eight feet from the ground, and is then supported on a frame work, which it covers as a roof. Thus supported, it covers an acre of ground. Several of the limbs are ten inches in circumference at a distance of twenty-five or thirty feet from the trunk. The annual yield of grapes is from 10,000 to 12,000 pounds, and the clusters of grapes average, when ripe, from two to two and a half pounds each.

—The sale of short horns, draught horses, and Cotswold sheep, at Toronto, December 4th, was the largest ever held in Canada. The three highest prices paid were, \$4,500 for "Seventeenth Duke of Airdrie," bought by A. McClinton of Millersburg, Ky.; \$4,000 for "Kirkleighton Duchess, Eighteenth," bought by H. Cochrane, Compton, and \$3,700 for "Oneida Rose," bought by B. B. Groom, of Kentucky. The total sum realized was \$79,000.

—Lumbering in the Adirondacks promises to be very lively this winter. A number of heavy contracts have been taken by the lumbermen for timber, and the parties will have to secure the services of a miniature army of men. Lumbermen are paid from \$25 to \$35 per month and boarded, according to their worth.

The Kennel.

DOG FARES ON RAILROADS.

THE Pennsylvania Company, operating the Pittsburgh, Ft. Wayne & Chicago Railway; Erie & Pittsburgh Railroad; Ashtabula, Youngstown & Pittsburgh Railroad; Mansfield, Coldwater & Lake Michigan Railroad; Cleveland & Pittsburgh Railroad, have issued the following general order to train baggagemen:—

CHICAGO, Nov. 24th, 1875.

From and after Nov. 24th, the rule allowing train baggagemen to collect on dogs and gas as their perquisites will be discontinued.

Hereafter, baggagemen will not be allowed to make any charge on a dog or gun, but may receive any gratuity when voluntarily offered by the passenger. They will be required to receive dogs and guns in the baggage car when offered for transportation by a passenger going on same train, and carry them free of charge. Baggagemen will be held responsible for the care and prompt delivery of them. They will also make a memorandum of them on their reports, naming the article or animal, stating where received and where left.

HENRY STARRING,

F. R. MYERS, Gen'l Pass. & Ticket Agt. Gen'l Baggage Agt.

These regulations seem to cover the ground satisfactorily, inasmuch as they insure transportation, (which has heretofore been denied on some railroads,) and fixes the responsibility of safe carriage and care upon certain specified persons. There has been a difference of opinion as to whether this plan should obtain, or a mileage tariff be adopted. The Missouri, Kansas & Texas R. R., and other railroads, have chosen and put in operation the latter system. The charge is not exorbitant, and will be cheerfully paid provided safe carriage and proper care of the dogs is guaranteed. In the respect that this plan makes the companies responsible—we presume for damages, in case of loss by negligence—we prefer it. Besides, the sportsman knows in advance precisely what he has to pay, and does not run the risk of vexatious higgling with such baggagemen as choose to be exacting; for certainly no gentleman would think of accepting their services without proffer of remuneration, although payment is optional. Neither can it be expected that baggagemen will pay the same careful attention to their charges without reward, as in case of pay.

In any case, it is desirable that a uniform regulation be adopted by all the Railroad Companies. It is a satisfaction to know, in these days when sportsmen travel great distances in quest of game, that transportation for their dogs is assured. The number of gentlemen who thus travel is very large, and increasing constantly, and railway officials will soon learn, if they have not already done so, that their patronage constitutes a very considerable item of revenue. We feel that their action will benefit all concerned, and must offer our congratulations upon the adoption of a liberal policy and enlarged views.

BLUE BLOOD.—A correspondent of the *Turf, Field and Farm* asks for information, as to what constitutes blue blood in dogs, and alleges that the "Squire" in his report of the Memphis Bench Show and Field Trial, holds that only blue blood exists in imported dogs. Now let us say that the "Squire" did not, to his regret, attend the Memphis Bench Show, did not write the article alluded to, and does not, after many years of careful breeding, believe that dogs from what are called the best kennels of Europe are better, in any respect, than some strains which have been bred in this country since we first commenced to shoot in 1825. We do not wish to be understood as underrating foreign bred dogs, or to discourage the importation of them, for by breeding to such, as we have recently to Pride of the Border, we obviate the danger from inbreeding, a system which is, in our opinion, carried to too great an extent in some kennels of England. We have owned and shot over a few imported setters and pointers which were good ones, but by crossing them with American bred stock we have found the produce to be stronger, more stylish looking, and better dogs in every respect.

DEATH OF SOME NOTED DOGS.—Dr. Strachan has had the misfortune to lose his fine setter bitch Flora, well known throughout the South and West. The New York Kennel Club will greatly miss Flora, but still they can hardly complain, as out of eight litters there have been but three deaths after the puppies have reached the age of two months. Dr. Strachan believes in the "selection of the fittest" and but little, if any inbreeding. We have also to report the death of Sir Frederick, owned by Mr. Steele, of Piermont, by Dr. Strachan's Don I, formerly the property of Sir Frederick Bruce. Sir Frederick was a fine dog, five years of age; the cause of his death has not been communicated to us. The breeding of Flora can be seen from the following abstract of pedigree:—

FLORA. (4 Laverack.)

Ruby, imp. by Dr. Gautier.		Dan.	
Mystery.	Cora.	Dandy, by Mr. Job-	Di,
Jet. Duchess.	Dash.	ling's Dandy, of Ld	bred by Capt.
	Moll 3d.	Rosslyn's blood,	Bruce, Castle
		who took the 20 gu-	Dawn, Ireland,
		inea prize at Newcastle, out of Mr. Langstaff's	out of Flirt by
		Moll, who, three generations back, descended	Fred'k, she by
		from Sir Wm. Redley's Grouse.	Duke of Gor-
			don's celebrated dog, Dandy.

Cora was sister to Countess and Nellie, owned by Mr. Llewellyn, and Duchess was own sister to Mr. Laverack's champion dog, Dash, sire of Cora.

Dandy and Di were obtained from Mr. Kendward, Esely Court, Herford, Esq., by Dr. Gautier of this city.

Flora was half sister to Dr. Strachan's red setter, Rake, one of the handsomest setters going, in or out of the field, and was bred by Dr. Gautier of this city.

In addition to the above we have just learned of the death of Mr. Chas. E. Coffin's fine old pointer bitch Meg. Meg was of imported stock, twelve years old, and died of old age. She was a dog of considerable local reputation and it was said of her that she never got a bad puppy. There is a young Meg in whom we have a personal interest, and if the young one only inherits the good qualities of the dam, we shall be satisfied.

THE BROOKLYN DOG SHOW.—It is a matter for regret that a bench show held in a locality so easy of access as Brooklyn should have turned out such a wretched failure as was the attempt last week. For this, however, the gentlemen of the Long Island Poultry Association have only to thank themselves. It could hardly be expected that any owner of a valuable dog would run the risk and care of a three days exhibition for a five dollar bill. Had the same amount been invested in silver collars or appropriate trophies of some kind, it would have been much more attractive. Upon being solicited we presented a cup of the value of fifty dollars which we presumed was to be offered as a prize in the Bench Show. Upon receiving the catalogue we were astonished to find that our cup had been donated for a coop of chickens, and we had barely time to substitute a more appropriate offering, for the handsomely embellished affair which would have found a suitable resting place only on the sideboard of some ardent sportsman. Mr. Von Lengerhke's orange and white setter Dash took the first premium in his class.

ENORMOUS DOGS.—Mr. Stanley, the *Herald's* African explorer, has found, near Lake Victoria, in the interior wilds, near the shore of the lake, a breed of dogs so large as to dwarf his large English mastiffs.

USELESS CANINES.—Many people, particularly farmers, have a habit of keeping large and ferocious dogs upon their premises, which make it dangerous for either friend or foe to approach the house. Many of these dogs, instead of watching their master's home at night, are predatory in their habits, and wander about the country, killing their neighbors' sheep. Thus, farmers often incur heavy losses while the authors of the mischief frequently remain unknown. But again, ferocious dogs are of no use to anybody. Thieves are never scared by them. The only way a dog can be of real service to a family is to keep a small one in the house at night, letting him have the run of the hall or entry and kitchen. They are better than any "alarm" arrangement costing hundreds of dollars.—*German town Telegraph.*

KENNEL PRODUCE.—The splendid setter bitch Queen (Blue Belton), purchased by J. J. Seitzinger, Esq., of Philadelphia, from our Field Editor, recently whelped thirteen pups by his fine setter Count, and every mother's son of them are bitches. Let us hope that at the next effort in the family way that Count and Queen will do better. All but two or three of the pups have been destroyed.

CURE FOR DISTEMPER.—A writer in the *Fanciers' Gazette* suggests garlic as a cure for distemper. The remedy is not a new one, as we tested it many years since and with success. Still it may be new and of service to some of our readers. This is what the writer in question says of it:—

"And now, sir, I am anxious to ask your readers if any have tried garlic as a prophylactic to distemper. Some years ago there was a letter in *Land and Water* from a breeder who had suffered greatly from distemper in his kennels, and he had been induced, after considerable hesitation, to try garlic, and, as he wrote, with wonderful success. I have tried it, giving a piece about the size of a bean of the raw bulb twice a week to puppies till they are nine months or a year old, and I have had no fatal cases where it has been given from puppyhood or for a lengthened period. One of the chief predisposing causes of distemper is cold, and every one is aware of the heating and warming properties of the onion tribe. If garlic is a preventive of distemper (I say if, because I have not tried it long enough to be sure, that is the reason I am asking for the experience of others,) it is a medicine so simple that it is well worth being known. I have noticed, too, that most of the reputed patent specifics in the shape of pills smell strongly of garlic. I know the natural feeling there is at pooh-poohing 'nostrums' of any kind, but I trust that none of your readers, if they reply, will sneer at garlic unless they have tried it fairly, and found it to fail."

Sea and River Fishing.

FISH IN SEASON IN DECEMBER.

SOUTHERN WATERS.

Pompano, *Trachinotus carolinus*. Grouper, *Epinephelus nigritus*,
Drum (two species.) Family *Scia*-Trout (black bass,) *Centropomus*
niger.
Kingfish, *Menticirrus nebulosus*. Striped Bass or Rockfish, *Roccus*
Sea Bass, *Sciaenops ocellatus*.
Sheepshead, *Archosargus probato-* Tailorfish, *Pomatomus saltatrix*.
cephalus. Black bass, *Micropterus salmoides*;
Snapper, *Lutjanus caesus*. *M. nigricans*.

[Under the head of "Game and Fish in Season" we can only specify in general terms the several varieties, because the laws of States vary so much that were we to attempt to particularize we could do no less than publish those entire sections that relate to the kinds of game in question. This would require a great amount of our space. In designating game we are guided by the laws of nature, upon which all legislation is founded, and our readers would do well to provide themselves with the laws of their respective States for constant reference. Otherwise, our attempts to assist them will only create confusion.]

FISH IN MARKET.—The supply of fish during the week has been fair and quite equal to the demand, although the variety is confined to fewer descriptions of seasonable fish and a few refrigerated kinds. Our quotations are as follows: Striped bass from Rhode Island, 25 cents per pound; smelts, from Maine, are rather scarcer and command 22 cents; bluefish, from Norfolk, 12½ cents; salmon, frozen, 50 cents; mackerel, 15 cents each; whiteperch, 18 cents per pound; green turtle, from Key West, 20 cents per pound; terrapin, from Savannah, \$10 to \$15 per dozen; frost fish, 15 cents per pound; halibut, 25 cents; haddock, 10 cents; codfish, 10 cents; blackfish, 15 cents; herring, 10 cents; flounders, 12 cents; pompano, \$1; eels, 18 cents; lobsters, 10 cents; sheepshead, 30 cents; scallops, \$1 per gallon; soft clams, 40 to 60 cents per 100; whitefish, 20 cents per pound; pickerel, 18 cents; salmon trout, 18 cents; brook pike, 18 cents; hardshell crabs, \$6 per 100; Spanish mackerel, frozen, 50 cents per pound.

ENGLISH SOLES AND TURBOT IN AMERICA.—In our issue of Nov. 25th we referred to the proposed effort to introduce these fish into our waters, the subject having engaged the attention of Prof. Baird, Mr. J. G. Kidder, of Boston, Frand Buckland, of London, Mr. Henry Lee, and other prominent naturalists, between whom much correspondence has passed. There seems to be doubt of success in the experiment, though opinions differ widely. Mr. Lee says that absolutely nothing is known concerning the impregnation of the ova of these fishes, and therefore the transfer of their eggs is out of the question. He thinks, however, that the young soles and turbot can be brought across the Atlantic without much trouble. He recommends that the experiment be made with soles from three to five inches long, and turbot three to four inches in diameter.

Leaving aside all conjectures as to whether these fish can be transported across the Atlantic and propagated here, the question arises where is the necessity for so doing when they already abound in our waters? We have a statement from Col. F. G. Skinner, Field Editor of our contemporary, the *Turf, Field and Farm*, that Admiral Coffin, who commanded the British fleet off the harbor of New York, during the war of 1812, informed the late John S. Skinner, who, with Francis Key, as Commissioner for the exchange of prisoners, had much intercourse with him, that turbot were caught in abundance just outside, if they would only fish deep enough. Every Spring the herring fishermen bring them here in considerable quantities and possibly if the English mode of fishing for them was adopted the number might be largely increased. That they have not been more appreciated is owing to the fact that while the fish is comparatively a new comer its qualities are almost unknown to our people. Turbot can be seen on the slabs of any of our fish dealers during the season and have sold as low as four cents per pound.

A FINE TROUT.—While at Bridgeport a few days since we had the pleasure of inspecting a splendid specimen of trout which fell before the skill of Mr. A. J. Hobbs at Lake Mooselucmagantic, Maine, on the 26th of September last. This fish, which was pronounced by Mr. Agassiz to be a genuine *salmo fontinalis*, weighed nine pounds, and was taken with the fly in fair casting, on one of H. L. Leonard's seven ounce split bamboo rods. Mr. A. J. Colburn of No. 31 Boylston street, Boston has preserved and mounted the fish in splendid style, and the trophy is one of which Mr. Hobbs may well feel proud.

—A salmon weighing a pound and a half was caught off Provincetown, Mass., a few days ago among some mackerel seized by the fishermen engaged in that business. Mr. Blackford had him on exhibition, placed alongside of two magnificent specimens of *salmo salar* weighing thirty-four pounds each and just received from the refrigerator of Mr. Enoch Piper, of Bathurst, N. B. These fish looked as fresh as though just taken from the water, and are preserved by some process known only to the manipulator, Mr. Piper, who is the father of fish refrigerating, he having adopted and patented his plan many years since.

—A seal, a very rare visitor to these parts at this season of the year, was caught off Montauk Point a few days since.

—Almost as rare an arrival as any of the foregoing was a lot of three thousand pounds of pompano received from Norfolk, they having been taken on the coast of North Carolina. No finer fish have ever appeared in this market, twenty of them averaging five pounds each. This fish, however, is for the rich alone, its retail price being one dollar per pound.

—Frank Burritt shot a seal weighing 125 pounds in Norwalk harbor last Wednesday.

SHAD, OH!—In our issue of Dec. 2d we announced the appearance of shad in Florida waters on the week previous. Almost simultaneously, or about the 25th of November, they were caught in the Savannah River, and in the Neuse River, below Newbern, N. C. This is early for shad, even in those waters. This fish is a luxury, but not to be enjoyed exclusively by our Southern friends, it seems, for Middleton & Carman, of Fulton Market, and Chappell & Storer, soon after received some fine shad from both sections, and sold them here on our own slabs. Enterprise, money, and steam will accomplish most anything.

—A school of whales made their appearance off Southampton, Long Island, on Saturday last.

THE FISHERIES.—A quiet week with the fishermen, as the Georges and Bank fleet are mostly hauled up, and the intensely cold and blowy weather has been unfavorable for any very extensive operations with the shore fleet. There have been 13 arrivals, 7 from the Banks and 6 from Georges. The receipts of fish are very light, comprising 225,000 pounds of Bank codfish, 80,000 pounds of Georges codfish, 25,000 pounds of Bank halibut, 2,800 pounds of Georges halibut. There is not a great stock of marketable fish in the market, and business is remarkably good for the season.

Mr. David Eldridge, of Nantucket, during the last five years, since the first bed of sea clams was discovered on the flats, has dug eighteen thousands three hundred buckets, which he has sold at an average of twenty-five cents per bushels—in the shell, amounting to \$4,575, or nearly \$1,000 per year.

The whales taken on the Northern Coast the past season were very large, with very heavy bone. One whale made 284 barrels of oil, and two others made 540 barrels.

The catch of the Arctic fleet will average about 1,350 barrels to each vessel, and the amount of whalebone, including that taken in trade, will be about 270,000 pounds.

Prince Edward Island oysters are sent to England packed in oatmeal, and by the time they reach London they are plump and wholesome, commanding about sixty cents a dozen.

The Newburyport fishing fleet will make their headquarters at Portsmouth from this date during the Winter months.

Codfish are being shipped from Halifax to Newfoundland.—*Cape Ann Advertiser, Dec. 4th.*

—San Francisco has a whaling fleet of eleven vessels, and the catch this season yielded 16,000 barrels of oil, 150,000 pounds of bone, and 20,000 pounds of ivory, the aggregate valuation being \$500,000.

Yachting and Boating.

All communications from Secretaries and friends should be mailed no later than Monday in each week.

—The steam yacht Skylark, hence for St. Augustine, Florida, was reported at Savannah recently.

—The Brooklyn Ice Boat Clubs—the Prospect Park and Capitoline—were favored with ice clear and strong enough last week to launch their boats on, and consequently the latter club placed the Flyaway on the ice on December 1st, and Capt. Hallock enjoyed the first sail of the season. On Friday, Dr. Chadwick, of the Park club, sailed his Lady of the Lake on the large lake at the park before a light breeze, and on Saturday Mr. Culyer's boat, the Icicle, was launched, but the thaw which set in on that day stopped the sport. Capt. McLoughlin and Mr. Weed, of the Capitoline Club, will launch new boats the next day the ice will admit of sailing, and four new boats are to be added to the Prospect Park Club fleet on the large lake.

COLLEGE ROWING ASSOCIATION.—The sixth annual convention of the Rowing Association of American Colleges was held at the Massasoit House, Springfield, on the 1st inst. Fourteen colleges were represented, and the following officers were elected for the ensuing year:—President, Oliver Stevens, of Bowdoin; Vice President, B. E. Warner, of Trinity; Secretary, N. W. Cadwell, of Hamilton; Treasurer, J. H. Haynes, of Williams. Trinity was readmitted into the association and given a vote in the convention, her failure to be represented in the last regatta being owing to the death of Mr. Cameron while the crew were in training. It was decided to row the next year's race in heats in case the selected course shall be too narrow for fourteen crews to row abreast, the crews to be divided by lot in two equal fleets, which are to row on the same day, the third Wednesday of July, both races to come off within the space of an hour, and the two winning crews to compete for the championship on the day following. A motion to have coxswains in future regattas was lost by a strong vote. The most important business of the committee, however, the selection of a location for the regatta of 1876, was finally left to be decided by a special convention to be held at the Fifth Avenue Hotel, in this city, on the 4th of January, and appearances indicate a strong want of unanimity on this point. The courses at Springfield, Saratoga, and New London are to be examined by a committee, who will report at the next convention. The English universities, Oxford and Cambridge, and Trinity College, of Dublin, Ireland, are invited to row against the winning crew some time next Summer, soon after the university race, the race to be a six oared race, without coxswains, and to be rowed on the course chosen for the next regatta. The convention elected Thomas Hughes, M. P., of England, as umpire, and Mr. Chitty, of the London Rowing Club, to serve in case Mr. Hughes will not accept. If neither will serve the umpire will be chosen by the captains at their meeting next Summer. The Regatta Committee for 1876 comprises B. F. Rees, of Columbia; J. E. Eustis, of Wesleyan, and S. A. McCall, of Dartmouth.

MASSACHUSETTS AT THE CENTENNIAL.—Capt. Henry W. Hunt, of the Aquatic Department of Massachusetts at the Centennial Exhibition, has recommended Mr. Paul Butler, son of Gen. Butler, and Mr. John W. Frazer, of the Boston Boat Club, as the delegates on the Executive Committee of the International Rowing Regatta. The Eastern Club, at a meeting on Friday evening, appointed a committee to take action in regard to a proper representation at the Centennial.

Rational Haztimes.

THE CENTENNIAL NINES.

The season of 1875 had no sooner ended than preparations were commenced for the Centennial campaign, which promises to be the most brilliant year of base ball playing known in the history of the game. Before the present year expires, eight clubs will have prepared themselves for the grand tournament of 1876. First on the list comes the Chicago Club, which the coming season will be run for the first time on the "Boston plan." Their Centennial team will be White, c., Spalding, p., McVey, 1b. and change pitcher, Barnes, 2b., Anson, 3b., Peters, s. s., Glen, l. f., Andrus, c. f., and Addy, r. f. Next come, the Hartfords, with D. Allison, c., Cummings, p., Mills, 1b., Burdock, 2b., Ferguson, 3b., Carey, s. s., York, l. f. s. Reimsen, c. f., and Bond r. f. The Bostons, in 1876, will present McGinley, c., Borden, p., "Josephs," Murnan, 1b., Beals, 2b., Schafer, 3b., George Wright, s. s., Leonard, l. f., O'Rourke, c. f., and Manning r. f. The first Southern representative professional nine to enter the arena, will be the Louisville nine, which will consist of Snyder, c., Devlin, p., Carline, 1b., Gerhardt, 2b., Hague, 3b., Fulmer, s. s., Ryan, l. f., Hastings, c. f., Bechtel, r. f., and change pitcher, Chapman is the club manager. The St. Louis nine for 1876, will include Clapp, c., Bradley, p., Dehlman, 1b., Battrie, 2b., Miller, 3b., Pearce, s. s., Cuthbert, l. f., Pike, c. f., and Mack r. f. This is a strong team, but it will need better management than it had last season to succeed.

—The local professional nine known as the Mutuals, will consist of Hicks, c., Mathewes, p., Start, 1b., Farrell, 2b., Nichols, 3b., Haliman, s. s., Booth, l. f., Haldsworth, c. f., and Cassidy r. f. and change pitcher. The Cincinnati Red Stockings will enter the arena in 1876 with the appended team. Pierson, c., Fisher, p., Gould 1b., Sweasy, 2b., Clark, 3b., Kessler, s. s., Suyden, l. f., Jones, c. f., and Field, r. f.

—The Athletic Club have not yet selected their team, but Al. Reach is to manage it, and the players will include Coons, c., McBride, p., Fisler, 1b., Sutton, 3b., and Jones, s. s.

—The Philadelphia Club, at a recent meeting, adopted a resolution requiring their club officials and players to go before a magistrate and take oath that they would not "sell" a game, or allow a game to be "sold" or "given" away. Before this was adopted, it was proposed to engage Higham, Zettlin, Malone, Nelson, Radcliffe, McGeveny, Treacy, Craven and McMullin. Since then a new nine has been selected.

GRECO-ROMAN WRESTLING.—The match between Andrew Christol and Prof. Bauer, the California champion, will be decided at the Grand Opera House on Saturday evening of this week, the balance of the stake money, \$1,000, in all having been deposited. Col. T. H. Mostery has been chosen referee, and there will be no restrictions as to grips, the winner of two falls in three taking the stakes. This promises to be the best of these contests as yet witnessed in this city.

—The foot race on Saturday afternoon at Mott Haven, between W. P. McNaughton, of Greenpoint, Long Island, and William Harris, of Norwich, Conn., two hundred yards for \$250 a side, was won by McNaughton, by one foot. Time—23 1-5 seconds.

—Recently there was a lifting match at Eureka, Nevada, between two men, for a prize of \$200, the winner lifting a fifteen pound dumbbell at arm's length the greatest number of times. The loser lifted it 1,130, the winner 1,144 times.

—Skating for the season of 1875 and '76 was inaugurated on the Capitoline Lake, Brooklyn, on December 1st, on which day a clear, glassy surface of ice three inches thick covered the lake in question. The sport was enjoyed there up to Saturday afternoon, when the ice began to soften away to the rise of the temperature. The Prospect Park lakes, too, were covered with ice three inches thick, on Friday, but no skating was allowed there as the lake is nearly seven feet deep.

The Colleges.

—From the new catalogue of Yale College it appears that its officers and students number all told 1,250. Of students, there are in the under-graduate classical department 582, distributed as follows: Seniors, 125; Juniors, 122; Sophomores, 155; Freshmen, 180. The latter is the largest class ever entered at Yale. Then comes the Scientifics of the Sheffield School, distributed into three classes, viz.: Seniors, 52; Juniors, 63; Freshmen, 72. The rest are graduate students, special students and 217 in the professional colleges of Theology, Law and Medicine.

COLLEGE ATHLETICS.—In pursuance with a call issued by G. W. Greene, of Harvard, and G. C. Webb, of Yale, a number of delegates representing various college athletic associations, met at the Massasoit House, Springfield on the 4th inst., for the purpose of forming an intercollegiate athletic association. The convention was organized by the election of Mr. Greene, of Harvard, as Chairman, and Mr. Marquand, of Princeton, as Secretary *pro tem*. Ten colleges were represented, as follows: Amherst, Columbia, Cornell, Harvard, Princeton, Union, Williams, Wesleyan, and Yale. It was unanimously voted that an association be formed which should have entire control of the athletic sports to be held in connection with the intercollegiate regatta. Messrs. Wallace, Platt, and Hammond, were appointed a Committee on Permanent Organization and after consultation they reported, with some slight exceptions, in favor of the constitution which had been prepared by Mr. Webb, of Yale,

the same being adopted by the convention. The name of the association is "An Athletic Association of American Colleges," and its object, as expressed in the constitution, is "the promotion of athletic sports among the members and its respective colleges by meetings and friendly contests." There is to be an annual field meeting held at the time of the annual college regatta, under the direction of the Committee on Athletic Sports. All races shall be decided by judges, one from each college represented. All disputed questions are to be referred to an umpire who is to be chosen at the annual convention, and whose decisions are to be final. Prizes are to be given by the association in all of the contests, but no objection will be made to receiving prizes from outside parties. Another convention is to be held at the Fifth Avenue Hotel in this city on January 5th.

RULES FOR FOOT BALL.—We have been asked to print the rules for foot ball, as observed in the games played in our American colleges. The rules vary very considerably with different colleges; but the following, being those adopted by the delegates from Harvard and Yale, appointed to select and arrange them, may be taken as the standard. They are the Rugby Rules somewhat modified:—

CONCESSIONARY RULES.

I. The grounds shall not be more than 400 feet nor less than 300 feet long, and one-half the length in width.

II. The goal posts shall be 20 feet apart.

III. The number for match games shall not exceed 15 nor be less than 11.

IV. Time of game shall be left to the discretion of the captains, but shall in no case exceed two hours, and that side shall be declared victor which, at the end of the allotted time, shall have secured the majority of goals. To secure a goal the ball must pass between the goal posts and over a cross line ten feet high.

V. After a goal has been won sides shall be changed and the losing side shall kick off. In the event of no goal being won at the lapse of half an hour, ends shall be changed.

VI. The ball may be caught on the bounce or fly, and carried; the player, so carrying the ball, may be tackled or shouldered, but not hacked, throttled, or pummelled. No player may be held unless he be in actual possession of the ball. No batting with the hands is allowed.

VII. When the ball passes out of bounds the player first touching it shall advance to the point where the ball went out and throw it in at right angles to the line.

VIII. Every player is on-side, but is put off-side if he enters a scrimmage, upon his opponent's side, or, being in a scrimmage, gets in front of the ball, or when the ball has been kicked, touched, or is being run with by any of his own side behind him (that is, between himself and his goal line). Every player when off-side is out of the game, and shall not touch the ball in any case whatever, or in any way obstruct or interrupt any player until he is on-side.

IX. A player being off-side is put on-side when the ball has been kicked by, or has touched the dress or person of any one of the opposite side, or when one of his own side has run in front of him, either with the ball or having kicked it when behind him.

X. In kick-offs, the winner of the toss shall have the choice of side or kick-off. The ball must be fairly kicked—not babied, from a point—to be decided by the captains.)

XI. Until the ball is kicked off no player shall be in advance of a line parallel to the line of his goal and distant from it (to be decided by the captains).

XII. Two judges and a referee shall be determined upon by the two captains of the contesting sides.

XIII. In match games a No. 6 ball shall be used, furnished by the challenging side and becoming the property of the victors.

XIV. The ball cannot be taken from off the ground, except for a kick, and it must be kicked from the point where it was taken from the ground.

XV. No hacking, throttling, tripping up or striking shall be allowed under any circumstances. No one shall be allowed to wear projecting nails, metal plates, or gutta-percha on any part of his shoes.

XVI. In case of foul the referee shall throw the ball perpendicularly into the air to a height of at least 12 feet from the place where the foul occurred, and the ball shall not be in play until it has touched the ground. On continued transgression of these rules by any player, the side to which he belong shall lose him.

Billiards.

OBITUARY.—We are called upon to chronicle the death of Mr. Christopher O'Connor, which occurred Friday, December 3d. No person in the billiard world was better known than Chris O'Connor, as was also his famous establishment, Nos. 60 and 62 East Fourteenth street, this city. One great secret of Mr. O'Connor's success was that for one of his liberal instincts and profound love of sport he was remarkably attentive to business, foregoing many a personal gratification in order to insure the comfort of his patrons. He was charitable to a fault, beloved by his intimate friends, and those with whom he may have differed at times on matters appertaining to billiards will now look in vain for some one who can fill his place. Particularly will American players miss him, as he was always over-zealous in their interest and that of American billiards. Mr. O'Connor leaves a wife but no children. It is proposed to inaugurate a tournament shortly for the benefit of his family, and Mr. Sheridan Shook has kindly offered the use of the Hippodrome for that purpose, or any other that may be deemed advisable to further the same object.

ALL SORTS.—Garnier has challenged Cyrille Dion for that medal. Report says that Maurice Daly has a challenge in, which is two days older, and Cyrille Dion will forfeit, in which event the former wins a second time without a struggle that mysterious piece of gold.... Charles E. Bladen, who was in 1865 superintendent of the St. Nicholas billiard room, was elected last week President of the Press Club in Centre street.... Dan Strauss, of University place, has a boy of tender years who is wielding the ash in an astonishing way. H. W. Collender made the young expert the present of a 4 by 8 table.... MacWarble goes this week to Charleston by steamer in company with three Collender tables for the Charleston Hotel.... Simon Burns also proposes taking a sea voyage this week, his destination being Galveston.... For \$100 a side at Terre Haute, Ind., Charles Frost, of that place, beat R. Lowther, of

Paris, Ind., two straight games. The games were four-ball, and the score of the first was 1,000 to 372, and that of the second 1,000 to 520. . . Eugene B. Kimball is at Westfall & Banker's, Rochester, N. Y., practicing assiduously for the tournament to be held in that city. . . At the Bay State Billiard Rooms, Worcester, Mass., Manfred E. Gould and John Brooks lately contended for \$50 at the American game, 1,000 points up. Gould won the game by 85 points, with an average of 21.31, while Brooks' average was 19.46. Best run for Gould, 114; for Brooks, 162. Referee, Byron F. Hill. Time of game, 2 hours 15 minutes.

Furs and Trapping.

There will be no change in our fur quotations until the middle of January.

FURS AND TRAPPING.—Ottawa advices of the 1st inst. say: The fur market is unprecedentedly dull this season, and prime skins are uncommonly scarce. One of our largest city dealers says he has seen but one bear skin and two beaver skins in seven weeks. The prices are unaltered.

CHANGES IN THE SKIN OF FUR-BEARING ANIMALS.—The obvious difference between the fur of animals in summer and in winter is found by Donhoff to be associated with an equally striking difference in the texture and thickness of their skin. Thus, the average weight of an ox-hide in winter is seventy pounds; in summer, fifty-five pounds; the hair in winter weighs about two pounds, and in summer about one pound; leaving fourteen pounds to be accounted for by the proper substance of the skin. These differences are quite as decided in foetal animals as in adults. Calves born in winter have a longer and thicker coat than those born in summer; moreover, there is a difference of more than a pound in the weight of their skins after the hair has been removed. Similar facts may be observed in the case of goats and sheep. That these differences are not to be ascribed to any corresponding change in the diet and regimen of the parent animals, is proved by the fact that they are equally manifest in the young of individuals kept under cover, and on the same food all the year round.—*Popular Science Monthly.*

—And now the Canadian trappers say the winter will be mild, because the muskrats have not built their houses yet, and the beavers have laid in only a very small stock of their usual provisions. These animals are an invaluable almanac.

THE NOTTOWAY BEAVERS.—A note from Mr. Newhouse, of the Onondaga Community, dated Poplar Mount, Greenville county, Virginia, says: "I have just got started in my trapping business, and will send you some account for your paper before long." Mr. Newhouse, it will be remembered, started last month for that section of Virginia that is suffering from the depredations of beavers, taking traps enough to clean out the colony.

FURS AND FEATHERS.—The question of furs has resolved itself nearly into a question of trimmings. The introduction of fur trimmings actually threatens to kill the fur trade. The reason is this: Fashion insists upon harmony between the different parts of the costume. It is convenient to have a fur-trimmed cloak or jacket, but it is not convenient to pay the price for mink or sable, or black martin trimming to match the "sett," which we already wear. What is to be done? Perhaps new furs are required as well as a new jacket, and immediately an idea strikes the thrifty mind of the ingenious modern woman. She will make jacket, or winter suit and muff, out of the same cloth, and trim them both with the same fur. This method will enable her to use a much cheaper fur as trimming, and save the necessity for a new suit, a most important

item of expenditure. Moreover, when the fashion has gone, they can go with it, and nobody hurt.

The new silk paletots, which are almost invariably lined or trimmed with fur, have especially suggested this solution to many a difficulty. Silk is not any more expensive than good cloth; a flannel lining, edged with fur, is cheap, better than fur on many accounts, and just as effective, make a muff to match with an edging of fur and a band of it, the same in shade but of better quality, round the centre, and the outfit, with the exception of the boa, is complete. Black velvet is beautifully utilized in this way, in fact, the cost of a really handsome set of furs goes a great way towards providing a complete velvet suit.

These fashions in furs, in color and kind, rather than in styles, have changed so within the past few years as to produce a feeling of uncertainty very unfavorable to a steady, popular trade. There was a time when a set of mink was *sine qua non* of the average woman's existence. The business reputation of a husband who could not afford his wife a set of mink was compromised, while their possession was the indubitable evidence of a certain standing and respectability. Since the decline of mink no other fur has reached or occupied the same position. The diversity is so great that it has become a mere matter of taste, and as few can tell the difference between the real and the imitations, or know, indeed, the names of the almost infinite varieties which they see about them, they shut their eyes and buy that which suits the condition of their purse, since society no longer imposes any special obligation upon them in this direction.

Feather trimmings divide the honor with the fur, and this again impairs the prospects of the fur fanciers.

Worse still, it is the more expensive and profitable class of trade that they cut into. Feather trimmings cannot be imitated; they require hand-labor and care in their preparation. All this makes them prized and sought for. Feather trimmings are newer also than fur, much more varied, and adapted, therefore, to a great diversity of fabrics. The tints and shades and prismatic hues blend with the colors of fabrics, and match the ornaments of the hat, perhaps even the composition of the fan. There is no end to the uses to which the soft, delicate or brilliant plumage of birds can be put, and ladies who can afford to preserve the unities in this costly way, find their excuse in the exquisite results.—*Cor. Hartford Times.*

MAGAZINES.

The Galaxy. The December number of this popular magazine opens with a new serial from the pen of Miss Annie T. Howells, entitled "Reuben Dale," a pleasant story of American life, which promises to be of equal merit with similar serials before produced. Mr. Justin McCarthy's story, "Dear Lady Disdain," is continued, and approaches a denouement. Mr. Willie Winter contributes a fair share of the poetry in "Relics," and Mr. A. H. Guernsey gives us an insight into the life and times of Walter Savage Landor. Richard Grant White, the irrepressible, spite of a recent severe illness, attacks us with another jaw-breaker—"CYCLOPÆDIA, an Egotistical Dissertation Concerning Dog's Tails"—why not foxes? The fellow in the fable was equally anxious to set a fashion. Henry James, Jr., describes the great French novelist, Honore de Balzac, and Mr. Albert Rhodes discomfets of "The Marriage Question." The Scientific Miscellany is valuable, and the Drift Wood brilliant.

Scribner's for December opens with an interesting illustrated article by Charles Stuart Welles, entitled "The Tour of the Nile." Dr. Holland's story of "Sevenoaks" is concluded, and Mr. Bret Harte's new serial, "Gabriel Conroy," is continued and rather increases in interest. Mr. Noah Brooks contributes an article on Japanese Pictures, in which the subject of perspective, as applied to antipodean art, is ably discussed. The present issue is well supplied with poetical articles, among them one by John Boyle O'Reilly, entitled "The Last of the Norwhale." The table of contents is lengthy and varied, and the editorial departments well filled with useful miscellany. *Scribner's* well maintains its high reputation as a leading American magazine.

The American Agriculturist. This valuable monthly publication completes its 34th volume with the December number. To farmers, it is one of the most useful periodicals printed, and without doubt stands at the head of journals of its class. To sportsmen and naturalists, as well as to the more general reader, it gives much valuable information of a practical kind. It is always profusely illustrated, and being furnished at the low price of \$1.60 per annum, comes within reach of persons of most moderate means. The *Agriculturist* has prepared a formal editorial notice of its new volume for the use of those editors exchanging with it who are too lazy to write a good one for it, which we think is very considerate. It very properly regards itself "worthy of even a fourth the attention usually given to the higher priced but not more costly magazines." This exception we consider as very well taken. It seems to be the set custom on the part of nearly all newspapers to advertise gratuitously, and with most fulsome commendation, each issue of the Monthly magazines and some two or three favored weeklies, without regard to the intrinsic value of their contents. Woodcuts and sentimental stories present more attractions to favorable notice than the more substantial pabulum furnished in the agricultural and scientific papers, and others affording a constant supply of more instructive material.

The American Naturalist, formerly published by the Peabody Academy of Science, has passed into the hands, as publishers at least, of Messrs. H. O. Houghton & Co., of Boston, to whom subscriptions for Vol. X, which commences with the new year, should be sent. The November issue, which is just at hand, is devoted largely to two papers, the first, the address of Prof. H. A. Newton to the members of the American Association for the Advancement of Science, and the other, an illustrated paper by Dr. A. S. Packard, on the "Life-Histories of the Crustacea and Insects."

Answers To Correspondents.

No Notice Taken of Anonymous Communications.

COCHIN, Haverstraw.—Tobacco stems mixed with a little hay, and placed in the laying boxes, is said to be an excellent cure for lice on fowls.

W. S. C.—Will you tell me of some party who change Colt's army or navy pistols, old style, loose ammunition, so as to be used with metallic cartridges? Ans. George Hayden, 143 Fulton street, New York.

A. H. S., Marshall, Tex.—Be kind enough to give me the London address of the *Illustrated Sporting and Dramatic News*? Ans. No. 198 Strand, London, W. C.

C. F., Lyndonville, Vt.—I wish to learn where the "Standard" revolvers are manufactured. If you know would you be kind enough to inform me? Ans. They are made at New Haven and sold at the gun stores advertising in our columns.

H. J., Titusville.—At a pigeon match shot under the rule where a cap does not explode shooter is entitled to another bird, one of the contestants missed fire, but shell proved to have no shot, but had powder. Was he entitled to another bird? Ans. The shooter should have another bird.

E. D. S., Philadelphia.—I have a setter pup eight months old, and for

the last few days he has been unwell, refuses food, seems dull and mopy, has diarrhea, and think he may have worms. Can you tell from this description what ails him, and inform me how to treat him. He has had distemper. Ans. Give him the powdered areca nut we have mailed to you, with directions for its use.

W., Hollidaysburg, Pa.—I have a setter 26 inches high and 29 inches around the chest, not fat. Do pure dogs grow so large? He is from English stock, nearly all white, with orange ears, hair 6 inches on tail and haunches; about 10 months old; learns very rapidly, but is rather headstrong in the field. 2d. Where can I find quail in Central Pennsylvania? Ans. 1st. Occasionally pure bred setters get to be as large as your dog. Mr. Colburn's Dash is 27 inches high. 2d. In York and Juniata counties.

YORK, Pa.—1st. What is a choke bore gun, and how does it differ from the old way of boring? 2d. Where can I obtain rules governing dog shows, and is there any standard by which judges are guided in their duties? Ans. 1st. Choke boring, we are informed, is done by enlarging barrel eight or ten inches below the muzzle and contracting it near the muzzle. 2d. For rules governing bench show of dogs, address J. H. Whitman, Esq., Chicago, Ill.

G. W. P., Gloucester.—1st. What are shot concentrators and how are they used in the gun, or how do you load a gun with them? What do you think of them; are they an advantage in shooting, or not? 2d. Which do you think the best gun, a \$50 muzzle or a \$50 breech loader? Ans. 1st. Concentrators are small cylinders of paper open at both ends, fitting inside of the shell around the shot. Many sportsmen think well of them. Our experience with all concentrators is rather unfavorable, having found them irregular in their operation. 2d. A \$50 breech loader.

W. C., Racine, Wis.—Please tell me the way, if there is any, to tell a full blood pointer or setter. 3d. What is the distance for shooting chickens in a match with a shot gun? 3d. How heavy should a gun be loaded for shooting chickens in a match, the bore of the gun being No. 15, muzzle loader? Ans. 1st. There is no certain way to tell if a pointer is pure blood by his appearance. We have seen a cross of pointer and hound, and also of pointer and bull terrier, with all the points of a pure bred pointer. 3d. Any distance agreed to; 40 to 60 yards is common. 3d. Use 3 drachms of powder and 1 oz. No. 7 shot.

NIMROD, Newton, Mass.—Through your paper I want to thank "T." for the report of the trial of his Greener's choke bore, which was very satisfactory. And now I have a question or two to ask concerning the construction of the ice-boats on the Hudson. I had a boat made last year, and owing to some fault in the runners it didn't sail. Will you please tell me how the runners and rudder are made, and how the edge is ground? 2d. How is the mast secured? Ans. The runners and rudders of ice boats are generally shipped on pivots in the centre, to enable them to pass with ease over obstructions. The angle of the runner, which is of steel, is sharpened, and it is on this that the boat runs. The mast is placed in a step and stayed with wire shrouds.

P. W., Worcester, Mass.—How can I break my dog of running in when a bird is flushed? I have a good pointer, fifteen months old, works well, and stands his game well, but when a bird is flushed he will run in and chase it if you do not kill it, and if you do kill the bird he will fetch it to you before you have time to reload. Ans. No dog will break shot if he is skillfully handled and properly punished for the fault. Your best way is to hunt your dog with a short check cord, and when he comes to a point let a companion shoot while you hold the cord, and the instant he starts bring him back with a sharp jerk, and make him down charge until the gun is reloaded and until he is ordered to *fetch dead*. A few rough turns with the check cord may be enough. We have found, too, that with a three-foot rawhide any dog can be broken of any fault if it is judiciously applied. The trouble arises very often from the fact that many shooters rush for the bird the instant it falls, thus setting the dog a bad example, which he very naturally follows, and of which it is difficult to break him.

S. H. H.—A friend of mine and myself have had a disagreement as to whether the length of the barrel of a rifle increases the range. I maintained that the length of barrel increased the range up to a certain length, and after that length was attained each inch added to the barrel proportionately decreased the range of the rifle. Also inform me at what length of barrel a rifle shoots the farthest. I think it is about 36 inches, but don't know exactly? Ans. The length of the barrel depends entirely upon the charge of powder used. The great principle of the barrel, aside from the idea of an apparatus for giving an accurate flight to the projectile is, it shall be in such proper proportion as to allow of all the powder to be consumed. The more powder used, then the more barrel. After the proper proportion of barrel to powder is ascertained, any additional length would be rather detrimental than otherwise, increasing friction, and consequently retarding the force of the ball. No positive length of barrel could be fixed as a limit. Modern rifle practice, with its decided tendency towards extreme ranges, is constantly augmenting the quantity of powder, and may, therefore, increase length of barrel. Thirty-four inches is about the extreme length of barrel now used.

J. C. B. AND SHOOTER.—Some time ago we received a photograph of a rifleman in the act of firing. It represented the marksman in a reclining position, the face to the right, the left arm and hand parallel with the gun, clutching the butt, the right hand over the gun drawing the trigger. What was novel about the picture was the use of the strap or leather string of the piece, which was attached to the trigger guard. The strap or sling was apparently, in the picture, held taut by the foot of the left leg—at least it seemed so to us, though photograph does not include the muzzle of the rifle. In the question sent us by J. C. B., whether this was in order in match shooting, taking the practice of the N. R. A., we incline to the negative, never having seen it used. (See issue of Nov. 11 in Answers to Correspondents, "J. C. B.") We have received from our friend "Shooter," of Canada, the following: "Are you not mistaken in your answer to 'J. C. B., Secretary A. R. R.,' inquiring 'can a strap be used in any way in shooting according to the rules of the N. R. A.?' You must know that nearly all military rifles have straps (or slings, which is the same thing) attached to them. Consequently I do not see how any association could legally prevent any competitor from using them to the best advantage, being a *bona fide* part of the rifle. I know that they are commonly used on sporting rifles at Wimbledon, and also on military rifles, and I don't know of any clause against using them in the rules of the N. R. A. Will you please to give your authority in your next issue?"—SHOOTER.

As the question is put to us by "Shooter," whose skill with the rifle is only equalled by his knowledge of the rules governing its use, we consulted an officer of the N. R. A. (submitting the photograph to him) whom we deem to be about the highest authority on this subject, and have received the following reply: "In the case of a military or other rifle having a sling, there would be no objection to twisting it around the arm or knee in firing. In Russell on 'Rifle Practice' mention is made of a well known shot, who fired while sitting with the sling of his rifle around his left arm and knee. Still, the sling must be used as a *sling only*, and as attached to the rifle. To use a Creedmoor rifle not made for a sling when firing lying down, by attaching a strap to the trigger guard, and passing a loop at the other end on the foot, as shown in the photograph, is not using it as a sling, but as an entirely distinct apparatus, equivalent to an artificial rest. I do not think it would be allowed at Creedmoor." We should be very glad to have further ideas on this subject, and would like to have from our readers some short comments made in regard to using slings, or how they may be employed in rifle practice. Of course a man may wrap the sling around his leg or arm; but can he stretch it between his leg and arm, or hand or foot, so as to receive an additional support or brace from it? Military arms have ramrods; could they be used in any way? They are integral parts of the arm, and by stretching a point could be made to serve the same purpose as the old-fashioned *fouquier*, or fork, early arquebuses used, which was an artificial rest.

A WEEKLY JOURNAL.

DEVOTED TO FIELD AND AQUATIC SPORTS, PRACTICAL NATURAL HISTORY, FISH CULTURE, THE PROTECTION OF GAME, PRESERVATION OF FORESTS, AND THE INOCULATION IN MEN AND WOMEN OF A HEALTHY INTEREST IN OUT-DOOR RECREATION AND STUDY:

PUBLISHED BY

Forest and Stream Publishing Company.

—AT—

17 CHATHAM STREET, (CITY HALL SQUARE) NEW YORK,
[Post Office Box 2832.]
127 SOUTH THIRD STREET, PHILADELPHIA.

Terms, Five Dollars a Year, Strictly in Advance.

A discount of twenty-five per cent. allowed for five copies and upwards.

Advertising Rates.

In regular advertising columns, nonpareil type, 12 lines to the inch, 25 cents per line. Advertisements on outside page, 40 cents per line. Reading notices, 50 cents per line. Advertisements in double column 25 per cent. extra. Where advertisements are inserted over 1 month, a discount of 10 per cent. will be made; over three months, 20 per cent; over six months, 30 per cent.

NEW YORK, THURSDAY, DECEMBER 9, 1875.

To Correspondents.

All communications whatever, whether relating to business or literary correspondence, must be addressed to THE FOREST AND STREAM PUBLISHING COMPANY. Personal or private letters of course excepted.

All communications intended for publication must be accompanied with real name, as a guaranty of good faith. Names will not be published if objection be made. No anonymous contributions will be regarded.

Articles relating to any topic within the scope of this paper are solicited. We cannot promise to return rejected manuscripts.

Secretaries of Clubs and Associations are urged to favor us with brief notes of their movements and transactions, as it is the aim of this paper to become a medium of useful and reliable information between gentlemen sportsmen from one end of the country to the other; and they will find our columns a desirable medium for advertising announcements.

The Publishers of FOREST AND STREAM aim to merit and secure the patronage and countenance of that portion of the community whose refined intelligence enables them to properly appreciate and enjoy all that is beautiful in Nature. It will pander to no depraved tastes, nor pervert the legitimate sports of land and water to those base uses which always tend to make them unpopular with the virtuous and good. No advertisement or business notice of an immoral character will be received on any terms; and nothing will be admitted to any department of the paper that may not be read with propriety in the home circle.

We cannot be responsible for the dereliction of the mail service, if money remitted to us is lost.

Advertisements should be sent in by Saturday of each week, if possible.

CHARLES HALLOCK, Editor.

WILLIAM C. HARRIS, Business Manager.

COLLEGIATE RIFLE MATCHES.

THE movement that has recently been instituted to introduce rifle practice among the different colleges, and to initiate an annual "Intercollegiate Rifle Match" at Creedmoor, is one that is deserving of commendation. All attempts to excite an interest in manly sports among the young men of the country are beneficial in the extreme. The hold which athletic exercises have taken in the various colleges is a strong proof of their value. Through the influence of the press and the support of the common sense of the community the interest in this subject is constantly increasing, and the attempt to add rifle practice to the list of college sports will undoubtedly be a great success.

There are many advantages connected with this practice that do not belong to the usual college amusements. Unlike boating, walking, or gymnastics, it requires no unusual strength or stature to excel. As no training and but little practice is required, the time taken from study is comparatively small. It develops those qualities of coolness, nerve, and sound judgment which are not only valuable in themselves, but the cultivation of which, as they involve abstinence from dissipation of all description, cannot but have the best effect upon young men. The advantages that will result to the public from having the youth of the country trained to the practical use of the rifle will be great. The defense of the nation, in the future as in the past, will depend upon volunteers from the people, and their value will be more than doubled if expert shots.

At Wimbledon the annual contests between the public schools and colleges is one of the great events of the meeting. Teams from Rugby, Winchester, Harrow, etc., are as regular competitors as those of the volunteers, and the Oxford and Cambridge match excites fully as much attention as the contest for the Elcho Shield.

It is to be hoped that steps will be taken at once to follow the example of Harvard and Middletown and organize teams in the various colleges for a grand intercollegiate match next year. Columbia, the University and the College of New York, from their proximity to Creedmoor, should set the example. The Alumni of the different colleges should take up the matter and offer a few prizes for competition; the rest would follow—a matter of course. It should be recollected, however, that the practice to be cultivated is "military shooting with military rifles," and particularly shooting from the shoulder. Long range shooting is well enough in its way, but will always be confined to the few. It is also too expensive to enable it to be popular. In England all college matches are shot with the same

weapons and at the same distances as those of the volunteers, and their example should be followed in this country. A match next Fall with military rifles, shot "off-hand" at 200 yards, and lying at 500 yards, would be undoubtedly participated in by most of the colleges, and, it is to be hoped, will be included in the next programme of the National Rifle Association.

For our own part we are quite willing to lend what encouragement we can to this movement by offering a badge as a prize for students' competitions, either at Creedmoor or at other ranges to which they have access.

A HOLIDAY APPEAL.

THE high estimation in which FOREST AND STREAM is held by its readers is attested to by hundreds of friendly letters now on our files. However, we seldom print encomiums, because we believe the paper can stand on its own merits without bolstering. With this written testimony before us we feel safe in urging our patrons at this time to press its claims upon the attention of their friends. Under the promise and prospect of better times to come, our circulation should be doubled during the year before us, and it can be, with very little effort on the part of those to whom we appeal. The time has now come when we desire to avail ourselves of the many kindly proffers of service that have been extended to us, and to test their sincerity and worth. We have labored faithfully and like beavers throughout a long period of financial depression to supply a want in journalism which the public recognize. If anything is lacking, an increase in our ready resources will enable us to fill the deficiency. What we desire is this:—

That each subscriber now on our lists will exert himself to influence an additional name. Let each induce a friend to take the paper, and the result we seek for will be attained. The individual service is slight, but the aggregate is most potential.

In this Holiday Season, when gifts are in vogue, no trifling present will be more acceptable to many than a year's subscription to FOREST AND STREAM. The benefit accruing will be substantial and continuous. To the youth it will yield more lasting pleasure and profit than a toy or trinket; to the adult it will prove a source of constant and unfailing information. In every large mercantile establishment and manufactory there are many employes who are much interested in the subjects of which this journal especially treats; no more fitting or welcome recognition of their services could be bestowed by their employers than a year's subscription to our paper. On the frontier army posts, isolated from civilization, are many officers to whom the FOREST AND STREAM would be most acceptable, as it now is to dozens of them who subscribe to it and write for it. It just meets their wants and their tastes. Let their friends at home make a note of this. To students of natural history, and all persons interested in field and aquatic sports; to members of rifle clubs, now rapidly multiplying all over the land; to the tourist or invalid in search of new fields of discovery or rest, the paper is invaluable. Each week its columns are filled with information of the most useful kind. The attractions of remote and unknown sections are weekly brought to notice in our pages. Useful recipes for all manner of requisites are given. Instruction is collated from most intelligent sources in all the arts that pertain to the sportsman's craft. New devices and inventions are developed. Solutions are constantly given to the problem of how to employ the leisure hour with pleasure and profit; to recuperate wasted energies; to enjoy nature as we find it. No other journal in this country, in its several departments, attempts to cover a scope so wide as ours. We entered a field three years ago which we found open and unoccupied, and are not weary in our efforts. With increased encouragement these efforts shall be redoubled. The test of experience has enabled us to secure a corps of most competent editors, whose chief incentive is the interest they take in their work.

May we not then bespeak a special remembrance from our friends to us in this Holiday Season? and while they are giving good gifts to others, let their gift to us be the simple and inexpensive one we ask, namely, an increase of our Subscription List. Let each of our patrons send in a new name. Is it asking too much?

—The *Daily Graphic* of Saturday last contains an illustrated article on Blooming Grove Park, Pa. There are views of Lake Giles, Lake Laura, and the Club House, which for a sportsman's club is the finest in this country, and commands an extensive view of lake, forest and mountain scenery. It was designed by John Avery, architect of the club, and is most admirably adapted to the wants of sportsmen and their families. It is a charming retreat either in Summer or Winter. The attendance of members the past season has been large.

—We are informed that our friend R. Schmiedeberg, Esq., of Hoboken, N. J., is about to leave us for Leipsic, Germany, to assume the duties of Field and Kennel Editor of *Der Weidmann*, a prominent sporting paper published in that city by Fr. Von Ivernois. Mr. Schmiedeberg, as President, has been a most active and efficient member of the Hoboken Club, established for the protection of game, and we regret to lose from among us, so useful and skillful a sportsman, and genial gentleman. He will, however, have our best wishes for his future welfare.

—Eighty-eight passengers arrived on the steamer Montgomery from New York to Fernandina, Fla., on the 20th.

ON WHAT DO SALMON FEED?

OUR correspondent, E. J. Hooper, Esq., of San Francisco, recently made some observations bearing upon this vexed question in the course of a recent expedition to the north coast of California, the results of which he has transmitted to our journal. In the course of conversation there with those who had been in the habit yearly of capturing them, it was remarked by one that he had never found any food whatever in the stomach of the salmon, and he was therefore at a loss to understand upon what they fed. He thought that they could not live upon fish or shell fish, mussels, &c., or he would have found some remains of them in their intestines. Mr. Hooper also examined them and found nothing of any kind of food within them. This led him to reflect upon the cause of their stomachs being entirely empty of any substance whatever. Like his companions in the discussion, he began to wonder what they fed on, and where they went to feed. He at once concluded that the digestion of the salmon must be so extremely rapid as not to leave any traces of food to be found in their stomach. On this subject, referring to Bertram's work, the "Harvest of the Sea," we find him stating that "hundreds of salmon were dissected in order to ascertain what they fed upon; but only on very rare occasions could any thing of the nature of food be found." What then do salmon live upon? was asked. It is quite clear that salmon obtain in the sea some kind of food for which they have a peculiar liking, and upon which they rapidly grow fat; and it is very well known that after they return to the fresh water they begin to lose their flesh and fall off in condition. The rapid growth of the fish seems to imply that its digestion must be rapid, and may, perhaps, account for there never being food in its stomach when found; although we are bound to mention that one gentleman who writes on the subject accounts for the emptiness of the stomach by asserting "that the salmon vomits at the moment of being taken." Does this gentleman mean by this, that vomiting takes place when the fish is landed or when it is at first hooked? We presume the former, of course. "In the many salmon we took on our northern trip," Mr. Hooper remarks, "I did not observe anything of this kind when they were lifted into our boat."

With all the advantages of the salmon's migration there is yet a great deal to be ascertained as to their birth, breeding and food, although of late years much has been discovered. With regard to the food, guesses have been made, and it is likely they approximate to the truth: these conjectures are that fish and various crustacea, with many other sea animals constitute, at any rate, their chief sustenance. To anglers especially, the very rapid growth of the young salmon or grilse is very satisfactory. After grilse reach four pounds and journey to sea and back again, it has been ascertained by marking them that in two months they grow into beautiful salmon, varying from nine to fourteen pounds in weight. They never return a grilse. There is also an instance quoted in the "Harvest of the Sea," of a fish of ten pounds being marked by a responsible party, which was caught at a place forty miles distant from the sea, traveled to the salt water, fed, and returned in the short space of thirty-seven days. When it again arrived it was found to weigh twenty-one pounds and a quarter. Thus may we fishermen rejoice in the fact that all that our fish commissioners and other patriotic gentlemen do, in planting so many thousands of salmon and their congeners in our rivers, lakes, and streams, will provide much sport and benefit that in a short time will be realized therefrom, thanks to them all.

AMONG THE NUTMEGS.—We took a run to Meriden, Connecticut, one day last week, and found that FOREST AND STREAM was an open sesame to the hearts of the many sportsmen of the place. Our good friend Jacob Glahn, President of the Central Sportsmen's Club, took us in charge and made our short visit most pleasant. To be sure they have a local option law in Meriden, but "Shank" is no bad substitute for lager, or "Tonic" for old rye. And then they must be harmless, as the Chief of Police drinks them occasionally. Bloxham's picture gallery is alone worth a visit, to say nothing of meeting that genial and well-known rifleman, Major Bixby. Through the courtesy of Mr. Wilcox, President of the Meriden Britannia Company, we saw all that was interesting in that extensive establishment, not the least so to us being the sketch prepared by Mr. Hirschfield, of the FOREST AND STREAM Cup for the Chicago Bench Show. We have yet to see anything of this nature which can equal the beauty of the design, and we are greatly indebted to the Meriden Company for having gone to an expense for models, etc., which exceeds fourfold the advertised value of the cup. We must not omit to mention a call on Messrs. Sanford & Lohman, the eminent engravers, to whom our readers are indebted for the capital portrait of Whisky. Messrs. S. & L. have now in hand portraits of Mr. Salter's Dash and Bess, and Mr. Jarvis' Dick, for this paper. By the kind permission of Parker Bros. we were allowed to go over their extensive works, where guns were being turned out in numbers which bespeak a lively demand for their excellent specimen of American manufacture. Our friends in Meriden will accept our best thanks for their kind attentions.

"CAMP LIFE IN FLORIDA."—The editorial notices of this book received since its publication are very flattering. The sale of the work is larger than expected, the binder being now at work upon the Third Thousand. No one going to Florida should be without a copy. 350 pp., 12mo. Price \$1.50.

AMERICAN AMMUNITION.

REALIZING the importance of this subject, which for some time past has been agitated in these columns, and being desirous of imparting to our readers such information as might help solve the question as to the quality of ammunition of home manufacture—referring in this instance more particularly to paper shells—we recently made a visit to the works of the Union Metallic Cartridge Co. at Bridgeport and gave to the manufacture of this branch of American ammunition a most thorough examination. A description of the details of this most ingenious and even wonderful process, so characteristic of a country productive of labor-saving machines of every kind, must, for want of space, be left for another time; a summary of results will be all that we can at present present. In a letter published last week from Mr. Hobbs, under whose direction the paper shells, and in fact all the ammunition of the Bridgeport Company, is manufactured, it was stated that the miss-fires of American shells was owing to the want of uniformity in the chambering of guns. It is unquestionably this want of uniformity, which, by allowing in some instances the head of the shell to sink below the position in the breech intended for it, thereby increasing the angle at which it is struck by the firing pin, to which the whole difficulty can be traced. In preparing for the manufacture on a large scale of an article of this description, for which expensive and elaborate machinery is required, it is necessary to start with a standard which shall ensure uniformity. Out of a number of guns Mr. Hobbs chose the smallest in order to avoid making a shell which would not enter the chambers of some guns. In four guns we examined, all purporting to be number twelve gauge, we found a difference of one-hundredth of an inch in the bore of the chamber. After the Bridgeport shell has passed through the last stage of manufacture it is still passed to another person, whose duty it is to examine each individual shell, and those in which the heads are found to be below the standard are rejected, branded and packed and sold separately at a reduced price, the purchaser taking the chance of miss-fires. These shells are marked and known as 3 C. Any sportsman finding this mark on his Bridgeport shell, may know that it is sent from the factory thus stamped to show that it has not passed inspection. We experimented first with some hundreds of these 3 C. shells. In the guns with the largest chamber a number of them, perhaps from five to seven per cent., missed. These same shells placed in the gun with the smaller chamber were exploded in every instance, with the exception of one or two where the first blow from the striker had probably displaced the fulminate. It will be borne in mind that these were condemned shells. We subsequently exploded a hundred or more of the regular shells in all the guns without one miss-fire.

To procure a uniform thickness of head is the great object in the manufacture of these shells. The difficulty of so doing can be realized when the multiplicity of processes is witnessed. In England, owing to the cheapness of labor, much of the work which here requires machinery, is done by hand. The question of paper alone was one most difficult to solve. The Messrs. Eley take all of one manufacture, and it was long before an American house could be found to turn out an article which would conform in all respects to the requirements. To sum up, if shot guns were all chambered with the uniformity observed in the manufacture of our rifles, we should hear no more of miss-fires from the first than we now do from the latter; or if the firing pins were made to act more direct, as for instance in the case of the Parker guns, we believe the same results would be reached. By the bye, we would like to hear from some one who has used the Bridgeport shell in the Parker gun; the action of the firing pin with them is almost horizontal, and unless a chamber was so large as to permit the shell to pass beyond the reach of the pin, no miss-fires should ever occur. Of one thing we are convinced, the Bridgeport shell is made with all care, the materials used are first-class, and the same as enter into the manufacture of their rifle ammunition, which is admitted to be excelled by none. The letter which we print below explains very clearly the cause of miss-fires and suggests a remedy, which coincides with all that we have written:—

PITTSBURGH, Penn., November 30th, 1875.

EDITOR FOREST AND STREAM:—

I have read with interest the various communications that have appeared in the columns of FOREST AND STREAM in reference to American ammunition, and have concluded to give my experience with Bridgeport shells; also, to give reasons why so many of them fail to explode. I have used upwards of 350 of them during the last five weeks, and only failed on two. Now, Mr. Editor, one thing is certain—we need ammunition that does not cost so much as Eley's, but we want it reliable. I use a W. C. Scott & Sons 8 1/2 pounds, No. 12-gauge breech loader, and have used both Eley and Bridgeport shells. When I first bought my gun I used American shells, and fully twenty per cent. failed to explode. The query then was, what was wrong? I studied the matter over thoroughly, and while examining the exploded and unexploded shells my attention was attracted to the difference in the indentation mark on the caps. Having here a clue, I took the barrels off the stock, pushed the extractor down to its proper position, and put the unexploded shells in and pushed them down with my thumb. I then laid a straight edge across the breech end of the barrels and noticed the distance from the face of the shells to the edge of my straight edge by fitting a piece of wood between them. I marked them, and proceeded with my investigations. I now took two exploded shells and went through the same formula, and I detected the difference instantaneously, viz., the exploded shells were thicker in the head. As the barrels were already chambered and countersunk for the shell head, this could not be easily remedied, so what was the alternative here? My gun has rebounding locks. While I was hunting a remedy for the disease I accidentally pulled the trigger back, and with my thumb shoved the hammer ahead on the pin and had my attention called to the fact that the hammer had to move one sixteenth of an inch before it touched the end of the firing pin. Here was

a good clue to work on. I argued that the one sixteenth additional length would reach just that much farther, and reach the shells with thinner heads and make a deeper indentation and strike harder on the anvils in the caps. I went to a machine shop, made two new firing pins, put them in, and found that only about six per cent. missed fire, and this on the left hand barrel. While drawing back the hammer I noticed that the left hand spring was stronger than the right, and also noticed it was perceptibly harder to shove forward. I took the locks off, took out the spring, eased the spring on the rebounding side, and now, Mr. Editor, I have no trouble with the Bridgeport shells not exploding. The English gun is evidently chambered for Eley's shells. I never had any pull off at the head while extracting. Just let persons troubled as Dr. Webb was try my experiment, keep his shells dry, and give the firing pin one eighth of an inch of a movement more if possible, and they will without doubt be better satisfied with the results.

Allow me to make a suggestion to our Bridgeport makers, and that is, alter your dies to make a thicker and more uniform head, and put stiffer and harder paper in them. Their caps for recapping paper shells are splendid. I have used hundreds of them in recapping American and English shells, and never had a miss-fire unless I was in too big a hurry to get my shells recapped and forced them in crooked, which had the effect of pulverizing the fulminating powder, rendering them useless. When the cap does not go in straight and smoothly, reject it, for a miss-fire may be the result.

Here is another item. When you find a shell does not explode, examine the head and you will see that it is invariably forced into the countersink intended for the head, and that the blow of the firing pin has struck the cap just hard enough to pulverize the fulminating powder before the shell is tight and firm against the shoulder, and that the indentation on the cap is made after the shell is forced tight against the shoulder and after the fulminate has been powdered and shaken out of the cap.

FRIEND OF AMERICAN WORKMEN AND SPORTSMEN.

RIFLE TYPES—NO. VI—CONCLUSION.

THE GRUMBLER AND PROTESTOR.—The cosmogony of the Rifle Range would be incomplete without the Grumbler and Protestor, two characters by no means of an amusing kind. These individuals are sometimes distinct as to species. Whereas you can stand the first, when the latter takes a persistent form he is insupportable. Grumbling may be defined as epidemic—protesting, fortunately, is only endemic. A man may, however, start out as a mild carper, merge into the confirmed grumbler, and end by becoming a chronic protestor. The grumbler "wants to know why every officer—every man jack of them—ain't on the range; what they were elected for, if they never come on the ground? Why must he stand in line to get his shooting ticket, when he saw Bill Wiper get his ticket without any such fuss?" He can't see why he "can't come down any day, or at any time, and fire at any target he pleases. Ain't it a free range and a free country? He would just like any man to tell him why they always made it a point of putting him to shoot on No. 4 target. Oh! he knew why—just to favor a lot of privileged fellows, who seemed to think the range was their's, and did just what they pleased. He wasn't going to fire off a single shot more until he knew where his last shot had hit. What was a range officer for, but to find it out for him? Suppose he had to run down a thousand yards or so to the target every time he wanted him? Wasn't the range officer put in office just for that? They wouldn't let him fire all his shots, but he was late and the match was ended. Was it his fault he missed the boat?" Generally the grumbler expects that all the rules and the entire machinery of the range shall be stopped or started according to his pleasure, and that every officer of the association should be at his beck and call. He never can see that exactly the thing he insists shall be done is impossible. His personal grumbles are incessant. "That man's rifle," he says, "has got one band too many and it ain't right," or "that other man's position wasn't fair; he shot fully six inches nearer the 1,000 yards target than I did." His own arms and ammunition are fruitful sources of grievance to him. "He never yet got a decent cartridge, and never expected to. Powder never was twice alike, and it wasn't lead the bullets were made of, but dross. There never was a gun kicked like his, nor a piece that caked and fouled so." Then the sun and wind have always combined to bother him. Even when it rains, that natural phenomenon surprises and aggravates him. He is certain, too, that every human being on the ground, from the waiter in the restaurant to the markers, are conspiring to defraud him of his rights and privileges. The grumbler is invariably a miserable shot, and deserves to be one. He frets, fumes and worries so much over any and every trifle that his nerves are entirely gone. At first when you are thrown in companionship with such a captious creature, his presence is irritating to a degree. It time you get to pity what is truly only an unfortunate form of insanity. If, however, charitable people look on the grumbler as a nuisance, the protestor is held to be a pest, and when he assumes the chronic stage, he is the most noxious animal to be found on the range. As there are sea lawyers, so there are range lawyers. He does not attend a match in order to shoot, but to litigate. He is only so far learned in the laws of the N. R. A. as to quibble with them. He is ever on the watch to find his neighbor at fault. If there should happen to be a single rule which might, by the most malicious twisting and ingenious straining, have a double or doubtful interpretation, he will wait patiently until his opportunity comes, and then he will manufacture a first-class snarl. Then only is he happy, and out comes an elaborate Protest. He has such a respect for this word, and gloats over it so much, that he never writes it without a capital P. He passes most of his useless life in concocting, compiling and eliminating protests. He watches positions, and should an unlucky man only put the thumb of his left hand the sixteenth part of an inch out of regulation drill, he notes it, and this is the ground work for some future voluminous protest. He has been known to interrupt a man who was in the very act of firing, by unrolling a protest as long as a piece of wall paper and fluttering it in his face. He wrote a protest of fourteen pages, founded

on the fact that Corporal Buster of the 277th, had the fifth regimental button on his military coat not properly secured in its appropriate buttonhole, and another document of equal length was directed against Private Sloven of the 772d, who certainly did his firing with unblacked boots. While ruining himself in stationery, and flooding the Executive Committee with protests, the protestor himself has this singular characteristic—that of being wrong ninety-nine times in the hundred. Either his protest is badly framed, or sent to the wrong officer, or directed against an innocent person, or at variance with the facts. Nevertheless he considers these matters as minor points, and insists on a judgment in his favor. Not satisfied with decisions dead against him, based on common sense, he protests again and again against official judgments. Next he breaks out in appeals, and from what was a cinder heap he constructs a Himalayan mountain. From the Executive Committee he appeals to the Board of Directors, and if he had his own way would carry his nonsense before the Supreme Court of the United States. This disagreeable being is the enemy of mankind in general and the deadly foe of rifle associations in particular. But what is worse, having hampered everything for a while, should his claims be ignored he never ceases bewailing what he calls "the injustice done him," and he ends by endeavoring to create ill feeling, invariably singling out the most meritorious officers in the organization and maligning them with false imputations. The best—the only remedy in a case of this nature—is to sit down on the protestor—i. e., to crush him out. Some rather honest yet hasty men on rifle ranges have thought that if an accident should occur, such as the discharge of his own rifle, so that he might be made lame for life, or incapable of coming on a range at all, that this would be considered by them as a merciful visitation of Providence; but we are not of this opinion. To give him the cold shoulder and to back up the decisions of the officers is the best plan; then send him a letter signed by the majority of the club politely requesting him to sever his connection with the association, and he has his quietus. This duty is an imperative one, or the chronic Protestor will ruin all the profit or pleasure to be derived from your rifle range. Such a man as we have endeavored to describe would keep on protesting and appealing in the kingdom of the blest.

OPINIONS OF THE PEOPLE.—We are pleased to quote what some of the leading journals say of our new book entitled "Camp Life in Florida," as well as a few private opinions:—

Fifty per cent. of the people going to Florida this Winter will, I believe, buy your book. It is most seasonable, and decidedly a hit.—*Com. L. A. Beardslee, U. S. N.*

It is just the book for every one going to Florida, and every one that stays at home. It must go off like hot cakes.—*Geo. A. Boardman.*

It is very interesting, and I am sure the public will appreciate a book so long needed.—*Major H. W. Merrill, U. S. A.*

Charming in its style, and valuable for the information it contains.—*Detroit Public Leader.*

All necessary information in its pages.—*Phila. Inquirer.*

One of the best guides issued.—*N. Y. Daily Graphic.*

Valuable and indispensable work.—*New Bedford Standard.*

Can find nowhere so much or so accurate information about Florida.—*Evening Mail.*

Cannot fail to interest.—*Richmond Dispatch.*

From personal observation we can recommend it as a capital guide.—*Tonkers Gazette.*

A most interesting contribution on the natural history and geography of Florida.—*Kentucky Live Stock Record.*

Has met with overwhelming approbation.—*St. Augustine Press.*

Highly interesting matter for the tourist, health or pleasure seeker.—*N. Y. Bulletin.*

No one could follow to Florida a more intelligent and genial guide.—*Washington Sunday Herald.*

Sportsmen will be delighted with this book, as it contains just the information they are constantly in pursuit of.—*Chicago Field.*

A great deal of information not to be picked out of common guide books.—*Rod and Gun.*

A mass of information that has not been hitherto readily accessible, and all visitors to the South will gladly avail themselves of its assistance.—*N. Y. Times.*

Altogether refreshing.—*Scientific American.*

Supplies a want long felt.—*Tallahassee Floridian.*

Readers essential service not only to sportsmen and health hunters, but to the State of Florida itself.—*Brooklyn Union.*

"CAMP LIFE IN FLORIDA."—The FOREST AND STREAM Publishing Company have sent out 200 copies of "Camp Life in Florida" to the editors of leading newspapers. Any of our exchanges who have not received copies, and wishing them, will oblige us by notifying us to that effect.

—Col. Skinner, of the *Turf, Field and Farm*, has published a letter in which he makes decided objection to Mr. Bergh's suggestion to the New Jersey farmers to shoot him for hunting foxes over their lands. This is quite natural, and we don't wonder at it. Better shoot the foxes we think—and send Mr. Bergh to Utica.

—While Dr. M. G. Ellzey, President of the Virginia Agricultural College at Blacksburg, was hunting for quail last week, he had a very narrow escape from death, his dog having knocked his gun from a log in such a way that it was discharged within a few inches of his head. The accident did not prevent his bagging fourteen quail, however.

NOW LET EVERY NEWSPAPER MAN HURRAH, GIVE THANKS, AND SING!—Postmaster Jewell, in his Post Office report says:—

"I recommend that the postage on transient newspapers and periodicals, books, printed matter of all sorts, lithographs and maps, sheet music, photographs and manuscripts designed for publication, shall be reduced to one cent for each two ounces or fraction thereof, which was the rate before the enactment of the law advancing it during the closing hours of the last Congress."

FLORIDA.—Our correspondent, "O. K.," who is a resident of St. Augustine, writes from that city under date of Nov. 25th:—

"The improvements here during the past Summer have been wonderful. Our hotel accommodations have been doubled, and the city is prepared for the crowd that is advancing. The place to-day entertains a very large number of visitors. The present influx exceeds anything yet recorded. Never before has the season commenced so early. The Magnolia has opened, and its proprietor, W. W. Palmer, is truly astonished at the many people applying for accommodations. The hotel has been refitted, etc., and its table is, as usual, unexcelled in the South—surely in the State. Our friend Ponce, of the Oriental, has done a fair business the entire Summer, and is now doing fairer. The St. Augustine Hotel, which now looms up twice its original size, will open on the 1st of December. It has been entirely refurnished, and a new dining room has been added, also an annunciator—in fact, everything that is required to make it first class in every respect. Capt. Vaill will command, as of old. The Florida House, by J. H. Remer, will probably open this week, after a thorough overhauling. The boarding houses generally have been reconstructed, and the accommodations this Winter will surpass those of any previous season. New buildings have gone up, improvements have been made, and thus year by year St. Augustine is steadily attaining the grand success that has been predicted for it. The facilities for attracting and pleasing the visitors have been increased extensively. This Winter we will possess a miniature Long Branch, situated on the north beach, fronting the Atlantic Ocean. A company are to erect large tents, bathing houses, etc., that will afford a desirable retreat for visitors. A livery stable will also be established on this beach. Throughout the city there are improvements that are evidences of a prosperous and pleasant season.

The St. John's Railway from Tacoi is in fine condition. A new engine and cars have been added to the rolling stock of the company. There will be four trains daily each way, and close connections made with all steamers on the St. John's River. At the St. Augustine depot the trains will connect with the Irwin Bros' line of omnibuses, which are new and just from New York. Another great and desired improvement here—that has long been wanted—is the opening of a first-class three-dollar-a-day house, which has at last been accomplished. It is a new building (now in course of construction,) and will be known as the Marion Hotel. It is situated on Charlotte street, near the St. Augustine Hotel, and will be managed by R. Palmer & Co., and is to be decidedly first class, with accommodations for one hundred guests.

The hunting and fishing in our neighborhood never was better, nor the game more plentiful. It is no rare occurrence for one of our young hunters—say Jim Ponce, Paul Mickler, or others—to start out in the morning with gun and dogs and return in the evening with three deer, besides ducks, quail, and other small game. It was but last Friday that the said famous Jim Ponce gained the woods in search of deer, when before he had gone three miles he killed two in succession. The venison is sold for from nine to twelve cents per pound. The wild ducks surround us on every side, and the rivers and ponds are a perfect mass of moving feathers. Ducks sell for fifteen cents each. The fishing here is always good, but at present our market is oversupplied. The trout, sheephead, bass, and black-fish bite nicely. Parties to Matanzas for the purpose of hunting and fishing are very frequent. On Thursday, the 11th, we figured in a party of this kind, and visited the above-named place, where we encamped for a week. Our party consisted of Mr. Geo. W. Fox, the United States interpreter of the Indians now captives in the fort; Mr. Jos. B. Burroughs, Mr. S. G. Whitney, and Mr. J. O. Whitney, of this place, and ten young, well-disposed Indians. The yacht Water Witch, Capt. R. Pinkham, was our means of transport. A beautiful sail of two hours—eighteen miles—brought us in sight of Matanzas fort, which, together with the Custom House, comprises Matanzas itself. We were landed, and the Water Witch, after leaving us a canoe, left for St. Augustine. We had been kindly offered the use of the Custom House, which was accepted. The game was plentiful, and we never wanted for a game dinner. The same with the fish. We fished early and often, for the fun was great. Sheephead were caught weighing five pounds each. At night, after the supper had been disposed of, we assembled the Indians and instituted a war dance, or some other kind of a dance, in which they all joined and enjoyed fully as much as their spectators did. A brave Kiowa warrior, Ah ke-ah, invariably led the dance, while another, Zo torn, beat the tom-tom. Their peculiar song and loud war-whoop were anything but enchanting. One evening we entertained two guests from farther South on their way to St. Augustine. The Indians were in good form and spirits, and kept up an incessant song, which our guests understood to be war songs, which caused them no little uneasiness, but when the scalp dance was reached our visitors skeddaddled unceremoniously. This, of course, amused the Indians, who, appreciating the situation, redoubled their efforts and yelled the louder. Finally peace again reigned, the Indians retired, and we were all soon fast asleep.

Your "Camp Life in Florida" has just reached me. You have done well, and succeeded in publishing the book that is eagerly sought after by the sportsmen and travelers. It is a handsome and interesting work, and may success crown your useful and untiring efforts for Florida."

GAME PROTECTION.

INTERNATIONAL GAME ASSOCIATION.—The Secretary of the "International Association for Protecting Game and Fish" has just issued, per order of Executive Committee, a sixteen page octavo report, with cover, of the proceedings of that body, showing its origin and progress, and, we trust, making it clear to every one what its objects are, and how it is proposed to accomplish them. Three hundred copies have been printed for distribution among the members.

It is gratifying to state that the Secretary has received letters from the most influential and intelligent members of the Committees on Nomenclature, Habits and Legislation, recently appointed, expressing their purpose to push forward the work assigned to them with vigor, and to leave nothing undone that is within their power to accomplish.

—The Yonkers Game and Fish Protective Society have issued a circular giving the close seasons for all descriptions of birds in the State of New York, and also the local laws applying to the county of Westchester. Copies may be obtained from the Secretary, Henry T. Keyser, Esq. This society has done much of late to break up Sunday shooting.

—A number of gentlemen have just formed the Elmira Sportsmen's Association, electing the following named as officers:—President, W. H. Gregg; Vice President, J. Stewart Hill; Secretary, L. M. Millsbaugh; Treasurer, G. H. Waite. It is organized for the protection of game and gyro practice.

—The season for deer hunting closed in Pennsylvania December 1st.

BRIDGEPORT, Ct., December 1st, 1875.

EDITOR FOREST AND STREAM:—

It is to be regretted that a trip to Stratford with a "Rigby choke bore and a butler" should have afforded so little sport to your correspondent, B. But that there shall be no cause of complaint for having his inquiries and suggestions pass unnoticed, it is desirable to have him informed that the gentlemen living in "Bridgeport, four miles from Stratford," who formed a society for the protection of game, think they do know all about the game laws of "sanctified Connecticut" and the other States in the Union. So can any one who reads FOREST AND STREAM. These gentlemen in Connecticut, with the State Association for the Protection of Game and Fish, did have "adequate laws framed," which provide for stopping both night and Sunday shooting, and did try to have them passed at the last session of the Legislature, but failed to get them through. These gentlemen think they know just what laws are required, and by what means they should be enforced. They also know that the night shooting is not all done by "thoughtless, improvident, drunken outcasts," but by some who call themselves gentlemen sportsmen, under the unsportsmanlike plea that if they do not shoot when they can, others will have all the fun. The section of the law that B. quotes accomplishes just what was intended, namely, to protect the ducks that feed in Long Island Sound along the shores of Connecticut from being driven from their feeding grounds by steam and sailing yachts from New York and other places with their swivel guns, and not by the "poor pot hunters."

The members of the Bridgeport club feel grateful to B. for his kind suggestions, and in return advise him to get posted before he again attempts to lecture "New England saints" or "Connecticut Yankees" on their want of knowledge and the requirements of game laws. H.

U. S. MINT, CARSON, Nev., Dec. 2d, 1875.

EDITOR FOREST AND STREAM:—

Being well aware of your interest in the preservation and increase of game in our country, and of the fish in our bays and harbors, I would ask leave to call your attention to the enclosed article, clipped from the San Francisco Chronicle of November 11th. If these important facts are noticed in your paper it will awaken a deeper feeling of indignation at the wanton piracy practiced by the Chinese and other foreigners in our woods and waters, and call forth other communications to our Western papers, thereby agitating the subject and tending to secure more stringent enactments of our Legislatures in accordance with the necessities of the case. E. B. BARNES.

[The abuses to which our correspondent refers are dwelt upon by the California Fish Commissioners, of whose annual report we present an abstract in our current issue.—Ed.]

The Rifle.

FOREST AND STREAM BADGES.—The fifth contest for the FOREST AND STREAM badges took place at Conlin's Gallery, No. 930 Broadway, on Thursday, Nov. 2d. W. B. Farwell having won the first badge once he is barred out for the second badge. Conditions—Ten shots, off hand, 110 feet; 200 yards target reduced in proportion to distance; Wimbledon rules:—

Name.	Score.	Total.
D. L. Beckwith, 1st "best score" badge	5 3 4 5 4 4 5 4 5 5	44
J. B. Blydenburgh	5 4 5 5 3 4 4 3 5 5	43
Chas. A. Cheever	4 5 4 2 5 4 5 4 4 5	42
W. B. Farwell	4 3 3 4 4 5 5 4 4 4	40
V. Sone, 2d "centre" badge	3 5 3 5 3 9 4 4 4 4	40
A. B. Hayburn	5 5 3 4 4 3 3 5 3 3	40
L. C. Bruce	3 5 3 5 3 3 4 5 4 5	40
Wilson MacDonald	4 5 4 3 4 3 5 3 4 4	39
M. P. Lennon	5 3 3 5 4 4 4 4 4 3	39
A. Marsh	5 3 3 4 3 5 3 3 4 5	39
William J. Sherwood	5 3 3 4 3 5 5 4 3 4	39
M. J. Duffy	3 4 3 4 4 4 4 4 4 4	38

The Turf, Field and Farm cups will be shot for on

Thursday, Dec. 9th, commencing at 4 P. M. All are invited.

HELLWIG'S GALLERY.—The first competitive shooting in a lying position for a gold medal, a Remington rifle, and a Colt's revolver, took place at Hellwig's new gallery, No. 273 Eighth avenue, on December 1st. The following are the scores:—

Name.	Score.	Name.	Score.
H. Fisher	39	P. G. Moore	38
A. V. Canfield	45	Peter Farley	44
B. C. Vannett	45	John Clark	34
F. N. Dewitt	32	R. G. Chambers, 3d prize	25
L. C. Bruce	45	F. Moore	31
William Lindsay, 1st prize	46	F. Kessler	38
Alexander Pyle	36	D. L. Beckwith, 2d prize	39
Big Ginger	44	T. C. Banks	35
James Barry	37	M. L. Riggs	46
James Shand	35	P. Femming	46
L. Bird	39		

MORSEMORE.—On Friday last, the third competition in the marksman's match came off. There were four entries, with the following scores.

Name.	200 yards.	500 yards.	Total.
George Langram	26	25	53
H. W. Blakemore	22	26	48
E. Connell	25	21	46
J. Clark	21	17	38

On the same day the fourth competition was entered on with the following results.

Name.	200 yards.	500 yards.	Total.
H. Maynard	29	23	54
G. Langram	27	25	52
J. Clark	26	18	44
H. Blakemore	29	14	43

On December 10th, the challenge sent by the Scottish American Rifle Club to the Yonkers, R. A. will come off. Conditions, ten shots at 200 and at 500 yards. Shooting to commence at 12 o'clock. Train leaves Thirtieth street depot at half-past ten o'clock.

BOSTON.—On November 4th, the Boston Club had their match at Spy Pond. Distance 200 yards, ten shots. The following are the leading scores:

Name.	Total.	Name.	Total.
E. J. Osgood	46	C. C. Wemyss	43
J. H. Frost	44	J. Wemyss, Jr.	41

The rooms of the Boston Club will probably be located at the rooms of the Massachusetts Angler's Association.

NEWPORT, R. I.—A match took place on the 4th of December at the range in Middletown for a Creedmore rifle. There were twenty entries. Conditions, 500 yards, five shots. We give the best scores.

Name.	Score.	Name.	Score.
Samuel Powel, Jr.	23	W. C. Cozzens, Jr.	21
J. Engle	23	Samuel Powel, Jr.	21
J. Engle	23	N. R. Landers	20
Charles Potter	22	Charles Potter	20

WAVERLY CLUB.—On the 22d of October Capt. R. C. Coleman, of the American team, assisted at the inauguration of Riverside Range, a most convenient spot on the bank of the Susquehanna River, near Sayre, Pa. The interest manifested on the occasion for rifle shooting was very gratifying to the club. Coleman's shooting at 1,000 yards was magnificent, he making 38 out of a possible 40. In the evening a dinner was given to Capt. Coleman at the Hotel Warford, at which were present every member of the organization and most of the prominent citizens of the town. On the 18th of November the Ithaca Rifle Club shot a match with the Waverlys. Conditions—400 and 500 yards; ten shots at each range:—

ITHACA.		WAVERLY.	
Name.	Yards.	Name.	Yards.
Mandeville	400 500	A. Hildebrand	400 500
Raymond	41 40	Finch	40 43
Green	33 27	Wells	49 45
Clark	35 30	Wm. Hildebrand	45 37
Blair	39 32	Campbell	39 31
Baker	33 27	Fish	45 31
Total—414.		Total—493.	

On the 23d the Waverly Club shot in a match with the Ithaca Club on the Ithaca Fair Grounds. The day was cold and stormy. Conditions—Ten shots at 400 yards:—

ITHACA.		WAVERLY.	
Name.	Score.	Name.	Score.
Mandeville	48	A. Hildebrand	49
Raymond	44	Finch	46
Green	44	Wells	45
Clark	45	Klase	39
Blair	43	Campbell	43
Baker	39	Knapp	37
Total	347	Total	259

This club will be larger in the Spring, and promise to make it "red hot" for any "granger" club who may tackle them.

—The Rochester Amateur Rifle Club seems to be in a most flourishing condition. The Club has an excellent shooting gallery of its own, where a clear 150 feet can be used. There are four targets, with all the proper arrangements for recording the shots. The Rochester Union declares the shooting gallery of the Club to be one of the finest in the State. The same authority states that "It is not a money-making institution, merely a social arrangement for the amusement and education of the club, and therefore the price of shooting has been fixed at the low rate of fifteen cents for ten shots. Any respectable citizen can obtain entrance to the gallery and shoot as much as he may desire, complying, of course, with the rules. The gallery is kept open from nine o'clock in the morning until nine o'clock in the evening. The targets are reduced from those used at 500 yards on a regular range, the bull's eye being two inches in diameter. The scores which count over 40 out of a possible 50 are numerous. No one has yet succeeded in making a full possible, and it is doubtful if it ever will be done. In a short time Rochester will have the largest amateur rifle club in the State."

CHICAGO RIFLE CLUB—IMMENSE SHOOTING!—The fifth competition for the Hamilton Rowe & Co. badge, valued at \$100, came off at the Southern Park Range Saturday, November 27th. The day was very fine. The following score will show that everything must have been favorable. Three sighting and seven scoring shots; distance, 500 yards:—

Name.	Score.	Total.	Name.	Score.	Total.
S. B. Sexton	5 5 5 5 5 5	35	R. S. Thompson	5 5 5 5 5 4	34
J. Mner	5 5 5 5 5 5	33	C. H. Prouty	5 5 5 5 5 4	34
J. A. Shaffer	5 5 5 5 5 5	35	C. C. Blackmer	4 5 5 4 4 3	31
Geo. Willard	5 5 5 5 5 4	34	C. Fuller	5 5 5 5 5 5	35

Sexton, Muer and Shaffer having tied, made five additional shots at same range with the following result:—

Name.	Score.	Tot'l.	Name.	Score.	Tot'l.
Sexton.....	5 4 5 5 5	24	Shaffer.....	5 5 5 5 4	24
Muer.....	5 5 5 5 5	25			

The above shooting is about the strongest in a general way we have yet noticed; 272 made by five men out of a possible 280 may be called stunning. If this is not sufficient suppose we look at the following as a score made on the 28th by the same club. The weather was very cold and disagreeable, the wind blowing quite hard. Conditions—Distance, 500 yards; two sighting and twenty scoring shots. The following are the scores out of a possible 100:—

Name.	Score.	Total.
George Willard.....	5 5 5 5 4 4 5 5 5 4 5 5 5 5 5 5 5 5	98
S. S. Sexton.....	5 5 5 5 5 5 5 5 4 5 5 5 5 5 5 5 5 5	98
J. Muir.....	5 5 5 5 5 5 5 5 5 5 5 5 5 5 5 5 5 5	98
Ch. Fuller.....	5 5 5 4 5 5 5 5 5 4 5 5 5 5 5 5 5 5	96
R. S. Thompson.....	5 5 5 5 4 5 5 5 4 4 5 5 5 5 5 4 5 5	96
N. C. Blackmer.....	4 5 5 5 4 4 5 5 5 5 5 5 5 5 5 5 5 4	95
W. E. Strong.....	5 5 5 5 4 5 5 5 5 5 5 5 5 5 5 5 5 4	94
A. G. Alford.....	5 5 4 4 5 4 5 5 5 5 5 5 5 5 5 5 5 4	93
M. Loomis.....	3 4 5 5 5 5 5 5 5 5 5 5 5 4 5 5 5 3	92
C. B. Prouty.....	5 5 5 5 5 4 5 4 4 5 4 5 4 5 5 5 0 2 5	87

A whole row of points of exclamation are insufficient to express our opinion.

OMAHA, Nov. 28th.—The presence of Major Fulton brought out the marksmen of the Omaha Rifle Club. The first match was at 200 yards, five shots, with the following results:—

Name.	Total.	Name.	Total.
Fulton.....	20	Budd.....	11
Petty.....	19	Thurston.....	16
Kennedy.....	17	Hoffmeyer.....	17

At long range, 800 yards, fifteen shots, the scores were:—

Name.	Total.	Name.	Total.
Fulton.....	67	Richards.....	49
Kennedy.....	56	Hoffmeyer.....	43
Petty.....	53		

CALIFORNIA.—In our issue of the 18th of November last, it seems we did not give to Co. C, 1st Regiment, full credit for the many prizes won by them. In the three days rifle contest held at the Presidio, to Co. C were awarded no less than nine prizes, and to Co. E seven. Especially in the team shooting were they in the front, the Silver Challenge Trophy, the Commander-in-Chief's Medal and the Gold Medal, three out of the five prizes having been adjudged to Co. C. When the shooting was so very generally good, it was, of course, difficult for us to discriminate.

CRESCENT CITY RIFLE CLUB, OF NEW ORLEANS.—We are in receipt of a brochure containing the charter and by-laws of this association, of which Col. W. J. Benham is President, Col. W. T. Vandry, Vice President; John K. Renaud, Treasurer, and S. Mullen, Secretary. The laws necessary to govern the Crescent City Club seem to us to have been carefully considered, and are, in our opinion, models of good sense, and as we are frequently asked what are the general rules to be used in order to conduct a rifle association, we should advise the adopting of just such by-laws as those employed by the rifle club in New Orleans.

USING THE DITTMAR POWDER IN THE RIFLE.—Some experiments with the Dittmar powder by a member of the American International Rifle Team, may be of interest. It must be understood that we by no means advocate the use of the Dittmar powder, as a few trials of this particular material cannot determine its merits. Explosive compounds of innumerable kinds exist; chemistry is adding each day another to the already large list, and though fulminates may have their use, common gunpowder, with its slower and more gradual generating power, seems as yet the substance best adapted to our wants. The Dittmar powder used was of the three grades—the coarsest, the intermediate, and the finest grain. Prior to loading the shells an English flask of approved make was used as a measure of bulk, charges of F. G. Hazard and the Dittmar being afterward carefully weighed from such measurement:—

Charge	Hazard's FG powder.	Dittmar's large grain.	Dittmar's small gr.	Dittmar's finest gr.
1-94	grains.	36	38½	42 7-10
2-93½	"	35½	38½	42
3-93 2-10	"	35½	38	41½
4-93 1-10	"	34	38½	43 7-10
5-93½	"	36½	38½	43 1-10
Total.....	467 3-10	179½	192	2-1
Average.....	93 23-50	35½	38 2-5	42 1-5

Distance fired at was 500 yards. The proper elevation having been acquired with the common powder, two bulls-eyes were made. Shells filled with the Dittmar were next tried, and eighteen shots were fired, the first ten of which with the usual cleaning of the barrel, then eight more without cleaning, the first two of which latter shots were placed on a target in a direct line low, about six inches under the bullseye. The elevation having been 1.10, an increase was made to 1.11½. Altogether eleven bullseyes were made, and the seven other shots not on the bullseye were close, the furthest being about 11 inches off. The second experiment with the Dittmar and with the same rifle with a slightly lower elevation, from 1.9½ to 1.10, gave in forty-four shots the following results: The first seventeen shots were not on at all. This was caused apparently by the wind and the absence of flags to determine the direction, and because the marker could not locate the first balls. Trying a second time, there having been some delay in order to load more cartridges, the results were better. With an adjustment of the wind gauge the first two shots were on the target, and of the twenty-seven shots, eight were bullseyes, and the remainder close, the furthest sixteen inches from the bullseye. With some slight precaution there was not, so our experimentalist informed us, any difficulty in loading the shells. After firing, the rifle was perfectly clean. The shells showed no trace of usage. After using the same shell four times it could be chambered without any difficulty. The recoil was slight. It is necessary to add that the marker stated that the bullets seemed to have been driven with great force on the target, even harder than with ordinary powder.

THE ELCHO SHIELD.—On the occasion of the presentation of this magnificent trophy to the gallant Irish team in Dublin the ceremonial took place amid much *éclat*, and in the presence of a large assemblage. A procession having been formed, a gun carriage bearing the Shield was escorted from the castle by a squadron of the Fourth Dragoon Guards, with their band, and by fifty men of the Sixtieth Rifles and a body of artillery. The members of the team present were Messrs. S. S. Young, W. Rigby, E. Johnston, J. Rigby, J. Wilson, R. S. Greenhill, and Mr. Foster. Lieut. Fenton was absent, being on Government duty in England, and Surgeon Major Hamilton was at sea on his voyage to India. Major A. B. Leech sent a letter regretting his inability to attend the reception of the shield, having been called to England. Appropriate speeches were made by the Lord Mayor, Alderman Manning, the City Marshal, and many other gentlemen whose names are familiar to our riflemen in the United States. The Lord Mayor did not forget to say a kind word in regard to his American guests who had contested with the Irish rifleman at Dollymount. "He hoped that the Irish eight, who so nobly won that distinction, might continue to represent their country, and be the bearers of, if possible, more signal triumphs in their after struggles. Their success was a proof that ere long the little check they received at Dollymount would be forgotten, and that when the Irish eight had given themselves more thoroughly to practice they would, like their brothers across the water, be in a position to say that they would shoot against any team in the world. Probably another opportunity would be presented to the Irish team across the Atlantic next year, when he hoped to be present, and would be glad to be accompanied by some members of the Council. He trusted that the Irish team would, on their return, be bearers of another triumph such as that, and that a similarly interesting proceeding would take place in the City Hall."

—The United States ordinance officer transmits the following in regard to the new rifles to be used by our regular soldiers:—

"The manufacture of Springfield rifles and carbines at the National Armory has been carried on during the past year with all the economy and success that the very small appropriation would admit of. Not more than 17,000 arms will be made under existing appropriations. Up to this date the entire army has been supplied with new rifles and carbines, calibre 45, and we have now in store a reserve supply of these arms of about 26,000. At the end of the present fiscal year our reserve supply may reach a total of 40,000 arms of the new model and calibre, about enough in case of war to arm one corps d'armée. It is not to be expected that in war our armies will be better satisfied with arms of obsolete patents, discarded models, than in the early days of the rebellion they were with the offerings of foreign markets. Men who are to meet the enemy in battle have a right to demand of their country, in whose defense they are willing to imperil their lives, to be placed on an equality with the foe, and be armed with the best weapon that ingenuity and workmanship can produce, and in our country, where armies are to be improvised, made up on the instant by recruits from the anvil and the plow, the want of military discipline and training should be, as much as possible, compensated by the quality of the weapon the soldier is to use. Our arsenals should be, therefore, well stocked at all times with a large reserve supply of the best rifles and carbines, and Congress should, in the spirit of economy, appropriate liberally for their manufacture."

The best rifle in the world is worth, however, no more than the old brown Bess, if men do not know how to handle them.

SHORT AND LONG RANGE.

CHICAGO, December, 1875.

EDITOR FOREST AND STREAM:—

It is evident that rifle shooting is destined to be, for the coming year at least, a subject of absorbing interest to great multitudes of people in this country and abroad. All the nations of Europe have been invited to compete with us at Philadelphia next Autumn, and while they are exerting themselves to the utmost to retrieve the defeat they have suffered at our hands, all America is going into training to sustain the honors achieved for us by the delegates from Creedmoor. Rifle clubs are organized, or in process of organization, in every considerable town and city in the country, and the class of men who compose them, and the zeal with which they have entered upon the work, afford sufficient evidence that the ball is fairly set in motion, which is destined next year to sweep over the country with a furor which nothing can stay.

At this early stage, therefore, it is well for all who are interested in the movement to consider seriously its objects and the best mode of attaining them. The want of such consideration is obvious in the reports of the clubs in all sections of the country, which are laid before us in the weekly issues of FOREST AND STREAM. The universal ailment seems to be to report good scores at long ranges, and every new club begins almost at the outset to practice at the distances at which any position is allowed. Tyros in shooting are surprised and delighted to find that by distorting themselves into a position which only on very rare occasions they would be able to assume, either in military or sporting service, and using a weapon which no man would ever burden himself with in the pursuit of game—a piece of artillery, in fact, with an astronomical observatory attached to it—they are enabled to make bullseyes and centres at enormous distances.

Now, if the only object in view is to train men for the Philadelphia matches, and those matches are to consist exclusively of trials of skill at very long ranges, and with all the mechanical arrangements that can be contrived, I grant that such training is all right and proper, so far as it goes; but I submit that it does not go far enough, for in the first place it excludes artificial rests, while the positions it allows are in fact the same in the result, only by a more awkward and elaborate process. It is perfectly easy to make an artificial rest which a man can carry in his pocket, and which can be adjusted in less time and with less difficulty than is necessary to put oneself into the positions assumed by many modern shooters. Then, again, it excludes telescopes, which are available in any actual service in which vernier and wind gauge sights can be used, while they are far superior in power. For such shooting, therefore, artificial rests and telescopic sights should be allowed, and anybody that cares to contend in matches where such machinery is used is welcome to do so.

But such practice alone will never make skillful rifle men for the exigencies of sporting or military service. In shooting antelope or buffalo on the plains, and occasionally in lake or river shooting, it is necessary to

shoot at very long range or not at all; but in ordinary practice at such game as is shot with a rifle, the range rarely reaches two hundred yards, is oftener less than one hundred, and demands a quick off hand shot. Every sportsman will bear me out in the assertion that, in the pursuit of game with the rifle he fires a hundred shots at a distance less than two hundred yards to every one that he fires at five hundred. I do not, of course, include antelope and buffalo hunters, neither would I be understood as arguing that long range shooting is a useless accomplishment, but simply that men who think they have acquired practical skill in rifle shooting by the method and with the weapons now so much in vogue will discover their mistake the first time they stand in a runway and try to shoot at a deer as he runs past them at an uncertain and constantly shifting distance.

The first object with every rifle club should be to train men for practical service. Only such weapons and such sights should be allowed as would be available for such service, and preference should be given to those of the simplest construction, and possessing the greatest facility of manipulation, combined, of course, with sufficient power for any required sporting purposes. Provided with such a weapon, the shooter should be forced to begin with off hand practice at short range, and only allowed to advance in proportion to the skill he acquires. He should be exercised, or should exercise himself, in judging distance and in quick sighting, which he can acquire by home practice of cap-snapping. Thus will be laid the foundation of his education, which, if he is ever called into active service, he will find to be infinitely the most important. If he is ambitious to train himself for election to a representative team he can go on with his practice to any extent he pleases; but there are multitudes of good rifle men all over the country who have no such wish, who know that off hand practice at from two to five hundred yards with a good sporting rifle involves the exercise of more skill than thousand yard shooting with the elaborate machinery and preparation it requires, while it possesses greater intrinsic interest and is of infinitely greater practical value.

It is to be hoped that in arranging the matches to be shot at Philadelphia due regard will be had to the development of all the essential points for actual service of both the shooter and his weapon. Off hand shooting, or shooting in positions which are readily assumed, as kneeling or sitting, should take precedence of the more elaborate positions which secure a rest for the gun; and rifles which are simple in their construction and manipulation, and require no very great care in cleaning and keeping in order, should have preference over those which are liable to cause delay and vexation by their elaborate construction or the necessity of very careful treatment. Vernier and wind gauge sights, or better still, as I said before, telescope sights, ought to be admitted at ranges of eight hundred yards and upwards, but I enter my protest, and hope that others will endorse me, against awarding the highest merit to such shooting as requires their aid, and I would have them vigorously excluded from all matches which are intended as tests of men and weapons in any but extraordinary emergencies of sporting or military service.

H. W. S. CLEVELAND.

[Differing from our correspondent as to the last clause of his very excellent communication, trusting that at the Centennial, matches of every kind, short and long range, will be shot, we think it would be better to allow the public to discriminate as to the exact amount of applause the champions of short or long range may merit. But we most heartily indorse the writer's views in regard to the tendency young organizations have at present of making rifle shooting at 1,000 yards the *sine qua non* of their ranges. Our correspondent's letter is a thoughtful one, and in many respects is exactly to the point.—Ed.]

Game Bag and Gun.

GAME IN SEASON IN DECEMBER.

Moose, <i>Alce Americanus</i> .	Wild Turkey, <i>Meleagris gallopavo</i> .
Elk or Wapiti, <i>Cervus Canadensis</i> .	Ruffed Grouse, <i>Bonasa umbellus</i> .
Red Deer, <i>Cervus Virginianus</i> .	Pinnated Grouse, <i>Cupidonia cupido</i> .
Caribou, <i>Rangifer caribou</i> .	Quail, <i>Ortyx Virginianus</i> .
Hares, <i>Leporine</i> .	Wild Ducks, <i>Anatina</i> .

GAME IN MARKET.—Until sufficient snow has fallen to allow Western market hunters to trap prairie chickens these birds will remain scarce. At present the market is almost depleted, and they are worth \$1.50 per pair. Ruffed grouse or partridges are more abundant, and sell for \$1.10 to \$1.25 per pair, the former price being for Maine birds, which do not attain the size and plumpness of those killed in our own and adjoining States. A few woodcock have appeared in market during the week, said to have come from Long Island, but more probably from Southern New Jersey. They were in fine condition, and sold for \$1.50 per pair. Quail are worth \$3 to \$3.25 per dozen. Canvas back ducks from the Chesapeake bring \$2.25 per pair; red heads, \$1 to \$1.25; mallards, \$1 to \$1.25; black ducks, 75 cents to \$1; widgeon, 50 to 75 cents; broad bills, 50 to 60 cents; teal, 50 to 75 cents; brant, \$1 to \$1.25; geese, 75 cents to \$1 each; rabbits, 50 to 65 cents per pair; venison, saddles, 22 to 25 cents; steaks, 25 to 30 cents.

—Four gentlemen of Alexandria, Virginia, have been hunting in the vicinity of Albemarle and Currituck Sounds, N. C., since November 20th. In a few days they killed 42 deer and 60 turkeys. They went up the Roanoke river as far as Shell Landing.

—Holabird's Hunting and Fishing Suits are especially adapted to service in Florida. Not only are they nearly impervious to water, but they are invulnerable to briars, burs, ticks, etc. One can hunt in them with far more comfort than in corduroys. They answer admirably as overhauls for general service.

—Rabbits are so numerous in Nevada as to cause enormous damage to crops. One farmer lost \$500 worth of cabbages in a single night, another had fifty acres of the finest barley destroyed. They are trying to poison the vermin out of existence.

MARYLAND.—Deer Park, Dec. 6.—Game is very plentiful and getting cheaper. I have never known as many ruffed grouse to be in the stores for sale before, their price being sixty cents a brace. Rabbits are more numerous than ever, and hundreds of them are killed every day. What is the matter with the quail this Fall? I have found within the past week several nests with eggs in them, which were evidently deserted, and have been shown young birds that were shot which are not larger than robins.

ALLERHANY.

Holmes, Shaw, Brown & Co., Bordentown, N. J.,
BUILDERS OF
Fast Iron Steam Yachts, Launches, and Torpedo Boats.
Builders of the Famous Iron Steam Yachts

CONTINENTAL (50 feet), speed 17.94 miles per hour; FIREFLY (50 feet), 17.94 miles per hour; MINNEHAHA, building (55 feet), 18 to 20 miles an hour.

VIRGINIA—Blacksburg, Nov. 21.—Quail are plenty here and in fine condition. Ducks plenty on New River—mallard and golden eye, called hereabouts "whistlers," and many fish-eating mergansers.

NORTH CAROLINA—Newbern, Nov. 30.—A small party of us have just returned from the Lakes with three wild geese, eight ducks, five of them black ducks, one red head, and two canvas backs, with several small birds, and one loon—not a very large bag, but excellent in quality. The mild open weather keeps the fowl in open waters, but a cold snap will drive them in-shore, where the sportsman will be able to reach his game. Fishermen and others from down the Neuse report the Pamlico Sound and Neuse River full of geese and brant, and say they never saw so many before. We started seven deer, but were so unfortunate as to kill none, the weather being very unfavorable, high winds with rain. One passed within ten feet of the writer, but not having gun in hand at the time, lost the chance.

I. E. WEST.

—Messrs. T. C. Van Buren and Mr. Belmont Purdy shot a match at fifty birds each, thirty yards rise, for \$150 a side, English rules, at the grounds of the Long Island Gun Club, on Saturday last. Mr. Van Buren used a Grant and Mr. Purdy a Scott gun; the former was declared the winner by six birds after forty-five had been shot at. Several sweepstakes were shot the same afternoon, in which Messrs. M. Van Buren, T. Van Buren, Count Menzelzi, and Mr. Claxson were the winners.

—The members of the Capital Sportsmen's Club of Topeka, Kansas, shot a match November 12th for a silver tobacco box, the conditions being ten single birds, 21 yards rise, 80 yards boundary. Nine persons shot, none of whom ever engaged in a pigeon match before. Messrs. J. W. Barney and Geo. B. Palmer shot off ties of eight; won by Palmer. Messrs. A. M. Autler and T. D. Sanborn tied on six birds.

DETROIT, Mich., December 3d, 1875.

EDITOR FOREST AND STREAM:—

The first contest of the home and home match between Chicago and Detroit pigeon shooters occurred yesterday, resulting in a victory for Detroit. By the annexed score you can see that some good shooting was done. The conditions were—Two teams of ten men each, to shoot at 25 birds each, at 21 yards rise, from H & T plunge traps, 1½ oz. shot, use of one barrel:—

CHICAGO.		DETROIT.	
Name.	Total.	Name.	Total.
Hawkins.....	19	Haskall.....	21
Morris.....	19	Caniff.....	23
Sherman.....	23	Dubois.....	21
Phillips.....	21	Long.....	24
Gillespie.....	21	Stenton.....	23
Wilson.....	20	Eldridge.....	21
Merton.....	13	Cristy.....	24
Stagg.....	18	Littleton.....	24
Turrel.....	20	Baker.....	23
Abbey.....	19	Gillman.....	22
Total.....	194	Total.....	225

The return match is to come off in Chicago some time in January.

Yours respectfully,

PORT.

[We are indebted to our correspondent "A. J. K." for another report of this match.—ED.]

PORT RICHMOND, November 26th, 1875.

EDITOR FOREST AND STREAM:—

The third annual festival of the Association was held on the 25th (Thanksgiving day), when the club badge was again competed for with the score below. Prizes—\$30, \$25, \$20, \$18, \$15 and \$7.

Shoot for badge, 10 birds each, Staten Island rules, members handicap'd.

Name.	Score.	Name.	Score.
Tranter—28 yds.....	1111111111	Tarker—28 yds.....	1111110010
Rathyen—28 yds.....	1111111111	Barnes—25 yds.....	1110101110
Vreland—25 yds.....	0101011111	Van Clief—21 yds.....	0011111010

Geo. Dixon.....	1011111111-8	W. Rose.....	1101111111-9
Total.....	16	Total.....	19

This is the first of a series of matches to be shot by the Woodland Sportsmen and Kennel Club. I will report anon our doings, etc.

C. W.

POST OF MORGANTOWN, N. C., November 19th, 1875.

EDITOR FOREST AND STREAM:—

I have been much entertained lately by the articles in FOREST AND STREAM written by admirers of the choke bore, and I smile to think of the fine appearance they would present shooting here, where five birds out of six must be shot inside of twenty yards or they will be out of sight. They would either cut their birds all to bits or miss them entirely, principally the latter. I only pretend to be a tolerably fair shot, but I very often meet sportsmen who shoot worse, and yet they will talk

about having the gun right on the bird every time. Nonsense! A correspondent writing in FOREST AND STREAM of November 4th hit the mark when he said, how many men can hit a bird on the wing with a rifle ball?

G. H. MORAN, M. D., U. S. A.

MR. PAPE ON THE ENGLISH GUN TRIAL.

NEW YORK, November, 1875.

EDITOR FOREST AND STREAM:—

Since my arrival in this country my attention has been called to an article on the late English gun trial, appearing in your issue of Sept. 16th, over the signature of "Fair Play," and believing in the old Latin axiom, "audi alteram partem," I have taken the liberty of asking for sufficient space in your columns to reply to the same. The impressions "Fair Play" has collected, appear to me to be from a very one-sided medium, and the circulation of such misapprehensions and errors can in no way benefit American sportsmen; but, on the contrary, be very apt to confuse and mislead the majority, who have never cared to wade through the mess of the late English gun trial. The remarks of your correspondent, I hold, are an injustice to myself, from being in that position not at all to be envied, assuredly as the maker of the guns which were placed second and third at the trial, and in consequence of this circumstance I was forced to a line of duty, or accept the position of cringing cowardice when I witnessed the most infamous trickery. I could not hesitate, whether I did succeed or not, my duty was clear.

First—"Fair Play" asks: "What did the London trial of guns decide for sportsmen, anything or nothing?"

It proved nothing more than what Mr. Walsh of the *Field* had told us could be done in 1867, that guns can be made to average regularly from 175 to 200. The choke bores of 1875 did not average this; therefore nothing new was proven. Second—"Was it a big advertising scheme, for some gunmaker?" The private trials were all got up for the advantage of fresh advertising gunmakers, whom the *Field* stated as having just made a revolution in gun making, by a new discovery called choke boring, and withheld my letters on the subject, which I wrote to explain that this so-called new boring was nothing more than my old patent boring, which was well known and referred to by the *Field* in 1867. One of their contemporaries—the *Land and Water*—published some of my letters, and announced a trial under their own auspices, when the *Field*, to stop this, hurried their forward.

Third—"How much did the *Field* pocket by it?" Mr. Walsh gave out at the trial that it was gotten up by the *Field* for business purposes. I hardly think that they do business for nothing.

Fourth—"The *Field* wanted to know what gun in all England was the best to answer the oft-asked question: 'Who makes the best gun?' Not a breath unfavorable has been uttered against the *Field* for its part of the programme. It wanted the best gun to win, and worked honestly for that end." If so, why were soldiers allowed to count the targets, who had been disqualified for false scoring at Wimbledon rifle shooting, and who actually put the prize up to the highest bidder, I myself being asked what I would give if I won? The proof of honesty lay in a nutshell. The targets were the receipts of honesty and the leveller of all disputes; but they had to be hidden from the light of day; they could not stand the gaze of honesty, although the remarks of the *Field* led the competitors to believe that the targets could be certified, inspected, and even photographed, if required. The unfavorable comments and charges against the false scoring that appeared in various sporting papers, is a sufficient answer to such remarks.

Fifth—"How was the decision arrived at—by taking closest pattern and greatest penetration?" The decision, as far as the Greener score was concerned, was arrived at by the soldiers having overcounted every one of those sheets from 5 to 8 points more than the gun had made. Myself and three other witnesses can prove the fact from actual recounting; every shot hole was numbered and my name written on the false sheets. The scrutiny was only stopped by the one man power when he found fraud was discovered.

Sixth—"Fair Play" "admires the way Mr. Greener's agent talks for him, and is ready to shoot against any other gun." If this is not tall talk, I am glad to find the agent so far ahead of the principal. Although Mr. Greener styles himself champion, he has never seen his way clear to accept my challenge to shoot my guns against his; but as his agent is quite good enough for me, I will extend the challenge to him, and meet him half-way between New York and home (St. Louis) and shoot two choke bores and two sporting bores against the same number of Mr. Greener's make, the looser to pay his loss to the nearest charitable institution to where we shoot. Immediate communication with the office of FOREST AND STREAM, No. 17 Chatham street, New York, will be attended to.

Seventh—"Fair Play" says: "The wear and tear tests which the winning guns in the London trial were subjected to proves the durability of the system, they standing two thousand five hundred shots unchanged." This argument is most preposterous. The report proves the very reverse. The winning gun that made the extraordinary score when a prize was to be got shoots for six successive weeks, two days a week, and never once can it make the string of shots given it by the soldiers. Not even once in that time does it come near the scores made by either of the three best guns. It cannot average above the twenty-fourth position of the trial, its total average being only 336.5, not even third, fourth, or sixth rate, and yet we are told this is unchanged. I could not fancy a greater change in the shooting of a gun, and I fancy "Fair Play," would think the same if he purchased a gun that could play such variations; but it played a marvellous tune at the proper moment, which it will never do again. Such writings, so wide of the truth, must confuse, and convey false impressions to sportsmen. The score made by the soldiers for the Greener gun was 405.5; the average score in the six week's shooting 336.5, while the second gun by Pape made 382.7, and the third gun made and bored by Pape makes 376.5; but it must be remembered that scores were changed for the wear and tear test, while competitors had been taught their lesson. "Fair Play" must see something extraordinary in a gun which heads its class one week and cannot average a twenty-fourth place in the next six weeks. If the targets were honestly counted, why did not Mr. Walsh at once confuse my charge by turning up the targets and settling the point then and there? Ten minutes would have proven or disproven the charge. He could have won my bet of \$50, or my offer

to donate the same amount to any London charity if the targets could be counted to show that Mr. Greener's gun had made this score. Seeing that neither justice or reason could prevail, I left for London and took the best legal advice with a view to have a judge's order to seize the targets; but, unfortunately, counsel's opinion was that the targets were private property, and as such no order could be got for their detention, otherwise I should have exposed the infamous fraud. All I had the power to do was to lodge a written protest of the false counting, which I did, and for this Mr. Walsh, in the next class shooting, debarred the best gun of the class as dangerous to life, because it cracked the common sheet iron on the face of the target. Mr. Walsh, by this, meant dangerous to the men behind the targets. No such excuse could exist, because the gun had not shot out its round; conditions or no rule gave any such power, and the gun would not have been disqualified had not every man who watched the targets through field glasses made the remark that this was the winning gun. In alluding to class 3, the *Field* states—"Without doubt in our minds, Mr. Davidson, the second in class 3, is entitled to be considered the best or the genuine old plan, since his barrels were not choked in the slightest degree." This gun also was made and bored by me, although exhibited in the name of Mr. Davidson. Trusting that you will pardon me for taking up so much space of your valuable journal, I remain, very respectfully yours, Wm. R. PAPE.

[Notwithstanding that the battle has been one thoroughly fought out in the columns of our English cotemporaries, we felt bound to give place to Mr. Pape's letter, not only on account of the subject being one of interest to our sportsmen, but because while the *Field* trial was fully reported in this country we are not aware that Mr. Pape has ever had a hearing. If Mr. P's remarks are not all strictly parliamentary it must be borne in mind that if his version of the story is correct, and he undoubtedly honestly thinks it is, he has much to complain of.—Ep.]

BOOKS RECEIVED.

LOG BOOK OF A FISHERMAN AND ZOOLOGIST. By Frank Buckland, M. A., Illustrated. London, 1875, pp. 400.

Whoever buys this handsome volume expecting to find piscatory lore will be disappointed, since the only fishing alluded to is that of the sea fish brought to London, and an account of the drawing of a net in that muddy puddle near London, known as the Serpentine, which being cleaned out led to the capture of "about 5,000 roach and tench of two to four inches long, with a few larger ones, and one trout eight inches long." The love of angling must lie deep and strong in the Briton to be sustained by such scanty aliment.

There is an interesting chapter on the Brighton Aquarium, where is a fine collection of sea fish, among them a grilse, which there, for the first time under the eye of a naturalist, has been evolved from a smolt, showing the genesis of the salmon. In another tank is a good-sized octopus, squid, or cuttle, called by Victor Hugo the devil fish, which name really belongs to the giant ray of Southern seas, the vampire of the ocean, *Ceraptera vampirus*. Mr. Buckland also gives a full account of the monstrous cuttles recently captured on the coast of Newfoundland, which verify the stories long current among American whalers of the existence of these formidable creatures in the Pacific Ocean.

Our author gives an amusing account of a dinner at the Langham Hotel, composed of American game. This began with American oysters, which the writer is good enough to describe as "by no means unpalatable." Terrapin soup he thinks "exceedingly good," and suggests that terrapins might be made to breed in English green houses, though whether by slips or cuttings, he does not say. Buffalo meat, quails and prairie hens met his approval, as did also the wild turkey, elk meat and canvas back duck; and here Mr. Buckland was introduced to cranberry sauce, which seems to have agreeably titillated his insular palate. But what a sad picture is presented of the poverty of the British Isles, where a man of mature age and apparently in comfortable circumstances, has hitherto lived in ignorance of this viand! An American sat near him at dinner to explain these strange dishes, and he appears to have stuffed the zoologist with some tough yarns, as well as tender slices, and also to have amused him with our national songs, among them the classic verses respecting "the grasshoppers that sat upon the sweet potato vine."

An interesting part of the book is that devoted to the wild animals of Scotland—the red deer, the wild cat and the wild cattle, if indeed those can properly be called wild, which have been owned, counted, bought and sold with the land for hundreds of years. In fact, the eagles seem to be almost the only wild creatures left in those thickly peopled islands. One sentiment produced in our mind by reading these books by British naturalists is, gratitude for being allotted to a country where wild creatures of fur, fin, and feather will remain for some time longer.—S. C. C.

A WOMAN IN THE CASE. By Bessie Turner: G. W. Carleton & Co., New York.

Whoever conceived the design of bringing out this young person as an authoress and presenting her portrait as a frontispiece, deserves more credit for the ingenuity of the idea as a source of profit, than for the quality of his wares. Those who are tempted by the catchpenny title into reading it, will find it even below the average of the mass of weak novel writing with which we are flooded; and if they have any expectations of finding even an allusion to the great scandal trial, let them at once abandon the idea. If Miss Turner had appeared before the public without such adventitious aids as a delusive title and her own portrait, her efforts would have been worthy of more praise, even if productive of less profit.

JOHNNY LUDLOW. G. W. Carleton & Co., New York.

The name of the author of this book is not given; but why he should keep his light under a bushel we are at a loss to imagine. There is a freshness about "Johnny Ludlow" that reminds us strongly of both Henry Kingsley and "Tom Brown." The sketches are perfect pictures of English rural home life, drawn in that pleasant way which forms such an attraction in Mr. Kingsley's works—notably in his "Stretton"—albeit not wrought in any form of plot. Each chapter is a sketch in itself, and the old Squire and Tod, and even Johnny himself, seem like old friends.

Camp Life in Florida.

By CHARLES HALLOCK,

AUTHOR OF THE FISHING TOURIST.

This is a most seasonable book for Sportsmen, Tourists, Invalids, and Settlers, and has been long needed in Winter tourists to Florida and persons seeking settlement there. It gives a full classification of the game and fish of the Southern Peninsula, routes of interior and coastwise travel, the agricultural resources of the country, and sites for settlement, hints for camping out, resorts for game, hotels, and such other information as will be of great benefit to visitors seeking Florida for health, pleasure, exploration, or permanent settlement.

348 pp., 12mo. Price, \$1 50.

CONTENTS:

Introductory Chapter.
Birds-eye Glance at Florida.
Outfit for Sportsmen.
Hints for Southern Hunting.
Coastwise Routes of Travel.
Game Animals and Birds of Florida.
Game Fish of Florida.
Three Months in Florida for One Hundred Dollars.
Supplementary Hints for Cheap Recreation.
Up the St. John River.
Indian River.
Florida the Promised Land.
Fort Capron.
Fishing at St. Augustine.
Black Bass Fishing on Spruce Creek.
Hunting the Panther.
The Environs of Tallahassee.
Private Dougherty and the Bass.
Pet Birds of St. Augustine.
Steam Yachting on the St. John.

For Florida.

PHILADELPHIA AND SOUTHERN Mail Steamship Company's line to Savannah, Ga., sailing every Saturday, from Pier 22, below Pine street, Delaware River, at 12 o'clock noon, making close connections through to all points South. The line is composed of the steamships JUNIATA and WYOMING. The Wyoming does not carry passengers. The Juniata is a favorite ship with the traveling public, having passenger accommodations of the most superb character. She has recently been refitted and elegantly furnished with everything requisite to the comfort and convenience of passengers.

Families en route for FLORIDA, Georgia, Alabama, and even as far as New Orleans, will find the Savannah route the most desirable for comfort, as well as the most economical. Through trains of the Central Railroad of Georgia, and Atlantic and Gulf Railroad, Florida, leave Savannah every morning and evening. The Florida steamers leave Savannah three days in the week for all points on the coast.

For through passenger tickets and bills of lading to all points in Florida, Georgia, Alabama and Tennessee, apply to WM. L. JAMES, General Agent, 416 South Delaware avenue, Philadelphia.

TO YACHTSMEN VISITING FLORIDA.

SARASOTA, Manatee county.

TO SPORTSMEN VISITING FLORIDA. This Winter I will furnish a schooner yacht of eleven tons, that will accommodate about a dozen persons. I will let them have her and two men to run her, and a small boat, for eight dollars a day. I will meet them at Cedar Keys or Key West, whichever is most suitable to them; only let me know when to meet them. WM. S. BENNETT,
Capt. schooner Cary M. Nov11t

FOR SALE CHEAP.

AN UNDIVIDED HALF INTEREST in a Splendid Fishery, well stocked, with 30 ponds, and room and water for 10 more. Sixteen acres of land, and a fine green house filled with plants. For particulars, enquire of H. H. THOMAS, Randolph, Cattaraugus county, N. Y. oct28 tf

Sportsmen's Goods.

Orange Sporting Powder.

ORANGE LIGHTNING POWDER,

The strongest and cleanest Powder made. Nos. 1 to 7, packed only in sealed 1 lb. canisters. The coarser sizes (higher numbers) especially are recommended to owners of fine breech-loading guns, giving great penetration with very slight recoil.

ORANGE DUCKING POWDER,

For water fowl. Very strong and clean. Nos. 1 to 5. Packed in metal kegs of 6½ lbs. each, and in canisters of 1 and 5 lbs.

ORANGE RIFLE POWDER,

The best for rifles and for all ordinary purposes. Sizes F.g. F.F.g. F.F.F.g. the last being the finest. Packed in wood and metal kegs of 25 lbs., 12½ lbs., and 6½ lbs., and in canisters of 1 lb. and ½ lb.

All of the above give high velocities and less recoil than any other brands made.

BLASTING, MINING, AND SHIPPING POWDER OF ALL GRADES AND SIZES PACKED IN WOOD OR METAL KEGS OF 25 LBS.

SAFETY FUSE AND ELECTRICAL BLASTING APPARATUS.

LAFLIN & RAND POWDER CO.,

21 Park Row, N. Y.

Sole proprietors and manufacturers of the celebrated ORANGE brand of GUNPOWDER. Recommended and used by Capt. A. H. BOGARDUS, the "Champion Wing Shot of the World."

DITTMAR POWDER
MANUFACTURING CO.

MY NEW IMPROVED POWDER

can now be loaded from an ordinary powder flask; grains hard. Use it now like Black Powder. No fear of overloading. Burns slow now. No fouling of the gun. Little or no smoke. Little or no recoil. Not very loud report. Less heating of the barrel in rapid firing. Good penetration and good pattern. Safe to keep, as it does not explode if set on fire, except well confined. Shells furnished loaded with powder only, if desired. None genuine without my signature on the can. CARL DITTMAR,
NEPONSET, MASS.

HOLIDAY PRESENTS.

Received the Prize at the Paris Exposition, 1867.

Fred. Julius Kaldenberg,
WHOLESALE AND RETAIL DEALER IN AND MANUFACTURER OF

Amber Goods, Meerschaum Pipes, Cigar Holders, etc.

Monogram and Crests cut on Pipes and Holders. Portraits made from Photographs. Pipes and Holders of any design, or made to order.

N. B.—By a new process I boil Pipes so that the color remains, no matter how much or how hot they are smoked.

Pipes sent by mail to all parts of the world.

SMOKE VANITY FAIR.

It is shaved from the best Natural Leaf, for Meerschaum and Cigarettes. Does not make the tongue sore. Liberal sample on receipt of 20 cents. Highest award, Vienna, 1873. Send for circular.

WM. S. KIMBALL & CO.,
PEERLESS TOBACCO WORKS, Rochester, N. Y.

Does not make the Tongue Sore.

SMOKE VANITY FAIR.—There must be some magical properties in it, akin to the wonderful Eastern plant that made captive those who inhaled it.

For Meerschaums.

A trusty friend, in weariness or trouble; a solid resource in Winter and rough weather, is a sweet pipe with Vanity Fair. Best dealers have it.

For Cigarettes.

There are times and places tolerant only of the Cigarette; tenderly white and sweetly fragrant. Vanity Fair is the correct thing for Cigarettes.

For Sportsmen.

Smoking is an elevated mental and psychological pleasure, when one uses that splendid article, Vanity Fair. Best dealers have it.

Vanity Fair will be your constant companion by day and night; in merriment and in distress. Vanity Fair is a genuine natural product, nothing about it artificial except the cutting.

C. STEHT, 347 Broome st., 3 doors from Bowery, under Occidental Hotel, recommends his large assortment of Meerschaum Pipes and Cigar Holders, suitable for CHRISTMAS and NEW YEAR'S PRESENTS. Monograms on Pipes and Cigar Holders artistically executed. Call and examine my stock and get Price List.

FOR EVERY SMOKER.

AN INDISPENSABLE ARTICLE FOR THE PIPE. Pick, Spoon and Press combined. Can be carried in the pocket. Has long been used in Europe, and now manufactured in this country for the first time. Sent post-paid on receipt of 50 cents. Address

WALKER & WELCH, 212 Main street, Buffalo, N. Y. Nov11-3m

CHAMPION GUNS OF ENGLAND

PAPE'S

Unrivalled Sporting Guns

Stand unequalled in every contest. Their performance at the London Trials of 1875 beats the records of any maker in the world.

1875. 12-Gauge, Choke Boring.

Maker of Gun. Exhibitor.

1st—Greener. Greener.

2d—Pape. Davidson.

3d—Pape. Davidson.

Ont of a class of 68 guns, 8 out of the 6 best were made by Pape. The Greener gun was protested against on the spot for having its score false counted, the fact proven there, and afterwards confirmed by same gun being shot for two days per week for six weeks in succession, when its average score only took 24th place, its very best score being greatly below the scores of the best six guns.

1875. 12-Gauge, Old Sporting Bore.

Maker of Gun. Exhibitor.

1st—Pape. Davidson.

2d—Pape. Davidson.

1875. Long Range, 60 yards, Choke Bore.

1st—Pape. Davidson

60 yards, Long Range, Sporting Boring.

1st—Pape. Davidson

Those champion Long Range guns, only 7 pound weight, with a charge of ¾ dr. to 1½ oz. shot, beat the best 8 bore Greener gun at 60 yards; weight, 15 lbs.; 6 drachms and 2½ oz. shot.

1875. The Sportsman's Snb. Cup, valued at \$45, was also awarded to W. R. Pape, for the original invention of choke boring. Winner of the London Gun Trials of 1858, 1859, 1866. Address

NORTH OF ENGLAND GUN WORKS,

Newcastle on Tyne, England.

H. C. Squires, No. 1, Courtlandt st. New York.

THE GREAT
London Gun Trial,
1875.

W. W. GREENER begs to inform his numerous clients in the United States that he has been very successful in the above trial, having secured the first prize, a silver cup, value 40 guineas—class 2 for 12 bores; also winner in class 1 for 8 and 10 bores, and class 4 for 20 bores. He has won in all the classes for improved boring, which is upon a different plan to any other maker, and is far superior in the three most essential points, viz., PATTERN, PENETRATION, and REGULARITY OF SHOOTING.

Mr. HENRY C. SQUIRES, of No. 1 Courtlandt St., New York, is now importing my DOUBLE CLOSE-SHOOTING GUNS to order, an invoice of which will be shipped to him on the 1st July, and can be examined about the 15th. All special orders given to Mr. Squires will be carefully filled. A full report of the GREAT TRIAL, showing the marked superiority of my guns over guns made by Dougal, Pape, Tolley, and others, will shortly be published, and can be had on application at No. 1 Courtlandt St.

W. W. GREENER,
Champion Gun Maker,

St. Mary's Works, Birmingham, England.

HENRY C. SQUIRES, of No. 1 Courtlandt street, has just received an invoice of these close-shooting guns, and from him any information in reference to the results of the Great Trial can be obtained on application.

W. W. GREENER'S

DOUBLE CLOSE-SHOOTING GUNS. Winner of the Silver Cup, value 40 guineas, at the Great London Field Trial 1875, beating 33 competitors with 68 guns, also winning in all the other classes for the Improved System of Boring. These guns will kill from 80 to 100 yards, loaded with large shot, and will shoot well with small shot with a less powder charge than guns bored upon the old system. For report of the Gun Trial apply to Messrs. McLaran, Williams & Co., Agents, St. Louis, U. S. A. Address

W. W. GREENER,
St. Mary's Works, Birmingham, England.

J. D. DOUGALL'S
EXPRESS SHOT GUNS.

(Title registered.)

SHOWN by trials at Wimbledon by Editor of the Field to possess the GREATEST PENETRATION and therefore LONGEST RANGE—thus: Circle, 30 inches; 300 pellets; average, 191; penetration, 37. The Editor's trial of Greener guns with 340 pellets of same shot and same charge of powder, gave 180, and penetration 30, although there were 40 more pellets in each charge. Should any controversy arise as to the durability of these new systems, we herewith warn all beforehand that our system is our own invention (though founded on the American idea) and is DURABLE, a fact remarked on by the Field, that the guns tried had been in use during last season, and references permitted to the owners. Send for Illustrated Circulars to

For Forest and Stream.
Deer Hunting in Minnesota.

It will snow to-night, I think; if it does, be at the crossing at six o'clock and we will see what we can do with the deer." So the note ran, written by a good friend of ours, and handed to us by a small boy, who insisted on an answer. Writing "yes" in large letters across the note, we sent him back and begun to get ready. First, we looked at the heavy double barrel gun, which is the gun for hunting deer in the brush. As they keep hid in cold, dry weather in the day time, and often creep within a few yards of the hunter, a glimpse or two of one gets of them in the brush, and a rifle is almost

useless. Next, we loaded some cartridges with 5½ drachms of powder and a dozen buckshot; got out the old "larra-gans," or rather the Canadian moccasins, and made them pliant and soft with oil, put a morsel of tobacco and a brier root pipe in one pocket of the blanket, wormers and extractor, compass and matches in another, locked the safe, blew out the lights, and proceeded homeward through the fast falling snow. At four o'clock the storm had ceased; about three inches of dry light snow had fallen, a breeze from the north swayed the tall pine trees, and at six o'clock, as we got to the crossing just under the hill where the little cotton streamers over the graves of the Indians fluttered weirdly in the gray morning light, our friend came along the trail, his well-trained dog—a cross

between a blood and fox hound—following at his heels. Said F—: "You go to the south end of the little swamp; go as fast as you like. I'll go north a mile or so and swing around that way. If I start anything, or find a fresh track leading into the swamp, I'll let Juno go, and then look out?" To the swamp we went, and waited till F— made his appearance. No deer—not a track—was the report, and the willow clumps on the Long Lake trail was the next point selected. This necessitated a walk of about four miles, and on rounding the shore of Gilbert Lake several fresh tracks heading for the willows aforesaid gave us what our old friend Fay used to call "great hopes." Juno whined to be off, but we were not ready and she was ordered to stay in. Along the trail we went for a mile or

DEER SHOOTING.

more, till the huge clumps of willows on the Big Meadow loomed up ahead of us, and while F— went on, so as to enter the brush from the north, we went into the meadow along a runway that went into and through the largest clump. Having taken a stand that commanded two or three open spaces, on a fallen tree, from which we could see all over the tops of the brush, we waited patiently for an hour; then the brush in front of us cracked once or twice. Silently the gun triggers sprang to full cock, as we peered cautiously into the thicket. Crack, crack, again went the dead twigs, and we confidently expected a deer to show himself; but the wary animal refused to come out, and after snorting once or twice, retraced his steps. At the upper end of the willows we now heard a yelp from the dog, accompanied by a command to "come in," followed at once with one, two, three shots from F—'s Winchester, and climbing up on the fallen tree as high as possible, we saw the deer break cover and run as only a scared deer can run, and plunge into the nearest clump. In a second or two F— appeared in sight on the track and motioned to us to come where he was. In a few moments we were with him. The red drops on the snow, the long and regular leaps, told that the deer had been hit, but not badly wounded. We kept the track, gave F— time to skirt the brush and get ready, and then went on, more intent on driving the deer out than shooting him. By main strength we crashed through the brush, starting the deer twice, which seemed determined not to leave his cover, till we gave it up and sought F— again for courage and advice, which resulted in taking our stands and letting Juno go in, which she did willingly, and brought the deer out into the meadow in short order, when F— shot him again, breaking his fore leg, and again through the shoulder, bringing him down. The first shot had struck him in the neck just cutting the flesh. To dress the deer—a four-prong buck—was the work of half an hour, and then we attempted to corral the deer that had saluted us with his whistle; but the firing and noise had been too much for his nerves, and his trail out of the brush into heavy timber told us we might as well let him go for the present.

"Let us try the willows on the side next to Long Lake," was F—'s next suggestion, and the same operation as before was gone through with. We could not do anything without Juno's help, and when he let her go she drove the deer out in the wrong place and went off in full cry, her bugle-like voice sounding fainter and fainter, till we could hear her no longer. "Well," observed F—, as he lit his pipe after luncheon, "it is human intellect against animal cunning. In order to get another deer the science of the still-hunter must be brought into play. We must hunt those fellows who *know* we are here; who have all the advantage of a thorough knowledge of the country; who can smell us for a hundred rods; who have grown gray in getting out of the way of the Indians, and I reckon we can go home with only *one* deer." We mentioned a French quotation, which means "it depends upon circumstances," and telling F— to meet us at the "Crossing" at night, we struck out. A long, lonesome walk through the "ever nodding" pines brought us to the meadow through which Hay Creek runs. As we struck the meadow we noticed several fresh tracks leading across the meadow into the oak openings beyond; and skirting the meadow in order to get the wind in our faces, we began to look the oaks over. It was cut up with tracks, new and old, like a sheep yard. Here the lordly buck had been courting with the does; here the torn up ground and long sliding tracks of a fierce struggle between a couple of bucks. Mixed up with these were the tiny tracks of the fawns and yearlings. As we stood undecided which course to take, a small bushy oak in front of us began to shake, and stern first, his tail erect and quivering, came a buck, *backing out!* What he was doing remains a question. Whether he was going to sail into another buck, getting ready to paw, or whether he was "showing off" to a doe, we cannot state. We dropped on one knee, in order to get a better sight, and at that moment he saw us. As we wheeled the gun cracked, and as he rose in air at the second jump we fired again through the leaves and brush. Both charges struck him, and when we got to him, a dozen rods away, he had no more frolic or fight left in him. Prone on his side he lay, the bright blood staining the snow. We were near the railroad track, and knowing that the section men would soon be along with their hand-cars, we stopped them as they came along, and with their help dragged the buck to the track, put him on the car, and "pumped" our way into town.

Brainerd, Minn., Nov. 25th, 1875.

LATE PASS AND RIVER SHOOTING.

SIX o'clock A. M. on the 15th of November of last year found the "Koronis Club," once before mentioned in these pages, dashing over the last quarter of a mile of the road to the Wilcox Farm, behind a splendid team of horses, drawing a spacious shooting wagon, the contents of which, to any ordinary observer, disclosed our mission at once. Although with great coats buttoned up to the chin, and silently flitting through the foggy and frosty night we ran some risk of being taken for smugglers, but as we were not near the "line," and with Prince and Ponto—our retrievers—dashing along behind, we were in no great danger of that.

Starting from Litchfield, Minn., about two o'clock in the morning, roused from our warm and comfortable beds at the hotel and chilled by the keen night air, we were not in good condition to enjoy the moonlit and very frosty landscape, and we looked anxiously for dawn, which would see us near our destination. We consequently hailed with joy the first rays of the morning sun, and it was but a short time before he began to assert his power by rolling off the mist in clouds, unfolding to us a scene of extreme beauty in the rich Autumn pastoral landscape, every leaf and blade of grass glittering like diamonds under his influence. We whirled by thrifty-looking farm houses, the rosy-tinted smoke ascending lazily from the chimneys and joining the fog, and together rolling into great banks of clouds, through which the sun's rays gleamed like dagger points. The rapid motion of the mist, under the influence of a gentle breeze and the constant changes of the cloud masses, gave a kaleidoscopic effect to the scene, needing only a few more colors to make it gorgeous. It required some such a scene to arouse us from the half stupor into which our long dreary ride had thrown us, and for the first time since our start were we at all social.

"Here we are," ejaculated H—, from the depths of his muffling, as a large, white, two-story, clean-looking farm house appeared through an opening in the trees, "let's wake 'em up."

Pent up in a city for almost the entire Summer, it is hardly to be wondered at that our enthusiasm broke out in divers ridiculous and undignified ways, and yelling at the top of our voices, we dashed through the open bars into Wilcox's yard, scattering pigs, chickens, ducks, geese, turkeys and calves in dire confusion, and arousing the ire of the resident dog, Major, who met us and our canines bristling and snarling with rage, until getting the wind of our party, he changed front and gave us a true canine and rather unpleasant welcome. Just then the door of the house opened and Wilcox, or "Bill," as we familiarly call him, thrust his head out, and looking real provoked at the liberty taken, exclaimed: "What in thun—" and recognizing us, changed to "Well, well, boys, how d'ye do? By gracious! you reminded me of a pack of '62 Indians—don't want any more of them in mine; but *you* are welcome, sure enough—been looking for you these three days. Look here, fly around!" (this to a scared and sleepy-looking Swede boy) "and take care of the gentlemen's horses; and you boys, shaking us cordially by the hand, you must be cold and hungry; come in." Then turning, he led the procession into the house, the windows of which had been filling up with inquisitive childish faces. It did not take long for Mrs. Wilcox to set a few extra dishes, nor for us to empty them. Such coffee and biscuit, and such "flap-jacks," smothered in cream and white sugar!—but I must stop. My mouth waters at the thought of them. "Don't be in a hurry, boys," was Bill's frequent expression, as he saw us becoming fidgety after surrounding our victuals, "Ducks won't fly till the fog lifts from the Pass—don't take much stock in your Pass shooting, no how; guess I'll take Major and beat you all at the river." But J— could not wait, and shouldering his gun left hastily for the lakes. Not much less anxious than the aforesaid impatient boy, we double-quickened it after him through the belt of woods that intervened.

Wilcox's Pass differed not materially from any other, being, as nearly all are, but a narrow strip of land between two feed lakes, and as we all knew the ground thoroughly, we were not long in posting ourselves in good cover. The dense fog still hung over all, rendering futile our efforts to pierce the veil and discover the game, which our ears plainly told us had begun to stream over. We endured this state of things for a while, the dogs beginning to manifest their impatience by running backwards and forwards, and gazing wistfully into the air when the ducks went over with their peculiar thrilling whistle of the wings. At this juncture of our affairs we hear a loud honking in the direction of Mud Lake, W— at the same time singing out sonorously, "mark goose!" Knowing him to be in the centre of the goose pass, we hurried to his side, the dogs following our example. Not trusting them implicitly, however, in this emergency, W— and J— each straddled one of the animals for further security. What a feeling about in extra pockets there was for B B shells, and what "goose ague" and nervousness was shown as the honking grew louder and drew nearer, will never be known outside of the Koronis Club. H— and W— in the centre, J— on the right, and the writer on the left, our eyes fixed, and our guns pointing in the direction of roast goose, we formed a model tableau. How we blessed the fog—never so dense. On they came. We knew that by the sound, and suddenly enough they appeared, not over five yards high, the leading gander with neck outstretched, looking, as he emerged from the fog, as large as a barn.

"Ready, boys!" excitedly from W—. Our guns went up quickly. "Pull!" A ringing report, and the old gander and two of his companions hurled themselves upon our little group. W— and J—, each quietly seated upon a dog, and thoroughly absorbed in the sport, had forgotten what a mine they sat upon; but the dogs had not. At the report, and faithful to their retrieving instincts, they gave tremendous leaps gooseward, throwing their riders in one direction and their guns in another, causing the dignified secretary to stand on his head in the moist sand, while J— posed just as artistically but a few feet distant. W— and J— insisted there was nothing to laugh at, while H— and I laughed until the tears rolled down our cheeks.

A freezing wind set in from the northwest, benumbing our fingers and causing our poor wet retrievers to shiver until their teeth fairly rattled, and as the flight, in consequence of the extreme cold, was very poor, we concluded it was but an act of mercy towards man and beast to retire. This we did in good time, casting back many a lingering glance at the Pass over which we had shot, both in anticipation and reality so often. As we staggered through the woods to the house with our load we consoled ourselves with the reflection, that if we had not quality, we could not complain on the score of quantity. It did not revive our spirits one bit when we discovered the large lake frozen over, and a solitary goose walking on the ice as if to test its strength, showing us conclusively that our Pass shooting was over. Literally speaking, we were a blue crowd on reaching Bill's cosy sitting room; for our feelings rivalled the color of our noses, and we began seriously to discuss our return homeward. Just then the door opened and Major sprang into the room, his shaggy coat covered with ice, followed by his master, Bill, with a fine back load of mallards. "Well, boys," he exclaimed, "how 'dye make out?"—didn't hear you shoot much; told you I'd beat you on the river." Then seeing how matters stood, he told us to cheer up, that the river was full of mallards and red heads, and a fine afternoon's sport was before us; this at once revived our spirits, and we responded promptly to Mrs. Wilcox's call to dinner.

Giving Bill the management of the afternoon's hunt, he advised a separation of the party, three to take the team and carry the section boat a few miles up Crow River, while he took down stream with the remaining one of our party. H— preferred accompanying Bill, so W—, J— and myself drove up stream with the boat. A brisk trot of a few miles and our boat was afloat, its bow well concealed by flags and wild rice stalks. My companions knelt side and side, guns in hand, in the bow, while I guided the boat with a paddle, my own gun lying across my lap. We glided along silently through the heavy wild rice, the mallards getting up within easy range, and affording beautiful shots. Now and then I would succeed in getting in a right and left after my friends had emptied their guns. Every bend and turn of the stream harbored more or less of the noble birds, and as our silent approach gave them

no warning, we delivered our shots with telling effect, and it was not long before it became difficult to move about in the boat, on account of the number of ducks lying in it. We were quite willing to quit when the team hove in sight, and were soon aboard with our precious load, and dashing swiftly over a good road down stream after Bill and H—, whom we espied directly, crawling on their hands and knees towards a clump of willows which hid them from the river. The noise of our approach reaching them, they motioned to us to join them, and on all-fours we accomplished the feat. What a sight met our gaze! The river at this point was fully fifty feet wide, and but a few rods distant there fed a large flock of brant geese and quite a large flock of mallards. After a whispered consultation, it was decided to give them a barrel each on the water and the balance on the wing. Bill gave a shrill whistle; instantly every neck went up in alarm, and then we sent in our fire, and again as they rose, covering the water with the dead and wounded. We dashed into the river with our long boots and retrieved four brant and five mallards, besides allowing a few cripples to escape.

Sitting around Bill's cheerful fire that night and listening to the howling of the storm, which had set in with great fury, he recounted graphically to us his experience during the Indian massacre of '62, how he was compelled to abandon his comfortable home and leave everything to the mercy of the red devils; his return with a neighbor after a few days in the dark to look after his stock and liberate them, so they might not starve, the neighbor going to his own home, agreeing to meet Bill at a certain place; how he met the Indians at his well, and how, by his nerve and coolness he outwitted them; the pursuit, and his final escape, and how not finding his neighbor at the rendezvous, he became uneasy, and after hunting for him finding his dead body with a hole in it, he then left hastily for the nearest settlement and returned with an escort, drove off the Indians and buried his friend. Midnight found us still up and listening to our host's adventures, and those of our party who had participated in the Indian war retired to dream over again the stirring incidents of those terrible days long gone by.

ALSACE.

Fish Culture.

ANNUAL REPORT OF THE FISH COMMISSIONERS OF THE STATE OF VIRGINIA.

THE first duty of the gentlemen forming the Virginia Fish Commission upon receiving their appointments, was to consult with Professor Baird, U. S. Commissioner of Fisheries, and in company with Mr. Jas. W. Milner, of the same Commission, and Prof. Goode and Major Ferguson, of the Maryland Commission, to visit the various fishing stations on the Potomac River. The object of this trip was to gather information regarding the condition of the shad fisheries, sufficient of which was gained to satisfy the Commissioners that by artificial propagation, clearing the stream of all obstructions to its source, and a few wholesome regulations as to close time, size of mesh and fixed nets, the river might be made to yield food for millions of people.

As the shad season was rapidly passing, the first requirement was to secure an expert. Mr. Seth Green's offer of the free use of his hatching boxes was accepted, and also Prof. Baird's tender of the aid of one of his most experienced experts, Mr. Fred Mather. After examining several points on the James River, Fish Haul on the Pamunkey River was selected as the place for Mr. Mather to commence operations. But the weather continued so cold and harsh, that though he remained three weeks, prepared to hatch a million a day, if spawn could be had, he did not find one perfectly ripe female shad. The run of fish becoming smaller, and being unremunerative, the proprietor of the seine "cut out," which put an end to further operations, or rather expectations, at that point.

In the meantime, Mr. W. D. Marks, of Mr. Green's corps, had been assigned to Greenlaw's landing, Tobago Bay, on the Rappahannock, a most famous fishery, where there are three large shore seines, and in former times as many as 6,000 shad have been caught by one of them at a haul. But there was heard the same complaint as elsewhere—very few fish, and those not mature. The catch of a day by all the seines and the gilliers, above and below the bay, in sight, did not reach a thousand. Nevertheless Mr. Marks, by extraordinary energy, succeeded in hatching and turning into the river upwards of a million of fry. He was prepared to hatch a million a day, and could have done it with ease, if spawn had been obtainable.

The Commissioners and their agents were most kindly received by all the fishermen, both gilliers and shore men who proffered every assistance in their power, and manifested great interest in the success of their work. All ripe fish were freely turned over by them to the use of the Commission. Mr. Marks, by having an understanding with the gilliers, that they should raise a flag whenever they caught a live and ripe fish, for which he would send a boat, obtained many fine spawners. Under the auspices of the United States Commission, some five or six millions of shad were hatched in the Potomac, and most of these turned into that river. A portion was distributed to other impoverished streams, of which a hundred thousand were deposited in the Staunton, where the Mildland Railroad crosses that river.

The attention of the Commissioners was next turned to the various water courses of the State above tide, Virginia being blessed with six distinct and well defined basins or water sheds on the Atlantic slope. With a suitable channel at the Great Falls of the Potomac anadromous fish, such as shad, herring, rock, salmon, etc., might ascend to the Alleghanies, in Maryland, Pennsylvania, and West Virginia, and by the Shenandoah, up the Valley of Virginia, to Augusta county. The basins of the Rappahannock, the James, the York, the Chowan, and the Roanoke and their tributaries were in turn examined, and all found to possess every advantage for the production of an immense quantity of fish of various kinds, all of which is now lost by the great number of dams which, in many instances, bar their courses.

Crossing the Alleghany in Southwest Virginia the trib-

tributaries of the Kanawha, Big Sandy, and Tennessee, are all fine waters for fish. The Holston and Clinch have long been stocked with black bass—there called black perch—but their numbers of late years are reported not very large. They are so voracious that they devour every living thing within reach, and then devour themselves, or each other. The tributaries of the Sandy also have black bass, and abound in trout. New River has in its main stream little but catfish, but there are many fine stretches of deep water which might be well suited to the land-locked salmon and the lake trout. But for anadromous fish, the Great Falls of the Kanawha constitute an insuperable barrier, and even if they could be circumvented, the rapids of the New River, where it passes through the mountains, present for ten miles a succession of whirlpools and sharp and jagged rocks, so destructive in character as to be a perpetual and insuperable barrier to the ascent or descent of fish.

Of the fish now existing in the waters of Virginia, and of others which it is proposed to introduce, the Commissioners speak as follows:—

THE ROCK OR STRIPED BASS

is, next to the herring and the shad, the most abundant and valuable of our waters. The Chesapeake and its tributaries are known to be its favorite resorts, but to what extent it ascends the James River appears to be uncertain. It has been ascertained that the eggs of the striped bass can be manipulated just as shad's are, and the discovery will enable pisciculturists to multiply them greatly. No gamier fish swims, if we except perhaps the salmon.

CALIFORNIA SALMON.

This anadromous fish, the Commissioners think, will be found well adapted to Southern streams having their sources in the mountains, from the fact of its ability to sustain itself in water of a much higher temperature than can the Atlantic coast salmon. The Sacramento fish occupy a river which passes through one of the hottest portions of the United States. These facts seem fully to justify the expectation that this salmon will prove a success in Virginia waters, and be a great accession to the fish supply. Thus persuaded, they have obtained from the United States hatching establishment on the McCloud, 340,000 eggs, which are now being hatched at Lexington and Blackshurg, under the superintendence of the experienced expert, Mr. Fred Mather.

BLACK BASS.

Some twelve or thirteen hundred of these fish have been distributed in various streams east of the Blue Ridge, enough in each stream to stock it, if not poached out before they have time to propagate. The black bass is very nearly allied to the fish erroneously called the Southern chub, but differs from it organically and in its habits. The chub does not possess the gameness of the black bass, and usually lies near a log or stump, and when struck attempts to break away by aid of the log.

BROOK TROUT.

The streams on both sides of the Blue Ridge are admirably adapted to trout, and once abounded in them, though now, owing to the many diabolical devices employed for their destruction, the trout are very scarce in most of them. The same may be said of the streams emptying into the Shenandoah from the North Mountain, the headwaters of the James, and throughout the Alleghany range and Southwest Virginia. Artificial culture and protection could readily restore to all these streams an abundance unknown in the earlier days.

There are some other varieties which may be worthy of a wider circulation. The red-eye, a fish not found north of the tributaries of the Chowan, is said to be a fine pan fish, and game, and grows to the weight of three pounds. It is proposed to distribute these fish in all Virginia rivers next Spring. The red-belly perch of the Nottoway (the red-breast bream of the South) is also represented to be a good fish, and may be found worthy of distribution. The Commissioners also think it probable that the red bass of Florida (red snappers) may be found to succeed in these waters—a gamy fish and capital for the table.

In some of the mill ponds of Charles City and New Kent, fed by streams that flow through sandy districts and are never roiled, a fish called by some the "bachelor," and by others the "sand perch," was formerly, and may be still found, a cross between the yellow-belly perch and the silver; and the impression that they were a non-fertile hybrid was suggested by the fact, that even in the few ponds where found, they were not abundant. It is regarded by those who know it, as one of the best fresh water fish. In shape it is nearly round. In biting, it nibbles like a sucker, and its favorite bait is the fresh water shrimp, though it will take worms and small minnows. It is found only in deep water with sandy bottom, and bites near the bottom. If not an unproductive hybrid, it may merit attention. The little white perch, which attends the shad in its ascent, is also worthy of mention. Being a delicious pan fish, it is a welcome visitor to every housekeeper, and its advent diffuses general joy among the boyhood of all tidal streams. In the deep waters of the James, the York, Rappahannock and Potomac, they may be caught throughout the Summer and Fall—sometimes quite a pound in weight. During Winter they drop back to sea, though some have continued in fresh water, and thereby suggest that they may be content with it as a permanent abode.

The report contains some suggestions as to fish ladders and legislation which are well considered, and doubtless will meet with legislative attention. The present laws relating to fish and game are severely criticised, and the Commissioners state that they were assured wherever they went in the State by the gentlemen whom they met, that new laws of this character would be welcomed by the people, and clubs or associations would be formed in every neighborhood to insure their enforcement. They are aware of the popular aversion to all prohibitory game laws and of the difficulty in enforcing them. There would seem to be a strong propensity with civilized men, amounting almost to an imperious instinct, to kill everything wild. We have reached that point that both self-interest and reason combine to admonish us that if we continue to enjoy the providential bounties of streams and fields, we must restrain that propensity, we must subdue that instinct. We must practice forbearance. We must, during the breeding seasons, protect fish and game from all attacks, and at all times from wanton and wholesale destruction. This can be effected by the voluntary individual and collective resolve of the whole community; or, in the absence of unanimous concurrence, by a stringent law to restrain the vicious and aid those who would save something from the general and impending wreck. It would be useless to enact a law

which did not meet the approbation of the great mass of the community. But, as already stated, from what they saw and heard in the country, there is a strong and decided feeling among the people to enforce a law, wisely framed, to attain the ends desired.

The report contains a voluminous and interesting appendix, with statistics concerning the different rivers of the State. Being a first report, there is naturally much concerning the origin and progress of fish culture, which, while new and particularly interesting to the people of the State, has already appeared in these columns. We have already alluded to the fact of fish culture having been introduced into the State colleges and other institutions of learning, and from the energy displayed by the Commissioners in this, the first year of their efforts, it is evident that Virginia intends to take and maintain a leading position in this most valuable and interesting of State enterprises. With this slight resumé of her Fish Commissioners' first Report goes forth our most earnest wishes for her success, and an assurance that every movement made in the good work will be most anxiously looked for and carefully reported.

DISTRIBUTION OF CALIFORNIA OVA.

The following table shows the condition in which the California salmon eggs are reported to have arrived at their destinations:—

Name of State.	Number of eggs.	Condition.
Massachusetts.....	80,000.....	Good.
Connecticut.....	480,000.....	Splendid; very few dead eggs.
Rhode Island.....	240,000.....	Not good.
New York.....	80,000.....	Not heard from.
New Jersey.....	320,000.....	Apparently very nice.
Pennsylvania.....	480,000.....	Remarkable success; one per cent. lost.
Maryland.....	500,000.....	Beautiful condition; couldn't be better.
Virginia.....	320,000.....	Fine order.
Michigan.....	800,000.....	Very little loss; eggs superior.
Illinois.....	80,000.....	Excellent; not over two per cent. loss.
Wisconsin.....	80,000.....	Splendid order.
Minnesota.....	400,000.....	Excellent; fine condition.
Iowa.....	800,000.....	Fine condition.
Colorado.....	240,000.....	Good order.
Utah.....	160,000.....	Two per cent. loss.
Canada.....	80,000.....	Very good.
New Zealand.....	50,000.....	Not heard from.
Northville, Michigan, for the United States.....	1,000,000.....	Good; four per cent. loss.
Kern River, Cal.....	250,000.....	First rate.
Truckee River, Cal.....	250,000.....	First rate.

The thermometer averaged 95° in the shade on the days these eggs were packed. They were loaded into wagons at noon, and were eleven hours on the road before reaching a railway station, after which they were conveyed by rail over three thousand miles. The only lot that arrived in poor condition was the Rhode Island consignment, and this is accounted for by their being three days on their way from New York to Providence. The same thing happened last year through the unaccountable and unpardonable negligence of the express agents between New York city and Providence. After deducting losses for transportation, it will be seen that about five million (5,000,000) living young salmon reached the Atlantic States, besides two million (2,000,000) which were successfully hatched and placed in California waters, making a complete total of seven million (7,000,000) salmon added to the stock of salmon in American waters from the McCloud fishery this year.

—The Sag Harbor *Express* says that sometime ago G. W. Thompson, a returned Californian, purchased the old mill pond and premises at Noanck and went into the business, or increasing the business already begun, of raising trout. Since then he has been busily at work, clearing up the grove in the rear of the pond, digging out the springs, and doing other work necessary for the purpose, until he has got one of the prettiest little trout preserves to be found on Long Island, and of that attractive nature that persons from Sag Harbor visit it almost daily to look into the art and mystery of trout culture. He has already some 20,000 fish of different sizes, and has thus far this season taken some 20,000 spawn, expecting to have from 150,000 to 200,000 during the season. He now has occupied by fish, or had when we were last there, nine boxes, 14 feet long, with 10 inches fall to the 14 feet, and 65 feet of boxes in different sections, for different sizes of fish; also a spawning box 12 feet long. He is also now building a reservoir 24 feet long, 2 feet wide, and 2 feet deep; an aqueduct 80 feet long, and a filtering tank which will hold 300 gallons. He has also 4 rearing boxes, and is soon to have 16 or 20 more.

State Fish Commissioners will oblige us by sending their Annual Reports for review as soon as issued.

Natural History.

[This Department is now under the charge of a competent Naturalist, endorsed by the Smithsonian Institution, and will henceforth be made a special feature of this paper. All communications, notes, queries, remarks, and seasonal observations will receive careful attention.]

THE NESTING OF AMERICAN BIRDS.

1—THE ROBIN—(*Turdus migratorius*, Linnæus, Wilson, Audubon, Baird, Coues.)

THE robin is distributed in the breeding season over the whole of the United States, except the extreme South, and over the most of British America. Everywhere it is one of the earliest birds to nest, and in the southern part of its range raises two broods in a season. In the Middle States the robins have paired by April 15th, and have begun to build before May 1st.

The nest is a clumsy affair and familiar to all, but the pains with which its walls are laid up, may not be so familiar. My own impression has always been that both birds work at it together; but the weight of evidence seems to be that the female is the real architect. "She probably considers him incapable of so great an undertaking," says Mrs. Mary Treat, "as to assist in the construction of even

a mud cabin. Nevertheless he is very watchful and solicitous while she is at work, and during incubation; and when the young are hatched he does as much for their support while in the nest as the female, and as soon as they leave the nest she shirks all the responsibility of protecting and providing for them upon him, while she proceeds to build another domicile, or fit up the old one. By this judicious management upon her part she succeeds in rearing three broods, while most other birds rear but two."

The situation of the nest is extremely varied, and little concealment seems to be attempted. A fork, or the upper surface of a large limb in an old orchard tree, is a favorite site, but woodland trees, the protruding end of a fence rail, a stump, a ledge of rocks, or a bush in the midst of a colony of noisy blackbirds, is also frequently occupied. Ranging through such a wide extent of country, and coming under such multifarious conditions, the nests naturally vary as much in construction as in situation. Eleven distinct varieties have been noticed in New Jersey alone. Sometimes the bird displays a strong lack of sense, as in one case in Geneva, N. Y., where a robin took possession of a sort of trough which had been nailed up under the eaves of a barn. The bird began building a nest in it, but seeming unable to fix upon any particular spot, deposited the mud and straw along the entire length of the trough, about ten feet. After working several days she abandoned the task. Another similar instance is recorded where a robin attempted to plaster its nest along the cornice of a house for thirty feet. When a place has been chosen, a little mud is first brought and patted by the feet into a suitable shape for the foundation. Upon this is laid a platform of coarse grasses, and walls of the same materials are gradually erected, intermixed with a plentiful allowance of mud, smoothed and compacted by the feet and breast of the bird. This is allowed to fully dry before the wall is further increased, and each addition is supported by an additional plastering of mud, until the proper height of wall is reached, when the whole is given plenty of time to dry before the rim is overcast with grass, so as not to break under the mother's feet while she feeds her young, and then the lining of soft grasses is put in. Sometimes one or the other will bring material unsuitable for a certain stage of the construction. This will not be thrown down and forgotten, but simply laid one side and used when the proper time comes. A curious deviation from the mud walls was noticed by one writer near this city. Two robins built nests in the same orchard. One was after the ordinary pattern, the other used for the main body of the structure fine fibrous roots and twine; she then added clean damp moss (*sphagnum*) instead of mud, which she must have gone at least a mile to obtain. To hold the moss in place she interwove long horse hair and fine dry grass. It took her four or five days to complete the structure, whereas the mud nest was completed the same day it was begun. The robin's nest, when finished, is about four inches in internal diameter and two inches deep, but very rough and bulky externally. Its construction usually occupies the birds for three or four busy days, after which, if the necessities of nature be not too urgent, and especially if the weather be damp, sufficient time is given for the mud to dry; while on the contrary it sometimes happens that the first eggs must be laid before the walls are fully done, and the finishing touches are put on afterwards. They are extremely solicitous for the safety of the nest, and jealous of intrusions, rousing the whole neighborhood with their fuss and clamor when disturbed; but by keeping a quiet and formal distance and making slow advances, you can easily win their confidence.

The eggs are four or five in number, of a beautiful bluish-green, or sea-green color, and are the largest of all the true thrush's eggs. They will average 1.10 by .80 of an inch in dimensions. The wood thrush's eggs resemble them most closely, but are slightly smaller and more slender. The eggs are dropped daily until the nest complement is complete. The female sits eleven days, by which time the young have all come out of the shell, and on the following day their eyes are open; but they remain in the nest from ten to fifteen days longer. For a long time they do not recognize their parents, opening their mouths as widely for food, and crying just as eagerly if a cat approaches the nest, as when they hear the fluttering wings that are really bearing it to them. When the young are able to fly they are piloted about and fed for two or three days by the male, while the female builds another nest and prepares for the second brood, often in close proximity to the first home. The old nest is left in a very dirty state, although it had been kept clean of all offensive matter during its occupancy. But the vermin with which the young are usually at first covered soon leave them. The nest once abandoned seems rarely to be returned to. The robin has numerous enemies which commit cruel depredations on his household, so that it is probably rare that two full broods reach an adult age. The crow, bluejay, crow blackbird, and cuckoo are all accused—probably with good reason—of destroying the eggs. It is said that after she has thus been robbed, the female robin will steal into the nest of one of her own kind, during a temporary absence of the owner, and appropriate it as her own; depositing a remaining egg of her clutch, or mayhap more, and, if plucky, will drive off the legal owner, and, taking bold possession, bestow all her care thereon, but she never disturbs the rights of other birds. Occasionally in cases of extreme necessity, she drops a single egg into a sister's nest and leaves it; but the act is never malicious or voluntary, and is always due to her own nest having been destroyed.

The Cape St. Lucas robin (*Turdus confinis*, Baird) is regarded as only a variety of the Eastern bird, from which its general habits are not known to differ.

THREE CURIOUS DISCOVERIES.—A recent examination of the bottom of an old Roman well, located near the hot springs of Bourbonne les Bains, in France, has resulted in three remarkable discoveries. After the excavation had been thoroughly drained, and a thick layer of refuse penetrated, the first discovery was made in the bringing to light of thousands of metallic ornaments, statuettes and coins, dating back to the time of Nero and Hadrian. Beneath the layer of ornaments, etc., a second layer was found, composed entirely of fragments of sandstone,

which, together with the metallic objects, were completely covered and held in masses by metallic crystals, evidently deposited by the water above. These crystals were of such a nature that geologists would unhesitatingly describe their formation to natural causes, working through ages. That such is not the case is plainly evidenced by the known eras of the coins above which they have formed. It will be seen that this circumstance may throw serious doubt over a large quantity of important geological deductions as to lapses of time, when the same, as is the fact in many instances, are wholly based on supposed slowness of formation of similar deposits. The third discovery relates to the fragments of sandstone. By comparing these with other pieces, already found in similar localities, the investigators have concluded that such fragments were thrown into the wells as votive offerings to local divinities by the ancient inhabitants of the country, and that the same custom, continued through centuries, accounts for the presence of the much more recent Roman money. A chain of proof mainly circumstantial, has been elaborated, which refers the stone fragments to the neolithic epoch, in prehistoric ages, and further shows that the pieces probably represent the earliest money used by man.

—The "sea serpent" has come again. This time he appeared off Cape St. Roque, South America. He was fighting with a whale—a cachelot, it must have been—which he wound himself about, and twirled with tremendous velocity. This monster "had two coils around a full-sized whale, with thirty feet clear at each end," and when the rumpus was over he "raised himself sixty feet out of the water." Pretty large serpent! An anaconda thirty feet in length would be a giant. The whole story rests upon the authority of the Zanzibar correspondent of the *Western Morning News*, who has written up an account, told with a sailor's latitude in details, of what Capt. Driver and the crew of a collier bark thought they saw.

—Two young lions, three weeks old, the progeny of the lions at Central Park named Lincoln and Jennie, are being reared by a terrier whose puppies were taken away. She has grown very fond of them and caresses them continually.

NEW BIRDS FROM MINNESOTA.

MINNEAPOLIS, Minn., Nov. 17th, 1875.

EDITOR FOREST AND STREAM:—

On the 22d of September, 1875, a fine specimen of the sanderling (*Calidris arenaria*) was shot in the vicinity of Minneapolis by Mr. W. L. Tiffany. There were two of them on the sandy beach of one of our many lakes, but only one was shot, the skin of which I have in my collection. From all the quotations that I can find regarding this bird, I infer that it is seldom found in the interior. On the 23d of Oct. '74, I shot a cardinal grosbeak (*Cardinalis virginianus*), in the midst of large woods, about six miles from this place. The specimen was a male in brilliant plumage. I have seen it mentioned in the *American Naturalist* that this bird has been found in the central counties of Iowa; but do not know that it has been taken in Minnesota before. On the 9th of May, 1874, while riding through an open, scrubby section of country, some seven or eight miles from Minneapolis, I saw large numbers of the Harris' finch (*Zonotrichia querula*). I shot two specimens, one of which is now in the possession of Dr. Hatch, of this city. On the 16th of the same month I shot the last specimen that has been seen in this locality, although constant and thorough search has been made each Fall and Spring since. They were seen in abundance only on the first day mentioned, and the same section being visited two days afterwards, not a single individual of the kind could be found. Besides the three mentioned above, I have in my possession specimens collected in Minnesota of the following species, not in the catalogue of the birds of this State, published by Dr. Hatch in 1874:—

Wilson's thrush, *Turdus fuscescens*. Probably common.
Golden-crested wren, *Regulus satrapa*. Occasionally met with during migration.
Red-bellied nuthatch, *Sitta Canadensis*. Rare.
Short-billed marsh wren, *Cistothorus stellaris*. Summer resident; not common.
Golden-winged warblers, *Helminthophaga chrysoptera*. Summer resident; rare.
Tennessee warbler, *Helminthophaga peregrina*. Abundant during the Spring migration of 1875.
Blackburnian warbler, *Dendroica Blackburniae*. Seen occasionally during migration.
Black-poll warbler, *Dendroica striata*. Taken during migration.
Cape May warbler, *Dendroica tigrina*. Five specimens were taken during the Spring and Fall migrations of 1875.
Canadian flycatcher, *Myiodytes Canadensis*. Occurs during migration.
Yellow-winged sparrow, *Coturniculus passerinus*. Not rare.
Black-throated bunting, *Euphiza Americana*. Abundant during the Summer of 1874, but none appeared during the Summer of 1875.
Olive-sided flycatcher, *Contopus borealis*. Summer resident, but rare.
Pileated woodpecker, *Hylotomus pileatus*. Not common in heavily timbered sections.
Yellow-bellied woodpecker, *Sphyrapicus varius*. Common in heavily timbered sections.
Baird's sand-piper, *Tringa Baadli*. Several specimens taken.
Forster's tern, *Sterna Forsteri*. Not common.

THOMAS S. ROBERTS.

The following are recent arrivals at the Philadelphia Zoological Garden:—

GARDEN OF THE ZOOLOGICAL SOCIETY,
FAIRMOUNT PARK, PHILADELPHIA, Dec. 13th, 1875. }
One Wild Turkey, *Meleagris gallopavo*. Presented by the Duncannon Iron Company, Penn.
One Jaguar, *Felis onca*; 2 Beavers, *Castor Canadensis*; 4 Common Camels, *Camelus dromedarius*, and 4 Bactrian, *Camelus bactrianus*, purchased.
One Yellow-cheeked Amazon, *Chrysotis autumnalis*. Presented by Miss Abbott, of Philadelphia.
One Horned Grebe, *Podiceps cornutus*. Presented by J. S. Champitt, of Philadelphia.
One Florida Gallinule, *Gallinula galeata*. Presented by H. B. Phillips, of Delaware.
One Yellow-footed Rock Kangaroo, *Petrogale xanthopus*. Purchased.
One King Vulture, *Gyparchus papa*. Purchased.
One Horned Grebe, *Podiceps cornutus*. Presented by J. W. Sweisfort, of Philadelphia.
One Leopard, *Felis pardus*. Purchased.
One Wild Goose, *Bernicla Canadensis*. Presented by J. M. Wilson, of Washington, D. C.

—The Natural History section of the Long Island Historical Society will hold a meeting in the hall of the Society, at Court and Livingston streets, Brooklyn, on the evening of December 30th.

NEW YORK, December 9th, 1875.

EDITOR FOREST AND STREAM:—

Will you be kind enough to ask your correspondents for a note of such birds as they surely know to rear more than one brood in a season? I can only start the list with the robin and bluebird from actual observation. Also, whether such birds breed a second time in the same nest, or build another, as does the robin? C. S. W.

[We gladly give space to this inquiry, but would offer a word of caution against substituting hearsay for personal observation. Anything that stimulates close and intelligent observation of the habits of our birds is welcome to our columns.—Ed.]

The Kennel.

COST OF KEEPING DOGS.—It is not an unusual thing for us to hear gentlemen say, that they would keep a good dog, or a brace, but for the expense of feeding, or for the expense of boarding them during the close seasons. Let us say that a full-grown setter may be kept in first rate condition at such times at an expense not exceeding twenty-five cents per week. One pound of cornmeal, costing rather less than two cents and a half, a pound of scraps costing one cent, when well boiled, is sufficient for one dog per day. During Winter this kind of food will keep a week. We have kept dogs for years on this food, and know that when regularly fed as above they keep in first rate condition. While dogs are being worked during shooting season, in addition to the above, they should have some meat.

—Mr. Joseph E. Fisher, of Brooklyn, who had the misfortune to lose his fine Gordon setter bitch Flirt has had the loss supplemented by the death, by distemper, of a daughter of Flirt, Queen of the Field. This fine pup was eight months old and sired by How's Duke. Flirt's pedigree was published in No. 2 of our present volume. Mr. Fisher still has his red setter Belle, who took second prize at the Mineola show, and is expecting shortly a litter of puppies sired by Hamilton Thompson's Duke.

—The Birmingham Dog Show of 1875 opened on the 29th November and continued until the 2d inst. Entries comprised an even thousand dogs, being something less than last year. The largest class was the Fox Terriers, of which there were one hundred and eighteen exhibited. The pointers numbered seventy-six, and the setters, of the three varieties, English, Irish and Black and Tan, one hundred and twenty-one in all. Of Collies, or Sheep dogs, there were fifty-seven, and of Retrievers sixty-three. Cocker Spaniels are not mentioned, but of Clumbers, there were twelve and also eighteen Sussex Spaniels. The awards had not been published when the last mail left.

—The Second English Field Trial Derby for setter and pointer puppies of 1875 is announced to be run in April 1876. The ground will be the same as on the last occasion, Horse Heath, near Linton, Cambridgeshire. The entrance is ten shillings, to be raised to four guineas for starters, and the winner receives fifty pounds. Entries close Jan. 1st.

THE CHICAGO BENCH SHOW.—We have received the prize list of the National Poultry Association, who hold their first exhibition at Chicago commencing on the 20th of January. The principal prize is a "special" presented by FOREST AND STREAM, valued at \$150, (nominally, its real value being much more) to be awarded for the best display of sporting dogs or bitches of any one breed or variety by one exhibitor. There are in all forty classes with prizes as follows:—Our space only permits us to mention the sporting dogs or the most valuable of other varieties.

Class 1.—Imported English setters, or their progeny, over one year old. For best dog, premium cup, value \$35; second best, cup, \$25; third best, \$10. For best bitch, premium cup, value \$35; second best, cup, \$25; third best \$10.
Class 2.—Imported red or red and white Irish setters, or their progeny, over one year old. For best dog, premium cup, value \$35; second best, cup, \$25; third best \$10. For best bitch, premium cup, value \$35; second best, cup, \$25; third best \$10.
Class 3.—Imported black and tan Gordon setters, or their progeny, over one year old. For best dog, premium cup, value \$35; second best, cup, \$25; third best \$10. For best bitch, premium cup, value \$35; second best, cup, \$25; third best \$10.
Class 4.—Native English setters, over one year old. For best dog, premium cup, value \$35; second best, cup, \$25; third best \$10. For best bitch, premium cup, value \$35; second best, cup, \$25; third best \$10.
Class 5.—Native black and tan setters, called Gordons, over one year old. For best dog, premium cup, value \$35; second best, cup, \$25; third best \$10. For best bitch, premium cup, value \$35; second best, cup, \$25; third best \$10.
Class 6.—Native red or red and white setters, called Irish setters, over one year old. For best dog, premium cup, value \$35; second best, cup, \$25; third best \$10. For best bitch, premium cup, value \$35; second best, cup, \$25; third best \$10.
Class 7.—Pointers, over fifty pounds weight, over one year old. For best dog, premium cup, value \$35; second best, cup, \$25; third best \$10. For best bitch, premium cup, value \$35; second best, cup, \$25; third best \$10.
Class 8.—Pointers, under fifty pounds weight, over one year old. For best dog, premium cup, value \$35; second best, cup, \$25; third best \$10. For best bitch, premium cup, value \$35; second best, cup, \$25; third best \$10.
Class 9.—Irish water spaniels, over one year old. For best dog, premium cup, value \$35; second best, cup, \$25; third best \$10. For best bitch, premium cup, value \$35; second best, cup, \$25; third best \$10.
Class 10.—Cocker spaniels, over one year old. For best dog or bitch, cup, value \$35; second best, cup, \$25; third best \$10.
Class 11.—Clumber spaniels, over one year old. For best dog, premium cup, value \$35. For best bitch, premium cup, value \$35.
Class 12.—Black retrievers and Chesapeake Bay dogs, over one year old. For best dog or bitch, premium cup, value \$35; second best, cup, \$25; third best \$10.
Class 13.—Retrieving spaniels, other than pure Irish, over one year old. For best dog or bitch, cup, value \$35; second best, cup, \$25; third best \$10.

SPECIAL CLASSES.

Class 23.—For best native English setter pup, under one year old, prize cup, value \$25; second best \$10; third best \$5.
Class 24.—For best English setter pup, from imported stock, under one year old, prize cup, value \$25; second best \$10; third best \$5.
Class 25.—For best pointer pup, under one year old, prize cup, value \$25; second best \$10; third best \$5.
Class 26.—For best Irish water spaniel pup, under one year old, cup, value \$25; second best \$10; third best \$5.
Class 27.—For best spaniel pup for retrieving ducks, under one year old, other than pure Irish, cup, value \$25; second best \$10; third best \$5.

Class 28.—For best English setter bitch, over one year old, with not less than two of her pups, under one year old, special prize, presented by *Chicago Field*, value \$50. For best Irish setter bitch, with not less than two of her pups, under one year old, special prize, \$50.
Class 29.—For best pointer bitch, over one year old, with not less than two of her pups, under one year old, special prize, value \$50, presented by *Rod and Gun*.

Class 30.—For best Irish water spaniel bitch, over one year old, with not less than two of her pups, under one year old, special prize, value \$50, presented by FOREST AND STREAM.
Class 31.—For best setter bitch of any breed, special prize, value \$35.
Class 32.—For best imported English setter dog, for stock purposes, to be shown with not less than two of his get, special prize, value \$50.
Class 33.—For best English setter dog, for stock purposes, to be shown with not less than two of his get, special prize, value \$50.
Class 34.—For best Russian setter dog or bitch, over one year old, special prize, value \$35.
Class 35.—For best red Irish setter dog for stock purposes, to be shown with not less than two of his get, special prize, value \$50.
Class 36.—For best brace of imported English setters, known as the "Field Trial Breed," over one year old, pedigree required, special prize, value \$35.

SPANIELS vs SETTERS.

FRANKLIN, New York, December 3d, 1875.

EDITOR FOREST AND STREAM:—

It is stated in your issue of December 2d that for ruffed grouse and woodcock shooting no variety of spaniel is to be compared with a good, steady, well-broken setter or pointer. Now, I have had some experience with all the above named dogs, and I have yet to see the setter or pointer that is equal to a well-broken cocker spaniel for woodcock and ruffed grouse. To say they are perfect don't express it. Again, it is stated that the only places we found where our spaniels were better than setters was in coverts, where the shooter could not follow his dog. Now, I ask is not that just the place where we mostly find cock and grouse? Where is the sportsman who has not found the most grouse in raspberry brush and second growth beach and birch, blackberry and other matted undergrowth? Those are the places where whole broods are found in early Fall. Often have I made an aperture in thick woods for my dogs to enter, and yip, yip, and a whirr, whirr, bang, bang. Then to say they are fine retrievers don't express it. Now, who in fairness will say that for woodcock a spaniel has any equal? For in the Eastern and Middle States, and in Canada, woodcock inhabit river and creek flats, densely covered with willows, also broom corn fields, where your dog cannot be seen at all fully half the time. I would as soon walk up my birds as go in search of a setter on a point. Again, it is stated that a setter will, when properly broken, etc. Mr. Editor, notice the "properly broken." Yes, but it will cost as much to properly break him or her as you can buy a first class pair of cockers for, and will cost you ten times as much to feed and keep them properly broken; and if you please, sir, they give you a few seconds notice—i. e., yip, yip—before the bird rises, to shoulder your gun. And is not that far more important to the shooter than to follow your setter say twenty rods and then walk up your birds? Again—"He is a much stronger dog; will do much more hard work." Now, where is he stronger according to size and weight? I claim that a spaniel, say thirty pounds, will propel himself far easier than a setter of sixty pounds, and will do just as much work, and he is fast enough for any man for cock and grouse. The only trouble with a setter, or the worst trouble is, they are too fast for this kind of work. Perhaps the writer of the article referred to would have the readers of FOREST AND STREAM believe that a draught horse will propel himself easier and do more hard roading than a horse half his size and weight. If the setter is superior to a spaniel for this class of work, why in the name of common sense and reason do they use the spaniel in England for pheasant and woodcock, and why are they so careful in breeding and breaking this beautiful, keen-nosed, intelligent dog? I have traveled all that country, east, west, north, and south, and there is not in all England woods or thickets to be compared with the Eastern and Middle States of this country, and yet nearly every nobleman's kennel contains favorite breed or strain of spaniels. Bye the bye, I notice an article in *Land and Water*, treating of woodcock shooting, that refers to using a good brace of spaniels for that purpose.

To sum up, I have used pointers and setters, and have come to the conclusion that they are unfit for this section, where the ruffed grouse and woodcock is the game, and have discarded them accordingly and replaced them with a pair of cocker spaniels, and I am a thorough believer in that breed of dogs, and if any one says aught against them I am on tiptoe. They are keen scented, quick and intelligent and good retrievers on land and water, and if I miss my bird on the wing, and it is treed, and I shoot the bird sitting, why that's my business; I want the birds.

Your correspondent, Manhattan, is in error in regard to a cross between the setter and spaniel, as in all the crosses of the kind that I have seen they will not point, nor yet will they bark, and it would be hard to tell when game was scented, and would require the constant watch of the shooter, and the game would be for the most part lost because it rises unexpectedly. In all else I endorse Manhattan, for I have never known a time when spaniels were so much required for amongst sportsmen as at the present time.

DELAWARE.

[In our article upon the relative merits of setters, pointers, and spaniels, we did not intend to discourage the use of cocker spaniels in sections of the country where the shooter cannot follow his dog, but we contend that such grounds are rarely met with. We commenced our shooting in 1825, have shot in more than half the States in the Union, and have in all probability killed more game, legitimately, than any one else in this country except Captain Bogardus, yet we have scarcely ever found shooting when spaniels would have been more serviceable than well broken setters or pointers; and when our correspondent alleges that it costs ten times as much to feed and keep them properly broken, we cannot agree with him. We admit that it would cost a trifle more to keep a setter or pointer, but after they are properly broken any skillful sportsman can keep them up to their work. But even a spaniel, in order to be useful, should be well broken, unless he is used to tree birds for his master to shoot sitting, but, for such purposes, perhaps little or no breaking is required.

Our correspondent states that in England, cockers are preferred to setters and pointers for woodcock shooting. In that country we are informed, that men are also used as beaters for this game and for pheasants. Their shooting must be very different from ours to require such means to make it sport.

The strongest argument in favor of setters and pointers, for even woodcock and ruffed grouse shooting in this country, is that at least nineteen twentieths of the shooters use them instead of spaniels—whereas if the latter were superior the fact would have been discovered long ago and they would have taken the position in the hearts and kennels of our sportsmen which our correspondent desires for them.—Ed.]

—The Legislature of Ontario, Canada, has just passed an amendment to the Game Laws allowing snipe to be shot on the 15th August, which is not considered too early in that Province.

TURNER'S "ELCHO" AND "LOO II."

St. Louis, Mo., December, 1875.

EDITOR FOREST AND STREAM:—

Charles H. Turner, of St. Louis, a young gentleman of wealth and refinement, and an enthusiastic admirer of fine stock, is doing more, perhaps, at present, for improving American dogs than any one person in the country. A few miles west of St. Louis he has built a kennel, perfect in its arrangements and attractive in appearance, and has seven pure bred red Irish setters, imported; two Irish water spaniels, imported, and an imported beagle bitch with a litter of seven pups. He has also imported several pointers and hounds for friends. His last importation, through Mr. Cooper, of Limerick, was a pair of beautifully formed and feathered red Irish setters—Elcho and Loo II—deep blood red in color, and rangy in style. The following letter came with them, written by Mr. Robert S. Greenhill to Mr. Cooper, which, with Mr. Turner's permission, is given to the public.

November 6th, 1875.

DEAR SIR—I give you particulars of my red Irish setter, Elcho. He is by Charlie out of Nell, both of which were specially purchased for their good pedigree, and sent out to Russia for breeding purposes. They are the property of Mr. Oppenheimer, of St. Petersburg. Charlie was by Mr. Purcell Llewellyn's Pat, out of Juno by Grouse, out of Ina, by Derby, out of Rhue. Nell was by Heather, out of Nance, by Dane, out of Loo; Loo by Bone, out of Quail. The dog and bitch come directly from the strain of both Lord Waterford's and Marquis of Ormond's breed, and were originally owned by Captain Irwin. You can get no better blood in Ireland. Elcho was pupped May 1, '74. I trained him myself, and is the best first season dog I ever had. He will drop to raising the hand, and at the word "Tono!" will be steady, and also on shot. I have no fault to find with him, and had I kept him over, I expect as a prize dog he would be heard of to advantage. On looking over the list he has beaten at this last show, you will see that some have taken prizes elsewhere. I can only say that it is the opinion of many that he should have had first prize here. I regret having sold him, and it is only because I have so many dogs coming on that I part with him. His puppies will be very like him in another year. In case you should send him to America, it will probably interest whoever may get him across the Atlantic to learn that he is called after the Elcho Challenge Shield, which came this year to Ireland by the last shot which was fired by me at Wimbledon this year. By this victory the American Rifle Team are supposed to have thrashed creation, having beaten Ireland in the rifle match, Ireland then beating England and Scotland. I showed the dog, Elcho, to some of the Americans when they were here; but he was not then for sale, or possibly he would now be in America. I shall be glad to hear how your friend likes him. The bitch you purchased I think is particularly good looking. Puppies out of her by Elcho should be valuable. I am, yours truly,

(Signed) ROBT. S. GREENHILL.

Sea and River Fishing.

FISH IN SEASON IN DECEMBER.

SOUTHERN WATERS.

Pompano, *Trachynotus carolinus*. Grouper, *Epinephelus nigritus*,
Drum (two species.) Family Scia. Trout (black bass,) *Centropomus*
nide.
Kingfish, *Menticircus nebulosus*. Striped Bass or Rockfish, *Roccus*
Sea Bass, *Scianops ocellatus*. *lineatus*.
Sheepshead, *Archosargus probato-* Tailorfish, *Pomatomus saltatrix*.
cephalus. Black bass, *Micropertus salmoides*;
Snapper, *Lutjanus caxus*. *M. nigricans*.

[Under the head of "Game and Fish in Season" we can only specify in general terms the several varieties, because the laws of States vary so much that were we to attempt to particularize we could do no less than publish those entire sections that relate to the kinds of game in question. This would require a great amount of our space. In designating game we are guided by the laws of nature, upon which all legislation is founded, and our readers would do well to provide themselves with the laws of their respective States for constant reference. Otherwise, our attempts to assist them will only create confusion.]

FISH IN MARKET.—The slabs this week have presented quite a number of novelties, chief among which may be mentioned an invoice of about 100 Savannah shad, in good order for the season; they sold for \$1 each. By the same steamer a few very handsome red snappers came to hand and were sold for 18 cents per pound. The last steamer from Key West brought a number of Sprnsh mackerel in capital condition, the largest weighing nine pounds. A marked peculiarity in the largest of these fish was the presence of a lateral stripe of the same color as the spots usually found; they sell for 50 cents per pound. Striped bass, from Mirimichi, are worth 25 cents per pound; smelts, from Maine and Nova Scotia, of unusually fine quality bring 15 cents per pound; bluefish, from Cape Hatteras, 12½ cents; salmon, frozen, 50 cents, mackerel, 18 cents each; white perch, 15 cents per pound; frost fish, 8 cents; halibut, 25 cents; haddock, 8 cents; codfish, 10 cents; blackfish, 12 to 15 cents; flounders, 8 cents; sea bass, 20 cents; eels, 15 cents; sheepshead, 30 cents; whitefish, 18 cents; salmon trout, 20 cents; black bass, 18 cents; pompano, \$1; green turtle, 20 cents; terrapin, \$12 per dozen; lobsters, 10 cents per pound; scollops, \$1 per gallon; soft clams, 40 to 60 cents per 100; hard shell crabs, \$4 per 100; soft shell crabs, the first of the season, \$1 per dozen.

MORE SHAD.—The smack E. A. Baker, Capt. J. W. Mosier, which arrived with her catch a few days since, brought in nine fine large shad, taken while bluefishing at sea off Chickacomica wood, twenty miles north of Cape Hatteras. It has been suggested that these shad, which by the bye weighed four and a half pounds each and were without roe, were Northern fish on their way South, but we have before contended that shad do not migrate, but after spawning go out to sea and return in due season to their own river. We believe that the fish in question were probable denizens of the Delaware or Chesapeake, although caught in a very unusual manner. The Baker's catch of bluefish numbered 4,900.

—Dr. T. Garlick, of Cleveland, Ohio, who is well known for the interest he has taken in fish culture, prints a letter in *Rod and Gun*, in which he attests to having cultivated a speckled trout until it attained a weight of six pounds and three ounces. This fish gained three-quarters of a pound a year in weight. It was exhibited, with two others, at two of the Ohio State fairs. Dr. Garlick says that many years ago, speckled trout were frequently brought by Indians to Fort Brady, at the Sault Ste. Marie, which weighed over nine pounds. So, this personal identity of *salmo fontinalis* of great sizes is being continually substantiated and placed beyond question or doubt. There are giants and pigmies in almost every separate form of life.

PERCEPTION OF FISH.

IN a recent number of *Chambers' Journal* there is an article illustrating intelligence in fishes of various kinds; for instance the carp, which comes for its food at call, and others that distinguish persons. An anecdote is told of a trout which was in the habit of taking red worms from the hand when offered, but which, having been once deceived with a long slender radish very like a worm in shape and color, never could be humbugged again. He intuitively distinguished them apart, and although he ceased to come out for the one, he was prompt enough in coming for the other.

Now here, we concede, is an argument in favor of those critical anglers who affect a multiplicity of patterns in flies. The most uncompromising of us old fogies, admit that we study seasons, temperatures, conditions of clouds, atmosphere, water, and the liek, in the selection of our flies for the time being; but we have never been willing to allow that trout can distinguish the real from the unreal with the nice perception that our ladies judge of laces and fur-belows. However, we have to yield a point when we find a trout able to instantly detect a spindling radish from an earth worm at a distance of several feet. Indeed we are so wide open to conviction that we are prepared to believe, on evidence, that a trout can instantly, or at second thought certainly, tell not only the difference between a green drake and July dun, but the difference between a natural hackle and a dyed one. It is obvious that if a trout rushes more than once at the same deception he must be a stupid fellow, and without discernment. After the second or third rise, we must either change our flies or our casting stand, at least, so far as the particular trout in question is concerned. Experience has proved this to every old angler. Sometimes, when striking successfully we secure each fish on its first rise, we find that we can take a dozen from the same pool; if we bungle in our business, and by missing to hook, give the trout a chance to detect our deception, we may thrash the water in vain, or with only two or three foolish fingerlings to answer our endeavors. Trout No. 1 has undoubtedly communicated his discoveries to his neighbors.

Well, this is a curious world, and peopled with curious creatures, all having intelligences that we little conceive of; and perhaps the fish that swim have as much acumen in their peculiar sphere as lawyers have in theirs, or as creatures that belong to higher orders of creation. *Quien sabe?*

—A Hamilton, Ontario, correspondent of the *Montreal Herald* says that on the morning and evening of Dec. 4th, a peculiar phenomenon occurred in that city, in the shape of millions of young herrings about one and one-half inches in length, coming through the water taps; in one instance about half a gallon in full came through.

FISHES AND FISHING OF THE GREAT LAKES.

FIRST PAPER—THE WHITEFISH.

WE commence this week a series of articles relating to this comparatively little known field of investigation, prepared from personal observations of a leading citizen of Michigan who must be considered eminent authority. Little conception can be formed of the trouble of obtaining information hereupon, as nothing reliable, positive or negative, can be gathered from the fishermen, and it is only by sifting and combining, that any satisfactory results can be reached.

EDITOR FOREST AND STREAM:—

After a series of extended trips I find that the principal fishing is done on Lakes Huron and Michigan, as the bold shores of Superior preclude the employment of nets to any great extent.

The whitefish (*Coregonus albus*) is among the best of lake fish, being second only to the Siskowit, and by many pronounced superior to the great trout. The spawning begins in November, terminating in December, and is indicated by the fish leaving deep water and appearing in immense numbers on rocky shoals. Formerly they frequented the streams for this purpose, but, at the present time, there are but few streams emptying into the great lakes that are free from saw mills and their attendant dust, which are offensive to these fish. At the first day's netting on the spawning beds the catch is wholly males, apparently well stocked with milt; on the second, a few females appear, plump with spawn. The proportion of females increases day by day, until after a week or ten days, when there are two or three and often four times as many females as males, after which they gradually disappear, until the latter preponderate, as they are the last as well as first upon the beds. The best opinion seems to be that the males precede the females only to prepare the ground; especially as they at that time assume an extraordinary roughness of scales, and employ themselves constantly in scraping up gravel, on which the spawn is subsequently deposited. Some, however, believe that the mere inclination to milt causes them to seek the proper position without reference to the presence or absence of the females; others still are of the opinion that they precede only to wait for the females, and do not commence milting until spawning begins. This latter opinion is undoubtedly the true one, for Mr. Milner has established the fact, that the act of spawning in the female and milting in the male, is carried on at the same time, and with a slight, though decided orgasm. The males have been accused of lingering for the purpose of feasting on the spawn, but this is contrary to nature and undoubtedly a slander; however, this is a mooted question. Seth Green says "as soon as the eggs are thus spread broadcast, all the fish in the neighborhood start for them and eat up all they can find, while the parents themselves are not backward about taking their fair proportion." I think it more than likely that Mr. Green is in error. Mr. Milner has had the best of opportu-

would supply spawn enough to stock the ocean, but from the fact that but a very small part escape the many enemies that feed upon the spawn and the small fry, comparatively few become even small sized fish.

nities for observing, and spent no little time at the ponds of Mr. Clark near Detroit. He gives a succinct, but thorough description of the act of spawning, showing him to have been an extremely careful observer. In no case does he mention this habit; he says, however, that "a few fish ova are frequently found in the stomach of the whitefish," but he don't say *whitefish* ova. If such had been the case, he would undoubtedly have mentioned it, and his account leads me to believe that he observed nothing of the kind. The most careful of observers among old fishermen assure me that the males who linger on the beds are employed in covering the spawn.

Whitefish of Lake Erie ascend the Detroit River and pass through the lake into the River St. Clair for the purpose of spawning, but seldom, if ever, go higher than Mooretown—eight miles from the outlet of Lake Huron. Again, Lake Huron fish ascend the St. Marie River for the same purpose; but it is a well established fact that none descend these rivers from the waters above for a like purpose. Lake Huron whitefish rarely enter the River St. Clair, except after a heavy and continued northeast storm, then they are driven into the river in large schools.

The average whitefish is of two or three pounds weight; a large one six or seven; rare specimens are caught, however, of much greater weight, sometimes turning the scales at twenty pounds. Those of Lake Superior and the Straits are larger, fatter and finer in flavor than those of the lower lakes. In the rapids of the Sault Ste. Marie they are taken in large quantities by the Chippeway Indians in dip nets and are of very superior flavor. The fish of Lake Huron and Upper Lake Michigan are very fair, but those of Lake Erie are decidedly inferior, which is probably due to the difference in temperature of these waters. Few travelers ever taste whitefish in perfection except they have visited the northern resorts. As eaten upon the hotel tables of Buffalo, Chicago, and even Detroit, it is comparatively a tasteless fish; as a meal for an epicure it must be had fresh from the icy waters at the Straits or of Superior, and cooked as soon as may be after it is caught. Then, to our thinking, the whitefish is one of the most toothsome fishes that swim, superior even to the salmon or brook trout.

Formerly the capture of whitefish was conducted by means of seines, but the wholesale destruction on the spawning beds has caused gill and pound net to supersede them. They do not take the hook readily. The food of this fish was long a matter of conjecture, but is now believed to consist mainly of the minute crustaceans and mollusks that inhabit these lakes. This is rendered probable from the fact that the mouth is constructed for nibbling along the bottom, being directed nearly downward. The frequent failure to find food in the stomach of the whitefish, is doubtless due to their capture in pound nets, where they would remain sufficiently long to digest the contents, but those caught by gilling have generally food partially digested. It is asserted that whitefish are migratory; how true this is I do not know, except it be for spawning purposes; they do, however, seek the deeper and cooler waters as Summer advances. The presence of large fishes in numbers at certain localities, of a size never taken anywhere else, would suggest a local habit, with no disposition for long voyages.

ARCHER.

✕—Our whilom correspondent, G. M. Fairchild, sends this note from his memoranda:—

"Last Summer a friend and self were fishing in the Jacques Cartier, when the following occurred: My friend, who was grubbing it with a worm on the bottom, felt a tug on his line; he struck, and a magnificent trout broke the surface of the water a second afterwards, apparently well hooked. My friend played it until he thought it safe to bring his fish alongside the boat for me to land it. I took the line, but the moment the full weight of the fish came I felt something give way, and I landed, not the trout, but a two-inch gudgeon as lively as a cricket. The gudgeon had gorged the worm and hook, and a second afterwards the trout came along and bolted the gudgeon. The hook being buried in the gudgeon there was nothing to hold the trout."

DOINGS OF THE FISHING FLEET.—There have been 17 arrivals of the fleet the past week, 13 from the Banks and 4 from Georges. The receipts are 300,000 pounds Bank codfish, 40,000 pounds Georges codfish, 62,000 pounds Bank halibut and 40,000 pounds Georges halibut. Bank halibut are in good demand, and Georges very scarce, sales yesterday at 16 and 11 cents per pound for white and gray. The shore fleet have had a good week of weather, consequently the market has been a little glutted, which has brought fresh cod and haddock down to \$2 per hundred weight, against \$4 and \$4.50 paid last week. The whaling business of New Bedford has been successful this year. They ship two tons of smelts some days by railroad from Waldoboro, Me.—*Cape Ann Advertiser*, Dec. 10th.

—Mr. B. P. Ware, one of the Executive Committee of the Massachusetts Angler's Association, reported at its recent meeting that the fisheries on the east coast of Massachusetts employ 138 vessels, 5 of which are steamers. The following table shows where they hail from, the number of men, and the number of hooks employed in trawl fishing:—

Port.	Vessels.	Men.	Hooks.
Boston.....	40	400	400,000
Gloucester.....	40	400	800,000
Gloucester.....	5*	50	150,000
Swampscott.....	15	150	180,000
Marblehead and Beverly.....	8	80	80,000
Provincetown.....	30	300	300,000
Other places.....	—	100	100,000
Total.....	138	1,480	2,010,000

*Steamers.

The Boston and Gloucester fleet are mostly for bay fishing. It will be seen that the vessels average about ten men each, and each man cares for from 1,000 to 3,000 hooks, the greatest number being handled by the steamers, owing to their greater ability and quickness of moving about. The hooks are attached to lines five feet apart on the line, making in the aggregate 10,050,000 feet of line, or 1,714 miles stretched upon the fishing grounds of Massachusetts Bay every good fishing day. It is estimated that each vessel on an average takes 400 to 600 small unmerchantable codfish daily that are substantially of no value, the fleet destroying probably from 80,000 to 100,000 daily. Doubtless a comparatively small number of fish

Yachting and Boating.

HIGH WATER, FOR THE WEEK.

All communications from Secretaries and friends should be mailed no later than Monday in each week.

—We print below our annual list of regattas and matches sailed in American waters during the season of 1875. There are doubtless some inaccuracies and omissions in it, but we have endeavored to make it as complete as possible. Next week we shall publish a list of winning yachts, both here and in English waters:—

February 6th, at New Hamburg; N. H. I. Y. C. regatta. First class, Quickstep first prize, Flying Cloud second prize; second class, Qui Vive first prize, Whiff second prize; special class, Zephyr first prize, Flying Cloud second prize.

February 13th, at New Hamburg; N. H. I. Y. C. regatta. Second class, Puff first prize, Whiff second prize.

February 23d, at Dorchester; Ice Yacht regatta. Nonpareil wins.

February 25th, at St. Augustine; St. A. Y. C. regatta. First class, sloops. Seminole first prize, Cricket second prize; second class, sloops, Columbia first prize, Traveller second prize; cats, first class, Carrie first prize, Eagle second prize; special class, Henrietta wins.

May 10th, at Philadelphia; D. R. Y. C. regatta. Adelphia first prize, Wm. B. R. Selby second prize, Fashion third prize.

May 10th, at Camden; Cam. Y. C. regatta. J. C. Dubman first prize, John P. Felden second prize.

May 20th, regatta at Charleston. Coquette wins.

May 22d, at Dorchester; D. Y. C. first championship regatta. Centre boards, Eva first class, Mabel second class, no race in third class, Tulip fourth class; keels, Lidie first class, winners.

May 29th, regatta at Marblehead. Magic first class; second class, sloop, Georgie; schooners, third class, Rambler first prize, Leader second prize, Avis third prize.

May 30th, at Perth Amboy; P. A. Y. C. regatta. Chemann first class, So-So second class.

May 30th, match at Hoboken. Charm beats Ripple, both of N. J. Y. C.

May 31st, regatta at Savannah. Eleanor wins.

June 5th, match at New York. Idler, S. Y. C., beats Palmer, N. Y. Y. C.

June 5th, at Quincy; Q. Y. C. regatta. Nettie first class, Mabel second class, Rocket third class, winners.

June 7th, matches at Brooklyn. Frank, L. I. Y. C., beats Robert Russell, L. I. Y. C., and Short Branch, L. I. Y. C., beats Only Son, L. I. Y. C.

June 8th, at Williamsburg; W. Y. C. regatta. Victress first class, Sorceress second class, J. M. Sawyer third class, Pidgeon fourth class, winners.

June 10th, at South Boston; S. B. Y. C. first championship regatta. Centre boards, Eva first class, Mabel second class; keels, Starlight, winners.

June 14th, at New York; S. Y. C. Corinthian sloop match. Addie Voorhis wins.

June 14th, at Philadelphia; Ph. Y. C. regatta. — Hoff first class, Brewer second class, Millie third class, winners.

June 15th, regatta at Whitestone. Harry Hill first class, H. A. Brush second class, Fidget third class, winners.

June 15th, at Chester; Chester Y. C. regatta. First class, King first prize, Lizzie Artis second; second class, Fanny first prize, Stella second; third class, Lawrence first prize; fourth class, Mommy first prize, Shoo Fly second; fifth class, Coates P first prize, Lizzie second, winners.

June 16th, at New York; N. Y. Y. C. regatta. Schooners, Palmer first class, Comet second class; keels, subscription cup, Wanderer; sloops, Vision first class, Madcap second class; steamers, Lurline, winners.

June 17th, at Nahant; D. Y. C. regatta. Centre boards, first class, Nimbus first prize, Eva second; second class, Mabel; third class, Bristol; fourth class, Tulip and Virginia tie; keels, Sunbeam, winners.

June 19th, at New York; Bk. Y. C. regatta. Schooners, first class, Comet first prize, Madeleine second; sloops, second class, Schemer first prize, Maggie B. second; first class, Undine first prize, White Wing second; third class, Wm. T. Lee first prize, Victoria second, winners.

June 19th, at Lynn; L. Y. C. regatta. First class, Lillie; second class, Fleetwing first prize, Nellie J. second; third class, Georgie first prize, Nymph second, winners.

June 21st, at Halifax; R. H. Y. C. regatta for challenge cup. Petrel first class, Cygnet second class, and Wavelet third class, win.

June 21st, regatta at Halifax. Bernice wins first prize, and Circe second.

June 23d, at Swampscott; E. Y. C. regatta. Schooners, Halcyon first class, Fearless second class; sloops, Nimbus second class, winners.

June 23d, at New York; A. Y. C. regatta. Schooners, Triton; sloops, Undine first class, and Kaiser Wilhelm I. second class, win. Undine also takes the Livingston cup.

June 23d, at Hoboken; N. J. Y. C. regatta. Emma first class, Annie M. second class, Charm third class, G. W. Dilks fourth class, winners.

June 23d, at New York; C. Y. C. regatta. Lillie first class, G. B. Deane second class, Tough third class, winners.

June 24th, at Toms River; T. R. Y. C. regatta. Lulu first prize, Rover second prize, Charry Hooper third prize.

June 24th, S. Y. C. ocean schooner Corinthian match. Palmer first class, and Peerless second class, win.

June 26th, regatta at Springfield. Zephyr wins.

June 26th, at East Boston; E. B. Y. C. regatta. Gael first class, Fanny second class, and Lidie third class, win.

June 23th, regatta at Onset Bay. Edith Rose first class, and Phosie second class, win.

June 29th, regatta at Little Bay Side. Three Brothers first class, Fidget second class, and Gracie third class, win.

July 1st, at New Hamburg; C. H. Y. C. regatta. Le Roy first class, Mary Emma second class, and Lulu third class, win.

July 1st and 2d, ocean steam yacht match around Long Island. Ideal beats Lookout, both of N. Y. Y. C.

July 3d, at Portland; P. Y. C. regatta. Viva first class, Gracie second class, and Rival third class, win.

July 5th, at Oyster Bay; S. Y. C. regatta. Schooners, Idler; sloops, Vision first class, Chrystie second class, Fei Seen third class, Mary Emma fourth class, winners.

July 5th, at Cotuit. Winners of the second and third classes not known; second class won by Waquoit, B. Y. C.

July 5th, regatta at Wakefield. Alice wins.

July 6th, at Quincy; Q. Y. C. regatta. First class, Fiona first prize, Florence second; second class, Massie first prize, Wildfire second; third class, Rocket first prize, Jennie second; fourth class, Lightfoot first prize, Annie second.

July 5th, at Perth Amboy; P. A. Y. C. regatta. First class, Susie T. first prize, Chemann second; second class, Emily P. first prize, William F. second; third class, Lulu first prize, Fidget second.

July 5th, Boston city regatta. First class, schooners, Fearless, E. Y. C., first prize, Edwin Forrest, Pilot No. 2, second; sloops, Coming, E. Y. C., first prize, Tartar second; second class, schooners, Vanitas, B. Y. C., first prize, Enigma, Bn. Y. C., second; centre board sloops, Clytic, E. Y. C., first prize, Eva, B. Y. C., second; keel sloops, Gael, S. B. Y. C., first prize, Lothe second; third class, centre boards, Wanderer, D. Y. C., first prize, Mabel, D. Y. C., second, Queen Mab, B. Y. C., third; keels, Volante, D. Y. C., first prize, Sunbeam, D. Y. C., second, Fearless, Bn. Y. C., third.

July 5th, at Wilmington; Car. Y. C. regatta. Little Walter first prize, Ripple second, Rosa third.

July 5th, regatta at Savannah. Georgie first class, Hattie Hull second class, Maggie third class, winners.

July 5th, regatta at San Francisco. Carrie Hayward wins.

July 6th, regatta at Newport. Annie M. first prize, Dick second, Sapho third.

July 7th, at Beverly; B. Y. C. first regular regatta. First class, Spray first prize, Fanchon second prize and pennant; second class, Ibis first prize and pennant, Curlew second; third class, Tulip first prize and pennant, Avis second.

July 7th, at Beaufort, Beau. Y. C. regatta. Sunny Side wins.

July 8th, at Gloucester; D. R. Y. C. regatta. First class, Willie Klintz first prize, Wm. H. Clymer, second; second class, Ida May, first prize, Chas. Abel second; third class, Robinson, first prize, Millie Keyser second; first class double end boats, John Bragan first prize, Florence second; second class double end boats, James Hagen first prize, Little Charlie second; first class skiffs, Louise first prize, Myers second; second class, Wm. Eckenbriess first prize, Wm. Taylor second; special class, H. O'Neal first prize, Saule second; Delaware River yachts, Bianca first prize, Adelphi second; sloops, Stella first prize, Eliza second.

July 8th, at South Boston; S. B. Y. C. second championship regatta. First class, centre boards, Eva; keels, Starlight, win for second time and take the championship; second class, centre boards, Posey wins, tieing Mabel; keels, Unknown wins.

July 10th, at Dorchester; D. Y. C. second championship regatta. First class, centreboards, Lillie wins, tieing Eva; second class, Wanderer wins, tieing Mabel; third class, Bristol wins; fourth class, Rocket wins, tieing Tulip; keels, first class, Mariquita wins, tieing Lidie; second class, Macduff wins.

July 12th, regatta at Albany. C. B. Knowles wins.

July 13th, regatta at Cape May. Schooner Madeleine and sloop Vin-dex win.

July 15th, at Genesee; G. Y. C. regatta. Seth Green wins.

July 17th, regatta at Bayonne. Argonanta wins.

July 19th, at Beverly; B. Y. C. regatta for prizes presented by Wm. Solier, Esq. Eva first class, Ibis second class, and Tulip third class, win.

July 22d, at New York; M. Y. C. regatta. J. M. Sawyer first class, Oriole second class, and Skip Jack third class, win.

July 24th, regatta at San Francisco. Freda wins schooner prize, and Gazelle sloop prize.

July 24th, regatta at Duxbury. Count first class, Die Lorelei second class, and Otto third class, win.

July 24th, regatta at Isle of Shoals. First class (race a total failure); second class sloops, centre boards, Shadon, E. Y. C., first prize, Magic, L. Y. C., second; keels, Tartar, of Boston, first prize, Mariquita, D. Y. C., second; schooners, Vanitas, B. Y. C., first prize, Sparkle, P. Y. C., second.

July 24th, regatta at Chicago. Zoe first prize, Lucy second, Annie Louise Carey third.

July 25th, at Greenport; Bk. Y. C. regatta for sloops. Sadie first class, and Schemer second class, win.

July 26th, at New York; H. R. Y. C. regatta. First class cabin sloops, W. H. Hamilton; open sloops, Carrie S.; second class, Andrew Blessing, winners.

July 26th, at Detroit; I. Y. C. regatta. Third class, Collins first prize, Mattie second.

July 31, at San Francisco; S. F. Y. C. regatta. Schooners, first class, Freda; sloops, first class, Gazelle; second class, Virgin, winners.

July 31st, Isles of Shoals match. America beats Resolute, N. Y. Y. C.

August 2d, Isles of Shoals match. America beats Resolute, N. Y. Y. C.

August 2d, at Nahant; B. Y. C. second regular regatta. First class, Eva first prize and pennant, Waif second; second class, Water Lily first prize and pennant, Ibis second; third class, Tulip first prize and pennant, Virginia second prize.

August 4th, regatta at Newburg. First class, Fidget, C. H. Y. C., first prize; Journeymen, C. Y. C., second prize; second class, Mary Emma, D. Y. C., first prize; Fidget, New York, second prize.

August 4th, race at Newport. E. O. Matthews wins.

August 4th, regatta at Sea Cliff. Anna wins.

August 6th, at New Hamburg; match for champion pennant of the C. H. Y. C. Mary Emma beats Fidget.

August 6th, at Quincy; Q. Y. C. first championship regatta. Lena first class, Mabel second class, Red Lion third class, and Annie fourth class, win first prizes; Florence first class, Flora second class, Jennie third class, and Lightfoot fourth class, win second prizes.

August 7th, at Haverhill; H. Y. C. regatta. Waverley wins.

August 7th, at South Boston; S. B. Y. C. championship regatta for second class. Unknown wins prize for keels; Queen Mab wins in centre boards, tieing with Posey and Mabel.

July 19th, regatta on Shrewsbury River. First class, Edward Minturn first prize, Claudine second; second class, Frank first prize, Eliza second; cats, Florence first prize, Ocean Spray second.

August 12th, Washington match. Witch of the Wave beats the Mary Jane.

August 13th, regatta at Oshkosh. First class, Niobe first prize, Myra Bell second; second class, White Cap first prize.

August 13th, at Newport; N. Y. Y. C. regatta for Commodore's cups. Schooner Clio and sloop Windward win.

August 14th, at Swampscott; B. Y. C. third annual regatta. First class, Queen Mab first prize and pennant, tieing with Fanchon and Eva for the pennant, Ariel second; second class, Water Lily first prize and pennant; third class, Tulip first prize and pennant, Virginia second.

August 17th, match at New Orleans. Adela beats Cayuga.

August 17th at Newport; N. Y. Y. C. regatta for Vice Commodore cups. Schooners, Rambler first class, Restless second class; sloops, Vision first class, Genia second class, winners.

August 13th, at Newport, N. Y. Y. C. regatta for Bennett cups. Schooner Mohawk and sloop Vision win.

August 18th, at Gowanus Bay; L. I. Y. C. regatta. Reveille first class, Joe Saunders second class, and Four Brothers third class, win.

August 19th, match at Newport. Annie M. beats Annie B. Case.

August 19th, at Newport; War. Y. C. regatta. Dolly wins.

August 20th, regatta at Oak Bluffs. Schooner Alice, of Providence, and sloop Maggie B., Bk. Y. C., wins; cats, Luella first prize, with and without allowance, Sea View second.

August 21st, at Quincy; Q. Y. C. championship regatta. Nettie first class, Mabel second class, winning cup; Edith third class, Annie fourth class, winning cup; second prizes, Lena first class, Flora second class, Jennie third class, Lightfoot fourth class.

August 21st, regatta at Duxbury. Pollywog first class, Wanderer second class, and Nina Foster third class, win.

August 22d, at Halifax; R. H. Y. C. first class race for the Governor General's medal. Squirrel wins.

August 23d, at South Boston; S. B. Y. C. second class centre board regatta. Tie to be sailed off. Posey wins.

August 24th, at New York; L. I. Y. C. regatta. Joe Saunders wins.

August 24th, at Portland; P. Y. C. third class match. Rival beats Mist.

August 24th, match at New York. Three Brothers beats Aunt Jerusha.

August 24th, regatta in Buzzard's Bay. First class, Ariel first prize, Ione second; second class not decided.

August 26th, match at Flushing. J. P. Midgeley beats Minnie A.

August 26th, at Haverhill; H. Y. C. first class regatta. Waverley first prize, Eva second prize, Princess third prize.

August 28th, at Portland; P. Y. C. match for second class. Georgie beats Cisco.

August 26th, regatta at Sands Point. First class, Gracie first prize; second class, Mary Emma first prize, Fidget second.

August 28th, at Halifax; R. H. Y. C. regatta. Squirrel first class, and Cloud, or Xiphias, second class, win; third class undecided.

August 28th, at Swampscott; B. Y. C. fourth regular regatta. First prizes, Eva first class, Ibis second class, Avis third class; second prizes, Water Lily second class, Virginia third class; pennants, Eva first class, holding it; Ibis second class, tieing with Water Lily.

August 28th, at Chicago; Ch. Y. C. regatta. First class, Frolic first prize, Zephyr second prize, Annie Louise Carey third prize; second class, Lulu first prize, Lucy second prize, Lincoln third prize.

September 1st, match at Fire Island. Windward, N. Y. Y. C., beats Wayward, no club, and Annie.

September 1st, regatta at South Boston. Syzyg first class, and Nellie second class, win.

September 2d, at Boston; Bn. Y. C. regatta. First class, no race; second class, Eva first prize, Magic second prize; third class, Wanderer first prize, Queen Mab second prize.

September 3d, at Quincy; Q. Y. C. third championship regatta. First class, Nettie wins, taking the cup, Indian second prize; second class, Secret second prize; third class, Lily wins, tieing with Red Lion and Edith.

September 4th, at Dorchester; D. Y. C. championship regatta. Lillie first class centre board, Mariquita first class keels, Rocket fourth class centre board, win for the second time and take the cups; Fannie second class centre board, wins, tieing with Wanderer and Mabel; Ruby second class, keel, wins, tieing with Macduff, and Water Witch third class centre board, wins, tieing with Bristol.

September 4th, at Hamilton; Hm. Y. C. regatta. Ina wins.

September 4th, at New Rochelle; N. R. Y. C. regatta. Sloops, Susie S. first class, Mary Emma second class; cats, Lurline first class, Fidget second class, Susie third class, winners.

September 6th, at Toronto; R. C. Y. C. regatta. Surprise second class, wins.

September 7th, at Toronto; R. C. Y. C. regatta. Race for championship, etc., Annie Cuthbert wins; race for Prince of Wales' cup, Oriole wins; race for Commodore's challenge cups, first prize for centre board, Oriole; for keels, Geraldine; Brunette second prize.

September 7th, race at Jersey City. Ella first class, Only Daughter second class, Aunt Jerusha third class, win.

September 9th, at Swampscott; R. Y. C. sixth regatta for second class pennant. Ibis wins.

September 9th, regatta at Cedar Point. Isabel, of Westport, wins.

September 11th, at Burlington; Bur. Y. C. regatta. Ina first prize, Dauntless second, Lady Standley third.

November 11th, regatta at Niagara. Ina first prize, Brunette second, Oriole third.

September 13th, at Boston; B. H. Y. C. regatta. Schooners, Annie M. first prize, Vesper second; sloops, centre board, Napoleon; keels, Quimper, winners.

September 13th, regatta at Coburg. First class, Lady Standly first prize, Annie Cuthbert second; second class, Surprise first prize, Nioma second.

September 14th, at Charlotte; G. Y. C. regatta for second class. Ocean Wave wins.

September 15th, at Charlotte; G. Y. C. regatta for first class. Ina wins.

September 15th, match at New York. Madeleine, N. Y. Y. C., beats Mohawk, N. Y. Y. C.

September 15th, at New Hamburg; C. H. Y. C. regatta. Le Roy first class, Freaks second class, and Blunt third class, win.

September 16th, at Swampscott; E. Y. C. regatta. First class schooner Halcyon, and second class sloop Shadow win.

September 20th, at Dorchester; D. Y. C. fifth regatta. Centre boards, Eva first class, Fanny second, Water Witch third, and Virginia fourth, win; keels, Volante first prize, Sunbeam second.

September 20th, regatta at Southport. Isabel first class, and Mary second class, win.

September 24th, regatta at Belleville. First class, Ina first prize, Lady Standly second, Dauntless third; second class, Leo first prize, Enid second, Katie Gray third; third class, Sunbury first prize, Troubler second.

September 21st, at Williamsburg; W. Y. C. regatta. Victress first class, Endeavor second class, and Rossina third class, win.

September 23d, regatta at Jersey City. Ella first class, Alice second class, and Aunt Jerusha third class, win.

September 23th, at New York; A. Y. C. regatta for small yachts. Vanita wins.

September 27th, at Little Bayside; Q. C. Y. C. regatta. First class, Octopexara first prize; second class, Journeymen first prize, Eleanor second; third class, Rosina first prize; prize for best corrected time of any Queens county yacht, Gracie.

September 27th, regatta at New York for championship of Staten Island and Sound. Chemann first prize, Annie C. second.

September 30th, at New York; N. Y. Y. C. regatta for Commodore's cups. Schooners, Atalanta first class, Comet second; sloops, Sadie second class, winners.

October 2d, at New York; S. Y. C. ladies regatta. Schooners, Idler; sloops, Addie V. first class, Alert second class, winners.

October 2d, at New York; Bk. Y. C. regatta. Schooners, Comet; sloops, Undine first class, Lizzie L. second, Victoria third, winners.

October 6th, match at New York. Estelle N. Y. Y. C., beats Resolute, N. Y. Y. C.

ICE BOATING.—The fine fleet of ice yachts at New Hamburg, Poughkeepsie and other points on the Hudson river, are being put in order for the winter campaign. Probably the most interesting event of the season will be the regatta for the Challenge Ice Yacht Pennant of America, now held by the New Hamburg Ice Boat Club, and which is open for competition to any Ice Yacht Club in America and Europe. We are indebted to Mr. Irving Grinnell, Commodore of the New Hamburg Club, for the following list of yachts in the club and the regattas arranged for the coming winter:

First class—measuring 350 square feet of canvas and over.		
Name.	Owner.	Area of sails.
Bertie.	G. C. Lawson.	434
Phantom.	P. A. Mesier Van Wyck.	366½
Quickstep.	Wm. Leroy.	429
Zephyr.	J. R. Lawson.	478
Zero.	S. W. Johnson and P. Leroy.	462½
Zig Zag.	J. Leroy and H. Millard.	431
Flying Cloud.	Irving Grinnell.	620
Second Class—whose area of sail is less than 350 square feet.		
Magie.	J. E. Losee.	185
Paul.	J. Grinnell.	210
Qui Vive.	Chas. Leroy.	292½
Whiff.	J. Grinnell.	306

In addition to the above, at least two new boats will be added to the club, both belonging to Commodore Grinnell. One is for exhibition at the Centennial; spreads 316 feet of canvas; is finished in the most thorough and handsome manner, and will be sent on to Philadelphia in the Spring. The other new boat is cat rigged, an experiment in ice yachting, tried for the first time by the Commodore last season, but in a very crude manner. This year the new cat rigged ice yacht has been built in such a manner that great speed and perfect control is confidently looked for by her owner.

There are 12 active members or boat owners, and 14 non-active members.

The following races are to come off this season:

1. The Regular Annual Club Regatta. Two prizes in first-class; two prizes in second-class.
2. The Regular Annual Regatta for non-active members. Two prizes also in the first-class; two prizes also in the second class.

The above is a race especially for the benefit of non-active boat owners, in which all the non-active members draw by lot the several boats of the fleet, and boats so chosen are represented pro-tem by the respective non-active members so drawing them, and the prizes are to be awarded to the non-active members representing pro-tem the winning boats. This is a new order of regatta, and produces much satisfaction among those members of the club who are not fortunate enough to be owners themselves.

3. A regatta by boats of the first-class for the beautiful silk pennant presented to the club last season by ex Commodore Kidd, of the Brooklyn Yacht Club, and which is a challenge flag to be sailed for only by the first-class boats in the club.

4. A regatta by boats of the second-class for the silk club signal also presented by Commodore Kidd, which is also a challenge flag to be sailed for only by the second class boats of the club.

5. A regatta between the New Hamburg Club and Poughkeepsie Club, for a flag held by the latter, called the Ladies' Pennant, open to a challenge from any club on the Hudson. The New Hamburg Club sent a challenge to the Poughkeepsie Club to sail for said flag last winter, but owing to the shortness of the ice yachting season, although the challenge was accepted, the race did not take place, but will undoubtedly occur this season.

In addition to all the before mentioned regattas, the New Hamburg Club now holds and offers for competition to all ice yacht clubs in any part of the world a magnificent silk pennant, known as the "Ice Yacht Challenge Pennant of America," the conditions of which I enclose for your perusal.

The greatest speed in any of last year's regattas was in the regular annual regatta of the New Hamburg Club, when the winning boat made the twelve miles of the course in 26½ minutes. It must be borne in mind, however, that in a race to a mark boat and return, half the distance must almost always be sailed over against the wind, when the speed of an ice boat is at least one-third less than when running with the wind three-fourths free, so that unless there be a straight-away race the time made in a regatta can hardly ever equal that frequently made in running from point to point on the river on some favorable day.

The officers of the New Hamburg Club are as follows: Commodore, Irving Grinnell; Secretary, P. A. Mesier Van Wyck; Treasurer, Jas. R. Lawson; Measurer, Charles Leroy.

The first regular meeting of the club takes place on Monday next, when a Regatta Committee will be appointed, and other arrangements made for the contests of the coming season.

The prospects of a good season are favorable. The upper Hudson is already frozen; the water here is very cold and freezes easily for so early in the season, and one heavy snow storm, followed by another cold snap like the last, will close the river here. It is rarely, however, that the season fairly opens before Christmas, though four inches of new black ice will carry the largest ice yacht.

There are quite a number of ice yachts up the river near Athens and Albany, but we believe there is no club formed up there, though one may be organized this winter.

THE CENTENNIAL REGATTA.—The circulars and invitations for the "Centennial Regatta" are now ready for distribution, and Secretaries of all rowing clubs are requested to send their addresses as soon as possible to the Secretary of the Regatta Committee, Jonathan Gillingham, that he may be able to forward the circulars to proper parties.

ORANGE CULTURE IN FLORIDA.—If oranges are not gold-apples, and the groves of Florida a new Hesperides, there are indications that the culture of this fruit is coming to be very profitable. A Palatka paper mentions that Dummitt's grove, which only cost \$1,000 per annum, yielded last year 600,000 oranges, for which the proprietor received \$11,000; and that, with proper care, it would give from \$50,000 to \$75,000 yearly. H. L. Hart's grove, at Palatka, yields him an income of \$15,000 to \$20,000 per annum. Arthur Ginn's grove, at Meltonville, of 1,100 trees, pays him \$12,000 to \$15,000 yearly, and is worth \$100,000. Mr. DeBarry, of New York, has a grove near Enterprise of 20,000 trees. Mr. Charles S. Brown, of New York, has one opposite Palatka of 1,200 trees. It will be strange if the handsome profits of the business do not stimulate the culture of a fruit which is always sure of a near and ready market.

Furs and Trapping.

TRAPPING IN NORTHERN MISSISSIPPI.

November, 1875.

EDITOR FOREST AND STREAM:—

Having some friends living on the Coldwater River, Tunica county, Miss., we accepted their welcome invitation to spend the Winter with them and enjoy some sport with trap and gun. Expecting to make trapping our principal sport, we accordingly took along with us a fair complement of "Newhouse" No. 1 and 2 traps, added to which we took also a good shot gun and Winchester rifle.

Within the last few years many of the once good trapping grounds of Wisconsin, Minnesota and Northern Iowa have been so thoroughly trapped out as to no longer pay the expert of the trap, and consequently many yearly make their way southward in small boats, seldom stopping until far below St. Louis, where, in the extreme southeast part of Missouri and northeast Kansas, and parts of North Mississippi, otter, coon, mink and wild cat abound, and in some sections beaver are quite plenty.

The Coldwater is a deep, narrow, sluggish river, running south through the eastern part of Tunica county, parallel with and some fifteen miles from the Mississippi. On the east of the Coldwater, through parts of Tunica and Panola counties, runs a line of bluffs, along the foot of which the wolves frequently gallop and give tongue to their melodious howl. Ducks are plenty the early part of the Winter, and geese and brant frequently find their way in from the "Father of Waters" and become easy prey to a good sportsman from behind a thick clump of switch cane. Frequently on either side of the river, back from one hundred to five hundred yards, are to be found cypress "brakes"—i. e., ponds of water from one to five feet deep, encircled by great cypress trees, among which grow up innumerable cypress "knees." These "brakes" are fine places to trap in, being nightly frequented by most of the fur-bearing animals in the neighborhood. The day following our arrival at Hudson's Ferry we took a light skiff, and putting some traps into it, stepped in and pulled down opposite a long lake, about a mile below, where, fastening the skiff, we packed our traps back some four hundred yards to the lake. We soon found "sign" of otter, and getting a forked stick drove it into the ground through the ring of the trap chain, and set a No. 2 double spring trap in the otter's path, some three feet or more from where he came out of the water, taking care to sprinkle the place well with water for several feet around to take away all scent, for the otter's sense of smell is very acute. We passed on around the lake, setting occasionally a small trap for mink or coon; but seeing no more "sign" of otter, we returned from whence we came. The following day we again visited the lake, but only found two coons; but on the second day, on going to our double spring trap, we were pleased to find a large otter jingling at the chain, which we soon killed and skinned without splitting, to be afterwards stretched on a thin board five feet long and seven inches wide at one end, tapering to six inches at the smaller end, with the tail drawn over the end and tacked on the opposite end. In stretching all hides that are cased, we insert a smooth stick under the skin from one end to the other, which, on being withdrawn when the hide is dry, will permit of the pelt being easily pulled off the board. We visited some six or eight "brakes" during our stay on Coldwater, and in most of them had good success with beaver, otter and coon. Mink are scarce in this section, and muskrat are almost unknown to many of the residents, and we have thus far only killed three. We will give some further account of the beaver and their habits which, here, can be studied to good advantage. Their paths from the river bank often led us to discover new ponds and "brakes," where often the first thing that would meet our sight would be the identical "Beaver house," as described and pictured years ago in some old Natural History. These habitations look like a massive pile of mud and sticks. They are from four to five feet high, and will readily bear the weight of a man. One day our curiosity led us to take along an old axe and with it we cut a square hole into the top of one of these houses large enough to admit our bodies. The top was from twelve to fifteen inches through, and inside, raised some six inches above the level of the water, was the floor, through which was a single entrance from the water beneath to admit the beaver and allow them to bring an occasional supply of willow branches and bark. The house that we examined was large enough on the inside to admit of an upright sitting posture. Beavers frequently use hollow cypress trees for the purpose of laying in during the day, instead of building a house. We caught three all in one trap and in one tree, by cutting a hole in the tree and setting the trap on their landing inside, and arranging a sliding pole to drown them by in deep water. We kept the hole well darkened during the day. Beaver are plentier in Northern Mississippi than in Arkansas. We know of one trapper who caught ninety-eight in one Winter, in Horn Lake, Miss.

TYRAN.

Answers To Correspondents.

No Notice Taken of Anonymous Communications.

C., Taunton.—In regard to targets, address Mr. Conlin, or the proprietors of the Creedmoor Junior Range, No. 260 Broadway, N. Y.

WEASEL, Norristown.—W. H. Brummitt, of Pontiac, Michigan, has twenty-five or thirty ferrets. Perhaps you can buy them of him.

BROOKS, Stamford.—Be kind enough to send your present address to this office, as we can perhaps arrange the Florida party to your satisfaction.

FLORIDA.—If the gentleman who wished to purchase a shot gun for two German friends going to Florida, will call at this office we can show him a first class weapon for sale at half price.

SENECA, Syracuse.—I have a five shot revolver, muzzle loader, made by Allen & Wheelock. Can I get it altered to a breech loader, and if so, where? Ans. Yes; D. Kirkwood, Boston, or Clark & Snider, Baltimore.

MADISON, Madison, Wis.—Will you inform me whether the Western Gun Works, of Chicago, is a reliable firm or not? Ans. The Great Western Gun Works are located at Pittsburgh, Penn., and are considered reliable.

F. R., Randolph, Mass.—Can you tell me the name of the Secretary of the new rifle association forming in Boston? Ans. Address Dr. Hazleton or C. A. Sawyer, Boston Rifle Club, care of the Messrs. Remington, 146 Tremont street, Boston.

BOSTON.—Please give dimensions of Conlin's target. Ans. Total diameter, 6½ inches; bullseye, 1½; from middle of bullseye to the centre ring, 1½; from centre of bullseye to inner, 2 5 16; from centre of bullseye to line of outer, 2½. We mail you a target.

H. B., Providence, R. I.—Will you tell me where the Rob Roy canoe is made in this country, and the probable cost of one? Ans. William Byles, Harlem; J. Everson, Greenpoint; and Mr. Jarvis, Watkins, N. Y. Cost from \$100 to \$180, the latter rigged with sails, etc.

A. F. D., Philadelphia.—I have a pointer pup, seven months old, and on the 21st of November he swallowed a silver half dollar. Please give me your opinion what will become of the half dollar. Ans. If the half dollar was pure silver it was probably passed within six days from the time he swallowed it. If it was a counterfeit he may have tried to pass it without success.

PERDRIX, St. Louis.—Is there a fixed rule to determine the position of a centreboard, as to distance from stern or bow? Ans. The centreboard of your boat should be one third of its length, and the centre of the trunk should be six inches forward of the centre of the keel. Will the wild rice of Minnesota grow as far south as Tennessee, and how is it to be planted? Ans. Certainly; it grows naturally in Indiana. Write to W. H. Holabird, of Valparaiso, if you wish to get it. For modes of planting, etc., see FOREST AND STREAM, Vol. IV., page 39.

JOSELYN, Charleston.—What is the difference between a bowline and a bow-line? Ans. A bow-line is any line run from the bows of a vessel in warping or making her fast, in contradistinction to stern fasts and breast lines (that is, lines from amidships); but a bowline is either a knot, of which there are three kinds, the bowline, the running bowline, and bowline-on-a-bight, or a small line used to haul the weather leech of a sail out when close on the wind. Something like the difference between a facsimile and a sick family—you see not much for sound, but a good deal for sense.

SECRETARY, Ithaca, N. Y.—1. Can forest lands be had in the vicinity of Indian River, Florida, on the homestead act? Ans. We do not know; address Florida *Agriculturist*, Jacksonville. 2. Is there good fishing and hunting throughout the year in Eastern Florida? Ans. One or the other. 3. Can Northerners live in the 24th latitude during the Summer months without injury to health? Ans. Certainly. 4. If a person has rheumatism, would the climate of Florida be for or against him. Ans. Depends upon the locality; some parts of Florida are very unhealthy, and others quite the reverse.

FRANK, East Liverpool, Ohio.—1. How can brass shells be cleaned without using any hard substance in scraping them inside? 2. My dog has been almost blind ever since he had the distemper. His eyes are large, and have a glassy look, and when in the field he cannot see me if over forty yards away. What is the remedy? Ans. 1. Metallic shells may be cleaned with turpentine and a stiff brush; but we have found shells to work best when not very clean, as they hold the wad in its place better, and shoot as well. 2. Try a drop or two of molasses in your dog's eyes occasionally.

H. S., Washington, D. C.—1. Please inform me of the best authority on the breeding and raising of black and tan terriers. 2. I have a black and tan terrier bitch, six months old, weighing only four pounds, and wish to have a good litter of pups from her. Do you know any one in Washington who has a good dog of the same size, and of pure breed? Ans. 1. A work was published in England some years since entitled "Turton on the Terrier." It has long been out of print, but by application to some second hand book dealer in London a copy might be picked up. 2. We do not know of such a dog there. Perhaps some of our readers can inform us.

AUGUSTIN, Pittsburgh.—Would it be advisable for me to have my setter pup broken this season? He is now six months old, and I see by your paper that many dogs are working finely in the field at that age. My idea was to housebreak him myself, and have him broken next season, commencing on ruffed grouse about September 1st. Would you advise having him broken by a professional dog breaker or by an amateur (a friend of mine), who could break him alone? Ans. Your pup should be housebroken, and worked moderately on game this season. If the amateur you speak of has skill, and will give the youngster proper attention, it would be as well to place him in his hands.

FLUSHING, New York.—Will you be kind enough to tell me what one of William English's canoes, Peterborough, Ont., will cost delivered in New York? His price for No. 2 is \$25; is that gold or currency, and what will be the best way to have it shipped so as to save expense? Can a sail be used, and will it carry two persons and their baggage? Ans. About \$50 currency delivered in New York, freight and duty included. Ship via Port Hope, Canada, and Charlotte Harbor (if boats are running) to New York Central Railroad. A neat triangular sail is made for use in these canoes, if desired, costing \$5 additional.

T. and L. R., New York.—Please let us know how to get to Florida for \$15. Ans. Pay as far as your money will go, and work your passage the rest of the way. 2. Can two men feed themselves by hunting, fishing, and eating fruit from the groves without going to the necessity of buying food? Ans. Certainly; the Indians do it, and so do some of the "poor whites." 3. What is the price of powder and shot in Florida? Ans. Any possible advance sellers can get on prices here. 4. Will the inhabitants buy the skins of animals, or trade them for powder, shot, caps, or food? Ans. Oh, yes! The natives will trade anything under the sun. They even brag on skinning the Yankees every Winter.

X., Rochester, N. Y.—1. Can umbilical hernia on a dog be cured? I have a setter puppy four months old that has it. 2. I wish to try the new worm remedy—areca nut—spoken of in FOREST AND STREAM. Where can it be obtained? Ans. 1. We have had several cases of hernia in our own kennel, but could not effect a cure in consequence of the difficulty in using anything in the nature of a truss. In cases of umbilical hernia, if the patient is tractable, or if a muzzle is used to prevent interference, a pad might be applied, by aid of a bandage, with some prospect of success. It would, however, require care and great patience. 2. Have mailed to you some powdered areca nut, with directions for its use. It is the best known remedy for worms in dogs.

A discount of twenty-five per cent. allowed for five copies and upwards.

Advertising Rates.

In regular advertising columns, nonpareil type, 12 lines to the inch, 25 cents per line. Advertisements on outside page, 40 cents per line. Reading notices, 50 cents per line. Advertisements in double column 25 per cent. extra. Where advertisements are inserted over 1 month, a discount of 10 per cent. will be made; over three months, 20 per cent; over six months, 30 per cent.

NEW YORK, THURSDAY, DECEMBER 16, 1875.

To Correspondents.

All communications whatever, whether relating to business or literary correspondence, must be addressed to THE FOREST AND STREAM PUBLISHING COMPANY. Personal or private letters of course excepted.

All communications intended for publication must be accompanied with real name, as a guaranty of good faith. Names will not be published if objection be made. No anonymous contributions will be regarded.

Articles relating to any topic within the scope of this paper are solicited. We cannot promise to return rejected manuscripts.

Secretaries of Clubs and Associations are urged to favor us with brief notes of their movements and transactions, as it is the aim of this paper to become a medium of useful and reliable information between gentlemen sportsmen from one end of the country to the other; and they will find our columns a desirable medium for advertising announcements.

The Publishers of FOREST AND STREAM aim to merit and secure the patronage and countenance of that portion of the community whose refined intelligence enables them to properly appreciate and enjoy all that is beautiful in Nature. It will pander to no depraved tastes, nor pervert the legitimate sports of land and water to those base uses which always tend to make them unpopular with the virtuous and good. No advertisement or business notice of an immoral character will be received on any terms; and nothing will be admitted to any department of the paper that may not be read with propriety in the home circle.

We cannot be responsible for the dereliction of the mail service, if money remitted to us is lost.

Advertisements should be sent in by Saturday of each week, if possible.

CHARLES HALLOCK, Editor.

WILLIAM C. HARRIS, Business Manager.

BASE BALL.

AMENDING THE RULES OF THE GAME FOR 1876.

THOUGH the existing code of playing rules governing the professional clubs is as nearly complete as it well can be, still the experience of the past season has shown that in the practical working of some of the sections a revision is necessary, especially in regard to an equalizing of the powers of the attack and defense as represented by the pitching and batting. It has been plainly shown by the play of last season that the pitcher, by the existing rules governing his movements in the delivery of the ball, has too great an advantage over the batsman, inasmuch as the former is permitted by the rules to deliver nine wide balls—balls out of fair reach of the batsman—before he can be punished by inflicting the penalty of giving the batsman a base on called balls; whereas, the batsman is allowed but three fair balls before he can be given out on called strikes. In other words, the batsman has to strike at every fair ball delivered to him, while the pitcher can deliver three unfair balls before even one "ball" can be called on him. This is manifestly unjust, and it is proposed to amend the rules so as to limit the pitcher to a delivery of but six unfair balls, by calling a "ball" on every second unfair ball delivered, and to extend the batsman's powers by allowing him to let one fair ball pass him before a "strike" can be called, by requiring him to strike at the second fair ball which passes him, instead of the first as now.

Another amendment which is favored by prominent professionals is that which proposes to allow a base runner to return to the base he leaves when a foul ball is struck without being put out. As the rule now works it punishes a base runner very unjustly. By way of illustrating the point we will quote an example of the play in question: A batsman makes a fine hit, on which he easily earns his first base—that is, makes his base without giving a possible chance to be put out. The next batsman then takes his stand, and hitting a ground ball close to the foul ball line, starts for his base, thinking the ball fair, as does the base runner, who attempts to reach his second base. The umpire calls "foul," on which the batsman leisurely returns to his position, while the base runner finds the ball—first held by the pitcher and then by the first baseman—at the base on his return, and, of course, has to retire from being put out. Now, it will be plainly seen that the skillful batsman who has earned his base is unjustly punished by the act of the poor batsman in hitting a foul ball. The rule in this case should allow the baseman to return to his

base without being put out. It is sufficient that he cannot make a base on a foul ball without his being doubly punished by being put out.

Another proposed amendment referring to foul balls is the one which will allow the base runner to run a base on a foul fly catch, just as he does on a fair fly catch. At present while a base runner on third base can leave his base and run home on a fair hit ball caught on the fly, the moment the ball is settled in the hands of the fielder, such base runner cannot leave his base on a similar catch of a high foul ball until the ball is held by the pitcher. There is no reason why such a distinction should be made. It may be said that the amendment will lead to fielders making more efforts to catch foul balls on the bound than on the fly, as the latter catch will hold base runners to their bases; but this is not a just conclusion, for the very uncertainty of the rebound of a foul ball obliges fielders to do their best to take all such balls on the fly. Moreover, the majority of high foul balls are such as the catcher and the first and third basemen generally attend to, and under such circumstances it would be almost impossible for a base runner to make home base from third, or third from second, his only chance being to run from first to second; besides which, the amendment would afford more opportunities for points on play than fielders are at present aware of.

It is proposed to take the rubber out of the ball, and to have its color red instead of white. While no change in the size and weight of the ball is needed or desirable, the removal of the rubber of it will ensure a deader ball than some which were used in the championship arena last year, and the amendment will be a desirable one. As regards the color of the cover, there can be but one opinion on that question, as the change from white to red, or some dark color, is very desirable. For the first two or three innings of a game on a bright sunshiny day it is difficult to judge the white ball for a catch while it is high in the air, the color—or lack of color rather—making it dazzling to the eyes. For fifty years past red has been the color of the cricket ball, and it has been found to be the best for fielding purposes. In base ball a red ball can not only be seen better by the fielder, but also by the batsman and catcher when coming from the hands of the pitcher. There is absolutely nothing to commend a white ball, while there is everything in favor of a red one.

THE FOREST AND STREAM INTERCOLLEGIATE CHALLENGE PLATE.

ON the editorial page of the last issue of the FOREST AND STREAM (December 9th) appeared an article advocating College Rifle Matches. Since its publication we have been more than gratified by the notice taken of this subject, first suggested by us, and would particularly call attention to an able article advocating Collegiate Rifle Matches, published in the New York Evening Post, of December 10th, from which we have quoted. Believing that the ground is already perfectly prepared, Harvard and Middletown having their rifle organizations, and other universities and colleges throughout the country being anxious to join the movement, the FOREST AND STREAM proposes to offer a grand prize to be awarded to a team at an Intercollegiate Rifle Match to be held during the Centennial celebration in 1876. The conditions which we think will be best adapted to such a match, we will state in full, explaining the reasons which dictate them.

1. The prize to be called the FOREST AND STREAM Intercollegiate Challenge Plate.
2. To be shot for by teams of not less than twelve, composed of undergraduates from any regularly chartered university or college in the United States.
3. The distances to be 200 and 500 yards; seven shots at each distance, with two sighting shots; position, standing at 200 yards, any at 500 yards, but the head of the man to be towards the target.
4. Weapon, any military rifle, in actual use in the United States Army, or in the National Guard of the State to which the college team belongs.
5. Members of such collegiate teams must have been matriculated in their university or college at least six months prior to the match.
6. The prize to be awarded to the team making the highest score. This prize to be subsequently shot for by the members thereof at such time and place as they shall decide upon, and the prize to be finally awarded and to belong to the member of the winning team making the highest score.
7. The Intercollegiate Match for the FOREST AND STREAM Intercollegiate Challenge Plate to be shot as one of the Centennial Matches of the National Rifle Association, and at such time and place as they shall prescribe.

We will now enter somewhat into detail in regard to stipulations under which the FOREST AND STREAM Intercollegiate Challenge Plate is to be contested for. A team of twelve will better develop the shooting ability and training of a collegiate organization, and will allow their marksmanship to be compared with the teams of the National Guard and also with those of Oxford and Cambridge in England. A team composed of twelve could not rely for success on two or three crack shots, who might bring up the average of the less skillful men. In team shooting, the good average of every man is more desirable than the brilliant shooting of one or more individuals. The distances 200 and 500 yards, we insist upon as better within the scope of useful practice. The 200 yard range will develop off-hand shooting, so necessary in the school of the soldier. The 500 yard, "any position," save that the head of the marksman must be towards the target, while allowing admirable practice to be made, is a military position. As to the weapons, which must either be the United States Army rifle or those in use by the National Guard of the

State to which the collegiate team belongs; the reason for this will be found just and conclusive. There are many young men in our universities and colleges who would not have the means of equipping their teams with any other weapons than those indicated by us. Our clause determining the absolute character of the arm, will preclude the "special arms," which are often brought with military team matches, which are not strictly, as we understand it, military arms in common use.

The advantage of a final disposition of the FOREST AND STREAM Intercollegiate Challenge Plate is manifest. While a team would have a perfect right to coach its individual members, and take all legitimate advantages due to training when the final result was to be determined, it is probable that the very best marksman in all our colleges would get the prize. We believe that all the universities and colleges throughout the United States, not only the students, but the Principals and Professors will take a direct interest in this match. With many of the leading collegiate seats of learning we have been already in communication, and all of them thoroughly endorse the rifle movement. The following letter sent to us from Amherst, coming from the Massachusetts Agricultural College, shows us what a strong hold rifle practice has even now among the students:—

AMHERST, December 9th, 1875.

EDITOR FOREST AND STREAM:—

In a recent issue you make some very pertinent remarks upon the desirability of our colleges taking up the practice of rifle shooting as a field sport. Allow me to say that one New England college—the Massachusetts Agricultural—has already set the example. As you well know, the military is a conspicuous feature of this institution. During the past Summer there has been rifle shooting, or target practice as a regular exercise. This has met with such general favor that recently a shooting association has been formed, from which a team of the six best shots will be chosen in the Spring to shoot with any competitors. One match has already been arranged with the Boston Institute of Technology, to come off in May next. The Creedmoor rules and targets have been adopted, and shooting will be practiced when possible during the Winter. An admission fee of \$2 is charged members, for the purchase of cartridges, etc. Some members use their own rifles, and others are supplied from the college armory. It is a very economical sport. At the Fall athletic contests the rifle came in for a share of the attention, and some very good scores were made, though I haven't the figures at hand. The prize was a handsome Hatfield revolver. It is unnecessary to repeat your remarks upon the good effects of the practice upon participants in the sport, which I fully agree with. Although this college has dropped out of the College Rowing Association, in which the Aggies won a proud name at first regatta, in the event of a College Rifle Association being formed she will not be found wanting.

LENNOX.

Though adhering to the essential points of the foregoing, which have not been hastily determined, but have occupied no small amount of careful thought on our part, we will be glad to hear any suggestions from colleges in regard to it. At some later date we will publish such regulations as to time of entries, as the National Rifle Association may suggest. We will as soon as possible give a detailed description of the FOREST AND STREAM Intercollegiate Challenge Plate, which we will endeavor to make among the handsomest trophies ever yet offered in the United States.

PROTECTION OF GAME.

THE regular monthly meeting of the New York Association for the Protection of Game was held on Monday evening at the residence of Mr. D. H. Lawrence, No. 6 West Fiftieth street, Mr. Royal Phelps, President, in the chair. The President read a large number of communications from all parts of the Union, some asking for copies of the Society's by-laws and general information on the subject of the preservation of game, and suggesting uniform game laws in every State, and others bearing testimony to the noble labors of the New York Association, not only in protecting game within its own jurisdiction, but in preventing the sale of game and fish brought from other States in the close season. Mr. Hallock called the attention of the Association to the wholesale netting and snaring of game birds in New England and New Brunswick during the close season; the shooting of deer in the Adirondacks, of which general complaint was made by the residents, and the killing and shipping of venison from Quebec. The sense of the meeting seemed to be that if the sporting gentlemen in the Adirondacks and other localities who complained of the wholesale destruction of game were too apathetic to organize, or hire a game constable to prevent it, they were undeserving of any sympathy from the New York Association, which had done so much already. Mr. C. Whitehead, Counsel of the Association, as Chairman of the Committee on Amending the Game Laws, reported an act to be submitted to the next Legislature amending the existing Game Laws so as to prohibit the killing, having in possession, or shooting, between sunset and sunrise by the aid of lights or lanterns, any wild duck or wild goose between the 1st of May and the 1st of September, under a penalty of \$5 for each bird; the killing of wood duck between the 1st of January and the 1st of September; the killing of English and other varieties of snipe between the 1st of January and the 1st of July; restoring the law in regard to quail by keeping the season closed, as originally, from the 1st of January to the 20th of October, under a penalty of \$25 for each bird, and the snaring or trapping of grouse or quail under a similar penalty. Mr. Whitehead also reported progress in the suit for the recovery of the judgment against marketman Racey. The report was adopted, and a vote of thanks tendered the committee. Mr. Phelps requested the members of the Association to use their utmost endeavors to co-operate with him in enforcing the law for the preservation of game during the ensuing season, and congratulated them on the flattering recognition accorded their labors in that direction by the sporting gentlemen in other States. The meeting then adjourned.—Times.

ONTARIO PROVINCIAL ASSOCIATION FOR PROTECTING FISH AND GAME.—Last Summer the managing editor of this paper exerted his influence through personal interviews with Dr. Jas. Ross, Stephen Heward, J. Maughan, Clifton Shears, of Toronto, C. A. Post, John Bertram, Maj. Bolton, John Ludgate of Peterboro, the editors of the *Mail and Globe*, and other gentlemen of the Province of Ontario, as well as by letter to many, to induce the organization of a Provincial Game Association similar in character to our State Association. Whatever weight these efforts may have had, modesty forbids us to enquire; certain it is, however, that such an association has just been formed, with every promise of the support of the public. Some ninety gentlemen met last week at the Rossin House in Toronto, when a committee composed of Messrs. Marsh, Coyne, Shears, Heward, and Boswell was appointed to draft resolutions and report to a general meeting at the earliest possible day.

This movement is but the precursor of similar action in the other Provinces, and the succeeding natural step will be the organization of a Dominion Sportsmen's Association similar in its composition and objects to our NATIONAL SPORTSMEN'S ASSOCIATION. We have labored earnestly to bring about this consummation, for we appreciate the grave importance of systematic correspondence and cooperation between the United States and Canada in this matter of game protection; resting as much upon the enforcement of salutary laws in years to come, as in their present or immediate enactment. In no way can this co-operation be secured so completely as by the formation of a Dominion Protective Association, exercising jurisdiction over the local clubs. These two separate bodies, existing in separate countries, but acting in accord and conjunction with each other, will be most potent; for it is possible that by the time the lately constituted committees of the "International Association" have completed their draft of the desired game laws, the Dominion and subordinate associations will be fully organized and prepared to act in accordance with their provisions, if enacted by the several Legislatures of the two countries, as it is hoped they may be.

Of the laxity of protective laws in Michigan an esteemed correspondent writes:—

In this State (Michigan) the laws are violated in the most open and flagrant manner, and I am yet to hear of a single prosecution. Those who are bound together by associations are not infrequently among the most open violators. Members of the Detroit clubs haunt the flats and Monroe marshes during the close season, slaughtering game, and no attention is paid to the fact further than the daily papers extol the prowess of the sportsman (?). The laws regarding the spearing of fish are violated daily in the Traverse region, and that, too, by prosecuting attorneys, State officers, and others whose duty it is to prevent such abuses. In New York things seem to be as bad. Oneida Lake is poached by all kinds of traps and nets, in direct violation of the existing laws, but no attention is paid to it as far as I can learn. Ruffed grouse that were snared are shipped every season on the lines of railway. I have seen circulars from houses in New York city, marked private and confidential, instructing how to snare, pack and ship, and to mark as butter, poultry, etc., and in almost every instance the station agents know what the packages are and how procured. The game constable is almost always inefficient, and will be until the office is held by other means than by political favor. I am sorry to see that "sportsmen's associations" are proving themselves associations for the promotion of trap shooting rather than the protection of game. Look at the State association that met at Oswego a little more than a year ago. What was done toward improving the existing laws? But there was a big trap shoot; just that and nothing more. The wholesale trapping, with no close season, is rapidly depleting the great lakes of the finer fish, and if thorough measures are not established whitefish and trout will be as scarce as the salmon in Lake Ontario. Localities where these fish were abundant five years since are now almost barren, and the numbers of such increase yearly.

Why will not the people awaken to these facts, and why will not sportsmen set the example? It is time for deeds, not words. A gentleman whom I met in Oswego said to me, "I would prosecute my own brother or father, even if I had to pay their fine, if they violated the tip end of the northeast corner of the game law." And I believe he would, and wish that such were the rule instead of the exception. Canada enforces her laws, but the States seem to enact such only for the purpose of breaking them.

DEER PARK, Maryland, December 6th, 1875.

EDITOR FOREST AND STREAM:—

I have noticed in the Northern papers several times lately brief paragraphs on the scarcity of small birds. I think that the subject is worthy of investigation, for it seems to be the cry throughout the Northern and Middle States. I know that in my own neighborhood there is not a snow bird, sparrow, robin, or any other of the cheerful little visitors that congregate around our doors in the winter. An occasional blue jay or a small woodpecker are the only birds seen save those that are strictly game.

The subject of new game laws has at last been taken up, and our country papers are doing all they can for it, but, as is the case everywhere, the strongest opponents it has are the *cidevant* sportsmen, who think that all they need to merit the name—i. e., that of sportsman—is a breech loader, a dog, a vivid imagination, and self-conceit proportionate to their own ignorance. We have several of this kind of bagpipers, and to give you an idea of their "airs" I will give you the gist of a conversation held with the greatest of them some time since. We had been talking about the International Society for the Protection of Game and Fish. "It is all a humbug," said he; "the fellows who get up anything of that kind are of no account whatever; all they want is for you to keep the birds from being killed by any one else, and when the law is up they'll come to help you slaughter it all in a few days. I know all about 'em; you can't tell me anything in regard to such kinds of associations. Besides that, you can't stop people from killing game whenever they wish, and it is all nonsense to think you can," &c., &c. Such are the arguments that are used against us and our efforts by men who, from their position, ought to know better.

OBITUARY.—Mr. Charles Bell of the United States Fish Commission, died of typhoid fever at Waukegan, Ill., on the 4th inst. He was a young fish culturist of rare promise; had been at the fish farm at Honeoye Falls since its establishment; was a graduate of the Academy at Brockport; and had for some years been studying medicine. He was engaged this season by the Commission in the work with the shad, and was on his way to Michigan to distribute salmon when he was taken sick. His age was twenty-two.

FOX HUNTING.

THE hunting of foxes with dogs, in this section of the country at least, appears, for the time being, to have subsided; none the less necessary, however, is it that the foxes should be kept down if we would have any game left, more particularly the ruffed grouse, which appears to be a dainty much affected by master fox, probably because of his being a "convenient" bird, not like the Irishman's turkey, "a little too much for one and not quite enough for two." However frightful it may sound to our English cousins, it is necessary, in the absence of more legitimate means of hunting them, that we should shoot our foxes, and the mode of doing so in Massachusetts is described in the following letters:—

BROCKLINE, Mass., November 26th, 1875.

EDITOR FOREST AND STREAM:—

I attended an old fashioned fox hunt a short time ago on Cape Cod, near Hyannis—no horses, but with an excellent pack of dogs (six of them) and six men. We take stands behind rocks, trees, bushes, or anything that will conceal a man, and the dogs are started into the brush. The place is called Great Island, is owned by one of our prominent Boston merchants, and is connected with the main land by a narrow neck of sand; and by stationing one person, or even by hanging up an overcoat or blanket at the point where the neck joins the island, the foxes are kept from going off, and as the island is only about a mile long and half as wide, the fox is sure to give some one a shot sooner or later. This time we bagged three in about two hours—one very fine old dog fox and two of this year's cubs. The two cubs came out of the woods almost immediately, and were killed, but the old one gave the dogs a splendid run of about an hour before he came within range, and then I had the honor of rolling him over with a charge of No. 1 shot, at about forty yards. This, of course, is not quite as high toned sport as your New Jersey fox hunters expected to have last week, but the results are much more satisfactory. On the cape foxes are considered as vermin, for they do a great deal of damage to the hen roosts.

LAWRENCE.

"One moment the noise indicated that he was coming nearer, the next the sound became fainter and fainter, and almost died out; finally, he took a direction towards a road which passed on the north side of the swamp. One of our party, Fred S., who is an enthusiastic sportsman and an excellent shot, after stationing us in a favorable place, with the injunction to keep our eyes peeled, started for the road. Upon reaching this he perceived by the fresh prints in the muddy road that it was not a rabbit, but a fox that the dog was chasing. Knowing that the fox would probably come back this road again, he hastened forward and finding a suitable place he crept into the bushes. Hardly had he concealed himself when the noise of the dog showed that the fox was approaching. Pretty soon he saw him coming down the road like a streak of lightning; as he went past him he gave him one barrel, intending to put in the other if he did not kill him. Not seeing him go by an open space he concluded that his shot had met with success, and on running out he found him kicking his last in the road. The peculiar circumstances connected with this hunt are not often met with in this vicinity. The time of day—as the early morn is considered the best time; the short time that passed between the starting of the fox and his being shot, it being about an hour; the size of shot used, being No. 7, as we did not expect to see anything larger than a rabbit, and had no other size. The fox was a red one, of medium size, would weigh about twelve pounds, and was killed within fifteen miles of Boston.

"D."

BROMFIELD HOUSE, Boston, December 5th, 1875.

EDITOR FOREST AND STREAM:—

On reference to our market price list during the season now past, we readily prove that the ruffed grouse in the Eastern States has been unusually scarce. In our own experience we have not found one fourth the birds we bagged last year. This difference offers a good ground for speculation as to the real causes, which, if discovered, might be of much importance to assist us in framing our protective laws. Although accounted for in various ways, it is a fact worthy of notice that in our ramblings of last winter we found the tracks of the prowling fox unusually prevalent. Imagine an area of a square mile, inhabited by a dozen grouse scattered about, and perhaps only one fox occupying the same ground. When the excessive cold nights of our winter forces them from their usual perches in the trees to seek a warm bed in the snow, what shall protect those helpless birds from falling a prey to their natural enemy.

Now the fox, having no natural enemy more formidable than the domestic hen, can be dealt with only with the dog and gun, and the sport involves so much real work and a natural tact and cunning, educated by a certain amount of experience, that few sportsmen are willing to devote their leisure days to it. Even if successful, and the "brush" is borne home in triumph, he has no choice offering for the table of himself or friend. The sportsman hunts the game bird for pleasure, the market shooter hunts him for profit. The fox hunts him to suck his warm blood and feast on his white and delicate flesh. So we all go hunting the game bird, and every "hoodlum" (FOREST AND STREAM) gets in a shot and occasionally kills his game, while the fox is left to prowl by night, stealing the unsuspecting chicken from the shadow of our dwelling, or surprising the beautiful ruffed grouse in his hiding place beneath the curtain of snow. After skillfully dodging the guns of a neighborhood all through the autumn he escapes us, but we find his feathers and bones where he died so ingloriously.

I am gratified to see that a move is being made in New York tending to increase the interest in, and popularity of, fox hunting, and hope it will extend over New England. Although the good old English style is impossible here, we can bring out a brace of good hounds and listen to them as they scud across the valley, and when they circle the adjacent hill and their deep voices ring out mellow and rich in the morning air, then is the time to bound forward and take the stand. And I would suggest, in conjunction with our protective laws, which have already done so much good, that our Legislature be urged to offer an appropriate bounty for every fox killed in season, thus increasing the attraction for the business gunner.

M.

Apropos of fox hunting comes the following letter from our Philadelphia correspondent regarding paper hunts. This is a sport which can be followed everywhere and by everyone, either on foot or on horseback, and we look forward to the day when it shall be part of the regular pastimes of our large schools and colleges, as it is now in England:—

PHILADELPHIA, November 29th, 1875.

EDITOR FOREST AND STREAM:—

I am glad to see that the fox hunt, of which you gave such an interesting account in the last number of the FOREST AND STREAM, has proved that Mr. Fairchild was mistaken when, in his letter of the 15th instant, he predicted that it would be a hunt without riders. He certainly would have no difficulty in mustering a "score of respectable cross country riders" in this city. To be sure, the number has greatly increased in the recent past. Fox hunting, steeple chasing, hurdle racing, and "hare and hounds," are sports that are looking up in this quarter, and are worth looking up in all the other quarters. Mr. Ellicott Fisher's "hare and hounds at Wakefield," a few weeks ago, was a decided success, and brought out some fine riders and some fine riding. The "paper hunt" was instituted not because the riders feared the rough riding, or because

there are no foxes, but just for the fun of the thing. There will be another meet on Saturday next, an account of which I will send you.

On Thanksgiving day a number of guests assembled at Spring Bank, and indulged themselves in tilting at a ring and hurdle racing over hurdles two feet six inches, three feet six inches, and a brush hurdle three feet eight inches. The riders numbered about forty, among whom the ladies not only claimed a good share in the numbers, but in the exhibition of skill in horsemanship.

Our hunters are not reduced to the necessity of chasing "bagmen," for foxes are not at all scarce, even in the immediate vicinity of the city. There will be a number of hunts in the coming few weeks, and of some of them you will hear.

SCULLS.

CHOKE BORES.

The writer of the first of the following letters, if he reads the article from the *Illustrated Sporting and Dramatic News*, will find that the writer only claimed that Mr. Dougall had so improved on the choke bore system as to prevent the balling or clubbing of the shot on the target. With regard to the second letter, we suggest that if our correspondent, in his challenge, had offered to test his gun against the other for something besides quality of material and beauty of finish, it would have been a little more business like. The fact is, gentlemen, your favorite makers are both good, and as for the choke bore, it will be forgotten before your guns are finally laid upon the shelf. By-the-by, we wonder if it was with a choke bore that Lord Henry Lennox shot Captain Montague at a partridge drive the other day. Col. Bodine, the eminent rifle shot and member of the American Rifle Team, has just informed us that he has one of Mr. Dougall's modified choke bores that for pattern and penetration is something remarkable:—

JACKSON, Miss., November 30th, 1875.

EDITOR FOREST AND STREAM:—

If the figures in your article on "choke bores," copied from *London Illustrated Sporting and Dramatic News* are not erroneous, then that paper knows nothing about choke bores. I presume No. 6 shot was used, about 280 pellets to the ounce; the pattern, shot after shot, averaged from 190 to 200 pellets on a twenty inch (say twenty inch) circle at forty yards. If that is not choke bore, what is it? Was the shot balled or clubbed, and where, then, does Mr. Dougall's discovery come in, that "choke bores, pure and simple, are a failure?" I make three points:—1. Mr. Dougall never made average targets as above. 2. Mr. Dougall never will. 3. The *Illustrated Sporting and Dramatic News* did not see it, either.

GEO. C. EYRICH.

NEW YORK, December 5th, 1875

EDITOR FOREST AND STREAM:—

In your issue of December 2d appears an article from "Gloan" on choke bores. I have read it carefully. It seems to me to be written for two purposes—first, to give his favorite maker another puff, and second, to assail the reputation of an eminent gunmaker, whose guns need no puffing, because they speak for themselves. This he does by insinuations, and by a misstatement of facts. He says "Mr. Pape was not entitled to the cup as the inventor of choke boring; that the only reason he secured it was because he was the only claimant in England." Can it be possible that "Gloan" does not know that what he states is not a fact? If Mr. Pape was the only claimant, why should the *Field* wait two months before deciding who was entitled to it? Again, he says, "What gunmaker ever heard, until lately, that Pape was boring extraordinary shooting guns." Let me ask "Gloan" if he ever heard of the gun trials of 1858, 1859, and 1866? Does he not know that Mr. Pape won all these trials; and that in the 1875 trial, out of a class of sixty-eight guns, three out of the best six were made by Pape? What position did Mr. Dougall get in these trials? In the 1866 trial his gun was fifteenth in a class of thirty-two guns, and in the last trial he took the very worst position, being out shot by small makers that were never heard of in America before. If Mr. Dougall makes such extraordinary shooting guns, why did he not accept Mr. Pape's offer to shoot six guns against his for any sum he might name. "Gloan" says, "Every one knows that he is opposed to excessive choke boring," and at the same time he tells us that his last gun has exceeded all that was done by the winner in the last trial. Surely he don't wish us to believe that a gun that will do this is a "modified choke?"

Now, sir, I have owned one, and seen a number of Dougall's guns, and in my humble opinion they are not the equal of Mr. Pape's. In fact, I have so much confidence in the Pape gun I now own that I make "Gloan" the following proposition: I will place my gun in the hands of Col. Skinner, of the *Turf, Field and Farm*, or the editor of your paper, and let "Gloan" send on the finest Dougall he has. Let these gentlemen, or some one they may select, decide between the guns on the following points—first, quality of material; second, beauty of workmanship. Furthermore, I will shoot my gun against any 12 gauge sporting bored Dougall gun he has in his possession for any amount, he may name, or for reputation.

E. L.

NORFOLK, Va., December 10th, 1875.

EDITOR FOREST AND STREAM:—

As promised in my last, and requested by you, I propose giving my experience with my Scott choke bore gun on quail. For open ground it is perfection, and in the field I rarely miss getting two birds from a covey, finding no trouble in killing them clean at forty and fifty yards; but as most of our shooting at quail is in thick brush, to which they invariably resort when flushed, the choke bore then proves a failure, as the shooting has to be done so quickly that the bird is either torn to pieces or missed altogether, more frequently the latter. So far as my experience goes, I much prefer a modified choke for general shooting, and while a poor shot will at first miss frequently with such a gun, I am satisfied it will in less than one season improve his shooting far more than it would be by a "scatter gun," and am rather surprised that you, who insist so strongly on every fish being killed scientifically, should wish the birds killed by accident. In my estimation they occupy a much higher position on the game list, and, although I am only an ordinary shot, I am perfectly willing for all to escape on which I fail to hold a correct aim.

Do not understand me as advocating choke bores for "double close shooting," as I think such guns must invariably prove to be useless toys in the hands of their owners, except for trap shooting, or an occasional long shot at a stationary object. Mine shoots far enough for me, as I recently killed a black duck with No. 2 shot at least, one hundred yards off, and with No. 4 or 5 shot I consider fifty to sixty yards an easy range. As a further evidence of its hard shooting power, in October I killed a fawn weighing one hundred pounds, with No. 8 shot, running straight from me at about twenty to twenty-five yards. I hope you will not be so severe on choke bores in the future.

ALFRED.

ST. LOUIS, December 11th, 1875.

EDITOR FOREST AND STREAM:—

When "Fair Play" wrote his article on Greener's guns he believed all he wrote. Since then he has gotten one of the guns, and he still believes it the best gun he has seen. As Mr. Pape desires to shoot in this country, his own against Mr. Greener's gun, "Fair Play" accepts his proposal, and will leave here to-night with his gun, and will meet Mr. Pape in your office some day next week and arrange a little private gun trial, to take place the day of meeting or the next day, the result in full to be published in your paper. This arrangement will not cost Mr. Pape a dollar, and "Fair Play" is sincere in saying he hopes if Mr. Pape's gun is the

better, it will win. Mr. Greener's agent is away from the city now, and knows nothing of my acceptance of Mr. Pape's proposal to shoot, as your paper only arrived one hour ago.

J. W. MUNSON.

[We regret that Mr. Pape should have sailed for England on Saturday last, and will, therefore, be unable to meet our correspondent in person. We fancy, however, that a representative Pape gun can be obtained from either our friend "Warwick" or E. L., who writes above, and that the trial may come off.—Ed.]

ENGLISH TURBOT IN AMERICAN WATERS.—The following letter from Prof. Gill of the Smithsonian Institute, qualifies a statement which appeared in our last issue to the effect that the English turbot already exist in our waters. To be corrected by such unquestionable authority as Prof. Gill is alone a sufficient compensation (to us) for the appearance of an error; and in view of its having brought forth a communication from the learned gentleman, we do not regret the occurrence. We need enlightenment on such points. Prof. Baird, the United States Commissioner of Fisheries, also writes us that the statement indicates a poor opinion of the sagacity and industry of American Naturalists to suppose that in the interval between the visit of Admiral Coffin nearly seventy years since and the present time, no second specimen has been obtained. We fancy that the key note to our own mistake is to be found in the closing paragraph of Professor Gill's letter, in which the necessity of a more thorough system of nomenclature is argued. The fish to which we alluded as being a turbot, so called by the Banks fishermen and dealers, is, it appears, the *Reinhardtius Hippoglossoides*, a fish more closely allied to the halibut family than any other. Poor old Admiral Coffin may also be pardoned for his mistake, as seventy years since the able corps of scientific gentlemen who now devote themselves to the study and elucidation of Natural History were not in existence, and the gallant sailor was necessarily deprived of those aids to knowledge enjoyed by later generations:—

SMITHSONIAN INSTITUTION,
WASHINGTON, D. C., December 9th, 1875.

EDITOR FOREST AND STREAM:—

In your issue of December 6th, apropos of English soles and turbot in market, you indicated that turbot already abound in our waters, and refer to statements of Col. F. G. Skinner and Admiral Coffin in confirmation of their occurrence. The statement of the Admiral, which serves as the basis of the paragraph, is, however, erroneous. The English turbot (*Rhombus maximus*) is not, and never has been, found in our waters. It is true that a species somewhat related to the turbot (the *Lophossetta maculata*) is found here, and is variously known under the names "spotted turbot," "window pane," "sand flounder," "water flounder," and "day light." This, however, is an almost worthless fish, and is but distantly related to the turbot of Europe. No one acquainted with the two species would think of identifying this fish with the turbot of England. A fish has, however, within a few years past, been brought to the New York market and sold under the name "turbot," which is nearly equal in its table qualities to the true turbot of the Old World. Specimens sent by Mr. Blackford show that it is the *Reinhardtius hippoglossoides*—a very different fish, belonging even to a different sub-family, and is more closely related to the halibut than any other species. This fish is not caught further southward than the banks of Newfoundland (from which it is brought with the frozen herring), and until lately was not known from any waters except from those of Southern Greenland. I am well aware that the statement is often made that English turbot are caught in our waters; but you may rest assured that there is no basis in fact for the assertion. You or your correspondents may at any time see specimens of all the species of flat fishes of our waters and those of England, such as soles, turbot, etc., in the Smithsonian Museum, and a view of them side by side, will show the great difference between the species called by the same name.

It may be remarked, also, that we have a relation (*Achirus lineatus*) to the English sole (*Solea vulgaris*) in our waters, but it is a "poor relation," very rarely brought to market, and a couple of the popular names applied to it (hog-choker and cover-clip) will serve to show the contempt in which it is held.

The contrary names which have been applied to our fishes and the errors which they induce, sufficiently show the need for the institution of a committee of nomenclature, such as has been lately appointed by the International Association for the Protection of Fish and Game. I believe that the English turbot and sole are occasionally imported and sold in our markets, and it is probable that one of our other flatfishes is also sold sometimes under the name turbot; but those facts do not, of course, affect the position that neither of those species are found in our waters. Respectfully yours, THEO. GILL.

SIR GEORGE GORE'S LUGGAGE.—A Norfolk (Virginia) correspondent writes us:—"Some of the natives here, as well as the 'intelligent contraband' don't understand why in the world 'sum white folks has so much baggage to travel wid.' Lord Gore sent his baggage down from Boston on the steamer a few days since. The pile was quite extensive, as you can imagine from the freight bill of eighty dollars. There were five servants, or attendants. A darkey happened to see the pile as it landed, and asked to see the head man. Approaching him he said—

"Boss.—I wants a situation."

"Well what can you do, can you cook?"

"No Boss, but I can drive; I could drive the tent wagon, or I could drive the animal wagon."

The darkey was very much demoralized when he was informed that it was not that kind of show."

OUT DOOR EXERCISE.—That open air and plenty of exercise constitute the best medicine, is shown in the case of our correspondent, Wm. H. Holabird, of Indiana, the well known inventor and dealer in Holabird's hunting suits. He writes us in this happy strain:—

"A few years ago I was nearly broken down. Close confinement in business sixteen hours a day, had reduced me to a mere nothing in flesh, and the common remark was, 'how miserable you look.' I removed to this city and commenced a life of freedom. With my dog and gun I visited nearly every portion of our country. I became familiar with every pond and lake, and in fact began a new study, that of nature. I have no regular physician now, don't need any. I take my tonic in the woods and on the prairie. God's pure air, with healthy exercise, takes the place of drugs and bitters."

NOTES OF A SPORTSMAN ABROAD.

LONDON, November 29, 1875.

EDITOR FOREST AND STREAM:—

Besides the direful effect of the excessive rains of late in floods and inundations, it has caused a sad damper to field sports of all kinds. It has fallen hardest of all, perhaps, on the fox hunting set. The fields are miry fetlock deep, the streams are swollen to rivers, the rivers to floods, and the whole country is heavy with too much of water for those who love to follow the hounds. One must be well mounted indeed to hold his place to the end of a half hour's hunt after a straightaway running pack, through mud and mire, over ditch and river—which is more poetry than the hunters find in their sport just now, I imagine. In spite of these great drawbacks, however, this sport is carried on with great spirit in most parts of the country. Foxes are said to be unusually plentiful and never ran away with straighter necks. I saw yesterday several fox hunters hurrying to a meet down in Hampshire county. Their boots and breeches were spotless in the purity of their unblemished black and white, a condition I fancy they will not retain at the end of a thirty-minute gallop over the miry country.

The wet weather has affected the shooting in a less degree, but greatly to its discomfort. Pheasants and partridges are said to be very plentiful this year. The poultry-ers' shops overflow with an abundance and variety of game birds, including ptarmigan and sickle-bill curlew. I notice that woodcock are scarce, however, and cannot learn that there is any really good woodcock shooting in the south of England. What a noble bird the English woodcock is, so much larger and heavier than our own. But I do not think in color of plumage it equals our bird in its rich and vivid shades of brown. In the "notes and queries" of one of the sportsmen's journals a learned discussion is going on whether a woodcock ever gets caught or entangled—"embarrassed" is the stilted phrase one writer uses—on being flushed in thick covert. Can any one who has had even one season's woodcock shooting doubt this common occurrence? I can recall several instances of it in my own experience this season. In one case I doubt if the bird could have extricated itself without the aid of a few shot. In the fright and confusion of rising in thick covert these birds often get "hung up" long enough to give the gunner a resting mark, which is sometimes quite as perplexing as a quartering one.

The shooting season seems to bring, this year, more than its usual chapter of gun accidents, one of the most distressing of them being the loss of an eye by Capt. Montague, by a careless shot from the gun of Hon. Mr. Stanley. It is only surprising there are not more of such accidents in this country, where so many nincompoops of Winkles go into the field, whose "guns will go off of their own accord, you know," as that sportive gent's had a way of doing. The "choke bore" controversy is carried on with undiminished spirit to the absorption of a large space in the sporting papers, without presenting any new features. Talking with an experienced sportsman yesterday, the choke bore was heartily approved by him for pheasant and grouse shooting. It is generally conceded, however, that it is best to have only one barrel choked—the one usually shot last.

Accounts of the sport enjoyed by the Prince of Wales in India, telegraphed in minutest detail are printed in the *Times*, and doubtless read with a relish by every proud Briton. I overheard two loyal subjects talking about it—"And did he really stick a pig, though?" "Yes; it said pig sticking, I'm sure; and that must be fine sport." The Prince has yet to come to Cincinnati! DRUID.

SNEDECOR'S ART GALLERY.—Last week Mr. John Snedecor opened to the public a most charming addition to his popular Art Gallery at 176 Fifth Avenue. This apartment is lighted from above and is so well adapted to the exhibition of paintings, that each one is shown to the best advantage—a requisite quite necessary in some cases. There are a number of remarkable pictures of Fish in the collection now on view, to which we wish to call the special attention of our readers, a very large proportion of whom are not only enthusiastic anglers but gentlemen of wealth. These pictures of fish, as we have termed them, are really marvellous studies from nature of the most striking character, and include not only the originals from the easel of that already celebrated artist, Gurdon Trumbull, of Hartford, Ct., but chromos of the same, so perfectly transcribed as to be scarcely distinguished from them except by the nicest perception of connoisseurs. It was our purpose to write a critical description of these paintings this week, but a pressure upon our space compels us to defer it. We will merely state here that the chromos were executed in Paris at a great expense to Mr. Snedecor, and are for sale at a figure which places them within reach of persons of moderate means. We urge our readers to pay a visit to the gallery and examine for themselves, and thus determine whether our enthusiasm and recommendation are well placed.

—A well-known contributor to *Porter's Spirit* in former days, writing from Mississippi, under date of Dec. 6th, says:—

"I took *Porter's Spirit* from its commencement to its close, that is, up to the death of Porter. I have seen nothing that was its equal until I subscribed for *FOREST AND STREAM*. Long may you wave."

FLORIDA TRAVEL.—Three boats run from Jacksonville to Palatka and return each day, viz.: the Hampton, General Sedgwick and one of Brock's Line. Besides, the steamer City Point, from Charleston runs there every Monday, the Dictator, every Thursday, the Lizzie Baker, from Savannah, every Thursday; the Lollie Boy, every Monday, for Palatka and Dunn's Lake; the Tuskawilla, Thursday, for Palatka and Silver Springs, on the Ocklawaha; the Hattie Barker, for Palatka and Mellonville on Tuesday's and Friday's; the Volusia for Palatka and Enterprise every Saturday. All the intermediate landings along the route are touched at by these boats.

—If any person has a friend who is fond of the dog and gun, he can scarcely make him a more acceptable Christmas present than one of Holabird's Hunting Suits, which are advertised in our columns. It will suit him perfectly. Remember this.

☞ No one contemplating a visit to Florida should go there without buying a copy of "CAMP LIFE IN FLORIDA." It will save him a great deal of inconvenience and expense. For sale by all dealers and at this office. Price, \$1.50.

The Rifle.

MARKSMAN'S BADGE.—In the Fifth Regiment twenty-nine men, of whom seven were commissioned officers and twenty-two non-commissioned officers and privates, are entitled to wear the marksman's badge. In the Eighty-fourth Regiment twenty-six men, eight of whom are commissioned officers, and in the Ninety-sixth, six, of whom one is a commissioned officer.

A RUNNING DEER AT CREEDMOOR.—The Winchester Repeating Arm Company have in a very handsome manner presented the N. R. A. with all the machinery necessary for a running deer. This novel target will be in readiness this coming Spring. It will certainly add very much to the interest of Creedmoor, and will bring into play rapid firing. The repeating arm is the arm of the future, and we have wondered why, before this, some of the manufacturers of this peculiar system of weapon had not placed a running mark at Creedmoor. A new school of marksmanship will now be produced, and some of the hunting element will certainly come to the front.

—The Winchester Arms Company will introduce a novel feature into their rifle range at New Haven. A deer made of boiler iron, hung upon pivots and mounted upon wheels will run upon a track seventy-five feet long, which is to be placed upon an inclined plane. The deer being started from one end of the track will travel rapidly, with a loping motion, which will be sustained by a simple arrangement of springs. The marksman, standing at a distance, will fire at the deer while it is in motion, and passing behind trees and blinds arranged to make the hitting of it more difficult.

FAIR OF THE LADIES' DIRECTORY.—This most excellent institution, which offers to teach all respectable women free of charge, such employments as are suited to their capacity, will hold a grand fair this week at the Masonic Temple, corner of Twenty-third street and Sixth avenue. Among the many useful articles on sale will be a very fine Remington sporting rifle. This rifle will have tickets sold for it which the holders can vote with for such member of the American Rifle team whom they think most of. The gentleman with the majority of the votes will have the rifle presented to him. This same rifle has been thoroughly tested by General Dakin, and at 500 yards the following scores were made by him: 70 out of a possible 75, and 48 out of a possible 50. A personal inspection of the gun has assured us that a more perfect weapon never was made by the Remingtons.

—The fourth competition for the *Turf, Field and Farm* cups came off at Conlin's gallery, 930 Broadway on Thursday evening, 9th inst. Want of space compels us to give only the winning scores, which were as follows: Conditions—10 shots, off-hand, 110 feet, 200 yards, miniature target reduced, Wimbledon rules. First cup, highest score; second cup, score nearest 35; third cup, score nearest 25. W. B. Farwell won the first, with a score of 46; J. O. Wright, second, with a score of 35; Frank H. Lord, third, with a score of 25. The sixth contest for the *FOREST AND STREAM* badge takes place to-day at 4 o'clock P. M.

—The second weekly competition at Hellwig's gallery, No. 273 Eighth avenue, came off on the 8th inst. Prizes, a gold medal, a Remington rifle model, and a revolver. Position, lying. The following are the best scores:—

Name.	Score.	Name.	Score.
Wm. Lindsay, first prize.	47	Big Ginger.	41
A. B. Vanhousen.	45	D. L. Riggs, second prize.	40
J. Woodward.	45	Green Smith.	40
A. H. Bogardus.	44	L. C. Bruce.	39
P. Flemming.	43	F. M. Dewitt.	39
D. C. Vannett.	42	T. C. Banks.	39
F. Kessler.	42	D. L. Beckwith.	39
James Barry.	41	J. McGlensy, third prize.	30

—The rifle tournament for the benefit of St. Peter's hospital, Brooklyn, opened in a most brilliant manner at Mr. Robert H. Miley's rifle gallery, in Court street, Brooklyn, on Dec. 3d. The prizes offered were the *Turf, Field and Farm* cup, and a medal presented by Col. B. E. Valentine and Mr. Miley. The following are the best scores:—

Name.	Score.	Name.	Score.
S. Wilson.	71	C. E. Degraff.	85-16
C. E. Hoyt.	79-16	Jas. F. Hallagan.	104
John Burns.	74	J. S. Case.	104
Mayo Fulton.	82	T. J. McCabe.	104

Distance, 100 feet. Shooting every Monday and Friday evening up to January 7th.

CREEDMOOR JR. RANGE, No. 260 BROADWAY.—The opening of this range took place on the 8th of December and was numerously attended. Creedmoor Jr. range presents the peculiarity of being an underground range, and we hear the rumble of the vehicles on Broadway. The distance, 100 yards, gives full opportunity for developing accurate shooting. Very certainly if a man can make bullseyes in a gallery, he is certain to make them at Creedmoor. In fact, we are inclined to think it is a trifle more difficult to run up a good score in a gallery than on the field range. The prizes were superb. The first was a large gold badge, presented by the Union Metallic Cartridge Co., having for its centre a white and black enamel of the target.

The second prize was an elegant gold badge, with appropriate devices, and the third prize an elegant revolver. We give designs of the first and second prizes.

The following are the best scores:—

Name.	Score.	Name.	Score.
F. Backofen.....	42	W. H. DeHart.....	37
T. C. Banks.....	41	J. McGlensy.....	36
Samuel Wilson.....	40	E. W. Smith.....	36
J. H. Stearns.....	39	J. G. Fream.....	36
J. L. Marvin.....	38	W. E. Webb.....	36
J. Woodward.....	38	A. V. Canfield, Jr.....	35
F. H. Holton.....	38	H. Leslie.....	34
T. M. Henderson.....	37	Dr. J. L. Farley.....	34
J. Mahony.....	37	F. N. Dewitt.....	33
J. D. Cheever.....	37	C. H. Webb, third prize.....	33
D. L. Beckwith, second badge.....	37	W. H. Beebe.....	33

There were 43 entries in all. The subscription match was opened yesterday, Wednesday the 15th December.

—The Scottish-American Rifle Club will have a contest with the American Rifle Association at the Glen Drake range next Saturday. The distance will be at 300 and 500 yards.

INTERCOLLEGIATE RIFLE MATCHES.—We take the following from the *Evening Post* of December 10th:—

“Another feature of the Centennial exercises in this direction which is worthy of every encouragement is the proposed intercollegiate rifle match, which, like that between the States, is meant to be of annual recurrence, and for which proper trophies will doubtless be provided. Rifle shooting is not only a manly and healthful exercise, in which students may properly engage with considerable zest, but it has the advantage over all other college sports that it is equally open to all students without regard to their possession or lack of special endowments in the way of muscular strength.

“It is worthy of consideration, also, that the skill to be acquired in rifle matches and in the training which must precede them, is of actual and permanent value both to the individuals engaged in it and to the country whose military material they are; and in every way the introduction of rifle shooting in our colleges is an excellent thing, that should receive all possible encouragement during the Centennial year.”

Boston.—The rifle club in Boston are now taking their weekly practice, and will probably continue doing so as long as the weather permits. On Saturday there was quite a meeting at Spy pond, and the shooting was excellent; distance, 200 yards, ten shots. We give the leading scores:—

Name.	Score.	Name.	Score.
E. T. Osgood.....	44	W. A. Jackson.....	40
E. W. Souther.....	43	C. E. Sanborn.....	40
T. A. Lockhart.....	42	A. P. Clarke.....	40
R. Burns.....	40	E. M. Messenger.....	40

MORSEMERE.—THE SCOTTISH-AMERICAN AND THE YONKERS TEAM.—This most interesting event came off on Friday Nov. 10th, with a team of seven from each of the two associations. Captain L. Bruce acted as captain of the Scottish-Americans, and Col. Ellis acted for the Yonkers team. At the 200 yard range the Scots made 246 out of a possible 350, but the Yonkers had 12 points more, but some necessary handicapping in the first team allowed for three military rifles, somewhat lessened the total score of the Yonkers. At 500 yards the Yonkers riflemen came out very strong, and won the match cleverly. In fact the shooting was superb at the longer range. Conditions—Challenge match between teams of Scottish-American Rifle Club and Yonkers Rifle Association, teams, seven men each, ten shots each at 200 and 500 yards, with privilege of sighting shots; any rifle allowed; military weapons to be allowed seven points each; light fair; wind changeable, mostly from VII; Creedmoor targets.

YONKERS TEAM.			
Name.	200 yds.	500 yds.	Total.
Fred Sheunard.....	37	46	83
L. M. Baltard.....	37	46	83

L. C. Bruce.....	34	43	77
D. E. Vannett.....	35	42	77
W. F. Edmonstone.....	38	38	76
F. Duke*.....	34	31	65
Captain W. Lindsay.....	28	40	68
Grand total.....			541

*These three gentlemen used a Remington 50 military rifle, and were consequently allowed seven points each, according to the conditions.

It may be particularly noticeable in the above match how much stronger both sides were at 500 yards. More off hand shooting is wanted.

THE RIFLE IN WISCONSIN.—Major Fulton, in his peregrinations, seems to inoculate all he meets with the rifle fever. This leading marksman attended a turkey shoot at Higham, Wis., last week, and fully explained the method of shooting as adopted at Creedmoor. Several meetings were held with the idea of organizing systematic rifle shooting, at which Major Fulton was present, and he was tendered a vote of thanks for his valuable suggestions. The Milwaukeeans and Highamites met in friendly contest over no end of turkeys on the occasion. The distance shot was 550 feet, bullseye 13 inches, from a rest. Fully two-thirds of the shooting measured not more than 24. Mr. Hill must be considered as the champion, as he carried off thirteen turkeys.

Game Bag and Gun.

GAME IN SEASON IN DECEMBER.

Moose, <i>Alce Americamus</i> .	Wild Turkey, <i>Meleagris gallopavo</i> .
Elk or Wapiti, <i>Cervus Canadensis</i> .	Ruffed Grouse, <i>Bonasa umbellus</i> .
Red Deer, <i>Cervus Virginianus</i> .	Pinnated Grouse, <i>Cupidonia cupido</i> .
Caribou, <i>Rangifer caribou</i> .	Quail, <i>Oryz Virginianus</i> .
Hares, <i>Lepus</i> .	Wild Ducks, <i>Anatine</i> .

GAME IN MARKET.—Western game is still scarce, but the present weather, if it continues, will bring forward a plentiful supply and lower prices will rule. Ruffed grouse (partridges) are worth from \$1.12 to \$1.25 per pair; pinnated grouse (prairie chickens) \$1.40 to \$1.50 per pair; quail, \$2.50 per dozen for Western and \$3 for Long Island birds; canvas backs, \$2 per pair; red heads, \$1 to \$1.25; mallards, \$1 to \$1.25; widgeon, 75 cents to \$1; broad bills, 50 to 75 cents; brant, \$1 to \$1.50; black ducks, 75 cents to \$1; teal, scarce at 75 cents to \$1; geese, \$1 to \$1.25 each; hares, 75 cents per pair; rabbits, 50 to 60 cents; venison, 20 to 25 cents for saddle and 25 to 30 cents for steaks. At Messrs. Smith & Lewis, No. 177 Fulton Market, we saw a fine collection of the American hare (*Lepus Americanus*) and spruce partridges, all from Maine. A fine specimen of black bear, weighing 400 lbs. arrived in market from Minnesota a few days since and was secured by Mr. Wallace, the taxidermist, who also bought a black tailed deer, from the same locality.

—A friend called in our office a day or two since and informed us that in reply to a letter he had written to one of the professional gunners at Havre de Grace he was advised that he could have a day's duck shooting on the Chesapeake for forty dollars. If this is the regular charge in that region for a day's amusement we would suggest that it would be a good plan for a few New York sportsmen to buy Chesapeake Bay and its gunning privileges.

—We acknowledge the receipt of two pairs of prairie fowl in excellent order, from Jacksonville, Ill., the present of a correspondent who desires to be nameless. These frequent attentions on the part of our friends are very gratifying. They keep the wife good-natured and the cook busy.

—We received a call last week from the champion, Capt. Bogardus, who had come from the West to be present at the match between Messrs. Bennett and Van Buren. The Captain has returned home, but will be with us again in January, when he has some matches on.

—See Capt. W. A. Myers' advertisement of gunning craft for charter in North Carolina waters.

—A pigeon match between Messrs. James Gordon Bennett and Travis C. Van Buren, was shot on Wednesday last, on the grounds of Mr. Wm. P. Douglas, at Flushing Bay, L. I. The conditions of the match were: Fifty single

birds each, English rules; stakes, \$2,000 a side. Many prominent amateur pigeon shots were present, and the professionals, Capt. Bogardus, Miles Johnson, and Ira Paine were also on the ground. Capt. Bogardus handled for Mr. Bennett, and Miles Johnson for Mr. Van Buren. After the forty-fourth bird had been shot at the score stood at 27 for the latter, to 19 for Mr. Bennett, and Mr. Bennett gave up the match, there being no possibility of his winning.

—A gentleman of Philadelphia, well known, and of unquestionable veracity says.—

While shooting on the Isle of White Bay I made a most remarkable chance shot at a swan with my No. 4 gun, with 12 drachms of Hazard No. 4 powder, and 3oz. S. G. shot, the swan being killed in the air, the distance being so great that we measured it with a tape line, it being 186 yards, one shot striking it and breaking its neck. Mr. John Krider says that it is one of the most remarkable shots he has ever heard of. He is now setting it up.

C. P. T.
MASSACHUSETTS—Salem, Dec. 13th.—Last Saturday morning three of us started for the islands outside our harbor in a dory. We did not expect to come back loaded, but thought we might see something, and we did. We pulled over some fifteen miles of ground, or water and saw a good many fowl, though in small bunches and shy, such as whistlers, old squaws, sheldrake, white winged coots, gulls and loons. I noticed the guillemots and waterwitches seemed more numerous than usual. I also enjoyed quite a novelty, at least in this section, and at this time of the year, namely: the shooting of some waders—the purple sandpiper, or rock bird—which name is very appropriate, as they confine themselves mostly to rocky ledges and to those that are farthest out from shore, and as weather, &c., has to be favorable to go so far at this season, it makes the sport quite a novelty. They are gregarious. I found about sixty in one bunch, and though shooting but eight, could have taken many more, as they were quite tame. They are in excellent condition, and I am told eat well, though I shall preserve (to look at) the best of them. I have often heard of these little fellows, but never shot one before, and greatly enjoyed the privilege. There have been some fair bags of quail made since I last wrote, but sportsmen have only three days more before the season closes. Rabbits are beginning to be taken since we have had some light snow.

TEAL.
NEW YORK—Elizabethtown, Essex Co., Nov. 26th.—Game is very abundant in Pleasant Valley this season. On the 16th half a dozen deer and two bears were killed in this neighborhood. Between fifty and sixty deer have been destroyed within a few weeks past. Although these timid animals are just as wild as when found in the deep recesses of the woods, yet they have frequently, this Fall, bounded into the door-yards in the village. At such times business is entirely suspended, and the men and boys and “other dogs” engage in pursuit and capture. Elizabethtown is delightfully situated eight miles west of Lake Champlain. Few localities have surroundings more charmingly romantic. Twelve miles further west is that gem of all the Adirondack valleys—the famous Keene Flats. They are both favorite resorts of artists and people of refinement generally in the Summer months.

E. R. W.
Babylon, L. I., Dec. 11th.—During the late cold snap the Great South Bay closed in with ice very suddenly, many gunners being overtaken and kept away from home for several days. Among them were Messrs. H. C. Poppenhausen and Mr. Funke of the Central Railroad. Their boat was caught in a floe, and after drifting for some distance, became wedged. For three days the unfortunate gunners were thus detained as prisoners. However, they brought home a whole boat load of geese, brant and ducks.

NEW JERSEY—Kinsey's Ashley House, Barnegat Inlet, Dec. 12th.—Geese and brant still plenty. Joel Ridgway and S. Soper killed 3 geese, 4 brant, and 18 black ducks on the 10th. Jesse Birdsall and Weiks Conrad 12 geese same day. On Mondy, Kinsey, Ridgway, and Soper killed 14 geese, 22 brant and 12 black ducks.

B.
PENNSYLVANIA—Holidaysburg, December 7th.—The season for hunting has not been very auspicious in this section, either for birds or deer. Although the woods were thoroughly hunted, very few deer were killed. The law forbidding the use of dogs in deer hunting will have a salutary effect in pursuing game, as great was the disappointment of many in the lack of success at still hunting—a practice not in accordance with their accustomed chase through the mountains. The hard Winter here, as elsewhere, has killed off the birds, so that the brush and forest sports may be said to have been a failure. A great many have turned their attention to rabbit hunting, and are introducing beagles to aid them in what is claimed by some to be an ignoble chase. Several imported beagles have been introduced into various sections, and the mountains will be made vocal this Winter by the charm of their music.

BARKER.
VIRGINIA—Norfolk, Dec. 10th.—First ray of sunshine to-day since the 3d, and “beastly weather” we have had the past week. The carters from Back Bay, Princess Anne county, are bringing in a very fair supply of ducks, a few geese and some swans. The steamer Cygnet has a good freight of them every trip. Every week the Boston steamer brings down parties bound to Currituck. There ought to be some good boats on Currituck Sound, as these parties generally bring fine boats with them, but it is very rare that they take them back. In future ages, when the sound will have become dry land, some geologist will report the discovery of a very singular deposit of lead—not in the shape of ore, but layers of irregular pellets. Then there will be learned discussions in the scientific world as to the origin of the deposits. Took a day in the fields a short while since with a friend and had very fair sport—18 quail, 4 hares.

W. H. S.
FLORIDA—St. Augustine, Dec. 4th.—All the hotels are open, a large number of visitors and sportsmen are here, and the season has fairly commenced. Judging from appearances the rush of tourists and hunters will be unprecedented this Winter. Wild ducks predominate. Deer and wild turkeys are now plentiful, and the market for venison well kept up. The trout are biting very briskly, and those caught have been large, some weighing four pounds. Recently a party of hunters, Alonzo Hernandez and D. S. Masters, of St. Augustine, with John and Wm. Mickler, of Deigo, were hunting on Deigo plains. Mr. Hernandez, in one shot, killed ten ducks. He killed thirty in all in a

few moments, while the rest of the party also did good work. During the day they killed three deer, and struck the fresh trail of a bear, but having no suitable dogs abandoned it. The game in this region is abundant. The young sportsman, just from New York, Mr. N. Edgar, visited Anastasia Island last Friday with the famous Indian deer trailer, U-wah-ne. Three deer were started, but the island being mostly under water, they were not successfully followed. There are a number of excellent hunters among the Indians here. O. A. K.

IOWA—*Davenport, Dec. 6th.*—There has been poor shooting here this Fall—no game at all, so far. H. B. P.

INDIANA—*Valparaiso, Dec. 8th.*—Pinnated grouse (*Cupidonia cupido*) were abundant, and are still. I made several good bags over my dog, Ned, who, by the way, is one of the best in this section of country. Duck shooting was a failure. Our Kankakee marshes were full of water, and a remarkable growth of wild rice rendered it almost impossible for the shooter to reach them, or for the dog to retrieve them. Quail are not in great numbers, but sufficient to afford good sport. They were thirty days late in hatching this year, and I heartily favor a law making the close season until Nov. 1st or 15th; let it be uniform at all events. Ruffed grouse are found in all our groves and thickets, and I have thus far bagged enough to afford me several excellent dinners. Wild turkeys are reported to be more than usually plenty north of us, about ten miles, and deer shooting in the Kankakee swamps will be excellent, if the ice makes and snow falls before the close season comes on. This will not matter much to many lawless characters, who regard neither law nor reason. Any sportsmen coming this way will receive a hearty welcome. W. H. HOLABIRD.

MICHIGAN—*Birmingham, Dec. 4th.*—Game is *game* in this section. Woodcock are where the "woodbine twineth," partridge are "wild as hawks" and "scarce as hen's teeth," quail are few and far between, though some of our shooters once in a while get a fair bag. George H. Toms and J. O. Beattie bagged 7 quail and 3 partridges one day, the largest yet. If you know to a certainty where a bevy of quail are, the farmer is sure to tell you "he has not seen them since the latter part of seeding time." Turkeys are not yet heard of. Squirrels have been very plenty, as well as rabbits. We must have a game law to prohibit shooting of all and everything for five years, and then something may increase. Although our country is full of lakes, the ducks could lay without crowding in a wash-tub. J. ALLEN BIGELOW.

MINNESOTA—*Shakopee, Dec. 6th.*—Owing to the mild weather with thaws and bare ground, that has succeeded the second cold snap, with its snow and sleighing, the chances are that our deer here in the valley will pretty much escape for the balance of the season, which closes Dec. 15th.

CANADA—*Montreal, Dec. 4th.*—Mr. Cauchon brought into market this morning four magnificent cariboo which he had captured in the mountains back of Cuatrecasas Bigat. This makes eight the redoubtable hunter has already captured this season.

GATLING SMOOTH BORE FOR SNIPE.

JACKSON, Miss., November 27th, 1875.

EDITOR FOREST AND STREAM:—

I wish to say a word for the benefit of such of your readers as count birds by the hundred in a few hours' snipe shooting on Barnegat Bay and call it sport, where a man and his son killed thirty-seven robin snipe with three barrels out of one flock; to market shooters, who "turn her loose" where "she" will do most execution at birds anywhere and at all times; and for the benefit of such men as "Zack Light" last Winter, who, while on a buffalo hunt one day squatted down in a buffalo wallow (after crawling and getting a stand on a herd of buffalo) and killed seventy-four head of buffalo just where he sat in the wallow. He killed that Winter 2,300 head. "The rest of us killed about 1,200 head." (See circular of Sharps Rifle Company.) To all such men I would recommend the idea of a townsman of ours, who wrote to the Chief of Ordnance at Washington in regard to having a Gatling gun built to shoot ducks. The chief referred the gentleman to Dr. Gatling, who wrote that he had never thought about the practicability of using one of his guns for flock shooting.

Just think of it! A flock of ducks or robin snipe, partridges, or grouse annihilated with one turn of the crank. Let the grouse pack as much as they like; the more the better. The Gatling will get them. And the buffaloes! why, bless my soul, the Gatling will soon exterminate them. I tell you, sir, we will then have sport! Think of the notices you will be able to give—"Mr. S. P. Ort was at Barnegat yesterday with his No. 2 Gatling gun. He bagged 1,399 bay birds in a little while, and one turn of his crank at a flock of robin snipe brought down 301 of them; that was the best shot of the season so far. Our shootists say that bay birds are really becoming scarce."

Think what a splendid chance you will have to report about the P. O. T. Hunters club's expedition after grouse on an Illinois or Kansas prairie, twenty members, with ten Gatling guns abreast, going slowly ahead and turning "her" loose as covey after covey of chickens get up. What a bag! Bag! Pshaw! train loads of chickens. Think of the philanthropy of the thing in the way of cheap food. No more bloated aristocrats eating grouse. No, chickens for the million! No doubt those miserable grangers would be eaten up with the grasshoppers, and a few old fogies would complain that it was not sport, but rest assured that they are antiquaries with a 12-bore shot gun; men behind the times; old impracticables who must be swept aside like cobwebs and not impede the march of civilization.

I have not patented the idea, Mr. Editor. It belongs to the same gentleman who built a dam across Pearl River, with a trap attached, to catch all the fish that would go in. Said dam was swept away by the first rise, as we intend to sweep away the old foggy notions of that class of gunners calling themselves true sportsmen. Hurrah for the Gatling "sporting" gun! GEO. C. EYRICH.

PANTHERS IN VERMONT.

GRAFTON, Vt., November 29th, 1875.

EDITOR FOREST AND STREAM:—

We have in our quiet Green Mountain town a small club of gentlemen styled the Northwest Fur Company, who devote their energies to fox hunting. Their President, Mr. Leveret Phelps, informs me that their success this season has been better than usual, and that foxes are very numerous on our hills. Last week a party of six gentlemen, with dogs, from Taunton, Mass., visited us and had very fine sport, taking home with them the skins of nine foxes, one live fox, and a large showing of ruffed grouse and rabbits. Of the former our woods are full, and as we have very few local sportsmen, and the boys have never been initiated into the mysteries of snaring them, the birds have a chance to live and grow. I know of no better hunting ground for this game. Rabbits are not as plenty as they have heretofore been, which may be accounted for by the numbers of foxes. Of racoons we have numbers; one man a day or two since captured four

Our neighboring town of West Wardsboro had quite an excitement a few days since. Two men discovered the tracks of some large animal, which they supposed to be a bear, and followed them up to a small piece of woods. It being nearly night they abandoned the tracks and organized a hunt for the next day. About fifteen men and dogs the following morning surrounded the woods; three of the men took up the track through the woods, and shortly came to the remains of a hedgehog, partly eaten, and then to the bed of some large animal. The dogs which they were leading became frantic; the game was evidently close by. Soon one of the party discovered an animal in a tree near at hand, and firing his shot gun brought down a panther. He was wounded in the breast, and in the fall broke one of his shoulders. On falling, the dogs attacked him, and a lively scene ensued. The panther leaped over a fallen tree top, taking two of the dogs with him. The men came up and grasped the animal's tail, the dogs still attending to the other end of the beast, who again jumped another tree top, leaving the men on the other side still attached to the candal extremity, when one of them bethought himself of his revolver, and emptied that into him. He was finally quieted by having his throat cut with a jack knife. The animal weighed 105 pounds, and measured seven feet from tip to tip. S. W. G.

DEER HUNTING.

SUNBURY, Penn., November 29th, 1875.

EDITOR FOREST AND STREAM:—

For the benefit of those of your readers who are fond of deer hunting, I give you a brief description of a trip, from which I have just returned, to Sinnemahoning, a station on the Philadelphia and Erie Railway, up the west branch of the Susquehanna in Pennsylvania. I and two friends left Sunbury on Wednesday noon of the 17th of November, and at half past five in the afternoon were at our destination, the Sinnemahoning Hotel, Joe M. Shaffer, proprietor, a quarter of a mile from the depot at the junction of "first fork," and main stream of the Sinnemahoning, and prepared to fix up business for the morrow. We hunted six days, ran from two to five deer each day, and five deer came to grief ahead of our dogs, two of which were shot by outsiders. This is essentially a place for driving with dogs, the topography of the country being broken into narrow defiles and steep ridges.

On Monday, the 22d—for we rested on the seventh day—we went for a drive in the "Carthorse Range." Our first start resulted in a failure of any of the party securing a shot, but the second was more successful, Joe M., our host, a thorough sportsman and gentleman, detecting a fine forked buck endeavoring to sneak away from Fido, who was working up the cold track. He gave him a charge of buckshot at about sixty yards, but alas, the music of the hounds grew faintly less till lost in the dim distance. On our return at night we heard, with mingled satisfaction and disappointment that our dogs had brought the buck to water about a mile above the house and quit it, the deer crossing the river and taking the ridge on the other side. We felt sure of compelling him to go to water again the next morning where he went out; but the fates ordered otherwise, for after getting him afloat, and bringing him to the brow of the mountain, sore from a buckshot wound in his brisket, he declined to take the descent, and suddenly wheeling went straight up the ridge and back into the mountains.

We had taken out with the pack two four months old hound pups to receive their first lesson; one soon gave up, but the little black and tan fellow followed in grand style, tongueing his level best in the rear of the old dogs. After holding our stands until it became apparent that the deer was not intending to take his back track to water, rain and sleet having set in, we returned to the hotel. Dinner over, and all the dogs back but Lead, Fido, and the pup—let us christen him Ginger—"Speaker Jim," a brother of Joe M., donned his rubbers and started out to find that pup or perish in the attempt. He was back in two hours with the buck and Ginger. The dogs had brought him to bay at a place called Turtle Hole, in Grove's Run, Lead, Fido, and Ginger holding him there from the gray of morning until two in the afternoon. If you want to know the price of that pup you must ask the "Speaker." I will only say, further, that I regret that the close season is no near at hand—1st of December—as to debar any one so inclined the pleasure of a chase there this season, but there are other seasons to follow, and I wish to say, in meed of the Shaffers, that they keep a hotel in the true sense of the word for sportsmen, know their wants and requirements, and are prepared to meet them. They keep a fine pack of hounds, wagons and horses, and any one who essays their hospitality will find that he will be placed upon the best stands, where he can kill the deer himself if he knows how, with no ulterior motive of driver or placer trying to steal the shot ahead of him, and will find in Jim Batchelder a sober and indefatigable driver, who is not going to let a deer lie quietly in his bed if he is anywhere in those woods, nor will he be a great distance behind the hounds in coming in at the death. Indian Joe, a cousin, and Christopher C., familiarly known as "Lum" Shaffer, another brother, are clever fellows and good hunters, and there are others also who will vie with each other to make the trip pleasurable. On the whole, its accessibility, combined with the sport and accommodations, make it a good place to go to, and if I were in the proprietor's place I would advertise in and subscribe for FOREST AND STREAM. I have a pleasant recollection of as fine a basket of trout as I have caught in many a day, taken from Wykoff's Run, directly across from the hotel, then kept by Perkins, nine years ago, when up in that region surveying pine timber lands. There are also three or four other good streams accessible from this point. Grouse are also said to be abundant in the early season. We saw but few, owing to the fact that they are now in packs upon the mountains. I had the satisfaction of clipping one fellow's head off with my rifle, for I don't shoot buck-shot. A. F. CLAPP.

HARE SHOOTING.

NEW YORK, December 7th, 1875.

EDITOR FOREST AND STREAM:—

In your valuable paper, under date of December 2d, is an interesting article on rabbits and hares, which suggests much fun to an experienced hunter by the judicious use of a hound and shot gun. If the experienced hunter were to use a breech loading rifle instead of a shot gun, I think he would get as much game and have more sport. I have just returned from the Adirondacks, where, finding the snow too noisy for successful deer hunting, I turned my attention to the hares, and used a Smith & Wesson revolver, with a shoulder attachment, and a couple of hounds, while my guide used a shot gun. The result was one more hare for the gun than for the pistol, but half the hares killed by the gun were so mutilated that they were given to the hounds, cats, and pigs. As the shooting in the swamps is of necessity at very short range—say ten to twenty yards—it does not require a very expert marksman to put a ball through the head of a hare if it is sitting upright; and if a hare had the appearance of having a pressing engagement in the next swamp I found that the report of the pistol always induced it to stop and look about to ascertain, if possible, what was the matter, thus giving plenty of time for a careful shot, which at so short a range always proved fatal. Moral: When in a hurry, don't stop. Please explain, if you can, why the little fools stop so quickly when shot at? Unless an experienced hunter can use a shot gun better than my guide, I would suggest the substitution of a light breech loading rifle, so that his game may be fit for the table. F. G.

—Articles of agreement have been signed for a velocipede race between A. P. Messenger and W. E. Harding for \$250 a side. The race will take place at the American Institute Building, on Friday, December 17, commencing at eleven P. M., and continuing twenty-six hours. One hundred dollars of the stake money has already been deposited, and the balance will be placed in the hands of F. J. Englehardt on the 16th inst.

Billiards.

ALL SORTS.—Affidavits are the latest sensations in billiard circles. Maurice Daly took the initiatory by making one last week to the effect that he did his best to win his last match with Cyrille Dion. This was done to decide a bet of \$50 against \$10, made between Charles A. Fink and Tim Flynn, the former laying the odds that Daly would not make such affidavit. . . . Garnier won a pair of oxen at the Jewish Fair held at the Hippodrome. The ticket cost him \$5, and a butcher gave him \$350 for the steers. . . . Cyrille Dion has not decided yet whether or not he will accept Garnier's challenge. He has ten days to consider. . . . For the past week two gentlemen of this city have been strenuously endeavoring to get on a match between Slosson and Sexton, but neither player appears to be satisfied with the conditions. . . . Sexton, however, authorizes us to state that he will play Slosson for \$500, but not on a wire cushion. . . . The entries for the Tournament, at Toronto under the management of Sam'l May, will close Wednesday December 15. . . . The Rochester, N. Y., tournament has fallen through owing to the absence of some of the principal players. . . . Simon Fitzgerald on Friday night lost the first game of a series of ten for \$25 each game. His opponent is an amateur of no mean skill, and the games are half and half, three and four ball. . . . James Cusick is in charge of the Union Square Rooms, owned by the late Chris O'Connor. . . . Maurice Daly left on the 8th inst for Florida via steamer to Savannah. The trip is purely in the interest of his health, and his stay there will be governed accordingly. . . . Gotham is threatened with a tournament at fifteen-ball pool. . . . A prominent sporting man of Providence is willing to back Clarke E. Wilson against Ned Bryan of that city for \$500. The game to be fifteen-ball pool, best in twenty-one games, and played in this city. . . . Cyrille Dion and Garnier exhibited at Hoboken last week. Two games were played—four-ball 500 points, and three-ball 200 points. Garnier won both. . . . The tournament sometime since, started at the Fifth Avenue Hotel, between a number of amateurs for an elegant champion cue, valued at \$25, was completed at the Columbia Rooms. Mr. M— tied with Mr. W—, and on the play-off Mr. M— won. The various games created much excitement among the players and their friends, and the struggles to obtain possession of the trophy won on Saturday last will prove a source of great enjoyment through the winters to the parties contesting. . . . The *Billiard Cue* for December, published by H. W. Collender, contains a finely executed illustration, entitled: "Monkeys as Billiard Players." . . . An unknown player called Drew has been stirring up the New Orleans players lately. He says he is from Texas. Henry Miller took hold of him, giving the odds of discount, but finding that too heavy, went down to fifty points in 300, at which odds the Unknown captured \$25. This got Henry's blood up, and he would only play even. A match was finally made for \$75, which, after a protracted struggle, was won by Miller, with 38 points. The question now agitating the billiardists is: "Who is Drew?" . . . Albert Hoa has come into possession of \$40,000 through the decease of a relative. . . . The Union Club of this city have ordered six tables from the factory of H. W. Collender. . . . Ralph Benjamin is at Durand's room, corner of Broadway and Thirty-second street. . . . Phillip Tieman, of Cincinnati, is making arrangements for a tournament to take place in that city next month. The entries are restricted to the amateur players of Ohio, the following of whom have signified their willingness to compete: Frank Ratteman, Wm. Meyers, John Meyers, Nick Bernard, and William West. The prizes have not yet been decided on. . . . On the evening of December 8 a meeting of Philadelphia professionals was held at E. H. Nelms', where resolutions of sorrow and sympathy were passed on the death of Chris O'Connor. . . . Miggioli vs. Burleigh—At Odd Fellows Hall, New Orleans, on December 9, the long-talked of match between William Burleigh, formerly of Kalamazoo, Michigan, and Frank Miggioli (champion), of New Orleans, took place before a large and enthusiastic assemblage. The contest was for the championship of the Northwest and Southwest. The badge representing which now goes back to Chicago, where it was originally won in the tournament of last April. Henry Miller, of New Orleans, who won it at that time was subsequently challenged by Henry Rhines, of Chicago, whom he defeated on July 8. Frank Miggioli, of New Orleans was the next challenger. The game took place on September 9. Miggioli winning by a score of 500 to 354, with the small average of 5 60-88. The northwestern people selected another warrior in the person of Wm. Burleigh and despatched him to the Delta to see what he could do. Their confidence was not misplaced, as the result of this game has proven, he beating Miggioli by a majority of 135 points. Burleigh was the favorite prior to the game at the odds of \$100 to \$60, no doubt occasioned by the poor show made by Miggioli in his practice games, he having been beaten easily the night before by Schafer, 290 points in 500. Schafer credited himself with an average of 16½ and a run of 109. The following is the summary: Odd Fellows Hall, New Orleans, La., December 9, 1875. Third regular contest for the three-ball Championship of the Northwest and Southwest; the badge and \$500 a side, between Frank Miggioli (champion), of New Orleans, and Wm. Burleigh, of Chicago. Game, 500 points on a 5x10 table, with H. W. Collender cushions. Score—Burleigh, 500; Miggioli, 365. Averages—Burleigh, 9 14-54; Miggioli, 6 47-53. Best runs—Burleigh, 69; Miggioli, 33. Referee—Louis Abrams.

GRECO-ROMAN WRESTLING.—The last of these events was decided on Saturday evening at the Grand Opera House and provided one of the finest exhibitions of athletics ever witnessed in this country. The participants were Messrs. Andre Christol, whose massive yet agile form has become familiar to New Yorkers, and Professor Bauer, recently from San Francisco, in which city he has had several struggles with his present antagonist. The rounds on Saturday evening were short but displayed wonderful skill. Christol won the first fall in eight minutes, Bauer winning the second and third and the stakes, amounting to \$1,000 in twelve and twenty-five minutes respectively. The last fall was splendidly contested. Again and again they locked arms and struggled and panted, sometime one or the other being thrown completely over his antagonists head but always escaping without both his shoulders touching the ground. Finally, Christol, in making a herculean effort to hurl Bauer to the ground, was carried with him and before he could extricate himself Bauer grasped him around the neck and turned his shoulders firmly down.

Miscellaneous.

THE HAZARD POWDER CO., MANUFACTURERS OF GUNPOWDER.

Hazard's "Electric" Powder.
Nos. 1 (fine) to 5 (coarse). Unsurpassed in point of strength and cleanliness. Packed in square canisters of 1 lb. only.

Hazard's "American Sporting."
Nos. 1 (fine) to 5 (coarse). In 1 lb. canisters and 6 1/2 lb. kegs. A fine grain, quick and clean, for upland and prairie shooting. Well adapted to short guns.

Hazard's "Duck Shooting."
Nos. 1 (fine) to 5 (coarse). In 1 and 5 lb. canisters and 6 1/2 and 12 1/2 lb. kegs. Burns slowly and very clean, shooting remarkably close, and with great penetration. For field, forest and water shooting. It ranks any other brand, and it is equally serviceable for muzzle or breech loader.

Hazard's "Kentucky Rifle."
FFFG, FFG, and "Sea Shooting" FG, in kegs of 25 12 1/2 and 6 1/2 lbs. and cans of 5 lbs. FFG is also packed in 1 and 1/2 lb. canisters. Burns strong and moist. The FFG and FFG are favorite brands for ordinary sporting, and the "Sea Shooting" FG is the standard Rifle powder of the country.

SUPERIOR MINING AND BLASTING POWDER.
GOVERNMENT CANNON AND MUSKET POWDER; ALSO SPECIAL GRADES FOR EXPORT, OF ANY REQUIRED GRAIN OR PROOF MANUFACTURED TO ORDER.

The above can be had of dealers, or of the Company's agents in every prominent city, or wholesale at our office.

For Florida.

PHILADELPHIA AND SOUTHERN Mail Steamship Company's line to Savannah, Ga., sailing every Saturday, from Pier 23, below Pine street, Delaware River, at 12 o'clock noon, making close connections through to all points South. The line is composed of the steamships JUNIATA and WYOMING. The Wyoming does not carry passengers. The Juniata is a favorite ship with the traveling public, having passenger accommodations of the most superb character. She has recently been refitted and elegantly furnished with everything requisite to the comfort and convenience of passengers.

Families en route for FLORIDA, Georgia, Alabama, and even as far as New Orleans, will find the Savannah route the most desirable for comfort, as well as the most economical. Through trains of the Central Railroad of Georgia, and Atlantic and Gulf Railroad, Florida, leave Savannah every morning and evening. The Florida steamers leave Savannah three days in the week for all points on the coast.

For through passenger tickets and bills of lading to all points in Florida, Georgia, Alabama and Tennessee, apply to WM. L. JAMES, General Agent, 416 South Delaware avenue, Philadelphia.

Sportsmen's Goods.

Orange Sporting Powder.

ORANGE LIGHTNING POWDER,
The strongest and cleanest Powder made. Nos. 1 to 7, packed only in sealed 1 lb. canisters. The coarser sizes (higher numbers) especially are recommended to owners of fine breech-loading guns, giving great penetration with very slight recoil.

ORANGE DUCKING POWDER,
For water fowl. Very strong and clean. Nos. 1 to 5. Packed in metal kegs of 6 1/2 lbs. each, and in canisters of 1 and 5 lbs.

ORANGE RIFLE POWDER,
The best for rifles and for all ordinary purposes. Sizes F.g. FF.g. FFF.g, the last being the finest. Packed in wood and metal kegs of 25 lbs., 12 1/2 lbs., and 6 1/2 lbs., and in canisters of 1 lb. and 1/2 lb.

All of the above give high velocities and less resigum than any other brands made.
BLASTING, MINING, AND SHIPPING POWDER OF ALL GRADES AND SIZES PACKED IN WOOD OR METAL KEGS OF 25-LBS.

SAFETY FUSE AND ELECTRICAL BLASTING APPARATUS.

LAFLIN & RAND POWDER Co.,

SMOKE VANITY FAIR.

It is shaved from the best Natural Leaf, for Meerscham and Cigarettes. Does not make the tongue sore. Liberal sample on receipt of 20 cents. Highest award, Vienna, 1873. Send for circular.

WM. S. KIMBALL & CO.,
PEERLESS TOBACCO WORKS, Rochester, N. Y.

Does not make the tongue Sore.

SMOKE VANITY FAIR.—It is a wonderful solace, and the best proof that it works no injury is the refreshed feeling you awake with next morning, conscious that there is no reasonable task you could not perform.

For Meerschams.

It has a permanent existence; again and again does it serve your turn, and still is ready for a fresh bout. That pipe is always ready for its fill of Vanity Fair.

For Cigarettes.

A cigarette is an interlude to the serious habit; a graceful make-believe for spare hours. For cigarettes Vanity Fair has no equal. Best dealers have it.

For Sportsmen.

Vanity Fair calms the brain, caresses the nerves, and as a semi-conscious act furnishes just sufficient nucleus for floating thoughts and fancies to crystallize about. Best dealers have it.

Best in the World. Ask your Dealer for it.

With Vanity Fair you can commune sweetly all the day long; incense for your success; mourner in ashes for your disappointment. Best dealers have it.

VANITY FAIR.—We wish those who hear of this tobacco the first time to ask some friend about it. Many people know it; they invariably praise,

CHAMPION GUNS OF ENGLAND
PAPE'S

Unrivalled Sporting Guns.

Stand unequalled in every contest. Their performance at the London Trials of 1875 beats the records of any maker in the world.

1875. 12-Gauge, Choke Boring.

Maker of Gun. Exhibitor.
1st—Greener. Greener.
2d—Pape. Davidson.
3d—Pape. Pape.

Out of a class of 68 guns, 3 out of the 6 best were made by Pape. The Greener gun was protested against on the spot for having its score false counted, the fact proven there, and afterwards confirmed by same gun being shot for two days per week for six weeks in succession, when its average score only took 24th place, its very best score being greatly below the scores of the best six guns.

1875. 12-Gauge, Old Sporting Bore.

Maker of Gun. Exhibitor.
1st—Pape. Davidson.
2d—Pape. Davidson.
3d—Pape. Pape.

1875. Long Range, 60 yards, Choke Bore.

1st—Pape. Davidson

60 yards, Long Range, Sporting Boring.

1st—Pape. Davidson

Those champion Long Range guns, only 7 pound weight, with a charge of 3 1/2 dr. to 1 1/2 oz. shot, beat the best 8 bore Greener gun at 60 yards; weight, 15 lbs.; 6 drachms and 2 1/2 oz. shot.

1875. The Sportsman's Sub. Cup, valued at £45, was also awarded to W. R. Pape, for the original invention of choke boring. Winner of the London Gun Trials of 1858, 1859, 1866. Address

New York.

THE GREAT

London Gun Trial,

1875.

W. W. GREENER begs to inform his numerous clients in the United States that he has been very successful in the above trial, having secured the first prize, a silver cup, value 40 guineas—class 2 for 12 bores; also winner in class 1 for 8 and 10 bores, and class 4 for 20 bores. He has won in all the classes for improved boring, which is upon a different plan to any other maker, and is far superior in the three most essential points, viz., PATTERN, PENETRATION, and REGULARITY OF SHOOTING.

Mr. HENRY C. SQUIRES, of No. 1 Cortlandt St., New York, is now importing my DOUBLE CLOSE-SHOOTING GUNS to order, an invoice of which will be shipped to him on the 1st July, and can be examined about the 15th. All special orders given to Mr. Squires will be carefully filled. A full report of the GREAT TRIAL, showing the marked superiority of my guns over guns made by Dougall, Pape, Tolley, and others, will shortly be published, and can be had on application at No. 1 Cortlandt St.

W. W. GREENER'S

DOUBLE CLOSE-SHOOTING GUNS. Winner of the Silver Cup, value 40 guineas, at the Great London Field Trial 1875, beating 33 competitors with 68 guns, also winning in all the other classes for the Improved System of Boring. These guns will kill from 80 to 100 yards, loaded with large shot, and will shoot well with small shot with a less powder charge than guns bored upon the old system. For report of the Gun Trial apply to Messrs. McLaren, Williams & Co., Agents, St. Louis, U. S. A. Address
W. W. GREENER,
St. Mary's Works, Birmingham, England.

J. D. DOUGALL'S
EXPRESS SHOT GUNS.

(Title registered.)

Shown by trials at Wimbledon by Editor of the Field to possess the GREATEST PENETRATION and therefore LONGEST RANGE—thus: Circle, 30 inches; 300 pellets; average, 191; penetration, 37. The Editor's trial of Greener guns with 340 pellets of same shot and same charge of powder, gave 180, and penetration 30, although there were 40 more pellets in each charge. Should any controversy arise as to the durability of these new systems, we herewith warn all beforehand that our system is our own invention (though founded on the American idea) and is DURABLE, a fact remarked on by the Field, that the guns tried had been in use during last season, and references permitted to the owners. Send for Illustrated Circulars to
59 St. James's Street London.

72 ST. JAMES STREET, LONDON.

WILLIAMS & POWELL,
Gun and Rifle Manufacturers,

Call the attention of the Sportsmen of America to the extreme SIMPLICITY, STRENGTH and DURABILITY of their New Patent "SIMPLEX" Breech loader and INDEPENDENT EXTRACTOR.

The parts in this new action are so few (only two,) its mechanical soundness so thorough, and the strength and simplicity of the action so great, that W. & P. feel sure it will supersede all the complicated and manifold grips now in use, its one powerful grip being far stronger than any double, treble or quadruple grip now used. In this new action LEVER and GRIP ARE ONE SOLID PIECE OF STEEL and the ANGLE OF THE BODY is left in its ENTIRE STRENGTH.

Drawings of action and extractor will be sent on application, and orders may be forwarded through any of the best houses in the States for execution in the Spring.

Guns guaranteed to make patterns of from 160 to 230 with No. 6 SHOT AT 40 YARDS, as desired.

NO. 25 SOUTH CASTLE STREET,
LIVERPOOL.

Third Edition.

Camp Life in Florida.

By CHARLES HALLOCK,

AUTHOR OF THE FISHING TOURIST.

This is a most seasonable book for Sportsmen, Tourists, Invalids, and Settlers, and has been long needed by Winter tourists to Florida and persons seeking settlement there. It gives a full classification of the game and fish of the Southern Peninsula, routes of interior and coastwise travel, the agricultural resources of the country, and sites for settlement, hints for camping out, resorts for game, hotels, and such other information as will be of great benefit to visitors seeking Florida for health, pleasure, exploration, or permanent settlement.
348 pp., 12mo. Price, \$1 50.

CONTENTS:

Introductory Chapter.
Birds-eye Glance at Florida.
Outfit for Sportsmen.
Hints for Southern Hunting.
Coastwise Routes of Travel.
Game Animals and Birds of Florida.
Game Fish of Florida.
Three Months in Florida for One Hundred Dollars.
Supplementary Hints for Cheap Recreation.
Up the St. John River.
Indian River.
Florida the Promised Land.
Fort Capron.
Fishing at St. Augustine.
Black Bass Fishing on Spruce Creek.
Hunting the Panther.
The Environs of Tallahassee.
Private Dougherty and the Bass.
Pet Birds of St. Augustine.
Steam Yachting on the St. John.

THE

PAPER STEM PIPE.

Just the Thing for Home and Camp Use.

Supplies a want which smokers have long felt—a pipe which shall give simply the taste and odor of tobacco smoke. This pipe never accumulates rank smelling liquid in stem or bowl, but is always clean and sweet. The bowl and mouthpiece are permanent, but the stem is of porous paper, to be laid aside after a few days' use and a new one fitted. Extra stems accompany each pipe. The price of extra stems, when not furnished with the pipe, is as follows: Four and a half and seven inches, 5c.; twelve inches, 15c. Sold by pipe and cigar dealers generally, or a complete sample sent by mail for \$1 by

Moosehead Lake Reminiscences

A FEW weeks since, while busily at work in my office, I was surprised by a call from your traveling correspondent, and still more surprised when I learned from him that his object was to ask me to contribute to your paper some reminiscences of my sporting experience in other days. The bare mention of it sent the blood tingling through my veins, but the second sensation was akin to that of poor old Rip Van Winkle, when looking for his former comrades after his long nap. Visions of jovial days in camp and field arose in my mind, and thoughts of *Porter's Spirit of the Times*, and of "Frank Forester" and George W. Kendall and many another less known, but not less dear, companions of the days of "auld lang syne" came over me, and made me feel my lonesomeness, and that anything I could contribute on sporting matters would be but a raking of dead leaves and a conjuring up of spirits from the past. My visitor was kind enough to say that I was

lakes and rivers, and run township lines in the vicinity of the above named lakes.

We went from Bangor by stage to Munson, and then traveled twelve miles on foot through the woods to the foot of Moosehead Lake, having sent our two batteaux and one canoe, and three months' provisions for twelve men, in advance by teams. There were two houses at the foot of the lake, where Greenville now stands, but no other dwellings on the lake or north of it. A steamboat, or rather a mud scow with an engine in it, was in service on the lake for towing rafts of lumber, and we chartered her to carry our party and traps to the head of the lake, which we reached just at night, and the next morning got our boats, provisions, etc., ashore, and began the real labor of carrying across the ten mile portage to the Penobscot.

No such advanced elements of civilization as the "hay rack, with two horses attached," which Dr. Thompson describes, existed in that region in our day. Only a rough track, bushed out by the axemen, facilitated our labor. Through this the batteaux were dragged, and the barrels

sions, carrying hard bread and pork in our knapsacks to last a week or ten days, and returning for a fresh supply, or leaving directions with the boatmen to meet us with such supply at some point on the lakes. In surveying Telos Lake we took the levels across to Webster Pond, on the line where the canal, of which Dr. Thompson speaks, was afterwards constructed.

Of course the experience of several months of such a life, in such a country, could not fail to comprise many interesting incidents and stirring adventures, the thought of which rises in my mind like the memory of a dream, or a vision of a previous existence. Hardship and exposure was our daily lot, and the labor was such as only men selected for the purpose could endure. We had shelter tents, but after the first excursion we left them at the home camp, preferring to do without them, or to make a camp of bark, if the weather made it necessary, rather than have the trouble of carrying a tent. Sometimes our line would run through cedar or hackmatack swamps, where, with the utmost effort, we could not make more than a mile or two

LILLY, Lemon and White Pointer, the Property of W. Arthur Wheatley, Esq., of Memphis, Tenn.--See Page 309.

not yet forgotten, and that my "Hints to Riflemen" were still quoted in sporting circles, and that an occasional bit of gossip from my pen in the pages of your journal would possess interest for some of your readers. And so he got from me a sort of half promise that I would now and then drop you a line, and perhaps that would have been the end of it, but a late number of your paper contained an account of a trip "Down the Allegash," by Dr. E. J. Thompson, which called up such reminiscences of the Maine forests that I cannot resist the temptation to tell you something of my experiences in those regions nearly forty years ago.

In the latter part of May, 1839, I went over much of the same route described by Dr. Thompson, and spent the whole Summer in the region of Chamberlain and Eagle lakes, which at that time were part of the territory in dispute between the United States and Great Britain, the line claimed by the latter being the dividing line between the waters flowing into the Penobscot and those which emptied into the Bay of Fundy. Notwithstanding the dispute, however, the party, of which I was one, was sent by the States of Maine and Massachusetts to make surveys of

of bread and half barrels of pork were packed on the shoulders of the men, slung on a pole and carried between two of them. It was here that we discovered the herculean strength of one of the party, which afterwards proved of inestimable value to us on more than one occasion. Stuffing his knapsack full of blankets, he got his comrades to lash a half barrel of pork on top of it on his shoulders, and actually carried it across the whole portage (two miles) without taking it off, and only once or twice resting by backing up against a tree. The feat was done on a banter, and established the reputation of the performer, whose name was Gove, as the strongest man in the party, which was made up of rugged woodsmen.

Our route was the same described by Dr. Thompson—down the Penobscot to Chesuncook, and thence *via* Mud Pond (the odor of which I well remember, as every stroke of the oars brought up the filthy mire from the bottom) to Chamberlain Lake, where we built a home camp and established our headquarters for the Summer on a point not far from the mouth of the inlet.

From this point we went out on our surveying excursion,

in a day, and the misery of toiling through such a region, under a broiling sun, with a heavy load of pork and hard bread on one's back, guiding the axemen ahead by sighting through the instrument, and keeping the topographical notes, while the black flies and mosquitoes were in swarms, and could only be kept off by continually smearing the face, neck and hands with a piece of salt pork, is such as no man can realize who has not tried it. Sometimes we could not get through a piece of work in the time we had calculated, and were forced to put ourselves on allowance, to make our provisions last until we could return to the home camp for a fresh supply; and there was scarcely a day that we were not obliged to work more or less in the water, and a change of clothing was out of the question. Yet we never had a man on the sick list for a day; and this corresponds with all my experience of camp life, which goes far to convince me that the evils of civilization, which renders necessary such elaborate machinery to supply our wants without endangering our lives, are but inventions of the evil one.

After completing the work of running out twelve town-

ships, and mapping the lakes and rivers within their limits, we returned to civilization at the end of August by the same route on which we went out, except that the return voyage down Moosehead Lake was made in our batteaux instead of the steamboat.

Our last camp was on the neck of land connecting Mt. Kineo with the main land, and the next morning we ascended Kineo and took the height of the precipice, which, if I recollect right, was 800 feet; but all my notes and journals of that and similar expeditions were destroyed in the Chicago fire of 1871.

On one of our surveying trips I slipped while walking on a burned log and sprained my knee so severely that my comrades were obliged to take me in a boat to the home camp and leave me to rest and recover by myself. Before leaving me they arranged that I should meet them in one week at the foot of Eagle Lake, where they expected to arrive at that time. One of the batteaux had been left there on a previous excursion for them to return in to the home camp, but as it would be uncomfortably crowded with the men and instruments I agreed to come down in the birch canoe and thus relieve them on the return voyage, the distance being about twenty miles. My solitary week at the home camp I have always remembered as one of the distinctly marked and peculiarly delightful experiences of my life. My comrades were ten or twelve miles distant, and no other human beings within a hundred miles. The sense of solitude was indescribably impressive, and I revelled in the luxurious feeling of independence and freedom from conventional cares and restraints. My lameness obliged me to keep as quiet as possible, but I used to take my rifle and fishing rod and hobble down to the lake shore and sit on the rocks and fish, or get into the canoe and go on exploring voyages up the bays and inlets. I improved the opportunity to put my camp clothes in thorough repair, and found no difficulty in keeping myself busy in sedentary pursuits, and with the aid of diligent rubbing night and morning with opodeldoc I got my injured limb into serviceable condition, and before the week was out found myself able to put in practice a project which had occupied my mind all the while. On one of my excursions I had discovered the mouth of a very considerable brook, which entered the lake within a mile or two of the main outlet, through which I must pass to reach the Eagle Lake. Its mouth was much choked with drift wood, but half a mile above it was a beautiful, clear stream, well stocked with trout. My plan was to spend a day there on my way down to Eagle Lake, and catch a mess of fish for the boys, well knowing how gladly they would welcome such a change from the regular camp fare of hard tack and pork frizzled on a stick. I started, therefore, early in the morning, and the wind being fair I found a dry, light spruce pole, which I rigged as a mast in the canoe, and with my camp blanket for a sail, and a good load of stones for ballast, I ran down the shore merrily, and reached the mouth of the brook before ten o'clock. Then I dragged the canoe over the drift wood, and paddled up stream to a suitable point for camping, and then landed and hauled up the canoe and got out my fishing tackle and made my way carefully to a point a few rods above, where the brook made a sudden turn, just above which was a deep hole, with two great beech trees hanging over it, their gnarled roots projecting from the bank. In this pool the trout were lying in schools close together, and at first bit readily at a piece of pork, with which I caught a good many, but all at once, as if by common consent, they refused to meddle farther with it, and I then caught a number of moose flies, somewhat smaller than bumble bees, and found they rose to them at once. Before night I had caught so many that when cleaned and split they filled a firkin, in which I placed them in layers with a little salt. Having finished just before night, I built a fire and cooked my supper, and then stretched myself on my hemlock bed for the night. Next morning, after breakfast, I resumed my voyage, running down to the outlet with my sail. This outlet, which is now dammed, as described by Dr. Thompson, was then a very rapid stream, requiring skill in canoe management to run through in safety. By the time I reached Eagle Lake the wind had increased from the northwest to such a degree that I could no longer use my sail, but by keeping under the lee of the shore I made my way till near noon, when I came to the entrance of a bay running up three or four miles, but not more than a mile across at the mouth. The wind blew fearfully right down the bay and across the lake, which was about two miles wide, and I doubted the possibility of making my way to the opposite point. I ran ashore, cooked a fish, and made some tea for my dinner while deliberating what I should do, and, having determined to make the attempt to cross, I piled in a heavy load of ballast, hoisted my blanket, and shoved off. By dint of hard paddling on the leeward side I was rejoiced to find that the birch held her course better than I had hoped, making but little lee way and shipping but little water, and by the time I had got half way across I felt easy and confident of success. But all at once my mast snapped short off, and my blanket sail was the next instant dragging in the water. I hauled it on board as soon as possible, and resumed my paddling, but shortly found it a hopeless task to try to reach the other side of the bay, as the canoe, in spite of all my efforts, was drifting bodily across the lake. All I could then do was to try to select the best place to run ashore, and fortunately I was able to do this on a sandy beach, where the waves were breaking, so that the bows had no sooner touched than the whole canoe was filled with water. I of course sprang overboard and hauled her up on the beach as soon as possible, threw out the ballast, and turned her over to empty her of water, and was rejoiced to find she had received no injury. Then I set about making myself comfortable, but thinking it not unlikely that my comrades would be coming up the lake in the batteau, I hoisted my blanket as a flag on a pole, which I stuck in the sand beside the canoe, to attract their attention. Then I went a few rods back in the woods, and, selecting a good spot, kindled a fire and busied myself drying my clothes and preparing a bed. This occupied me till near sundown, when I began to think of supper, and had just hung my kettle on the fire, and got ready to fry some fish, when I heard a shout, and running down to the shore found my comrades crowded into the batteau and coming in shore to learn the meaning of my signal. The wind by this time had subsided, and they landed without difficulty, and upon learning of the provision I had made for them they at once decided to go no farther that night. Of course there was no end of fun and banter over my mishap, but the trout supper was the object of prevailing interest, and its enjoyment in anticipation, realization, and subsequent discussion, afforded a degree of pleasure

which can only be realized under similar circumstances, when the simplest comforts of ordinary civilized life become so difficult of attainment as to assume the character of luxuries.

I know not if a single one of my companions on that expedition still lives. The two officers who were associated with me have been many years in their graves, but as I recall the incidents of that Summer in the wilderness their spirits rise vividly before me. I hear their quaint jokes and merry laugh at the evening camp fire when recounting the occurrences of the day. I see the graceful waving of hemlock boughs as the bright flame shows them in strong relief against the surrounding blackness, and for the moment I fancy myself once more young and active, and enjoying the freedom of forest life; and as the vision fades away, and leaves only in its place the realities of today, I am still thankful for the possession of even the memory of scenes and events with which I have so many pleasant associations.

H. W. S. CLEVELAND.

Chicago, December 12th, 1875.

Fish Culture.

THE BASS QUESTION.

[From the Live Stock Journal.]

IN reply to Mr. Yeomans' letter in our October number, we will say that his complaint of the bass growing scarce in the Columbia reservoir and the lake in Coventry, after devouring the other fishes, is precisely what has been reported of the Potomac, but which is now denied.

The Journal has steadily opposed the introduction of this fish where waters were to be stocked for food. As a sporting fish it is good, but we have repeatedly asked the question, to which as yet no reply has been made: "Where is the bass fishery that yields the tons of food furnished by the shad, herring, sturgeon, whitefish, cisco, and the lake trout fisheries?"

In answer to the questions of Mr. Yeomans, as stated above, it is a disputed point whether black bass are destructive to all other fishes. We do not think that they are more so than pickerel or yellow perch (the ring perch as it is called South), still too much so to be a profitable fish. They will take a good sized minnow. The character of the bass may cause the difficulty in catching; they are a capricious fish, taking the fly readily at some seasons and places, and in other localities refusing it altogether. They are a Summer fish, and it is doubtful if they feed at all in Winter; they probably hibernate. To find the most killing baits in your locality you will have to experiment. Try the artificial fly of different patterns, live minnows, troll with spinning bait; if your waters are large enough use a sail or row boat and a spoon on two hundred feet of line with eight-foot rod and reel, or if small ponds throw the spoon near the weeds with a stiff rod and draw it sideways from the bow of the boat, or skitter with artificial minnow. For still fishing, use the tail of a crawfish, which is very killing; or better than all baits for this fish, go up a swift stony brook and turn over the stones, and when you see a horrible looking creature about two inches long and half an inch wide, with a head and pincers like a beetle, body compressed vertically, six legs on thorax, and a lot of rings on the body, with a fringe to each one that at first glance looks like legs, color dirty brown, body terminating in two short tails, with two small hooks on each, pick him up, he is harmless; get as many as you want, and if bass don't bite at that they don't want anything, or there are no bass to bite. The above very unscientific description refers to the larva of the hellgramite fly (*Corydalis cornutus*), and is called by the name of the "hellgramite" in Pennsylvania, "dobson" in eastern and "hellion" in western New York, besides other cognomens. We do not know the range of this insect, but find it in the limestone waters of New York, under flat stones in swift streams.

In this connection we would refer to the communication of Prof. M. G. Ellzey, one of the Fish Commissioners of Virginia, who being both a naturalist and a sportsman, his opinions are entitled to great consideration:—

THE PREDATORY HABITS OF BLACK BASS.

I have noticed that many writers have taken the ground that black bass (*Gristes salmoides*) will in time destroy all other sorts of fishes which may be found in the waters into which they are introduced. My interest as a sportsman and my duty as a Fish Commissioner of Virginia, have led me to examine the question. I have repeatedly fished in the upper waters of the Roanoke for two years past, where bass have been plenty for many years, and find the usual varieties of catfish, suckers, sunfish, chubs, minnows, etc., existing in great abundance in the same pools in which I have been in the habit of catching the bass. I have recently observed the same thing with regard to Goose creek, a large tributary falling into the Potomac near Leesburg, in which I have fished ever since I was four years old, having been born upon its banks. Notwithstanding the presence of great quantities of bass, the white chub, sunfish, stone-roller, etc., have never been more abundant in that stream than now. Notwithstanding what has been said and supposed, the bass fishing on the Potomac has never been better than this season, nor have the smaller varieties of fish appreciably diminished in that river. In almost all the streams tributary to the Ohio these fish exist, along with great abundance of other sorts, and here they have existed ever since the discovery of that country. It is, therefore, plain that as a general thing these fish are incapable of exterminating other sorts in the open waters of running streams. In confined ponds the case may be different, for in such places there are few weeds, rocks, shoals and other places affording protection to small fry from the attacks of their predaceous enemies. Nor is the black bass by any means a pond fish, but during the whole season, from early Spring to late Autumn, is found in the rapids, only retiring to deep still water at the approach of Winter. The *Gristes nigricans*, on the contrary, scarcely exists in running streams, and is by nature exclusively a pond fish. Very inferior in every respect to the former species, it is nevertheless often confounded with it. In some waters, at certain seasons, this fish can scarcely be taken with a hook, and may in small lakes and ponds so diminish the supply of other fish as to spoil the fishing, being itself a very capricious biter. But the *Gristes salmoides* is truly a game fish, and may always be taken with certainty either with minnows, crayfish (or crawfish), small frogs, or with the artificial fly. Fly fishing for them is scarcely inferior sport to fly fishing for

trout. Nor do I believe any one need fear that they will exterminate other fish inhabiting the streams with them.

M. G. ELLZEY.

KELTS AND SMOLTS.

The following instructive correspondence appears in the London Field of Dec. 4th. Let our fish breeders preserve it:—

SIR:—There can be little doubt that the preservation of kelts after a certain date is a mistake. In an ordinary season, and when the natural flow of water during the Spring months carries most of the spawned fish down to the sea, little mischief is done; but occasionally, as in such a season as 1875, an immense number of foul fish lie about the pools of a river and eat up everything within their reach. I suppose it may be accepted as a fact that what is called a well-mended kelt, either male or female, has flourished upon food of some sort. Now what can this food possibly be, except what has been fairly intimated by your correspondents during the last few weeks? After spawning, kelts must and ought to be protected. They are then, as every salmon fisher knows, weak, deformed, repulsive in appearance, and altogether incapable of escaping the poacher. If Nature allows it, and there is a good flow of water, they soon drop down to the sea, are out of harm's way, and instantly begin to recruit for their succeeding voyage up the river. On the other hand, perhaps the river is almost dry; large, long, deep pools afford a convenient asylum for days, weeks, even months. From these lairs they issue, and I firmly believe, live on their children and grandchildren. How many times has every rod fisher rued the destruction of some favorite and valuable fly, a good casting line, perhaps even a strained rod, owing to the voracity of these wolves of the pool, well-mended or otherwise. But I will not further allude to the annoyances the rod-fisher has to contend with in consequence of the late migration of kelts. I am, however, convinced, after an experience of many years, that there should be some date fixed for the termination of their annual preservation. A well-mended kelt after that date would be good for your gillie, if not for yourself, and you would have some small satisfaction in landing and killing a stout, strong fish, which you may very possibly have taken for a clean one until it is actually on the bank and cut into. I maintain that more good than harm is done by killing such a fish. He and his numerous allies have been doing unmeasurable mischief, and at least he does not return to do more. A friend of mine is now just returning from a certain northern river. I wonder how many legally clean fish he has killed, and how many of those legally clean fish contained! Rest assured that, in any season, very little mischief could be done by killing kelts after a certain date, and in many positive good would accrue from the practice. But I would allow the gravid fish of October and November to go up their rivers in peace.

A. R. T.

SIR:—That smolts and also much larger fish are not too big for kelts to eat, I think the following will prove:—Early this Spring I went to fish a deep "catch" on the Verniew. When just about to throw, I saw a trout of, I am certain, much over half a pound—indeed, I believe him to have been nearer a pound—taking some small duns as they came down the stream. I stopped a moment, hoping he would swim off, when suddenly a large kelt dashed at him and carried him away in his mouth. I saw the trout for a moment out of the water in the kelt's mouth, and noticed both the long hook on the lower jaw of the latter and his lunkness as well as the color of his scales. I am therefore sure, though he took his prey across the middle, he was not a pike.

The trout was on the top of the water, and the kelt came at him, not with a run, but a regular head-and-tail rise, in the way a salmon so often takes a fly.

H. OWEN JONES, Conservator of the Severn.
Tredern House, Llansaintffraid, near Oswestry, Nov. 30th.
[Nothing could be more to the purpose than the above case. Similar instances have been mentioned within our memory in the Field years ago, and no doubt when attention is called to the point there will be no lack of confirmation.—Ed.]

THE LAST OF THE PENNSYLVANIA ELK.—In the Quaker State is an Elk county, so named from the abundance of Elk that once roamed its forests. Some six years ago the last of this race passed away—exterminated by the market hunters. A correspondent of the Germantown Telegraph tells the history of the exploit in the following words:—

"Six years ago, we had in our woods the only wild elks left in the State of Pennsylvania, (seven in number.) They had been hunted hard for two Winters, but had escaped the hunter's rifle. I saw the fresh foot-prints of these noble deer in the Summer. One old bull had a track as large as a two-year old steer. But a deep snow fell in the following March, and after it came a light rain, this freezing on the snow formed a hard crust. Then came a half dozen worthless half breeds, from the Indian Reservation in the State of New York, with dogs and snow shoes. They found the poor half-starved beasts yarded in the deep snow. The men and dogs could run on the crust, but the elk, trying to escape, broke through up to their backs, and in this way soon became an easy prey. They took out one (a calf) alive, the rest they killed for their hides, taking but little of the meat. Thus perished the last of a noble race—the last elk I believe in the State of Pennsylvania."

The same writer says that by the change made last Winter in the game law, by which the close season for hunting deer was restricted to the two months of September and October, hundreds of deer have been saved to Elk and adjoining counties. More deer have been killed in December heretofore than in all the rest of the year; many of them having been taken by steel traps set in their runways, the animals beating themselves to a jelly, rendering the meat black and unfit for use.

—An honest California farmer sent to the Illinois State Fair the heaviest fleece of wool on record, its total weight being a trifle over fifty pounds. The Wool Growers' Association had it scoured and weighed. There proved to be thirty-eight pounds of grease and dirt in it and two pounds of burrs, so that it was a case of more fleece than wool.

Sea and River Fishing.

FISH IN SEASON IN DECEMBER.

SOUTHERN WATERS.

Pompano, *Trachinotus carolinus*. Grouper, *Epinephelus nigritus*,
Dum (two species.) Family *Scia*-Trout (black bass), *Centropomus*
undatus.
Kingfish, *Menticirrhus nebulosus*. Striped Bass or Rockfish, *Roccus*
Sea Bass, *Sciaenops ocellatus*. *lineatus*.
Sheepshead, *Archosargus probato-* Tailorfish, *Pomatomus saltatrix*.
cephalus. Black bass, *Micropterus salmoides*;
Snapper, *Lutjanus carus*. *M. nigricans*.

[Under the head of "Game and Fish in Season" we can only specify in general terms the several varieties, because the laws of States vary so much that were we to attempt to particularize we could do no less than publish those entire sections that relate to the kinds of game in question. This would require a great amount of our space. In designating game we are guided by the laws of nature, upon which all legislation is founded, and our readers would do well to provide themselves with the laws of their respective States for constant reference. Otherwise, our attempts to assist them will only create confusion.]

FISH IN MARKET.—The supply during the week has been ample for the demand. In fact, with the great abundance of poultry the consumption of fish is not as large as it will be after the commencement of the New Year. Stiped bass continue to be received in a frozen condition from the Mirimichi and sell for 20 to 25 cents per pound, according to size; smelts, from Maine, are worth 15 to 20 cents; bluefish, caught off Cape Hatteras, 12½ cents; salmon, frozen, 50 cents; mackerel, 20 cents each; shad from Savannah are arriving in fair quantities and sell for 60 to 75 cents each; the present supply, however, is only a spurt, and prices may any day advance. White perch bring 15 cents per pound; Spanish mackerel, 50 cents; frost fish (tom-cods), 10 cents; halibut, 20 cents; haddock, 10 cents; codfish, 8 cents; blackfish, 10 to 15 cents; flounders, 12 cents; sheepshead, 25 cents; whitefish, 18 cents; pickerel, 18 cents; salmon trout, 16 cents; black bass, 18 cents; green turtle from Key West, 20 cents; terrapins, from Savannah, \$10 to \$15 per dozen; scallops, \$1 per gallon; soft clams, 40 to 60 cents per 100; hard shell crabs, \$4 per 100; soft crabs, \$1 per dozen.

FISHES AND FISHING OF THE GREAT LAKES.

SECOND PAPER—THE SISKOWIT AND MACKINAW TROUT.

At the head of the list of fish inhabiting the Great Lakes stands the siskowit (*Salmo siskowit*); found only in the waters of this basin and there confined to Lake Superior, and in rare instances only found in northern Lake Huron. It was formerly asserted, and is now believed by many, that the siskowit was not a distinct species, but a hybrid of the whitefish and Mackinaw trout. This could hardly be believed, even if science had not definitely settled the question, for the difference in the spawning season of these fish, and the fact that they are seldom, if ever, caught in localities where the siskowit abounds, precludes such a possibility. A few moments intelligent observation would have set this matter at rest long since, but no one deemed it of sufficient moment until a few years since. Even were it originally a hybrid as some claim, it has one characteristic uncommon to the class, viz.: prolification.

The siskowit spawns in August and September, and always in deep water; in fact, the fish is never taken in much less than forty fathoms. The fattest of all known fish, it has no unpleasant or oily odor, and for the table is valued above all others. This fish has been extensively maligned by ignorant newspaper writers, as unfit for eating on a fresh state; that it was insufferably oily and rank, though all united in its praise when salted. With the concurrence of such authority as Agassiz, I have no hesitancy in pronouncing it food fit for an Emperor in either state. There is, however, a species of white meat trout of very different quality, so closely resembling the siskowit, that it is largely sold under that name, by which means the nobler fish is undervalued, except where well known. This, I believe, is known to the Indians as the "bear trout," and I presume is the fish that furnished ground for criticism to the detractors of the siskowit. The siskowit weighs from five to twenty pounds.

Another favorite fish is the Mackinaw salmon or trout (*Salmo namaycush*). This trout attains the greatest weight of any of the lake fishes, the sturgeon excepted. For these local names there is no reason whatever, as this fish is found from Buffalo to Duluth, Chicago, and throughout the lakes of British North America. (The Yukon river in Alaska, I believe, excels in these fish.) The Mackinaw trout is largely known as the lake salmon, but truth compels us to state that for the table, he is inferior to the salmon of salt water. As compared with the whitefish his most ardent admirers will generally concede a point in the favor of the latter; still, like the siskowit, the trout has suffered at the hands of the ignorant. When taken from the icy waters of the Straits or Superior, and boiled, plunged into the pot alive, or as nearly so as your conscience—and Mr. Bergh—will permit. *Salmo namaycush* is not so inferior as supposed. This trout is not a game fish in any sense of the word, and he is so gross a feeder as to bite at anything from a minnow to a corn cob, and when once hooked, surrenders readily, with scarcely a struggle. Nevertheless, rolling for trout is a favorite pastime of the residents and tourists of northern Michigan. It is said that the Mackinaw trout bites best when he is fullest. Large and solitary specimens are frequently taken—sometimes with the gaff alone—while swimming at the surface of the water. These are known as "racers," and are always thin. The average weight is about five pounds, but monsters weighing from fifty to one hundred are heard of. The largest that ever came under the writer's observation weighed fifty-three pounds seven ounces, and was caught near Elk Rapids, or Traverse Bay. I had never before seen any that exceeded fifteen pounds. The spawning season begins in October and ends early in November. But very little seems to be known of their habits at this season. Rocky bottoms are

usually, but not always, preferred. A clay bottom near St. Joseph, Mich., is said to be frequented by trout for this purpose.

Fishermen claim the principal food of the lake trout to be whitefish, and assert that they are often caught in their nets while robbing them of these fish; however, Milner says in every instance that came under his observation the supposed whitefish proved to be ciscoes, yet he does not doubt the fact of their preying upon whitefish to some extent.

—The subjoined letter from Seth Green has additional interest in connection with the foregoing paper:

ROCHESTER, November 29th, 1875.

EDITOR FOREST AND STREAM:—

Agreeable to your inquiries as to what I think of the probability of re-stocking our great lakes with white fish, I will say that I have hatched white fish every Fall for the last ten years, and I have no doubt that they can be stocked in four years' time equal to the best that they ever were. This Fall Mr. Gerome made arrangements with me to put the Holton hatching box in a house in Detroit, Mich., which has been done, and there are eight million white fish spawn in the house at the present time, doing well. When I say eight million, I mean that there is not one spawn less. My brother, Mr. M. A. Green, took the spawn, and Owen Chase, one of my men, has charge of them. If all concerned will visit the house they will see for themselves that, by using the Holton hatching box, all our great lakes can be stocked, and the price reduced one-half in four years' time. Yours,

SETH GREEN.

A FEW FISHES.—Among the many remarkable paintings on exhibition at Snedecor's Art Gallery, 176 Fifth Avenue, are several studies of Fish by Gurdon Trumbull, Esq., of Hartford, Conn., which we noticed briefly in our last issue. One of these is a croppy, or roach, which may be referred to as an almost perfect photograph from nature, in color. If colors could be photographed, the artist's occupation would be a precarious means of livelihood. As this art has not yet been discovered, though long sought, our only dependence is upon the brush and pigments, and most enviable is he who can wield them with a master hand. The brilliant hues of the croppy render it a most desirable subject for artistic study.

Fish No. 2 is a black bass in deep water, with a hook and a section of taut line in his mouth; only this and nothing more. The position and attitude of the fish with his head slightly depressed, his tail undulating slowly, and the shining leader running perpendicularly to the upper world, that we cannot see in the picture, enables us to appreciate the situation at a glance. The bass is evidently in that mood, so trying to the nerve and patience of the angler, called "sulking," and we can easily imagine the angler with the but of his rod advanced, the line reeled well in, and the much tested rod bent to a dangerous curve by the strain which the weight and strength of the captive have brought to bear upon it. Now, when a fish sulks, it is after he has essayed his most ready artifices to escape. Our invisible angler has already played this determined and obstinate fellow for several minutes without discovering evidences of distress. He has watched with the exhilaration and anxiety of the occasion his flying leaps, his furious rushes, and his counter runs, has heard the humming of the reel and the intermittent click of its retrieving, and felt the varying forces that have animated the swaying rod, judging of the strain meantime with nicest perception, lest the supple wand should break, or the line part, or the hook tear out, or be ejected in consequence of an incautious relief of tension. Now comes a critical period. The fish is by no means quiet, but keeps up a peculiar tugging motion. This motion is not usually visible to the angler, but is made perfectly intelligible by Mr. Trumbull's picture, and this is where the success of the artist's effort lies. We can see "just how the whole thing works." This painting manifests a most elaborate and painstaking detail of scale work, color, and anatomy, characteristic of all of this artist's work. We might venture to say that there are precisely the same number of scales here that there were on the original live fish. The price, we understand is \$500.

But the choice pictures of the collection are not these. What we wished especially to consider are two companion pieces representing a trout and a black bass, each weighing about three pounds, a size sufficient to require careful work and afford good sport. Regarded in the light of an ichthyological study alone, these are most valuable as showing the anatomical structure of the two varieties of fish, the number and shape of their fins; the size of scales; shape of head, jaw, opercles and tail, and the distinctive markings and coloring of each. The only suggestion we have to offer is that the color is too deep an olive. In nature we have usually remarked a greener tinge. The careless observer is not apt to note the marked difference in the characteristics of the fish which they casually examine. It is the province of the artist to note all this, and upon his critical observation his success depends.

In his representations Mr. Trumbull prefers to leave much to the imagination of the viewer, and by this he produces the happiest and most striking effects. In each of these paintings, as in the one already examined, we see only the fish, a section of the casting line, and a small area of water. Both have freed themselves—the bass by breaking away, and the trout by slipping the hook. The bass is in still water; the trout in the act of passing over a foaming cascade. It has been considered a high artistic attainment to portray an animal, or even the waves in motion. To attempt to give this life to a fish seems almost presumptuous; but here we have both the water and the fish in action. The trout has unhooked himself at the very verge of the fall, and as he is swept over, followed by the visible fly and a yard of trailing line, (bad handling on the angler's part,) he exhibits a look of helpless passivity, distress, and fright, and a bewilderment at his sudden release which we would hardly suppose the eye and facial muscles of a fish

were capable of expressing. Not only can we conceive the downward movement of the fish and of the falling water as in the act of happening, but the slight motion of the disengaged line drawing through the foam leaves the flashing trail of its feeble resistance.

In the bass picture there is a great deal more facial expression in the fish and motion in the body. A fish with its immobile features, its stony armor that hides the play of the muscles: who would think that expression and nobility could be discerned or made apparent in these? The physiognomy of this bass is something striking. He has evidently been running out many yards of a too tautly held line with great vim, and now by a desperate lateral sweep and simultaneous dive has broken himself free, carrying off the fly and and part of the leader. The course he has taken is indicated by the sharp foam tracings which the sweep of the line makes through the deep water. His back bone is bristling and rigid; the muscular action of the body and tail required in the effort are apparent; the protruding eye indicates desperate energy combined with alarm, while we can fancy that there is just an appreciable pleasing consciousness of escape in the intelligence that gleams from it.

Surely one cannot but marvel at the genius that can accomplish all this—on canvas. We judge of the merits of the paintings from an angler's standpoint chiefly and not with the eye and technical phraseology of a professional critic, but we feel certain that no one will consider our judgment misplaced. Mr. Snedecor has been at great expense to procure in Paris chromos of these pictures, which are so perfectly imitated as to be scarcely distinguished by the best connoisseurs, when placed side by side. One hardly knows which most to admire—the genius that can conceive and create, or the successful imitator and copyist. The price of the chromos are \$24 cash; for the originals something like \$4,000 were paid, we believe.

Speaking of fish, there are two other paintings at the corner of Fifth Avenue and 16th street, said to be equal to these in merit, which we shall take occasion soon to examine and report upon.

—Anglers in Great Britain, as well as those at home, should be pleased to receive a statement that is authentic, of some of the fishing done in American waters—at present date almost wholly Canadian, owing to the barren condition of our once well-stocked waters of the United States. We therefore give herewith the salmon scores of one of the chief rivers of Canada for the years 1874 and 1875:—

STATEMENT OF SALMON FISHING AT RIVER GODBOUT, FROM 27TH OF JUNE, TO 7TH OF JULY, 1875.

DATE.	No. and weight of Salmon by each rod.								Total No. of fish daily.	Total weight of fish daily.

July 9—Caught by Mark Molson and his son, Montreal, 8 fish, weight not known. Caught shortly after by P. Macnaughton and son, Quebec, 21 fish, weight not known.

—The *Live Stock Journal* says that S. W. Goodridge, of Grafton, Vt., has an order for three fly rods for the Paine of Wales. A few years ago Englishmen thought that no fine rods could be made in this country.

THOSE "NEEDLE POINTS."—Our very attentive correspondent, Seth Green, Esq., whom his intimate friends have learned to call "Uncle Seth," though he may deferentially be called the *father* of fish culture in the United States, has sent us the following characteristic letter:—

ROCHESTER, N. Y., Dec. 16th, 1875.

EDITOR FOREST AND STREAM:—

I see that there are some unbelievers still living. Well, there is nothing strange in that. I expected there would be when I wrote you my experience in using a fish hook made of a needle. I do not charge anything for it. I published it for the benefit of my brother anglers, and I would like to have those who are possessed of some skill try it. I see my old friend Phil Freas, of the *Germantown Telegraph*, is one of the unbelievers. He says he has not tried it. Phil, try it, and if you get the right bend and point and temper, your success will be so great that you will wish you had an india rubber arm that could reach from Philadelphia to Rochester to shake hands with me. If you could invest that arm with the power of the electric telegraph, you would send a message to me that would read: "Bless you, old fellow, I took one-third more fish to-day with the needle trout hook than I ever caught in any one day before with the same number of bites." Yours, SETH GREEN.

Our celebrated tackle dealers, Messrs. Abbey and Imbrie, are large importers of Warrin's needles; we do not know that they can do better, pecuniarily, than to turn their needles into fish hooks, just as the nations are instructed to beat their spears into pruning hooks, so that there shall be no more warrin' among them.

—Mr. D. H. Fitzhugh, of Bay City, Mich., thinks that the grayling are fated to run out, like other varieties of game fish. In a cordial invitation to us to fish the Manistee next year, he says:—"We shall have only a few years at the gaayling, as they are fast being used up, and there are only a few localities where they thrive."

TRUCKEE RIVER TROUT.—A correspondent tells the following big fish story:—

"Certain officers connected with an Eastern railway, commonly known as the 'Pan Handle' route, lately visited California, traveling in their own private commissary car. While en route westward, hearing of the superior quality of Truckee River trout, one of the gentlemen, with the intention of agreeably surprising the party with a rare fish breakfast, telegraphed for two dozen brook trout to be in readiness on the arrival of the train at Truckee Station, for the use of the occupants of the car. When the train drew up to the depot two Indians approached the car with a huge package. At first they were directed to the baggage car, as the private car was not suitable for freight; but insisting that the package was intended for said car, judge of the feelings of the gentleman whose wish was to surprise his traveling companions, to find his order for brook trout consisted of twenty-four magnificent fish, weighing from three to five pounds each, with the bill for the same, amounting to \$12.75 coin, which was promptly paid to the Indians under a charge of secrecy. Two or three of the trout were ample for the breakfast of the party, and the remainder were distributed gratuitously among the train men. Moral: Truckee River brook trout are not sardines."

—A California correspondent, referring to one of his vacation excursions in that State, says:

"The country around the McCloud and Sacramento Rivers, at their head waters, is the finest game and fish country in the United States. We killed only for food as we needed them seventeen deer in five days, while without exaggeration we could have killed fifty. The fact that during that time we caught alive six little fawns, will show how numerous the deer are. Our largest catch of salmon amounted to 296 pounds for three of us in two hours. We also caught the Dolly Varden trout, so called on account of the large red spots peculiar to the trout of the McCloud River only, and the gamest trout in the country."

OUR FISHERIES.—Occasionally our fishermen return with a full catch and finding a bare market realize remarkably handsome amount for the time occupied and capital invested. Among the best fares made by Gloucester smacks during the past season may be mentioned that of the sch. E. C. Dolliver. She weighed off on her last trip 92,154 pounds halibut, her stock amounting to \$4,678.72. Time absent, four weeks. Crew shared \$185.87 each. Her entire stock for the year is \$20,100.

Sch. Alfred Walen, made her trip in eighteen days, the shortest but one on record. She weighed off 94,000 pounds of halibut, 4,000 pounds of codfish, her stock amounting to \$3,320.

Sch. Gertie E. Foster, Capt. Edward Morris, has landed the past year, 668,517 pounds of halibut and 19,220 of cod, stocking \$26,071.56 net.

Sch. Chester R. Lawrence, Capt. Thomas Hodgdon, has landed the past year, 401,612 pounds of halibut, and 304,517 pounds of codfish, stocking \$22,800.16 net.

Sch. John S. Presson, Capt. William H. Greenleaf, has landed the past year, 319,917 pounds of halibut and 331,815 pounds of codfish, stocking \$20,913.22 net.

Sch. Lizzie K. Clark, Capt. Edward Morris, made the shortest Bank trip of which we have any record, in March, 1874. She was absent seventeen days and landed 85,810 pounds of halibut, stocking \$4,676.

Capt. Thomas Hodgdon, of sch. Chester R. Lawrence, has the honor of landing the largest fare of halibut ever brought into Gloucester on a single trip, 126,526 pounds. His stock was \$4,708.

Sch. S. R. Lane, Capt. Solomon Jacobs, arrived from Georges with 123,115 pounds of codfish, and 862 pounds of halibut, and stocked \$2,544. Cook's share, \$156.62; average share, \$90.01. Time absent, thirty days.—*Cape Ann Advertiser*.

DOINGS OF THE FISHING FLEET.—It is quiet about the wharves, and the fishermen, as a general thing, are taking a rest. Some little activity prevails in rigging the new vessels, and in fitting away the balance of the Newfoundland fleet. But one misses the bustle and activity which prevails when the trips of halibut and cod are being unladen from the vessels. There have been 13 arrivals of the fleet the past week, five from the Grand Banks, seven from Georges, and one from Newfoundland. The receipts of fish are 60,000 pounds Bank halibut, 210,000 pounds Georges cod, and one fare of herring. The shore fleet have not had a very successful week. Prices are \$2.50 per hundred weight for cod and haddock.—*Cape Ann Advertiser*, December 17th.

BASS FISHERY.—The bass fishermen of the Northwest Miramichi have made some very large catches this season through the ice. The largest was made on Friday night 26th of November, when an aggregate quantity, estimated at three tons, was taken. Nets of mesh under regulation size are being used and the overseer has more work than he can do in preventing illegal fishing. The number of men engaged in catching bass is as great as two hundred some nights. Within three weeks, overseer Hogan has made three seizures of illegal nets.—*Chatham (Canada) Advance*.

—Mr. Wilkins, Fishery Inspector, Belleville, Canada, reports the capture of one of the largest whitefish ever caught in the bay of Quinte, which was taken by the fishermen at Lawrence's Point, about three miles west of the town, last week. The fish weighed ten pounds one ounce.

Natural History.

[This Department is now under the charge of a competent Naturalist, endorsed by the Smithsonian Institution, and will henceforth be made a special feature of this paper. All communications, notes, queries, remarks, and seasonal observations will receive careful attention.]

THE NESTING OF AMERICAN BIRDS.

II.—THE VARIED THRUSH—(*Turdus naevius*, Gmelin, Audubon, Cooper, Coues; *T. migratorius* var. *naevius*, Baird, Br. and Ridg.

THIS is an essentially west coast species, and is known in many places as the Oregon robin. Its range extends from the Rio Colorado to the Yukon, and eastward through the Rocky Mountains. In the Spring it retires to the extreme north to breed, and to Mr. W. H. Dall we are mainly indebted for what we know of its nest, several of which he discovered in Alaska. One, found May 22d, was built about 2½ feet from the ground, upon a pile of rubbish which had been drifted into a clump of willow bushes. The situation—as in all other cases—was a secluded one, close to the river bank.

The nest was 6 inches in diameter, and 2½ thick, but the depression of the cavity was slight. It was composed of dry mosses and lichens well compacted, and fragments of dry stalks of grasses. Another nest, found by Dr. Minor in Alaska, was a more finished structure. The outside consisted of a basket of slender twigs, within which was an inner nest of interwoven fine dry grasses and long gray lichens. The eggs, in number, size, shape and ground-color, are closely similar to those of the eastern robin, but are very distinctly spotted with a dark amber brown, nearly black, which make them indistinguishable from the egg of the mavis, or song thrush (*Turdus musicus*) of Europe.

—The difficulties in the way of obtaining the precise knowledge asked for in the letter from "C. S. W." published in FOREST AND STREAM last week, are illustrated by the correspondence now going on in the English outdoor papers over the question whether their common starling raises more than one brood. It is quite as common and domestic a bird as the sparrow, and nests in holes about the houses; yet not one person in ten who has written letters, is able to say that two broods are raised, or that they are not. It is to be hoped that habits of more careful scrutiny into the ways of familiar birds will be promoted by this controversy.

ABNORMAL PLUMAGE OF THE CALIFORNIA QUAIL.—Mr. John Lucas, of San Raphael, lately shot and sent to me at Nicasio, Cal., for mounting, a singularly marked specimen of the California quail (*Lophortyx Californicus*). It was a female, and the following is a description: Head, neck and throat light ash; neck dotted with small, round white spots; breast dark ash; abdomen white, each feather bordered with dark slate; plume at base light ash, changing into a deeper shade at the apex; sides or flanks having each feather with a central, lance-shaped white stripe bordered with light rufous; primaries and secondaries very light ash fading into white; back wings and upper tail-coverts, a soft rufous tint; under tail coverts with a dark slate-colored stripe bordered with a rich rufous; tail light bluish-ash; feet and legs horn-color. There is a white individual in the same covey, and Mr. Lucas is very anxious to secure it, but I consider the one described above as more of a curiosity, as I have seen several pure white. C. A. ALLEN.

WORK OF THE CHALLENGER.—Dr. Wyville Thompson's summary of the latest work on board the Challenger, during its cruise from Yokohama to Honolulu, is as follows:—

"We were particularly successful during this cruise in getting good samples of the fauna from great depths; and we found the fauna of the North Pacific at depths of from 2,000 to 3,000 fathoms, although not very abundant in species, by no means meagre. For each of six dredgings and trawlings, at depths greater than 2,000 fathoms, we found, along with a few fishes, a fair representation of all the larger invertebrate groups; and in one dredging, No. 253, at a depth of 2,125 fathoms, we took a small sponge, a species of *Cornularia*, an *Actinia* [sea-anemone], an annelid in a tube, and a bryozoon. We are again struck with the wonderful uniformity of the fauna at these great depths; if not exactly the same species, very similar representations of the same genera in all parts of the world."

From fourteen to twenty albatrosses followed the ship from the coast of Japan to within two days' sail of Honolulu, when they suddenly disappeared. The distance was about 4,000 miles.

—The ages of domestic animals, which are from time to time reported as remarkable, are more frequently estimated than ascertained. In the present instance, that of a cat, a writer in *The Field* is able to furnish dates of birth and of death, showing that he survived his twenty-first birthday by eight months—a length of life to which few cats attain.

—Sea-gulls are said to be caught alive in a unique way at Mount Desert. A stick is put through the tail of a small fish, and then it is left upon the sea shore where it can be seen by the birds. They then seize and attempt to swallow it head first, and succeed remarkably well until they come to the stick, when a stop is made. They cannot swallow it further, and it is equally impossible to raise it, and so they choke, strangle and fall over, when they are captured.

—At Airsaig House, near Glasgow, Scotland, bees are to be found every Spring, although the nearest hives are four miles away, and separated from it by two broad arms of the sea. It is a good instance of how far bees sometimes go to pasture.

WHAT DO SALMON EAT?

November, 1875.

EDITOR FOREST AND STREAM:—

I have read the editorial in your paper of Dec. 9th, referring to the communication of E. J. Hooper, of San Francisco, about the habits of the salmon on the Pacific coast, and as I have lived there all my life and fished a good deal, and especially spent last Summer fishing for salmon on the McCloud and Sacramento Rivers, I know something of the habits of the fish.

When the salmon first arrives from the sea and enters the Sacramento River it is a bright silver fish, lively and fat, and is then in season as an article of food. After a short time it commences to run up the river to spawn. From that time until it returns from spawning it does not eat anything. I arrive at this positive conclusion, first, from personal observation, as not a single fish we caught in the two rivers mentioned had a morsel of food in its stomach; also, the old hunters and Indians say the same thing, while the assertion of a proprietor of one of the Oregon fish canneries, whom I met on the stage, that out of ninety-five thousand fish which he had cut up and canned that season, only three had anything in their stomachs, ought certainly to prove what I say. It would be impossible, out of the thousands of fish caught in the seines used for the purpose, that there should not be at least a large percentage of fish who had just eaten—if they did eat. I never saw or heard of a salmon vomiting, either on being hooked or landed. I spoke of catching these salmon, and of course the question will naturally arise: "If they will not bite, how is it possible to catch them?" This is just where a curious anomaly makes its appearance. When a female is caught, she is opened and the roe taken out; it is quite large and moderately firm. This is used for bait, and at this and this only will a salmon bite. The hunters and Indians say that just as a bull runs at a red flag, there is a kind of irresistible fascination which causes them to swallow the eggs of their own kind; and moreover, while the salmon are in the river the trout will not bite at anything but salmon eggs. By the time the fish arrive at the head waters of the rivers they have changed from a smooth, lively fish, to a tired, battered, sometimes flimsy creature, of no account whatever for food, and eaten only by the Indians. At this time they develop huge dog-like teeth in their jaws, and the males fight savagely with each other. I have often seen them shaking each other like bull-dogs. The labor of preparing a spawning place still further reduces them, till at last a great many die of the wounds they have received from fighting and turning over the rocks to spawn. I have seen them collected in pools in hundreds and thousands, waiting to get strength enough to run the rapids, while their very backbones were protruding through the skin, a ghastly white color. The men who have lived long in the region say that they never get back to the sea, but die, just as a butterfly does in the chrysalis; that, in fact, the spawning is a final act of the fish, and it is certain that multitudes do die, so as to make the very stream polluted and raise a stench to be smelled for some distance.

Livingston Stone was asked his opinion on the matter when he first went up there, and replied at once that they did not return. A little while afterwards he "didn't know," and so the matter rests. I am a native of California, and shall be happy to give you any information respecting the Pacific Slope. R. TALLANT, Harvard College.

PHILADELPHIA, December, 1875.

EDITOR FOREST AND STREAM:—

Your enterprising correspondent, Mr. E. J. Hooper, who is doing so much to enlighten your Eastern readers as to the fish and fishing of the Pacific Slope, is at a loss, as many old anglers are, to know what salmon feed on. But a more pertinent question suggested to Mr. Hooper's mind is, "where they went to feed?" and the answer is a solution of the supposed mystery of the empty stomachs of all salmon taken by the angler.

Anadromous fishes, such as the salmon, shad, and river herring, acquire all their growth, fat and flavor not far beyond soundings, where the sea fairly teems with the lower orders of life. Dr. Knox, an angler as well as a scientist, mentions the eggs of various *echinodermata* and crustacea. Amongst the latter, Prof. Baird includes the *Myxus*, to which order shrimp belong; and there is no doubt that on their marine feeding grounds a salmon's stomach would be found pretty well distended with either or all of these. Canoe men who have attended me in my salmon fishing have assured me that they have speared salmon in bays and estuaries at the mouths of rivers, where the water was strongly brackish, which had been feeding voraciously on smelts, and on their congeners, the sparlings, which are about half their size, and that they have taken a score or more of the latter from the throat and pouch of a single fish. But as far as my search has extended—and I have examined them until I was convinced of the fact—I have never, in the fluvial portions of rivers where salmon rise to a fly, found anything but a stomach shrivelled to the size of my little finger, and filled only with hard, curdy substance.

It is conceded by all who have investigated and given thought to the subject, that anadromous fishes ascend rivers to breed, not to feed; that it is only the reproductive instinct that impels them thitherward; and it is not unlikely that this gradual depletion of body from the time they leave the salt water is necessary to maturing the ova and milt. As we all know, shad and salmon are unfit for food after spawning, and many die from their long fast and the exhaustion caused by breeding. Why then, it may be asked, does a salmon, shad, or herring rise to an artificial or occasionally a natural fly, or the salmon of California take a spinning bait, or even a minnow? Sir Humphrey Davy, I think, answers this query conclusively, that it is a remnant of its old predatory instinct; for a young salmon, before it goes to sea, is in no respect different from a trout in its habits and manner of feeding. A young shad has teeth which the mature shad has not, and feeds on flies like a trout or young salmon. So also do our river herring, or alewives, as they are called in New England. And yet all of these fish have shrivelled, empty stomachs while in our rivers, the occasional natural flies they may rise to never distending or being detected in them. THADDEUS NORRIS.

CENTRAL PARK MENAGERIE.

DEPARTMENT OF PUBLIC PARKS, }
NEW YORK, Dec. 19th, 1875. }

Animals received at Central Park Menagerie for the week ending December 18th, 1875:—

One Brown Pelican, *Pelecanus fuscus*. Presented by Mrs. S. G. Eastman, of Poughkeepsie.
One Red-billed Grebe, *Podilymbus podiceps*. Presented by Mr. Wm. H. Kirby, New York City.
Two pairs of Wood Ducks, *Aix sponsa*. Received in exchange.
One Prince Albert Curassow, *Crax alberti*. Received in exchange.
One King Vulture, *Gyparchus papa*.
One Cape Buffalo, *Bubalus caffer*. Bred in the Menagerie.
W. A. CONKLIN, Director.

UTICA PARK ASSOCIATION, }
UTICA, N. Y., December 14th, 1875. }

EDITOR FOREST AND STREAM:—

At the regular annual meeting of above date of the Utica Park Association for officers for 1876, the following gentlemen were unanimously elected:—

Hon. Charles W. Hutchinson, President; Hon. Miles C. Comstock, 1st Vice-President; Thomas R. Proctor, 2d Vice-President; Charles R. Weed, Secretary, and Alexander Buell, Treasurer.
Very truly yours, CHAS. R. WEED, Secretary.

The Kennel.

GUIDO'S LILLY.—The illustration on our first page, for which great credit is due to Messrs. Jacob Glahn and Sandford and Lohman, of West Meriden, Conn., engravers, is a capital likeness of this well-known prize winner. Lilly was born in May 1873, and is lemon and white. She is out of Arthur Gibson's Lilly and by Lancaster's Sam—all lemon and white, and superb field dogs. Gibson's Lilly is out of Fanny, liver and white, said by her owner, Atkinson, of Memphis, to have been imported at Baltimore, Md. Lilly's sire is Morgan, from kennel of Col. James Gordon, of Pontotoc, Miss. Sam's mother was imported by Wm. T. White, and his sire imported by Col. G. W. Morgan, of Botetourt County, Virginia. This strain is noted for rare intelligence and exquisite rose. May, Lilly's sister, won first at Memphis, 1874; her younger brother Noname won first at Memphis, 1875, and Lilly won first at Mineola, 1875. She was broken by T. M. Horsfall, and was his prime favorite.

—Mr. Theo. Morford, of Newton, N. J., has sold his fine orange and white setter, Duke, bred by himself, by Joe out of Nellie, to a gentleman of this city, for the handsome price of \$300. Duke is now two years old, and was worked on the prairies during the past season.

THE BIRMINGHAM DOG SHOW.

WE noticed in our last issue that the entries to the above show numbered one thousand. We have now the list of awards, and the comments upon the same by English papers, although we notice quite a variety of opinions upon the same subject. The following is from the Birmingham Herald:—

The pointers, though numerous, were not up to the Birmingham standard. The champion prize for large sized dogs, and Messrs. Elkington's cup for the best pointer in all classes, was won by Mr. Wippell's Wagg. The prizes for large sized dogs were taken by Mr. Mason's Marquis and Mr. Salter's Duke. Mr. Whitehouse and his lemon and white blood was still to the fore, although in the medium sized champion dog class his Joke had to "cave in" to Mr. Brierley's Sultan (Whitehouse blood), looking as sleek as a seal. Mr. Prior's Neil took the prize for bitches. In the small sized classes Pax and Cedric, Lady Pearl and Rosalie reigned supreme, with one exception—the champion class for bitches, where the prize was taken by Mr. Oliver's Luna, also bred by Mr. Whitehouse. In the medium class for dogs Mr. Norrish was first with Don the 2d, and Mr. Parr second with Don.

The English setters are admitted on all hands to be the *crème de la crème* of the show this year. The foremost of our setter breeders were well represented. Mr. Laverack, a veteran breeder of this century, was conspicuous by his absence, but representatives, and worthy ones, too, from the kennels of Messrs. Jones, Macdonald, Price, Llewellyn, Lower, &c., well supplied this deficiency, all of whom have the best Laverack blood in their respective strains. In the champion dog class Mr. Jones had an easy victory with his Quince II., Rap looking as well as ever—full of utility, good loins, stern and coat, and as sound feet as a dog of his age could have. In the champion bitch class Mr. Jones' Flash had to give in to Mr. Llewellyn's Petrel, his latter being without any pedigree given in the catalogue—why we don't know. It is not fair to the other exhibitors who comply with the Birmingham Show rules, by giving the pedigree as requested in the schedules, that their dogs should be given in prizes to competitors who exhibit dogs in violation of the rules of the show by withholding the pedigrees of the dogs entered. In the open class for dogs the first prize goes to a pure Laverack dog named Dash, by Pride of the Border, out of Dicken's alle; the second merit to Mr. G. de Landre Macdonald's young dog, Ranger II., son of his champion field pointer, Ranger, from Wonder, No. 1,567 in the Kennel and Stud Book, and winner of the stakes at the Devon and Cornwall Field Trials, 1873. This young dog won the second prize in the open class at the Crystal Palace Show at Summer; he was the best sterner dog in the show, and is faultless in his head, having a long, lean, intelligent face, full of expression. He is very much improved in addition, and is a young dog that must "come with a sh" to the front as soon as he is full grown, his pedigree both sides being long and illustrious, and his appearance all but perfect. Mr. Bower's Bandit deserves special mention, as he is somewhat of a celebrity, being by Mr. Jock (own brother to Mr. F. R. Hemming's Rock), and Mr. Bishop's field winner Judith. The English setter bitches were a grand class; in fact, the best in the show; Mr. Jones' Rival being one of the handsomest we have seen for a long time, though she succumbed to Phantom, a winner of the first prize, and Doro the Second, belonging to Miss H. Alderson.

The black and tan setters were a very good class. In the champion class we regret we cannot endorse the judge's opinion, as Lang, which was passed over, was immeasurably superior to Mr. Meyrick's Rock. Though showing a very superior in his muzzle, yet Lang's grand head and erect limbs, and well ribbed flanks, are as perfect as of record. In the bitch class Regalia, the property of Mrs. re. won the champion prize, and looked in brilliant condition of coat. In the open classes a new exhibitor, Mr. L. Parsons, of Taunton, showed in Grouse and Floss—both took the second prize for dogs and the first for bitches—a very beautiful brace, in splendid coat and condition, evidently evincing the patient care and attention bestowed upon them by their constant attendant, William. The first prize for dogs was won by Mr. Seville's house, and the second, for bitches, by Mr. Webley's alle.

The Irish setters were as fine a lot as have yet been exhibited at Birmingham, and Mr. Sandell gains first in dogs with Palmerston, the great winner at Irish shows; and Mr. Llewellyn second, with Kite. The prizes for bitches went to Mr. McHeffies' Mina and Mr. Kennedy's bus.

A correspondent of *Bell's Life* says of Dash:—He is a blue Belton, of the size and somewhat ressem-

bling old Dash, but he has not such a good head as his ancestor, being a bit broad across the forehead, and the shape has not altogether the remarkable Laverack carving, as it were, about it, which marks this breed of setters. The success of a Pride of the Border will be read with interest by our American cousins, for Mr. Laverack sold this dog and Fairy together, and an American has recently told me Pride of the Border is the best dog that has been imported.

THE MONTREAL HUNT SEASON OF 1875.—The "Montreal Hunt" held their first autumn meet at the "Kennels," 10th September and the last on the 13th November, at the village of St. Henri, nearly a fortnight sooner than ordinary seasons. The meets were well attended, the average number of horsemen present being about fifteen or twenty.

The pack consists of twenty-six couples, about twenty being the average hunted each day—Tuesdays and Saturdays. The covers usually drawn were situated within an area of from 20 to 25 miles on either side of Montreal.

It may fairly be assumed that the best horses in the Dominion are hunted with the Montreal hounds, and that in no portion of Her Majesty's Empire is to be found a stiffer country over which to ride than the Island of Montreal—the usual height of the post and rail fences and stone walls being 3½ to 6 feet. The best commentary upon a sharp and severe run of over an hour or so, is that of a field of thirty horses not more than three or four can live the pace!

THE MEMPHIS FIELD TRIALS.

THE FIELD IS THE TOUCHSTONE.

MEMPHIS, December 6, 1875.

EDITOR FOREST AND STREAM:—

The report of the Memphis Field Trial as given in the FOREST AND STREAM, leans so strongly toward the defeated Blue Beltons and Field Trial strain of setters, in spite of results already crystallized into history, that this critique is to defend the home and winning dogs, for whom no arm nor voice has been raised, and who are so freely pronounced inferior by those who failed to run anything against them superior, of which the plate, the purses, and the whole results wherever they were entered, are silent and eloquent witnesses. I honor the liberality, pluck, and chivalry of "Dogwhip," "Mohawk," Adams, and Taylor, in coming so far among strangers whom they left enduring friends, and am glad to know they came, and will come again not for gain, but for glory and for the good cause. They may in 1876 and thereafter, be able to demonstrate what they so staunchly believe: that the imported strains can surpass in the field our best natives; and when we see it we shall be heartily converted. But, this is not to detract from their merits—they are beautiful and good—but when the golden apples of the Hesperides shall germinate African crabs, or the virtuous loves of Sientia Caucasians shall engender Siamese twins, then shall I believe a noble race of pure native setters whose parents, grandparents, sons and brothers, have already proven capital field dogs, able and willing to beat the scions of imported stock before a cloud of witnesses, should be rejected as inferior, and accomplished facts discarded for an unfulfilled prediction of evil. In excess of enthusiasm, your own reporter has canonized faults as virtues, for he says "Maude and Paris, both flushing, were taken up. Romp and Rake—flush for Romp in corn, and well done." Had he but pointed, what eulogies and encomiums might we not have been favored with! In the genesis of this critique I wish to clearly state I base it on figures and awards we have had, and which I deem a bulwark of defence against imputations of unworthiness, shielding the natives with theegis of protection from ingratitude, and let us forgive them even for the capital crime of having beaten, both in the brace and champion single stakes—in all they ran for—the sons and daughters of the magnificent Leicester, of the queenly Dart, of Llewellyn's Prince, of Jerome's imported Shot, and of the near blood of the Marquis of Anglesea crossed on the Tilley Gordons. We adopt "Mohawk's" declaration that the Tilley Gordons are more closely allied to the imported than native strain, and this imported strain being bred to the English Blue Beltons of the Marquis of Anglesea, classifies Romp and Rake as nearer the imported than the native strain, I am specially glad that in these genuine English Blue Beltons the native brace, Tom and May, had adults (four years old) and broken, and here worked by the acknowledged prince of trainers, Mr. Thomas M. Horsfall, to contend with. Over the Field Trial entries it is conceded the natives had an advantage in age, but this should have been more than balanced by the claimed extreme superiority of blood, and was certainly reinforced by the more careful breaking also of the royal entries. If the royalists aforesaid must have equality at least, at all points in order to compete at all with native setters, their superiority is not evident as sunlight, but per contra, is so occult as to demand a microscope. While we are sincerely glad the imported strains contested in the Memphis Field Trials, giving the natives worthy foes and beautiful prisoners after the test was over, we will have passed America's second Centennial ere practical sportsmen will utterly discard winning republicans, doing royal work under the poorest handling (as did Campbell's Tom and May, Tom again when he won the American championship) for royal losers, doing less perfect work with far higher scores for breaking. It will be after the asserted superiority of the Beltons and the Blues shall have been clearly proven and their defeats covered up with victories yet in the dim uncertain distance, ere our pure, fast, staunch, and oft-tried winning natives can shake their gory locks at us and mutely say, as we discard merit for fleecy beauty: "Ingratitude, thou marble-hearted fiend, how sharper than a serpent's tooth it is!" Gentlemen, when you shall have won the laurels, it will then be time enough to wear them; do not anticipate and claim them in undue confidence, for your pleasure and renown will be lessened when you shall have reached the now unwon goal; and should you by any chance again be beaten in 1876 as in 1875 and 1874, your Phaphar and Abana of Hope will again be tinged with the Marsh of an annual defeat. If those who are more than satisfied with their own true Blues, and are more than dissatisfied with the native ready Reds, assert the Campbell entries were flukes, we are quite sure those who have known them, longest and best, proclaim them all flukes of the same calibre, a whole race of flukes without a known exception. I doubt not the defeated have abundant plausible excuses, but the most numerous excuses are the most barren substitutes for success. However, they may prove sorely needed crumbs of comfort—manna steeped in honey. Had the case have been altered, it might have altered the case. Let not the blue bloods again say (for their own credit) their dogs had been run too much, were exhausted, for the extreme limit of each race was two hours, and allowing them to have run the full time of each race consecutively (which they did not), they had to run but six hours in two days. If that pumped them out I do not admire their system of water works. And this, too, after several frosts. What will Summer prairie shooters think of this, men who have hunted dogs under eighteen months old, the same length of time in one day, without distress, and repeated it merrily on the morrow? But one writer says it is the produce of imported dogs that is destined to sweep the natives from the field. For us, "Shamrock," he is a Cassandran prophet, but all his demonstrations are as yet castles in the air of the future; but let us see how this idea works retrospectively, for exactly such an animal ran in the late Field Trial at Memphis, the Gordon bitch "Mab," aged and worked by her trainer, the chiefest among ten thousand, Mr. T. M. Horsfall. I do not fear contradiction from any witness or any reader of the record, when I say her work was extremely poor, her chances the most favorable of the

day, and her score the lowest of the entire meeting. One point, with her tail awag all the time, and five flushes, made among hard lying quail in sedge-grass, was the evidence she gave to support the authority above, and prove her superiority over our best natives. The record shows 53 out of 100 for her and her mate, and their most partial friends knew that to be a most liberal score of their earnings. The statement that Maude, Paris, and others of the Belton and Llewellyn strains were put down at the worst time of day, and the natives when birds were feeding and it was cooler, is a weak begging of the question, proven by the fact they were taken up, and again put down at most favorable times. Did I not feel assured this is an omission of the writer referred to, I would not fail to say *suppresso veru* is cognate to *suggestio falsi*, but he shall have the benefit of the doubt. One commentator, whose eyes can see but an imported mouse, although a home mountain were between, endeavors to put Tom and May, the winners, to disadvantage, by saying they had already had many thousand head of game killed to them, showing they had been elegant workers and perfect successes. That is what we want, and while their meritorious past is thus inadvertently admitted, he would have us adopt untried dogs for the future. This argument is like "vaulting ambition which overleaps itself and falls on the other side." Is proof of ability, will, and success, a bar? If so, I call on Mr. Clickener and Mr. Williams, (of McLaren & Williams, St. Louis,) to join me in drinking the health of the Campbell dogs, pronounced by them, disinterested witnesses, the best dogs of the entire trial to draw blood over. GUIDO.

FOOD FOR DOGS.

EDITOR FOREST AND STREAM:—

I was much amused at Mr. Fitchet's idea of the proper way of preparing food, and ere long will give you mine. All I could say in favor of mine is, that I seldom have a case of sickness of any kind, and not a single case of perceptible distemper within the last ten years, and during that time I have at no time had less than ten to twelve dogs in my kennel, and at present I number sixteen. E. A.

By all means give us your mode of feeding dogs so as to get rid of distemper.—ED.

KENNEL PRODUCE.—On the 16th inst. Mr. J. E. Fisher's red Irish setter, Belle, dropped four strong pups to Hamilton Thompson's Duke. The litter comprised two dogs and two gyps, all a rich blood red, and doing well.

MAGAZINES.

St. Nicholas. The promise made by the editors of this charming magazine that its December number should excel any of its predecessors appears to have been faithfully fulfilled. A perfect plethora of good things has been served up as a Thanksgiving dessert for all the good little boys and girls (and are there any who do not?) who read *St. Nicholas*. Very appropriately, the portrait of the great story teller, Hans Christian Anderson, adorns the frontispiece, surrounded with illustrations from his own inimitable stories. Mr. Noah Brooks' story, "The Boy Emigrants," is continued to the fourth chapter, the only serial, by-the-bye, in the number. Nearly all of the articles are illustrated, and one of them, "One Hundred Christmas Presents and How to Make Them," is accompanied by no less than twenty illustrations and diagrams. Mr. Trowbridge's "Bass Cove Sketches" are continued, the present one being entitled "Off to the Island." Jack in the Pulpit continues his pleasant week day sermons, and the Riddle Box offers a handsome model yacht as a prize to the best guesser.

The Popular Science Monthly for December contains the usual number of valuable papers, contributed by some of the foremost scientific writers of the day. Prof. W. S. Barnard contributes an interesting illustrated article entitled "Opossums and Their Young," which treats in an elaborate manner of *Didelphys Virginia*. It is a little remarkable that this our only marsupial is found neither in Europe, Asia, or Africa. Mr. Herbert Spencer discourses of "Idol and Fetish Worship," and Mr. Hezekiah Butterworth gives close attention to a very worthy subject—"Strange Mental Faculties in Disease." The place of honor is accorded to a valuable paper by Prof. Tyndall, entitled "Martineau and Materialism." We desire to congratulate Prof. Youmans, editor of this magazine, upon his safe return from his European trip.

Wide Awake. The sixth number of this new publication, edited by Ella Cameau, and issued from the press of Messrs D. Lathrop & Co., is before us. It is wonderful how the children of this generation are catered for. Here is a rival to *St. Nicholas* springing up and already taking hold of the affections of the little ones. The present issue is a perfect mine of treasures, comprising illustrated stories for all ages. The favorite story of "Little Silver Hair and the Bears" is done in rhyme, and birds, beasts and fishes all come in for notice. "Kim's Last Whipping" points a moral, and "The Magic Carpet" is like a glimpse of the "Arabian Nights." *Wide Awake* has been consolidated with the California juvenile magazine known as *Sunshine*, and the combination promises to work successfully.

THE TRAVELER'S OFFICIAL GUIDE is published monthly by the National Railway Publication Company of Philadelphia. Being the recognized organ of the National General Ticket Agents' Association, it is thoroughly reliable, besides being the most comprehensive publication of the kind issued. The December number is now out.

Yachting and Boating.

HIGH WATER, FOR THE WEEK.

All communications from Secretaries and friends should be mailed no later than Monday in each week.

WINNING YACHTS OF 1875.

WE last week published a list of regattas and matches in American waters for 1875. We now print a list of winning yachts in our own as well as English waters. We may make the same remark as we did last week, that there are probably some omissions and inaccuracies, but such are almost inseparable from a work of this kind. The American list comprises over three hundred vessels, and the English but seventy-four, but in the latter case only yachts of five tons and upward are noted, and if the list had been continued to the same limits as our own the numbers would have been more equal. It must be borne in mind that across the water a vast number of yachts are

used for cruising purposes whose names never appear in lists of entries, and that the vessels below are almost exclusively racing craft.

We cannot see that the past season has been productive of anything of unusual interest as tending to determine any of the vexed points in yachting matters. The question of keel versus centre board for large yachts still remains in *statu quo*, and while bearing in mind some of the really meritorious performances of the Mohawk, we think that the balance of the testimony tends in favor of the keels. The coming season, however, promises to be fraught with incidents of much importance. The occurrence of the Centennial, and the establishment in England of a Yacht Racing Association, indicate a thorough revision on both sides of the water of all rules applying to time allowance and measurement for tonnage, where the latter forms the basis for allowance.

LIST OF ABBREVIATIONS USED IN THE LIST.

There will be no change in our fur quotations until the middle of January.

For Forest and Stream.

REMINISCENCES OF AN OLD TRAPPER.

"EAST SLANG" and the "South Slang!" Since the first Green Mountain boy set up here his household gods and began his "betterments" in the heart of the great wilderness which covered all this fertile plain, these tributaries of Little Otter have borne these euphonious names. Rich fields were they, and for many a year were the haunts of the otter, the mink, and the muskrat. The otter has long been a thing of the past in these waters, to which he stood godfather even in the aboriginal days, for "Wonakakutuk"—the river of otter—was it known to Abenakis. "Riviere La Loutre" the French explorers christened it, and the English only translated the name again to Otter Creek. The last otter seen in this region was shot at by Platt Gage, in the South Slang, thirty years ago, and the last killed succumbed to the long smooth bore of old George Champlin, longer ago, in Lewis Creek, hard by.

Such a fertile trapping ground was this that L., who lived at the falls, when hard pressed by creditors to name a day when he would pay a bill, used to put them off by saying "He didn't know, it all depended on Tim's luck up the East Slang." Tim was his son, a mighty hunter and trapper, and the father of fox hunting here, according to the New England fashion.

Mink have become scarce since their fine fur grew so valuable, and will soon be numbered with the extinct unless they fall from gracing the forms of the fair sex, and to such cheapness as they bore in the days of my boyhood, when Bill Berch caught thirty-six one Fall, and was thought to have been on the high road to fortune when he sold them for seventy-five cents each. They were plenty as squirrels then, and their regular tracks — — — dotted their way through the snow from hollow log to hollow stump all along the shore of this stream. Then C. W. and I trapped with one trap—a double spring one—fit to hold a wolf, and given to me by Sils Bailey, having come into his possession in some mysterious way, and we seldom failed to get a mink for each setting. I remember well how we found where a mink had dragged a large perch all the way down from Lewis Creek to the Slang, a mile at least, and had left some crumbs from his bounteous feast at the door of his house, which was the hollow stump of a great water maple, standing in the marsh, and these fragments we used for the bait of the trap, set with such pious care as became young trappers, and how upon going next morning to the place I found unmistakable signs that the mink had been caught; but he was not there, only the trap, all in pieces, but neatly piled up, and some small tell-tale boot tracks leading away. These I followed, and ran the young thief to cover in his father's house, a mile away, and recovered my stolen furry.

The old stump and old trap are gone, and my old comrade is in the great West, engaged in greater and more lucrative business than trapping mink at seventy-five cents a skin, but never happier, I'll warrant, nor as free from care, as when he and I were vagabondizing on the shores of Little Otter and the East Slang.

The muskrats—"mushrats" we called them—were innumerable in those days, and towards the close of a bright April day we would seat ourselves on an old log and see a dozen of the sleek fellows at a time clearing the calm waters on their silent way to a neighboring burrow, or to some bog or log, on to which they would crowd with a clumsiness so different from the ease and grace of their movements in the water, that one might think the animals underwent some magic metamorphosis on emerging from their most congenial element. Then we would "sneak" them up to us, simulating the cry which they utter in the season of their amours, which resembles the whining of young puppies. When our victim was within easy range

we would blaze away with our charge of BB's. Then our rat, if he was ours, riddled through and through, and done to death, but struggling bravely to the last gasp, would splash and spatter furiously for a moment, turn on his back, and with a few final kicks give up the ghost; or perhaps dive, and when he had been lost to sight until hope had died within us, would pop suddenly to the surface stone dead, with his jaws full of the bottom sedge and rushes, to which he had fastened with a death grip. But too often, alas, for the satisfaction of our thirst for his innocent blood, he would disappear at the flash of our gun, and as instantaneously would go his way under water, and we would see no more of him till he was far out of range. Then it was the gun that hung fire, or the shot was too light, or anything but the flurried aim of the too certain shooter. And so we would continue blazing away till the shades of night came down, and the swimming rat could not be seen; only the bright wake, at which we would shoot just where its brightness clove the darkness of the shadowed water. And then, when sights were undistinguishable, we would gather up our dead and wind our way homeward, splashing through puddles, stumbling over logs, tired, happy, and hungry. Here, now, is a log—an ancient log—barkless, mossgrown at its landward end, smooth and water-worn towards the stream in which its smaller end lies, at right angles with the shore, and notched all along at intervals for half its length, on the upper side, by the axe of the trapper. Here, nearest us, is a water-worn trap notch, made thirty years ago, perhaps, by the axe of old Josh, who said "the rats were decreasin' faster than they diminished." It was high water that Spring, and the water was over this notch then, as the brown turf is now over the man who cut it. There towards the farther end, where you see a forked stick in the water, is a trap set now, in a notch like this, about two inches under water, and into that forked stick is slipped the ring of the trap chain. Just this side of the trap you see a little "sign," showing that the favorite old log is still in favor with the few surviving members of the house of Musquash, and no doubt when our friend, the trapper comes to-morrow he will be rewarded by pulling to the surface the humped up and water soaked body of a "drowned" rat. If the trap is not so set that the rat will drown, he will leave the trapper nothing but his toes as a memento of his brief captivity. But there comes the trapper now, making his daily round, poling his "trotlish" craft through the tangle of button bushes and the sprouts of the water maple. Now his quick eye detects signs on that old log; he levels a place for his trap, sticks his tally pole, has his trap set in five minutes, and goes on his way towards that remnant of muskrat house. There is a feed bed, and a trap set in it, and, see, he has taken a rat there. Now he comes towards us, and hauling up alongside our log he sees his trap is not on it, as we supposed it was, so he takes out his trap hook—much like a gaff, only with a longer handle—and groping on the bottom soon gets foul of the trap chain, and directly brings up a muskrat, stark dead and dripping, with one forepaw in the trap and his scaly tail curved downward, shaped like a cimeter.

"What luck?"

"Only seven to-day out of twenty traps I've been to; they haint no rats."

These fellows are always grumbling that there are no muskrats, while it is their own fault that the animals are not plentiful, for they trap for them in the Fall, catching many worthless "kits," and in Winter and Spring they also trap them, leaving the poor, persecuted brutes unmolested only during the Summer, and they would not give them even that respite if the skins would then bring five cents each.

The trapper will land to chat with us, and skin his rats while the feast of reason is progressing. You see that he begins at the head, ripping from the chin to between the fore legs, and, skinning the head, he strips the skin off whole to the tail. How readily he does it. He will have the seven skinned in twenty minutes. Those rods of "nancy bush" in his boat are bows for stretching these skins. He will bend them into the shape of a snow shoe and draw the skin on, flesh side out, and then fasten it at the ends of the bow by cutting a cleft therein with his knife, into which the skin draws and is held. This he will not do till he gets home, as the stretched skins would make an awkward bundle. And now our trapper goes his way, leaving the carcasses of the muskrats lying on the ground; and a royal feast will they make for those hungry crows cawing in the tree tops yonder.

Make a note of the fact, in case you should ever wish to catch a mink, that there is no better bait for him than a bit of muskrat. It will attract him quicker than fish even.

AWASOOS.

HOW TO TRAP FOXES.—The trapper selects a spring as near as may be to the line of travel followed by the foxes. This is dug out so that the water may occupy a pool at least four feet in diameter. The brook or streamlet issuing from the spring should be so arranged that the trapper, approaching the latter, may do so by walking in the water, for if a human foot track is ever found about the premises no fox will come near it, save with the greatest suspicion. The trap—the common steel one—is placed in the water of the spring, just so deep that the pan of the trap is under it not more than half an inch. The position of the trap, in reference to the margin of the spring hole, is about that of the distance of the length of the trap spring. The bait is placed in the water beyond the spring, in the direction of the middle of the spring, about the same distance from the trap that the trap is from the margin. The trapper then cuts a little pole about six feet long, and, balancing it upon his finger to find the middle of it, drives into it there a staple, and thus fastens the chair of the trap to the pole. The best bait is a piece of a skunk with the hair on. This is placed upon a stone so that the hair side shows. The trap being in its place, the pan of it is to be covered with a bit of moss so arranged that while it covers the pan it does not touch the jaws. The jaws are to be covered with leaves, and the chain also, if it cannot be hid in the mud at the bottom of the pool. The whole spring should have its bottom strewn with leaves. A few drops of the musk of the skunk should be left on the ground, within a foot of the pool, on some hard dry spot. In all the work which these directions involve, the utmost care is necessary that the human hand shall touch nothing except that which is under water. The bait has to be handled with sticks. The pole should be, if possible, sunk in the mud of the outlet. Neither the hand nor the foot of the trapper should touch the ground around the pool for twenty rods, if possible. The trap should be visited once in two days. If the

trap is gone the track of the game can be easily followed in the snow. In any case the fox cannot go far before the toggle catches and brings him up. He commonly goes down hill.—Rutland (Vt.) Herald.

Answers To Correspondents.

No Notice Taken of Anonymous Communications.

F. F. J., Springfield.—To obtain "Fur, Fin and Feather," forward 50 cents to Chas. Suydam, No. 149 Chambers street, this city.

E. M., New York.—Mr. W. P. Pape has returned to England, but, we understand, will be here again in the Spring.

RATTER, Port Hope.—The Bazar office, 32 Wellington street, London, have just published a six penny work on ferrets, with instructions concerning their breeding, management and working. It is well spoken of.

CONN, Danbury, Conn.—Please inform me where I can get a safe and good gun for \$35, what make; breech loading? Ans. There is no good safe breech loading gun made at that price. We have a good second-hand gun for sale at \$35.

D. W., Chicago.—I would very much like to get your opinion as to which gun would have the greater recoil, a large or small bore, everything else being equal, as length of barrel, weight of gun, same style and material, same charge each of powder and shot, etc., with reasons therefor? Also, would it follow that if either bore has greater recoil that it shoots the stronger, or the reverse? Ans. The larger bore would, in all probability, have the least recoil, and shoot equally as strong, if not stronger.

G. S. J., Keene.—1. Is a Remington gun, 10 bore, 8½ pounds, perfectly safe with 4 drachms of good powder as its charge? 2. I am about to buy a rifle; want one that I can use at the target 500 yards; want the ball as small as possible, yet to be death to a deer, if well directed. What will be the right thing? Ans. 1. Yes. 2. We cannot recommend any particular rifle. You have half a dozen to choose from among those advertised in our columns.

F., Pike county.—Do the Sharps sporting rifles correspond with your ideas of a short range rifle? If not, whose make does correspond in the twist and penetration? What is the objection to the old-fashioned Sharps rifle that used paper cartridges and caps? There must have been some, or they would not have quit making them. What is the address of the maker of the sporting rifle? Ans. Yes. The objection to the old style was the use of the cap, whereas in the new rifle, fixed ammunition is used. Messrs. Merwin, Hubert & Co., are the makers of the Phenix rifle.

BLUE JAY.—Is such an article manufactured for gun barrels as laminated steel, and will you please state process of manufacture? Ans. Laminated steel is used for all the best gun barrels; the process may be briefly described as twisting narrow strips of metal spirally round, and welding them together. 2. Can you tell me the season of the year the worm fish (called fall fish) spawn? Ans. Don't know. Has Blooming Grove Park lately suffered by forest fire? Ans. Up to last month it had not.

W. LIVINGSTONE, Rutland, Vt.—1. Where would I be most likely to sell a case of Vermont birds, containing over 100 kinds, mounted by myself? Ans. Advertise in FOREST AND STREAM, or write to C. J. Maynard, Newtonville, Mass. 2. Write in reference to employment to the Secretary of the Museum of Comparative Zoology, Cambridge, Mass., or to the Society of Natural History, Boston, also stating your wish to collect in the South. 3. Your liability to fevers in the South will depend on various localities and other circumstances, and cannot altogether be decided beforehand. 4. Do you know of any rifle shooting a single B shot that I could get cheap? Ans. We know of no rifle of so small a calibre, unless it is the Hobart parlor rifle; price \$10 to \$15.

BISMARCK, Hackettstown.—I have a very fine Bismarck pup eight months old. When about two months old I washed him with carbolic soap to destroy fleas, and three days after he went blind in both eyes and remained so for two weeks, when the right eye came to and the left eye remained blind four weeks, and when the left eye came to, the right eye went blind again, and enlarged twice the natural size, and remains so yet. I would like to ask your opinion, whether it will make any material difference in his hunting or not; and if there is any cure for him, and if so, what? Ans. We have doubts if your dog can be cured; but the loss of an eye will not materially affect his hunting. The famous Sancho, belonging to Mr. Forman Taylor, has but one eye, yet it has been offered to hunt him against any dog in the country.

ONTARIO, Cleveland, Ohio.—1. In your issue of Nov. 11th you have an article headed "Pistol Shooting Extraordinary," which induces me to ask your opinion of the enclosed target, made by myself with a Colt's navy, 5 consecutive shots, 100 feet. What do you think of it? 2. What is the cost of the Wesson rifle, and where is it manufactured or sold? Ans. 1. We have never seen better shooting than that represented by the target you sent to us. 2. The Wesson rifle is manufactured at Worcester, Mass., and is sold by the gun dealers advertising in our columns. Prices vary according to size and finish; the rifle mostly used is sold for \$27.

B. M. R., Danbury, Conn.—1. Will you be kind enough to inform me in regard to the points of an Irish setter? I bought one, which was recommended to me as such, but have been told that he was not. Mine is large and high standing; color, red, except the chest and toes, which are white; he has soft silky hair and curly around his shoulders; nose not very broad; large, fine formed head—a fine-looking dog in every particular. 2. Another question I would like to ask: Did the Irish Rifle Team, the first time they came over here to shoot, bring with them an Irish setter for breeding purposes? If so, who had the dog, or who did they leave it with when they returned? Ans. 1. We cannot tell from your description if he is an Irish setter or not. 2. We have no knowledge of the Irish team having brought out any dog with them.

T. H. M., New York.—A friend of mine, a few weeks ago, had knocked down to him at an auction sale, a fine 12-bore, top snap, rebounding hammer gun marked "Wm. Moore & Co., London," for the sum of \$72. On taking it to a practical gunsmith, however, to be looked over with admiration, he was somewhat disconcerted to be assured that the gun not only never came out of Moore's shop—if there is any such place—but was never made in England at all, being evidently of Belgian manufacture; that the gun was, however, a good piece, and worth the money. Is there really such a firm as Wm. Moore & Co., and if so, how do their guns stand, and do they have an agent in this city? Ans. There is no such firm now in existence, but if your friend has a gun worth the money paid for it, why should he be dissatisfied? We should not, however, consider an auction sale as the place to pick up a really fine gun, unless, indeed, it was a sale of the effects of some sportsman gone to the happy hunting grounds, or otherwise *hors du combat*.

ALECK, Hannibal, Mo.—I am troubled with bronchial and throat disease, and have been advised by my physician to go to Colorado next Summer and "rough it." Please state if the enclosed list is a proper outfit, etc.? Ans. Forty pounds, in addition to a rider of average weight, is all that prairie travelers are willing to pack on a horse's back. Blankets, extra clothing, etc., are strapped on the counter; the saddle bags contain little conveniences; it is quite practicable to carry your flour, etc., in bags, as you suggest, if you can only keep it dry. On the plains good horses can be bought for \$40 each, and an extra animal is usually taken along for a pack horse. The best mount you can have is a mare, and a mule to follow. Matches are often carried in a bottle to keep them from the damp, but a bottle may break. A vulcanite rubber box will not break, sink, get wet, or burn. A gun and rifle are necessary. For a trout rod, cut a sapling in the mountains, whenever you require to use it. It would be quite unwise to travel alone, but there are generally parties that you can attach to. Holabird's clothing makes a very desirable over-suit, and is becoming much in vogue.

A WEEKLY JOURNAL,

DEVOTED TO FIELD AND AQUATIC SPORTS, PRACTICAL NATURAL HISTORY, FISH-CULTURE, THE PROTECTION OF GAME, PRESERVATION OF FORESTS, AND THE INOCULATION IN MEN AND WOMEN OF A HEALTHY INTEREST IN OUT-DOOR RECREATION AND STUDY.

PUBLISHED BY

Forest and Stream Publishing Company.

Advertising Rates.

In regular advertising columns, nonpareil type, 12 lines to the inch, 25 cents per line. Advertisements on outside page, 40 cents per line. Reading notices, 50 cents per line. Advertisements in double column 25 per cent. extra. Where advertisements are inserted over 1 month, a discount of 10 per cent. will be made; over three months, 20 per cent; over six months, 30 per cent.

NEW YORK, THURSDAY, DECEMBER 23, 1875.

To Correspondents.

All communications whatever, whether relating to business or literary correspondence, must be addressed to THE FOREST AND STREAM PUBLISHING COMPANY. Personal or private letters of course excepted.

All communications intended for publication must be accompanied with real name, as a guaranty of good faith. Names will not be published if objection be made. No anonymous contributions will be regarded.

Articles relating to any topic within the scope of this paper are solicited. We cannot promise to return rejected manuscripts.

Secretaries of Clubs and Associations are urged to favor us with brief notes of their movements and transactions, as it is the aim of this paper to become a medium of useful and reliable information between gentlemen sportsmen from one end of the country to the other; and they will find our columns a desirable medium for advertising announcements.

The Publishers of FOREST AND STREAM aim to merit and secure the patronage and countenance of that portion of the community whose refined intelligence enables them to properly appreciate and enjoy all that is beautiful in Nature. It will pander to no depraved tastes, nor pervert the legitimate sports of land and water to those base uses which always tend to make them unpopular with the virtuous and good. No advertisement or business notice of an immoral character will be received on any terms; and nothing will be admitted to any department of the paper that may not be read with propriety in the home circle.

We cannot be responsible for the dereliction of the mail service, if money remitted to us is lost.

Advertisements should be sent in by Saturday of each week, if possible.

CHARLES HALLOCK, Editor.

WILLIAM C. HARRIS, Business Manager.

A MERRY CHRISTMAS!!

CHRISTMAS FOR POOR CHILDREN.—The Children's Aid Society, which has been an important agency for the relief of the suffering poor, appeals to the benevolent, young and old, for means to enlarge its usefulness during the approaching holidays. The Society desires means to send out a party of homeless children to the West, to furnish clothing, shoes and food to thousands of destitute children in the city, and to give good Christmas dinners to the inmates of the Lodging Houses. Donations of provisions and clothing may be sent to the Central Office, 19 East Fourth street; money may be sent to W. A. Booth, President, 100 Wall street, J. E. Williams, Treasurer, Met. Nat. Bank, 108 Broadway, or C. L. Brace, Secretary, 19 East Fourth street, New York. This society has cared for about 14,000 boys and girls in its five Lodging Houses, during the year, of whom over 4,000 have been provided with homes; over 10,000 children have attended the various schools of the Society, and many thousands more been furnished with meals and lodging. The almoners of such wide-extended and important charities deserve encouragement.

A KINDLY ACT.—The fish dealers of Gloucester, Mass., have forwarded to the Howard Mission of this city a present of 3,000 pounds of cured fish, which, with the potatoes supplied by other charitable persons will make a hearty meal for many a hungry family this Winter. The generosity of sailors is proverbial, and in this instance the virtue is extending to the shore division of the calling.

FROM THE WEST.—We recently received a pleasant call from Mr. Zimmerman of the St. Paul Sportsman's Association, who presented us with photographs of himself and his splendid dogs, Fuller and Occie, also one of Mr. G. W. Baldwin, who for two years past has held the champion badge of Minnesota against all comers at the trap. If they shoot as well as they photograph in Minnesota, their "artists" must be at the top of the tree.

By the bye, speaking of photographs, we are indebted to Rev. Joseph Waugh, principal of the Hollidaysburg (Pa.) Seminary, for another, showing a perfect pyramid of game, and indicating that the institution of learning, over which Mr. Waugh presides is admirably adapted as a place for teaching the young idea how to shoot.

SUGGESTIONS TO NEW RIFLE ORGANIZATIONS.

FOR practical purposes, at the commencement of a rifle organization use military arms, for such weapons are exceedingly accurate at all ranges up to 500 yards. One great point to be gained by employing these particular arms, is, that they are inexpensive and readily obtainable, but what is more important is the fact that by using military arms National Guardsmen are naturally led to become a part of such association, and regimental officers of all grades are ready to give their assistance. Having a preponderance of military men in the association is of vital importance, as it entitles it to public support.

It is exceedingly unwise at the initial movement of the rifle range to devote too much attention to long range shooting. As it is, we are all inclined to think that a great many associations outside of New York are giving too much of their time to this branch of rifle practice. Let us have prose first, and afterward we may indulge in poetry. In order, then, that men should be somewhat accustomed to their arms, is the reason that we advise at first the use of the military rifle. As the taste increases, more accurate and elegant arms, adapted for distances over 500 yards, may be employed.

At 200 yards, as an extreme range, outside of the military arms there are innumerable rifles which do capital work, and which are readily purchasable at a low figure. Most especially develop, then, off-hand shooting, for the simple reason that in a very short time, with a moderate amount of practice, the members will be amazed at the skill acquired. Most individuals in a rifle association are accustomed to shoot off-hand, but have never been taught to appreciate distance, nor effects of elevation, nor any of those simple corrections for light or wind, which enter so largely into accurate shooting. As there is nothing very new or not readily comprehensible to those shooting off-hand, as to position alone, these more novel points as to corrections may be readily inculcated. Off-hand shooting, predisposing to composure of nerve and steadiness, is the first great school of the rifle. It may be taken pretty much as a fact that a man who can score bullseyes off-hand at 200 yards, will find no difficulty in doing the same thing at 1000 yards, while there are a great many skillful riflemen who may be dabblers at extreme ranges, who would not make an average of centres at 200 yards. Some men can dance very elegantly who walk very awkwardly. A good leaven of military men in all country rifle associations, on account of the discipline which they bring into it, is of the greatest advantage. It is true that the country soldier does not rendezvous in a palatial armory, nor can he be resplendent in a showy uniform, nor does there exist the *esprit de corps* which is found in the crack city regiment. Even his drill may be looser, and martinet officers exceptional, but what he has is, in the first place, greater familiarity with arms in general, and what is better, more time, more leisure than the city man which he can devote to practice. It is extremely difficult in a large city to find men, engaged in any business, members of military organizations, who can find the opportunity to shoot. In the country men are not so entirely absorbed in their business. The distance to be traveled over in New York, for instance, in order to get to a range takes several hours, and it is a whole day's business to go and return. In the country, a mile off from the town centre, a squad of men could practice, and accomplish in a couple of hours or so, what would have taken the New York man all day to get through with. So certain are we that the country possesses the stuff out of which the ablest marksmen are to be made, that we believe, in time to come, in the next three or four years, that the champion men in some future American team, will be in the major part drawn from the country and country towns, and not from the larger cities. The best proof we can now bring forward, in defending this prophecy, and of the excellence of country organizations, is the skill developed in the Fourth regiment, of Oswego, and it is no small feather in their cap, that a company of them beat clean out of sight such crack city companies as those of the New York Twenty-seventh and Twenty-third regiments. It was a familiar early acquaintance with off-hand shooting which gave the Oswego men almost fifty per cent. better scores than their competitors.

It might be well, in order to interest a certain class of marksmen, who, though good as off-hand riflemen, do not care for the monotony of regular target shooting, and who are used to sporting rifles, to practice on a moving target. Such targets could be made out of sheet iron, either in the shape of a man or a deer, and fastened on a track and allowed to pass down an inclined plane. For such a purpose the inclined track should be about 50 feet long and the velocity imparted to the figure ought to be about 7 to 8 miles an hour. This kind of work would be sure to bring out the hunting element, the men certain to knock a deer over when running through the woods. That coolness and quickness of aim which is found so abundantly in the country could show its prowess here. Before a running deer on a range the country marksman would develop such wonderful skill that the city man would play a ridiculous figure. In regard to "the running deer" it seems singular that the manufacturers of repeating arms have not seen before this the advantage of such a moving mark, as the use would essentially help to establish the claims to excellence urged by various makers. It would be a triumph of marksmanship and of arms to see a man hit a running deer three or four times as it passed over a space of fifty feet. Such a target is about being provided at Creedmoor. The system of monthly matches for badges, to be shot

for until won by the same individual three times, has done more to stimulate rifle practice than anything else. It allows the inexperienced opportunities of measuring their strength against veteran shots. It keeps up a pleasurable excitement and occupies the range. It induces many indifferent shots to enter into the association, and men of means are never found wanting, who are not glad to offer prizes for such a worthy cause as the development of military rifle shooting. Lastly, by all means propitiate the local press. Never on gala occasions neglect having a Press Match. Creedmoor and the National Rifle Association, in fact, the whole rifle movement in the United States, owes a great deal of its progress to newspaper men. Treat your local editor and the reporter who comes on the ground with the utmost courtesy. If he does not understand it all at a glance, you may be sure that he will be at the very bottom of it in a remarkably short time. Ink and paper, though they are noiseless, keep up a din of an incessant character no rifle can make. Then it is best always to advertise your matches. Above all, remember that ranges and rifles associations are made chiefly for the soldier, and that the element so unfortunately called "the sporting man" must have no place on it. Sedulously keep down all bets, or wagers, or anything likely to convert your association into a gaming club. So far in this country, and it may be one of the reasons for the great success of the rifle movement, no missionary association has ever been purer, nor freer from the gambling pollution than our rifle organizations.

GAME PROTECTION.

THIS special department of our paper, which we make so prominent at the present time, is most valuable, because it not only reflects the opinions and personal observations of our leading sportsmen all over the country, but serves as a receptacle for valuable information and discussion respecting the habits of creatures, the proper times for fixing close seasons, the rights of farmers and landowners, the depredations of poachers, violations of law, &c. &c.; all of which will eventually be of great service to any committee appointed to investigate these matters.

With regard to the difficult problem of law to stop violations of the game laws and punish offenders, in face of a strong public prejudice against their enactment, which makes prosecutors odious, too much wisdom cannot be secured. One correspondent whose influence and reputation is wide, writes as follows regarding the abuses in the Adirondacks:—

"I need not assure you that I am interested in the preservation of our Adirondack game; at the same time I must confess that I have become sick of the game law business. The law has been changed so often that I have little confidence in its being made efficient, and still less in keeping it so, if perchance the right policy should ever be adopted. You know that hotel keepers, guides, and hunters break the law in relation to deer, and have always done so without fear of consequences. Can you suggest any way to make the law operative in the woods?"

"You know my views in relation to the market question. The Adirondack territory cannot afford to furnish venison for our large city markets. I may remark here that with a dead letter law that forbids killing deer after Nov. 10, the market season is kept open until Feb. 1st, the natural effect of which in respect to still hunting, needs no comment. If there is really any intention to improve the law and make it more efficient for the preservation of game, I shall rejoice, and will do all in my power, but I very much fear, from past experience, that nothing will come of it. If night hunting and still hunting in deep snows could be suppressed, leaving August, September and October open for hunting, the deer would increase rapidly. I should by all means advise an early closure of the market season in respect to venison."

We take few exceptions to the law as it now stands, which is good enough, if enforced. One remedy has been suggested by a prominent resident in the Adirondack country. It is to secure the services of detectives appointed by the State, and paid for out of a special appropriation, to visit the lakes and known hunting grounds with power to arrest the first person caught violating the laws. When caught, the offender should be punished. In the wilderness the news of the arrest, fine, or imprisonment, would spread like wild fire, and from his knowledge of men there, he feels certain that it would have the effect to deter all others from infringing the laws, except in out of the way places.

In our opinion, to make any good law wholly effective, there should be a Chief Game Commissioner, appointed by the Governor of the State, having jurisdiction over its entire territory; the State should be divided into districts and each district be placed in charge of a Deputy Game Commissioner to be appointed by the chief; these in turn to select proper overseers and wardens and employ them on sufficient salaries to police the river courses and forest ranges assigned to them—the salaries to be provided as hereinbefore suggested. This system is in force and successful operation in Nova Scotia and can easily be adopted here.

With regard to the collecting of game for wholesale shipment to market, we have long been aware of the extensive operations in the West and Middle States, but did not know until lately that the same system was in vogue to any great extent in New England and the British Provinces. One informant in New England says that for the past few years market shooters have come far and near, and made it a business to go through the country towns, loaning cheap guns to the farmer and supplying them with ammunition, and paying them five to ten cents for each ruffed grouse they would bring in to the nearest office, and then ship the game thus obtained to the Boston and New York markets. An officer of the Eastern Express Company has stated that on a single day last Octo-

ber his company shipped 1,500 pounds of ruffed grouse to Boston and New York, and that they had carried more tons this season than he dared to say. Away off in the Province of New Brunswick these game collectors are also busy. In Charlotte county they have been engaged for two months past netting ducks. They select the spot most frequented by the fowl and set a lure by strewing corn on the border of the lake. This is repeated until the birds are great in number; then the nests are set with a fall adjusted so that when the ducks are well under it, the net is dropped on them, when a general butchery is proceeded with by clubbing the birds with stout sticks. They are then, as quickly as possible, gathered together, put in barrels and sent on their way to the American market.

In the Province of Quebec, a leading journal announces that parties are making preparations to export venison to Europe just as our prairie fowl are exported from our own ports. No locality can long stand such a drain upon it, and unless something is done to prevent, no game will be left. One remedy that suggests itself is to pass a law prohibiting the exportation of game beyond the limits of the State or Province. We have our doubts about the constitutionality of such a law, but the difficulty can be obviated by the appointment of Game Commissioners and Detectives as already advised.

—Forty Americans who had gone into the Province of Ontario for the purpose of killing deer after the commencement of the close season, (Dec. 1st.) have been arrested.

NORFOLK, Va., December 13th, 1875.

EDITOR FOREST AND STREAM:—

Our Legislature is now in session, and there will be some resolutions offered in regard to game laws. What is needed is a more uniform set of laws through the country. W. E. Taylor, a gentleman of this place, is much interested in the subject, and I think intends to call the attention of the members with whom he is personally acquainted to the desired improvement of the existing game laws. He is an active member and original starter of the Norfolk Game Protective Association. Weather clear and cool to-day. Saw some quail in market last week only three-quarters grown. S.

PORTLAND, Me., December, 1875.

EDITOR FOREST AND STREAM:—

We have a good deal of legislative work on our hands in this State the coming session, and but few workers. Among our proposed alterations are an entire revision of the fish laws; additional protection to deer and caribou, as well as moose, including, if possible, an appropriation for the pay of wardens; also some measure to prevent the wholesale slaughter of ruffed grouse. I trust that the next year will show some improvement in our laws, and that in time we may make a respectable appearance in this respect, even by the side of your model State.

MANASSEH.

We have received a copy of the constitution and by-laws of the Bay Club of Sodus Point, N. Y., which was organized a few months ago for the protection of fish and game, and now numbers 125 members. Sodus Point offers fair advantages to anglers and gunners. Our correspondent, Charles Wood, furnishes the following notes:—

"The town is situated on Lake Ontario, about mid-way between Oswego and Rochester, or its lake outlet Charlotte, and is built on a small elevation or ridge extending along the long narrow point which almost separates the dark blue waters of the lake from intermingling with the silvery wavelets of Great Sodus Bay, save at one point where the government piers by running out into the lake keep the channel open. The bay is from two to two and a half miles in width, embellished by three small wooded islands, whose sandy bars and shaded holes the black bass and pickerel know and love right well; and a fourth islet about twenty feet by fifty feet in length covered with marsh grass, where I have stopped the swift career of many a wild fowl. In Summer a fair bag of plover, yellow legs, and now and then a curlew may be made on the beach and point. Later on, the ruffed grouse and English snipe, particularly the former, are plenty in this vicinity, and I could once have added woodcock to the list, but for some reason unknown to the writer, this bird has completely deserted its old haunts this last season.

A REVIEW OF A YEAR'S EFFORTS.— WHAT ADVANCE HAVE WE MADE?

NOW that the Summer is past and the rod, gun, and collecting basket are, for a while laid aside, it seems proper we should review the Summer's work, and every effort that has been made, whether in the field, in the forest, by the stream, or in the study, and see if in anything we have advanced.

We commence with angling. There is no disputing the fact, that every year adds much to our stock of knowledge in this art, also that there is yet much to be learned. None can be blinded to the fact, that the art is not only a gentle art, but that it is fast advancing to a refined one. If we continue thus to advance, the day is not far distant when angling will become a fashionable pastime for both sexes, especially for the higher classes. Well! let that day come quickly, for angling facilities will then be increased in proportion. It will then become fashionable to have fish preserves and to stock streams and lakes, until all our waters shall yield a tribute to the enterprise of the people and give room for many thousand anglers.

In angling goods we have made this advance during the year: We have become more familiar with what we have, and more qualified to decide which is best and most suitable for different waters. We think it is now demonstrated that the split bamboo rod, is the rod of rods for trout angling; but that an eight ounce rod of this character is too light for bass fishing; certainly it is for our Western lakes. There we often hook two, and sometimes three black bass at one cast. And then we are likely at any moment to hitch on to a twenty or twenty-five pound pickerel. In either case, with an eight ounce rod, one may make up his mind to devote the rest of the day to landing his fish. A

jointed bamboo or Japanese, with lancewood tip, we believe to be the most comfortable and safest bass rod ever used. As to hooks, we believe that about all anglers will agree in saying that the Sproat and O'Shaughnessy are two of the best hooks ever invented. We prefer the former for all bait and fly hooks, and the latter for spoons, spinners, and artificial minnows. In lines, the fine waterproof silk are the best on the stream, and the braided linen for lake and sea. In flies there has been but little change; however, we are learning some important lessons: First, that many styles made with no resemblance to anything that flies, creeps, or swims, proves to be very successful. Second, that hackles or palmeres are after all the standard flies, and had we no others, these would be sufficient. Every year we are more and more inclined to the hackle flies, and now provide ourselves with a greater variety than ever before. In bass flies there is this advance: they are in greater demand, and more have used them the last year than ever before. The fly should be large and gaudy and shot for deep fishing; in shallow water use the same as trout flies. We trust all have learned these simple lessons. If they have, then we have gained something. It is gratifying to see that very few now prefer bait fishing. Fly angling is practiced now more than at any time before in our history. As a consequence light and delicate tackle has been in greater demand the past season. Thus we are making greater advances in the gentle art.

FIELD SPORTS.—In field sports we have also gained much. Certainly in the breed of our dogs we have made great advances, and in time the pure bloods will entirely displace the mongrels whose numbers are legion. The bench shows and field trials, if continued, will create a universal demand for the purest strains. Again, in a very few years we shall not be under the necessity of importing dogs. We shall have them of our own breeding. The demand for the best dogs is constantly on the increase, and the few who have been instrumental in introducing and breeding in this country the pure strains, are entitled to great credit, and should be encouraged by every lover of a good dog. As to the treatment of the diseases to which dogs are subject, we in this locality feel that we have made no advancement. About one dozen of our most valuable local bird dogs have succumbed to the distemper the last season. Mayhew's or Stonehenge's treatment proved of no avail, neither was the skill of our best physicians sufficient to save them. The first attack seemed to be paralysis of the spine. Under this they went down at first, and it was impossible to raise them to their feet again. It is humbling to us as dog fanciers, that we could not save our valued servants. But not only here, but all over the country, we hear of many dogs dying with this complaint. Therefore it is plain to see that a new treatment must be found or a specific discovered.

GUNS.—In guns there has been this progress: The breech loader has steadily advanced and occupied the whole country, so that in a very short time there will not be a single muzzle loader left save as the relic of a long and illustrious career. It seems to me, among many lessons we have learned regarding improvements in guns, there is one very important one, viz: that our own American guns can be made equal to the best in the world. Now if it is true that we can furnish a gun of our own manufacture as good as the guns we have been in the habit of importing, then it is an advance of which every American should feel proud. The choke bore question is yet in abeyance and although some of our best sportsmen are using them, their superiority, except for trapshooting, is not, we think, unquestionably demonstrated. [In fixed ammunition and in all shooting apparatus there have been immense improvements. Our cartridges, powder, shot, hunting suits, and our camp equipage, are equal to the imported. It is unnecessary to particularize, but in all these things our achievements have been very great and very satisfactory.

FISH CULTURE.—Is it not wonderful how long we have been in learning the simplicity and value of increasing the supply of food fishes. Again, it is wonderful to what extent this enterprise can be carried. What we have already accomplished is but the beginning of an immense public work, which is certainly the greatest enterprise of this age. Our depleted and heretofore barren waters will soon teem with unnumbered millions of edible fish, proving a greater blessing to the masses than any other discovery of the last quarter of a century. Now that the enterprise has become national in character, we cannot set any bounds to it accomplishments, and it is gratifying to see that almost every State in the Union is waking up and now beginning to comprehend its value and magnitude. If the members of our various State Legislatures have been reading and observing men during the last year, we may hope for ample appropriations to carry on the work during the year to come. We expect to see, yet in our day, fresh water fishes more abundant than was ever known before in the history of the world.

GAME LAWS AND PROTECTIVE SOCIETIES.—It is yet impossible to estimate the value of the various game laws the States have already given us. But this much we can say, thus far, they are working out a great good, and if the States shall unite, as they ought, and give us co-operative game laws, with extreme penalties for violations, it will be just what the country, even at this late day, has come to demand. The good results which have followed the execution of the laws we already have, are apparent to every observer. But, have as many game laws as we desire, they will be void, or almost useless, without the aid of protective societies to enforce them. These are doing an

immense amount of good, and we are only astonished that their value is not more fully comprehended by the sportsmen and by the people. Strange it is that all sportsmen in the country cry out for a game laws; yet there are many places where sportsmen are many, in which a sportsmen's club or a protective society cannot be found, or does not exist. Until Congress or the States adopt such a system as will hold the officers, in a degree, accountable for the violations of protective laws, we must form societies for this purpose, and rely upon our own efforts. It seems to me that a part of our business should be this Winter to induce the legislatures not only to give us proper game laws, but to provide for the faithful execution of the same. But if sportsmen will have a little more respect for each other, and unite to elevate and execute, great will be the result. We must not tire in this work. We have made great advances the last year, but we shall do more than this, if we unite for action. Again, it is encouraging that this subject has become national and international. And we apprehend that the International Association for Protecting Game and Fish will accomplish a work which will astonish us by and bye. Societies auxiliary to this should be found all over the country, whose mission should be the protection and study of game and fish. Before our work is accomplished we shall, no doubt meet with many discouraging results, but we have advanced, and shall still advance.

NATURAL HISTORY.—It is gratifying to see that every year the study of this branch of our outdoor pursuits is more and more attracting the attention of sportsmen. To the naturalist sportsmen we are greatly indebted for very much that we know regarding the habits of our game and fish, and we have reason to expect much more from them in the future. Again, it is gratifying to see that the masses are beginning to respect the sportsmen and naturalist. We well remember, and not many years ago, when we returned from the fields and streams burdened not only with game, but curious creeping and flying creatures, singular things animate and inanimate, that we were made the laughing stock for almost a whole community, and men said, "he had better throw his collection out of the window and do something more useful." Our great field at present seems to be to study more fully the habits of our food fishes, for the more thoroughly we understand this subject the more successful we shall be in fish protection. For the next year let us all see how much we can learn regarding the habits of our fish, and having learned, let us report, that all may share in the knowledge we have gained.

LITERATURE AND THE PRESS.—Who among us does not feel elated when he sees all around him the good effects of the press, our special advocates. It is impossible to estimate its value, not only to us as a class, but to the whole people. How comes it that Legislatures and the best of our people begin to open their eyes, and are making haste to help us in our efforts to protect and increase the supply of game! How comes it that the secular press begins to notice us, occasionally copying an article from our papers! It all comes because of the existence and wide spread influence of the FOREST AND STREAM and kindred papers. The former is doing more to win the secular press and the people to our favor than all else besides. What we have gained in this respect the last year is astonishing. What we want now, is also the influence of the local press, and we think the time has now come when it is demanded of every secular paper in the land to devote at least a small portion of its space to this kind of news and to the advocacy of fish culture, games laws, and protective societies, and also to encourage and laud the efforts of those engaged in these pursuits. If they will do this we shall have but little difficulty in obtaining and enforcing all the protective laws we demand or require.

Now, in conclusion, let us say to our collaborators, during the year to come let us make a greater effort to learn, and to improve upon everything, and above all, to see what we can do to encourage and sustain our literature, for without this medium our hopes and aims are hopeless. Again, let us see what can be done to induce our local press to aid us in our efforts to create a public and popular sentiment in favor of game laws and game protection; against poachers and pot fishers; and in favor of gentlemen sportsmen and humble naturalists.

Lake City, Minnesota.

D. C. ESTES, M. D.

—The Toronto Weekly *Globe* has just undergone a surprising and most creditable metamorphosis. By one single effort of exceptional enterprise it has quite outstripped the whole of its Canadian contemporaries, and now appears in a form and character that would do credit to the best journals printed in the United States. The Provinces of the "Dominion" have never been distinguished in their journalism, most of the papers being laggard in news, primitive in their letter-press and form, and decidedly unmetropolitan in every aspect. Quite recently the Montreal *Gazette* adopted the folio sheet, and is now greatly improved and quite creditable to the chief city of Canada. The *Globe*, however, eclipses it, appearing as a twenty page paper, printed with exquisite typographical taste, and including a great variety of departments that meet the requirements of a mixed constituency and render it acceptable in every respect.

CAMP LIFE IN FLORIDA.—Editors of newspapers who have not received copies of this seasonable book for review, and wishing them, will oblige us by notifying us to that effect.

FLORIDA.—After two weeks of stormy weather, the sun shone out on the 10th instant, to the delight of the inhabitants and sojourners in the "Land of Flowers." Friday morning early there could be discerned a glistening white frost, covering the grass in many places.

The St. John's railway is now running four trains a day each way between Toco and St. Augustine.

St. James Hotel at Jacksonville has nearly one hundred guests, and the other hotels are doing well. The tide of permanent settlers is drifting towards Marion County, which contains some of the richest land in the State of Florida. The residents give visitors a warm welcome.

The St Augustine Press completed its fifth year on the 11th December, and in a review of the period since 1869 it says:—

"At that time, the only hotel receiving visitors was a small portion of the present Florida House, and capable of accommodating about 40 guests. This was all the hotel accommodation that was required for the visitors of the Winter of 1869. There were several boarding houses, but their accommodating capacity was limited. Probably, that season, the total number of guests in St. Augustine, did not exceed 500, all together. Last year, 1875, the number of visitors reached nearly, if not quite, 10,000.

This is but a simple illustration of the great advance St. Augustine has made in five years, in all branches of trade, and the rise in real estate has been of a corresponding character. Property which could be bought in 1869 for \$500, to-day is worth and will bring \$5,000."

—Prof. Robt. Bell, of the Dominion Survey, has just completed the seventh year of his explorations in that extensive region lying between Lake Huron and James Bay. The territory comprises many millions of acres, and is found to abound in Huronian rocks which are rich in metallic ores and other economic minerals. Valuable discoveries of copper, iron, serpentine, soapstone, etc., have been made. Coal exists in large quantities to the northward of this great Huronian area, and gypsum along the lower part of Moose River. Fish were not found to be generally abundant in the lakes and streams passed over, nor in the southern part of James' Bay; and game was very scarce except around the shores of the bay in the Autumn.

John Ross Browne, the famous American traveler, died at his residence in Oakland, California, last week. Mr. Browne traveled over the greater part of the United States, and very extensively in Europe, Asia, and Africa. Having acquired a fair ability as a sketcher, he made pictures of whatever struck his fancy. The result was the publication of a number of humorous works, which attained wide popularity. Among them may be mentioned "Yusef, or the Journey of the Fangi; a Crusade in the East," "Washoe," which grew out of an inspection of the new mining regions of the Pacific, under an appointment from the Government; "An American Family in Germany," "The Land of Thor" and "The Apache Country." In 1868, Mr. Browne was appointed Minister to China, which post he held for two years. He was fifty-eight years of age.

—An association has just been formed under the title of the Virginia and North Carolina Poultry and Pet Stock Association, and the following officers were elected: A. M. Bowman, of Augusta county, President; First Vice President, R. T. Fulghum, Raleigh, N. C.; Second Vice President, Dr. L. R. Dickinson, Richmond; Third Vice President, V. M. Firor, Charlestown, West Virginia; Fourth Vice President, Dr. E. C. Withers, Danville, Va.; Fifth Vice President, W. S. Thorn, Wythe county; H. Theodore Ellyson, Richmond, Secretary and Treasurer. Mr. Ellyson is one of the proprietors of the Richmond Dispatch, one of the ablest journals in the South. This new association will doubtless be of much benefit to the States of Virginia and North Carolina.

CAMP LIFE IN FLORIDA.—Of our new book the Albany Journal says:—

"We have already noticed this admirable volume on Florida, and the more we read of it the better we like it. It contains valuable information for every one, but it is especially valuable and interesting to the angler and sportsman; for it shows Florida to be a very paradise for these classes. No one should go to that 'happy hunting ground' without this volume with him."

FOREST AND STREAM finds its way to our table regularly. We find it invaluable for all that is claimed for it. It has drawn to its columns a corps of learned contributors, which enables its editors to present to their readers a journal unexcelled in its specialty.—Philadelphia Farmer's Journal.

—In the East River, the other day, a sea gull was so persistent in securing a fish it had caught, that it was run over by a ferry boat and drowned.

—A very appropriate present for a friend addicted to the soothing influence of the weed, may be obtained at C. Stehr's, 347 Broome street, dealer in meerschaum pipes and cigar holders.

—Sunflowers prove to be the most perfect preventive against chills and fever that has yet been tried.

—Some New York engravers are trying the wood of the magnolia as a substitute for boxwood.

The Rifle.

FOREST AND STREAM BADGES.—The sixth contest for the FOREST AND STREAM badges, took place Thursday, December 16th, 1875, at Conlin's Shooting Gallery, 930 Broadway. The conditions were as usual, viz: ten shots, off hand range, 110 feet, 200 yards target reduced in proportion for distance, Wimbledon rules. The winners were, L. C. Bruce, first badge; score, 44; "Centre" badge, by L. V. Sone for the second time, score, 39; "Inner" badge, by J. O. Wright, with a score of 30. The following is a summary of the six competitions for the FOREST AND STREAM badges:—

COMPETITION NO. 8.					
1st Badge.	Center Badge.	Inner Badge.			
1—Wm. Klein.....43	G. W. Hamilton.....40	J. E. Whitley.....30			
2—C. A. Cheever.....44	R. Wiley.....39	G. W. Smith.....30			
3—Thomas Lloyd.....44	A. Marsh.....40	C. Blackie.....30			
4—W. B. Farwell.....45	L. C. Bruce.....40	J. Waydell.....30			
5—D. L. Beckwith.....44	L. V. Sone.....40	C. E. Blydenburgh.....30			
6—L. C. Bruce.....44	L. V. Sone.....39	J. O. Wright.....30			

The fifth competition for the Turf, Field and Farm cups takes place Thursday, December, 23, commencing at 4 P. M. All are cordially invited to participate in the contest.

—At Creedmoor Jr. 100 yard range, a Subscription Match was shot on Wednesday Dec. 15th, open to all comers. Distance, 100 yards; position, off-hand; entrance 50 cents. There were 102 entries. One-half the entrance money was divided between the first, fifth, tenth, fifteenth and twentieth best scores. The winners were: Herman Funke, Jr., score, 24 out of a possible 25; W. B. Farwell, score, 23, but as no prize, was given for second best, his shooting was too good for second prize, for which there was a tie between C. C. Harris and J. L. Allen, which was shot off and won by Mr. Allen. For the third and fourth prizes there were ties between T. C. Banks, R. Rathbone, F. Backofen, J. L. Allen, A. J. Holcombe, and M. J. Duffy, which has not yet been decided. There being no limit to entries, Mr. Farwell came in for fifth prize, on a second entry, with a score of 20. Wednesday the 29th the second subscription match will take place.

HELLWIG'S GALLERY.—The third competition shooting in lying position for a gold medal, a rifle, Remington model, and a Colt's new model revolver, took place at Hellwig's new gallery, No. 273 Eighth avenue, Dec. 15. The following are the winners: A. B. Vanheusen, first prize, 46; D. L. Beckwith, second prize, 40; J. McGlensey, third prize, 30. All below twenty-one not counted.

MILEY'S GALLERY, BROOKLYN.—At the tournament for the benefit of St. Peter's Hospital, now being carried on at this gallery, the following are the best targets as yet made: Conditions, ten shots string measurement. Mayo Fulton, 6 5-16; John Burns, 6 3/8; James F. Halligan, 7 1/4; P. Cadden, 7 1/2; James Connors, 8 1/4; T. J. McCabe, 9; Owen McShane, 11 1-16; P. Baker, 10 15-16; A. Dougherty, 10 11-16; J. S. Case, 10 11-16; P. H. McMahon, 10 15-16; J. H. Dougherty, 13 15-16. The shooting will continue every Monday and Friday from 2 to 12 P. M., until January 7, 1876. The first prize is a cup from the Turf, Field and Farm; the second, from Col. B. E. Valentine, and the third Mr. Miley presents.

MORSEMER.—On Friday last the members of the Yonkers Rifle Association held their fifth competition in the marksman's match. Mr. Langram made the highest score yet accomplished in this match. The following are the scores:—

Geo. Langram.....	200.....4 3 4 0 4 4 4.....23	55
E. Connell.....	500.....5 4 5 4 5 5 4.....32	51
H. Maynard.....	200.....0 4 3 3 4 4 4.....22	48
H. W. Blakemore.....	500.....2 5 4 5 4 4 4.....29	46
T. Coyle.....	200.....4 4 5 4 5 4 3.....25	23
	500.....5 3 3 4 0 4 4.....23	
	200.....3 3 4 3 4 5 5.....27	
	500.....0 2 5 4 4 4 0.....19	
	200.....0 4 5 4 0 2 3.....18	
	500.....5 2 5 0 0 3 2.....15	

The next match on the tapis at this range is that for the "Harris Trophy," a beautifully mounted Sharps rifle, presented by Mr. G. L. Harris, of New York. The conditions are twenty shots for each contestant at 300 yards; this range being selected so as to put outsiders on an equality with the Yonkers riflemen, the latter never having shot at this range. Some of the "Glen Drakes" should go over. Christmas will be a gala day at Morsemer. Besides the Harris Trophy mentioned above, a match will also be shot between members of the Yonkers team—Major Shonnard, A. H. Jocelyn, L. M. Ballard and H. J. Quinn on one side, against Capt. Smythe, H. L. Garrison, G. L. Morse and Dr. Perry on the other. Conditions: forty shots each at 500 yards.

The Yonkers riflemen have declined the challenge of the American Rifle Association, of Mount Vernon, on the terms proposed by that organization, at least for the present season, but are thinking of shooting a match with the Chicago team, by telegraph, but have not fully decided on it. By the use of the Geiger boards no bullseyes on the wrong target are now possible.

GLEN DRAKE.—The American Rifle Association have issued a programme for Christmas Day, Saturday next. Twelve prizes are distributed in the different matches, which will consist of an all-comers' match, a ladies' match, a subscription match, and the De Peyster Badge match. The distance for all the matches will be 300 yards, shooting off-hand. The matches will commence promptly at 10:30 A. M., and close at 4 P. M.

Trains leave Grand Central Depot, New York, New Haven and Hartford Railroad, for Pelhamville, at 9:05 A. M., 10:05 A. M., 12 M. and 2:20 P. M.; return at 12:30 P. M., 2:25 P. M., 5:15 P. M., and 8 P. M. Stages will run from depot to range on arrival of trains.

SAN FRANCISCO.—The National Guard Shooting Club held a monthly competition for their medals last week. The range of this club is located at San Bruno, where bulkheads have been fitted up for two targets at 200 yards, one at 500 yards, one at 600 yards, and one at 1,000 yards. Everything has been done to enable the markers to indicate the shots with the greatest facility. Adjoining this range the Union Guard, Co. A. Second Infantry, have established a range, with bulkheads for targets at 200 and 500 yards, and the ground surveyed for a bulkhead at 1,000 yards. This range was inaugurated on the same day. The scores made by the Nationals were as follows, there being five shots at each distance:—

Name.	200 yards.	500 yards.	Total.
Hentz.....	17	24	41
LeBreton.....	23	17	40
Snook, E. N.....	18	19	37
Muller, H.....	18	19	37
Smith, C. T.....	19	17	36
Sherman.....	18	17	35
McElhenney.....	20	15	35
Dunn.....	17	16	33
Robertson.....	16	16	32
Sime.....	16	16	32
Ford.....	17	15	32
Pascoe.....	17	15	32
Snook, E. C.....	18	14	32
Doane.....	16	15	31
Beaver.....	18	13	31

Mr. Klose, President of the Shooting Club, invited Gen. McComb to try a match, to dedicate the range, with the following result:—

Name.	200 yards.	500 yards.	Total.
A. F. Klose.....	26	19	45
General McComb.....	24	17	41

The California Guard Light Battery have been entrusted with the charge of the Gatling Battery which has replaced the old Parrott guns belonging to the State.

—The riflemen of Auburn claim to have a natural rifle range with a dead level of 1,000 yards and a natural bluff fifty feet high.

ILLINOIS.—A rifle club to be known as the Elgin Amateur Rifle Club, has been formed at Elgin with the following officers: O. Chisholm, Esq., President; Frank Leman, Vice-President; J. S. Dumser, Secretary and Treasurer; Executive Committee—E. Hancock, M. S. Moulton, Charles Lightner, D. M. Turner, and M. D. E. Lull. Last week Major Fulton visited the Club and participated in a match gotten up for the occasion. The distance was 500 yards, and the Major made a long succession of bullseyes. Of the other participants Mr. D. W. Rogers' score of 21 out of a possible 25 was the best.

INTERCOLLEGIATE RIFLE MATCHES.—With regard to our proposed badge for a match to be shot by undergraduates of American colleges we have received the following letter.—
HARVARD COLLEGE, Dec. 15th, 1875.

EDITOR FOREST AND STREAM:—

In regard to our rifle club here, of which I am a member, I am afraid your generous proposition to present a cup to be shot for by colleges, with military rifles, will not meet with much encouragement here, as we all use sporting rifles, and our aim is to become good shots with them. I am happy to say that at last a great deal of interest is taken in the club, and that it is to be formed in the Spring beyond a doubt. We have had several trial shots—best score, 40 out of a possible 50, at 200 yards, off-hand, but hope to do better. Yours, R. TALLANT.

One of the objects which governed us in naming military rifles was the equality under which the contestants would be likely to shoot, and because we conceive it to be proper that the use of the military rifle in large institutions should be encouraged in preference to that of a purely sporting weapon. At Amherst, and we believe some of the other colleges, military drill is practiced, and it would add greatly to the effectiveness of our volunteer force if it was made a part of the curriculum in all institutions of learning. The use of a military rifle would not prevent the riflemen from using any other weapon for amusement or practice. We should be glad to hear the sentiments of college men on this subject as applied to our badge, and stand ready to so amend the conditions as to make them satisfactory to the greatest number.

THE USE OF THE STRAP.

HAMILTON, Ont., December 13, 1875.

EDITOR FOREST AND STREAM:—

I inclose you a card of myself, lying down in the position of shooting, with a strap attached to the rifle and around my knee, the object of which is not for a brace, or to steady the rifle, but simply to receive the recoil on the knee instead of any other part. Now, my opinion is, according to the various positions which riflemen are permitted to shoot in now, that the use of the strap is just as fair as the use of a pad on the butt, or anything else that would tend to make it easier to shoot. But we will take it for granted that the strap might be objected to; the individual using it might go to work and get a stock made with a curve on it to fit the knee, which would answer the same purpose, which I don't think could be objected to, as there is no law which prohibits any pattern of stock which a rifleman may choose being used. For example, take the pistol stock: it is a recent invention, and of course is an advantage, otherwise it would not be so generally used, and no objection was ever raised against it. But I am of the opinion that all those positions where the barrel of the rifle rests on any part of the body are unfair, and that the intention or definition of "Any Position" means strictly, that no part of the barrel should rest beyond where it is supported by the left hand, when shooting from the shoulder, because if it does, it is simply a solid rest, and might as well rest on a stone, a stump, or anything else. And as for nerve, the most nervous individual is just as good in that position as the individual with a nerve of steel. This brings the whole matter down to who has got the best rifle, and not a test of men at all. Again, I understand that the National Rifle Association disallow shooting with the Military rifle in the back position. Why is this? Because I believe there are numbers of men who could not by any means twine themselves into the knots which it is necessary to do to hold the rifle perfectly steady, and of course those men shooting in the front position would be at a great disadvantage shooting against men whose peculiar formation of body enabled them to shoot lying on their back or side. I think the executive of the National Rifle Association of New York acted very wisely in enacting this rule. But I know many of your readers are more conversant with the subject than I am, and I would like to hear their opinions on it. As to using the ramrod for a rest it could very easily be done, by having a hinge on it half-way, or where it might be required. It could be pulled out when shooting and rest on the ground, or stuck in so that the muzzle

would rest perfectly steady; but that would be opposed to the rule which says, "No part of the rifle must rest on the ground, the ramrod being a part." Yours truly,
JAMES ADAMS.

[We think that our correspondent errs in his remark that the lying position brings all riflemen on an equality, and that the shooting becomes merely a test of rifles. At the distances at which the prone position is allowed the nicest judgment as to elevation and allowance for wind is required. As far as the use of the strap is concerned, we published in our issue of the 9th inst., upon the authority of a well known riflemen the following remarks:—

"In the case of a military or other rifle having a sling, there would be no objection to twisting it around the arm or knee in firing. In Russell on 'Rifle Practice' mention is made of a well known shot, who fired while sitting with the sling of his rifle around his left arm and knee. Still, the sling must be used as a sling only, and as attached to the rifle. To use a Creedmoor rifle not made for a sling when firing lying down, by attaching a strap to the trigger guard, and passing a loop at the other end on the foot, as shown in the photograph, is not using it as a sling, but as an entirely distinct apparatus, equivalent to an artificial rest. I do not think it would be allowed at Creedmoor."

For our own part we look upon the increased use or desire for adventitious aids in rifle shooting, as wrong, and if persevered in, likely to result in much harm.—Ed.

—Whether artillery practice on the Creedmoor principle is exactly within our scope we are not prepared to state; but our National Guard are following out what the volunteer service has been doing for some time in England. We give place, then, to the following, taken from our exchanges: "The new Parrott Rifle battery of the Twentieth Brigade at Elmira, has started an artillery Creedmoor of its own, at 1,200 yards. There are four sections in the battery, and they commenced practice Nov. 11th, at 1,200 yards, targets twelve feet square, bullseye three feet by six feet, each section firing twelve shots in a high cross wind. The result of the practice was as follows: Section I—seven outers, five misses; Section II—one bullseye, four outers, five misses; Section III—one bullseye, six outers, six misses; Section IV—One bullseye, five outers, six misses. The example set by Captain Walker's battery is one to follow. In militia artillery accuracy of fire is the first thing requisite, and by no means impossible of attainment.

—The removal of Sharps rifle works from Hartford to Bridgeport will be completed about the 1st of next February. The new works in that city are located about a mile west of the railroad depot, and include three buildings, all of brick. The main building is 250 by 40 feet, four stories and a half high. The blacksmith shop is 160 by 40 feet, one story high. The cartridge shop (including store room) is 40 by 70 feet, and one story high.

—The scores made by the members of the Yonkers Rifle Club have not yet been beaten.

Game Bag and Gun.

GAME IN SEASON IN DECEMBER.

Moose, *Alce Americanus*.
Elk or Wapiti, *Cervus Canadensis*.
Red Deer, *Cervus Virginianus*.
Caribou, *Rangifer caribou*.
Hares, *Lepus*.

Wild Turkey, *Meleagris gallinago*.
Ruffed Grouse, *Bonasa umbellus*.
Pinnated Grouse, *Cupidonia cupido*.
Quail, *Ortyx Virginianus*.
Wild Ducks, *Anatina*.

GAME IN MARKET.—The supply is still more scarce than it should be for the season, the receipts of Western game being extremely limited and prices continuing high. Ruffed grouse sell for \$1.25 per pair, while prairie chickens are worth \$1.50; quail bring \$3 to \$3.50 per dozen, mostly Long Island birds; canvas backs are higher than when last quoted, say \$2.50 to \$3.50 per pair. There are no red heads in market, unless it be a few refrigerated birds. The supply of ducks during the week from the Chesapeake and Currituck has been limited; at the latter place gunners say there are plenty of birds, but that the weather has been too mild to bring them inside, and consequently there is but little "fighting." Mallards are worth \$1 to \$1.25; brant, \$1.25; widgeon, 75 cents to \$1; black ducks, 75 to \$1; broad bills, 60 cents; teal, very scarce at 75 cents to \$1; geese, 75 cents to \$1.25 each; hares, 75 cents per pair; rabbits, 50 cents; venison, 25 to 30 cents per pound.

—A party from Mineville, Essex County, N. Y., recently killed in the North Woods, four deer, whose weight ranged from 200 to 275 pounds each.

A NEW RECOIL CHECK FOR GUNS.—This is an invention intended to check the backward blow of a gun by neutralizing the effect of the recoil through the medium of a spring. Providing that the result would not be to lessen the penetration of the gun the idea is a good one. The illustration in our advertising columns explains the principle upon which it acts.

—At the November meeting of the Board of Supervisors, of Green County, New York, a resolution was passed, making it unlawful to kill rail or expose them for sale between the 1st of January and 20th September, under penalty of \$25 for each bird. This excellent provision was secured through the influence of prominent sportsmen of Catskill, and will meet with general approval.

—Messrs. Burwell (proprietors of the Ondawa hotel, Schroon Lake Village), Pardo, and several other gentlemen, have just returned from a hunting excursion to Crane Pond, where they enjoyed glorious sport for several days. But think of camping out when mercury stands 20° below zero! They brought out several deer, numerous ruffed grouse, and other small game.

PIGEON SHOOTING.—Ira A. Paine and Miles Johnson shot a match on Monday last, at Dexter Park, on the Jamaica road, Long Island. The conditions of the match were, to shoot at seventy-five single rises, each to furnish half the birds, for \$250 a side, English rules, twenty-seven and a half yards rise. The match resulted in favor of Paine by the following score:—

Paine—1011101111100111, Johnson—01111111111101
11111001011111110111, 1111101110101100110111
1111111110110011111011101010110011100010011
011011111—Killed 56; missed 111111110011—Killed 50;
16. [missed 20]

—Capt. Bogardus has accepted the challenge of Mr. John G. Clark, Jr., of Dallas, Texas, to go to that State and shoot a field match at quails. The champion also publishes a counter challenge to Mr. Clark, inviting him to come to Illinois and shoot a match at prairie chickens.

MOOSE IN THE MEGANTIC BASIN.

December 6th, 1875.

EDITOR FOREST AND STREAM:—

After the thaw here November 25th and 26th the weather suddenly changed cold, and bade fair to make a hard crust on the snow, favorable for hunting moose. On the evening of the 27th the writer and a friend from Long Island stood at the railway station in Robinson anxiously awaiting French's team to convey us to Scotston. After a pleasant drive of an hour and a half we reached Scotston, where we found Archie MacDonald, who was to accompany us as guide and trail leader. Early the next morning we drove up the Megantic road to a camp situated at the base of the northeastern part of the mountain, built by Messrs. Low and Pierpoint, of your city. The first day we hunted in the swamps and over the spruce ridges north and east of the camp, but saw no signs of either moose or deer. The next morning we crossed over the mountain into the basin, where we soon found a moose yard, but there was little or no crust on the snow, which was at least two and a half feet deep, which made it impossible to run them with our dogs, or to still hunt them successfully, as our snow shoes would sink into the snow with a crackling sound at every step we took. This would alarm them, and keep us from getting a shot. We however satisfied ourselves that there are an abundance of moose in the upper parts of the basin. The low alder flats along the brook is one immense deer yard. We there shot a fat buck to replenish our larder. Should there be a heavy fall of snow, or a thaw, and settle the present snow, so that it would be possible to use dogs, there could be some rare sport had in that basin before the close season (February 1st) commences. In crossing over the mountain from the camp we mounted a peak to the left of the trail, where we had one of the finest views imaginable of the surrounding wilderness. North and east of us lay a long stretch of level country, dotted with small lakes, whose waters must be teeming with speckled beauties, and many of them as yet unvisited by the "knights of the rod." Nearly due north we could see Nicolet Mountain, and to the right of it, and farther away, the St. Francis. Both mountains are near lakes of the same name. In the east were seen the boundary mountains, with lakes Megantic and Spider at their base. Under our feet, at the south, we had a birdseye view of the basin, with the main mountain in the rear for a high background. At the west we caught occasional glimpses of the Salmon River, near the "still waters," and back of the river the forests of Ditton and Newport, with the eastern township mountains in the far distance. I must again protest against parties who come here from New York or elsewhere paying those that they employ here such exorbitant prices. This was a cheap country for sportsmen, and would remain so if you New Yorkers would refrain from paying Adirondack prices. A man here is willing to work with his team for three dollars, and you come here and pay him ten dollars, and also pay the men who act as guides two dollars, when they used to be well satisfied with one dollar or a dollar and a quarter per day. You may be able and willing to pay such prices, but in so doing you do a great injury to us brother sportsmen who are not able to pay such fancy figures, for after you have established such rates we must either pay them or abandon our old sporting grounds. Perhaps you are not aware of the cheapness of labor here in this district, or perhaps you have been imposed upon by those whom you have employed. If the latter is the case please inform me of it, and we will try and remedy the matter at once.

STANSTEAD.

P. S.—We christened the peak where we had our view "Hot Draft Peak," as a strong current of warm air issued from a crevice in the rocks near the top.

We emphatically endorse the protest of our friend, which is not without cause. We recall an instance that came under our personal observation on the piazza at Paul Smith's, in the Adirondacks, three years ago. "Moses, here!" called out a prominent Brooklyn sportsman of wealth to his guide who was passing, "if you'll drive a deer into the lake for the Judge to-morrow morning I'll give you \$20!" The Judge sat near, and was doubtless pleased with the attention of his friend, the guides were tickled by the liberality, the impecunious were awe struck by the display of wealth that could afford so great a largess, the greenhorns gaped in admiration at the prowess of the hunter, the latter enjoyed the opportunity to patronize the judge and to have his vanity gratified, the dogs liked the run, and in fact everybody was happy except the poor fawn (as it proved), which took the water and yielded the ghost in the scorching month of July.—Ed.

STILL HUNTING IN THE ADIRONDACKS.

SPRINGFIELD, Mass., Dec. 12th, 1875.

EDITOR FOREST AND STREAM:—

I have received a letter from Mr. Fenton, of No. Four, Adirondacks, dated Dec. 6th, in which he narrates a hunting adventure which, I think, would be interesting to the numerous sportsmen who read your valuable paper. We quote:—

"There has not been much hunting since I wrote you, but, I have been out just three days and bagged three deer—I am mistaken, I have been hunting four days; it took me two days to kill one. The first day I killed a three-year old buck. In about a week from that day there came another favorable time for still hunting; the wind howled through the woods, the trees clashed together, and the snow fell thick and fast. I crossed the lake and entered the woods in search of new tracks of deer. I traveled rapidly for two hours, when I came upon a buck's fresh tracks where he had just risen from his bed and gone slowly on, feeding as he went. I advanced cautiously, being confident that he was not far away. I soon ran on to him, and as he raised his head I brought my rifle to my shoulder and fired rather quickly. He wheeled at a right angle and made a few quick bounds and stopped short. I brought the other barrel to bear upon him, but he was too quick for me, for he sprang just as I drew the trigger, and the ball passed harmlessly by him; he only made a few jumps and then halted again. Ah! then if I only had had a breech loader, I could load up again, but he was off. I felt sure of him, for the first shot must have given him his death wound. I struck across the angle to his track, expecting to find blood on the snow where he ran, but what was my chagrin to find none. What did it mean? It can't be possible that I missed the first shot. I went back to where he stood, and found some hair that the ball had cut from his side and carried it twelve feet beyond, and never drew blood. But I soon found another track, made about an hour previous, which I took and followed perhaps

one mile when, as I came over the brow of a hill, I met a monster buck coming up the hill not fifty yards away. He looked much surprised to see such a looking object as I was, and eyed me keenly. I quickly brought my rifle to bear on the point of his shoulder and fired; but he was too massive for the penetrative powers of my rifle, for the bullet smashed against his shoulder and was torn into a dozen pieces, breaking the shoulder bone, but penetrating no deeper. When I saw the nature of the wound I knew I should have a hard hunt to get him. He made no halt for a mile, when he laid down. I saw him and prepared to give him another shot, but he anticipated my kindness and sprang to his feet and made away at the top of his speed, on three legs, as fast as most deer go on four. He now made for Beaver River, and I expected he would cross it, but he only went to the edge of the water and ran back into the woods, where I started him again without seeing him. He now took directly up the river, and after pursuing him more than half way to Wardwell's (the distance from No. Four to Wardwell's is eleven miles) I gave up the chase. I had a very serious time in getting home, for darkness came upon me when I was more than two miles from Beaver Lake. It was fearfully dark and I was completely exhausted. It would take a good mathematician to enumerate the number of my falls. Once I came to a perpendicular ledge of rocks, and in order to get down I crawled off on to a tree which grew up from the base of the cliff, and slid down to the bottom. I reached home at eight o'clock, weary and disheartened over the misfortunes of the day. The following day, although feeling foot sore and tired, I started at daybreak for the old fellow's track, six miles away, which I reached at half past ten. I started him about a quarter of a mile from where I left him on the previous night. All hope died within me when I started him without even seeing him, and I saw that he ran as fast as on the previous day. I knew that only strategy could capture him, as it was so noisy under foot that I could not approach him without his quick ear detecting me. I well knew that he would make for the river, and I pushed on with all possible speed to see if I could catch him in the water; but in this I was disappointed, for he plunged in and got across without my even getting a glimpse of him. A little way above, at a still place in the river, the ice was frozen across strong enough to bear me. I crossed and kept well back from the river, to come upon him in an opposite direction from which he was expecting me. I knew he would soon lie down after he came out of the water, and in this I was right, for I soon saw him rise on of his bed and fly at fearful speed through the woods. Quick as thought I sent a bullet flying after him, which struck him in the flank and passed forward, causing him to fall, and after firing four more shots into him, I succeeded in dispatching him. I have killed no larger deer in a long time. The saddles weighed 105 pounds."

Yours for the woods,

FRANK BOLLES, JR.

The above method of "still hunting" will receive no remonstrance from any sensible person, although some of our correspondents have decried it. It tests the skill, strategy, endurance, and general knowledge of a hunter more than any other mode known. Indeed one has to work hard for his venison.

ANOTHER DEER CHASE.

SAVANNAH, Ga., December 9th, 1875.

EDITOR FOREST AND STREAM:—

Seeing in your paper of the 2d inst. an account of a race between a locomotive engine and a deer, I thought I would give you an account of a similar race which happened under my observation. In making one of my regular pay trips of this road, and while on the Florida Division, running at about twenty-five miles per hour, a buck and a doe jumped on the track just ahead of the engine about seventy-five yards. The engineer gave chase, increasing speed and gradually gaining on the flying deer. The race was for about a mile, and when we were almost upon them we came to a small trestle. The buck took one side and the doe the other, and our train passed between the two at the rate of forty miles per hour.

C. SANSEY.

BREECH LOADERS AND THEIR ACTIONS.

BOSTON, Mass., December 10th, 1875.

EDITOR FOREST AND STREAM:—

Judging from the interest exhibited in guns through your columns, a few words upon the necessary points of the breech loading action may not be inappropriate. In the number of guns which at different times I have had the opportunity of examining, and which have betrayed symptoms of determined weakness, it has struck me forcibly that the purchaser, with merely the most common elements of criticism, could have foreseen that which must prove to be the ultimate weakness of his gun.

In the first place, a breech loading action, to be effective must be upon a good principle. The numerous improvements and inventions which have taken place during the last twenty years go to prove that the public upon the one side seem struggling to secure a breech loader which will fulfill all requirements, and the inventor, upon the other hand, trying to cater to the public want. It cannot be doubted but that safety and solidity seem to have been the first requisites, and, curious to say, when this necessity was met on the part of the inventor by the introduction of the double grip, it had not even the support of a patent, the first builder of the same being Jones, an action fier, who introduced it fifteen years ago; no one can doubt that for safety and simplicity nothing has yet superseded the double grip Lefauchaux.

The next effort seems to have been automatic closing, or the introduction of spring and snap work to secure the barrels to the action. In this class of work there seems hardly to be a mechanical motion but what has been tried for the purpose mentioned, and few that have been based upon principles good enough to last above a year or two; in some cases not even that long. It is in this class of guns that the purchaser requires to exercise a closer scrutiny, as the incentive upon the part of the maker to make his guns close with a click limits very much the chances of a durable gun.

Believing that, in the case of sporting guns, inventions seem to have culminated in the tipping up or dropping of the barrels as the preferable method, I confine myself to that principle particularly. One of the first points to be observed in a breech loader is that there is a good distance between the axle upon which the barrels hinge and the face of the action upon which the base of the cartridges rest, and in addition, that the axle is as close to the plane of the action as is commensurate with the strength of points upon which the barrels hinge, the more direct that the axle is in front of the line of fire the less is the strain upon the bolt which holds the barrels to their place. The next important part is that the gripping, or bolting, takes place at the extreme end of the barrels. The extended lump in this case claims some attention, but as it must necessarily be narrow, or make an ungainly action, it prevents it having that abrading surface or breadth of bearing which is so essential to containing surfaces under great strain. If the lump attached to the barrels extend as nearly as possible flush with the breech end, a great advantage is secured in the case of all snap actions. I look upon the failure of the side snap, in comparison to a number of other actions, as being purely from the fact of the gripping taking place so far along the body of the action and not at the extreme end of the lump. Make the side snap action with the gripping near the end of the barrels, and it makes a durable and simple action. There is no more important point to be observed than that the line of motion of the bolt moves in a line direct with the centre of the axle upon which the barrels hinge. This must be an obvious necessity. During the moment of strain upon the action by explosion, a tendency to separate is the result, and in the case of a bolt not at its biting part moving in the direction of the axle, a heavy abrasive motion is the consequence, and which in the course of time shows itself in a rickety and shacking action. In the case of an action bolted in the direction of the centre of its hinge, when the tendency to spring takes

place during explosion, pressure is the only result between the contending surfaces. In the case of extended lumps, pass a straight edge along the surface of the bite and it will miss the centre of the axle by nearly, and sometimes over, half an inch, and the top of the bolt, which is likewise essential, will be a great deal worse. Here then we have the advantage of a very powerful grip while it lasts, more than neutralized by a sheer mechanical loss. In addition to this, there is much more power in forcing the barrels into position when the bolt runs in its proper direction, and in snap actions, where the power of the spring requires to be economized, this forms an important consideration.

Another feature, adopted in higher qualities of guns, is the practical value of the extended and projecting rib which continues back into the action. This rib, in having to work into the action at an angle sufficient to clear itself as the barrels move upon the hinge or axle, does not admit of that efficiency in holding the face of the action to the face of the barrels so necessary at such a place; but it must not be forgotten that in the case of actions carefully bolted they spring slightly beyond the bolting from a neutral axis nearly half way between the face of the barrels and the very back of the breech piece. Here, then, the extended rib helps restrict, though not thoroughly, the tendency to separate between the two faces. This style is likewise useful in presenting lateral motion, making it a great assistance in the case of double rifles made upon the drop down principle and using heavy charges of powder. To assist in such cases, a multiplicity of bolts have been adopted, forgetful of the fact that if there is one effective place in the action for the bolt to operate to its best advantage, then the power of the spring had best be expended on that one than lavished away at other parts to counterbalance the friction thus introduced. This more particularly alludes to bolts which labor under a mechanical disadvantage. To possess the extended rib to its best advantage, it should, when looking down upon the top, appear to put out suddenly to each side and then round off at the corners, instead of being nearly circular, as they are generally made.

When safety and solidity have been well attended to it is not too much to say that certainty of fire is one of the most urgent requirements of the breech loader, and, while speaking of this, I must differ from your opinion in *FOREST AND STREAM* of December 9th. To the eye of the sportsman it looks well to see the strikers or plungers lying parallel with the barrels. Now, were it possible to have the motion of the hammer take place from a centre directly or vertically below the end of the plunger where it has to strike, no one could dispute the efficiency of such a blow, so that it took place at a sufficient distance from the centre of the tumbler, and thus secure velocity; but gun locks, as they are ordinarily attached, render it impossible to have this done without spoiling the appearance of the gun, and the question stands, How can the greatest certainty of fire be secured with the present means at disposal? I would urge that principle which gives the least friction at the point of contact between the hammer and plunger, and which gives the greatest or generates the most sudden heat at the point of contact of plunger and percussion. To effect this no better method can be adopted than to make the plunger operate in the direction of a right angle with the axle of the tumbler, the top of the plunger being the corner of the angle. If this be done no force is lost in grating along the face of the hammer. But it is contended that it is lost at the front of the plunger. This will be admitted, and also that it is the very place the force should be lost; and, seeing that it is attrition, it merely means heat. Any one can notice in those guns with direct strikers how the nose of the hammer seems grated down, and the amount of surface that seems to have been traveled over before the blow has been completed. This means lost force, which should have been expended at the other end of the plunger. It must not be lost sight of that in the direct strikers the blow from the hammer is given at a part nearer the centre of the tumbler than is the case with the oblique plungers. The consequence is less motion on the part of the plunger, and, still more, less velocity. This is everything when certainty of fire has to be taken into consideration, and gives conclusively the preference to the oblique striker, so long as the obliquity does not exceed 45°. This excessive angle is merely the result of pitching the locks too high and too far back; otherwise, with care and a good thick breech piece, it need not exceed an angle of 30°, if that much.

D. KIRKWOOD.

MATCH RIFLES—MUZZLE LOADERS vs. BREECH LOADERS.

DUBLIN, Ireland, December 2d, 1875.

EDITOR *FOREST AND STREAM*:—

In yours of the 18th of November you do me the honor to quote from a letter of mine to the *Volunteer Service Gazette*. I could have wished, however, that your extracts had been made so as to enable your readers to see that my letter was not written for the purpose of disparaging the American victory over the Canadians, nor yet to excuse the defeat of the rifles used by the latter, which any reader of your paper would suppose were all "Rigbys," whereas there was only one of my rifles in the match, the other "Provincials" using Metfords. I wrote to correct an erroneous comparison made by the *Volunteer Service Gazette*, and incidentally remarked that the score showed that the American rifles did not hold their elevation so well as the Metfords, inasmuch as about twice as many misses were scored to the Americans as to the Canadians. You ought, I think, to have quoted this remark as well as the sequel from which you draw the conclusion that my rifles "want more powder and more lead for long ranges." As the reputation of my rifles has been made by their shooting in strong winds at 1,000 yards, I can hardly take this as proved; but as there is practically no limit to the charge which may be used with a muzzle loader, except the ability of the shooter to endure the recoil, whereas the charge of the breech loader is limited to the capacity of the cartridge. No superiority can be claimed for the latter on that ground. I have shot with both breech and muzzle loading rifles for fifteen years, and for target practice have no hesitation whatever in preferring the latter. They need no cartridges; no previous preparation of ammunition, and no cleaning between the shots. They will give equal velocities with less powder than the breech loader. Whenever the progress of art gives breech loaders which, without cleaning, will equal the performance of muzzle loaders, I am ready to reconsider this opinion. I am, yours truly,

JOHN RIGBY.

SHOOTING IN BAVARIA.

MUNICH, November 14th, 1875.

EDITOR *FOREST AND STREAM*:—

I spoke in my last of the hare shooting here, and having now the leisure time I send you a short account of it. Yesterday I had the pleasure of attending one of the first *treib jagden* of the season in the Kyf River. About seven in the morning we met at the depot, some twenty or twenty-five guns, most of them old and well known sportsmen. I would like here to say one word in regard to the politeness and attention of the railroad officials to sportsmen. As an illustration, one of the company was late, and hadn't sufficient time to procure his ticket, so when the guard came round he stated the case to him. "It makes no difference," said the guard, "you can buy a return ticket in Dachau (the name of our destination), and then give it to me." They also issue tickets for dogs, which you take with you in the cars.

But to continue. At last we arrived at Dachau, after a half hour's ride through a country all of which is preserved by the king. We saw plenty of game from the car window, and anticipated good sport. On arriving we were met by the head game keeper and about twenty boys, called *treibers*, to collect and carry the hares. After a glass of beer in the *wirthshaus* we started out, and were soon at work. In the first *boden* we had the best luck, and shot about thirty, of which I had the good fortune to kill five. For about five minutes I had pretty warm work, for the hares came so fast that, between my loading and shooting, several escaped that I could have easily killed if I had been prepared. And so the day passed away in excitement. On every side was heard the constant shooting and the yelps of the dogs that were retrieving the wounded

hares. About half past three the horn was heard telling us that the shooting was over, the result being 115 hares and some six partridges which was not up to the average. We then returned to the *wirthshaus* where we found a good dinner waiting for us, to which we did ample justice; after which we rode home in our car, attached to a freight train. Enclosed you will find the statement about grayling, which I promised some time ago to send you. I send you the original in German, and the translation.

Now, one word more and then I am finished. In your paper for October 21st there is a picture of a so-called dachshund. I have shown it to several of my friends here, and they all say it can be no real dachshund. I shall send you a photograph of what is called here the real dachshund, as soon as I can find one.

W. G. M.

ANOTHER CHALLENGE.

NEW YORK, December, 1875.

EDITOR *FOREST AND STREAM*:—

I notice in your last issue a suggestion of testing shot guns of different makers, for pattern, penetration, and merit of workmanship, material and design, and as I have two guns for which I entertain a very high opinion, I should be pleased to have them shot against any guns of the same bore by any maker with reference to above claims to excellence. Both of my guns are made by W. W. Greener, 10 bore, one weighing 9 pounds, the other 13½ pounds, the heavier, modified choke bore, the lighter, choke bored; charge for the heavier gun to be 5 drachms powder, 1½ oz. shot, and of the 9-pound gun 4½ drachms powder and 1½ oz. shot. Competing guns to use the same quality of powder and size of shot. Chilled shot not allowed. The loading to be done by a party mutually agreed upon. The targets to be at 40 yards range, and of uniform size and thickness.

Knowing that many of your readers have guns of high excellence, I should be pleased to extend this challenge to all who may wish to compete, to show which is the "champion gun." The match to come off any time within two weeks of acceptance, and I hope that Mr. Scott's and Mr. Pape's guns, or any other maker's guns of equal excellence, will come forward and compete in this trial. Each owner of guns entered to name a judge, and both parties to agree on an umpire. The heavier gun is perfectly plain, the lighter gun engraved. Each competitor to bear his own expenses. The ground selected to be within five miles of this city.

F.

Rational Pastimes.

CRICKET.—A meeting of cricketers was recently held in London, at which it was resolved to send a representative "gentlemen's eleven" to the United States during the Centennial Exhibition. The visit will be a combination of the pleasures of a tourist party and of cricket, as the company (which will include about twenty-five cricketers) will visit Niagara, Saratoga, and other places of note. Their principal matches will be those played in Philadelphia. The Philadelphia cricket clubs will shortly hold a meeting in that city to arrange a grand international centennial cricket fete for next July, in which representative elevens from England and Canada will compete with the American eleven—the sides being equal this time, there being no longer need of odds being given to our American club team.

—A game has recently taken a step towards popularity in this city which bids fair to be the commencement of a rapid increase in public favor throughout the country, and that is rackets. As played here and in Philadelphia—in which city it has become quite a favorite recreation for the Winter season—it differs from the English game somewhat, inasmuch as it is played with a small wooden bat instead of the racket bat used in the English game. Moreover, the ball is larger and more elastic than the regular racket ball. In all other respects "American rackets," as the new version of it is called, is the same as the old game. It requires great agility of movement, keen sight, and quick perception, and it is an exercise which brings into healthy action every muscle of the body in running, stooping, jumping, and in the active use of both arms in batting. The best racket court now in this city, and the only complete one, is that of Barney McQuade, located in Madison street, near the junction of Grand. On Friday, December 17th, a grand match was played there between Oscar Manning, Philadelphia's champion player, and Barney McQuade, New York's strongest exemplar of the game, it being the first six games of a series of eleven, the other five having to be played in Philadelphia. The match began at 2:20 P. M., and it was continued until near dark, at which time each player had won three games, Manning, however, scoring the most aces, or points. In the first game McQuade was the victor by a score of 21 to 19, the game occupying twenty-five minutes, it being admirably contested throughout, the manly character of the play and the courtesy shown each other being marked features of the match. The grace and activity of movement of Manning, and his gentlemanly deportment, won for him high commendation from the crowded assemblage of spectators. He easily won the second and third games, by scores of 21 to 9 and 21 to 10, but the fourth ended in favor of McQuade by 21 to 17. This left the score of games at two for each side, and the closing play was watched with deep interest. In the fifth game Manning handled his bat in handsome style, both in "serving" and in his "returns," and the result was his success by a score of 21 to 9. The last game, however, was won with ease by McQuade, it being nearly dark, Manning falling off in his returns. The score was 21 to 6 in favor of McQuade, leaving the tally of games at three to three. It will be seen, therefore, that the match is in an interesting position for the concluding games in Philadelphia.

On Saturday, 18th instant, a four hand contest took place at McQuade's between Manning and Moore on one side, representing Philadelphia, and McQuade and Lenahan on the other, the two latter winning three games out of the five constituting the match.

A splendid racket court is in process of construction in Twenty-sixth street, this city, for a private club, the outlay for the building reaching over \$100,000. In fact, quite a revival of rackets is promised, as it is eminently a game suited for those of sedentary employment, such as our merchants, bankers and commercial men, not forgetting literary and newspaper men.

—The advent of Mr. H. E. Bird, of the London chess club—one of the most noted of its members, and a well-known writer in the European chess magazines—in the metropolis, has given quite an impetus to the game in the chess circles of the city. He has met our leading chess experts at the game, and only Captain McKenzie has been able to cope with him successfully. He defeated Mason with ease in four games out of five, Mason playing his favorite Ruy Lopez gambet, and on Saturday night last he polished off Signor Alberoni at the Brooklyn chess club to the tune of four out of six games, one being drawn. Mr.

Bird is a quiet, good natured, gentlemanly looking person of forty-five; bald, short, portly, of round, florid face, fringed with light, soft whiskers. He moves the pieces gently, but without hesitation, and plays an interesting game for lookers on to observe.

GRECO-ROMAN WRESTLING.—A match has been made between M. Louis Carteron, who is said to be champion of Europe, and Professor Miller, the late antagonist of Andre Christol, to be decided at the Brooklyn rink on Christmas night. The stakes are \$1,000, and the articles of agreement permit of any hold. Christol is anxious to have another bout with Professor Bauer, three falls in five, to be decided before the close of the year.

—The ball was hoisted at the Capitoline Lake again on Friday, 17th instant, and on the 18th there was a large congregation of skaters on the lake, the number of ladies on the ice being noteworthy. No skating was at command either at Central or Prospect Park, as the ice was not thick or strong enough to admit of safety with such a crowd on it as would throng the park lakes when the skating signal goes up. At Prospect Park on last Thursday, though there was no skating, the ice boats of the Park club were out on the lake, and rapid sailing was enjoyed. The Lady of the Lake flying from the south end to beyond the dam in about a minute and a half. As soon as the ice is in condition there will be a regatta at the lake, in which boats of the Park and Capitoline clubs will race for the pennant. A base ball match will be played on the large lake at the park on Christmas day, by which time no doubt skating will be at command.

—The National Curling Association committee have decided to have the grand annual match, North vs. South, at Prospect Park this season, instead of at Central Park, as heretofore. The large sixty acre lake at Prospect Park will be placed at their service for the occasion, and on this thirty rinks can be laid out with ease, as it is half a mile long and nearly a quarter wide.

Billiards.

SLOSSON AFTER SEXTON.—Since Sexton beat Slosson at the late Tammany Hall tournament, the latter has been extremely anxious to get on a match with his old antagonist, as he attributed his defeat at that time to his want of practice. Considerable talk has been indulged in *pro* and *con*, but the friends of neither party could effect a match. Slosson has now gone at it in a business like way, as the appended challenge to the editor of the *Sportsman* will show, and we have been assured that Sexton, who has just returned from the East will accept:—

I hereby challenge William Sexton to play me for \$500 a side. The game to be three ball, 600 points up, governed by the rules for the three ball championship of the world, and to take place in this city. The date of play and other details to be mutually agreed upon. In earnest of my intention I enclose \$250 as a preliminary stake. This challenge to remain open ten days from date.

GEO. F. SLOSSON.

ALL SORTS.—Rudolph Wendolake, aged 17, who had charge of the fifteen ball pool table at Loton and Murphy's, this city, died suddenly on the 19th instant from the effects of a spider's bite. . . . Sexton and Garnier exhibited at the Bay State House, Worcester, on the 17th instant. In a three ball game of 250 points Garnier went out with a run of 125 and an average of 17 6-7. Sexton scored 102. A four handed game was then played, two prominent local players assisting. This game, which was four ball, caused a great deal of amusement, as the amateurs seemed not over courageous when they found themselves in such distinguished company. Sexton and Gould, and Garnier and Brooks played as partners. Brooks opened the game with three, and Gould followed with thirty, the largest run made by either of the local billiardists during the game. At the close of the eighth inning the game stood—Garnier and Brooks 1,158, Sexton and Gould 852, and the game was brought to a close. . . . Henry A. Horn, of billiard notoriety, repeats his lecture on "Drumming as a fine art" at Boston December 23d. . . . Patsy Fitzgerald is now in charge of the fifteen ball pool table at Garnier's. . . . As the proposition to match Wilson, of this city, against Ned Bryan, of Providence, for \$1,000, best in thirty-one games at fifteen ball pool, has not been accepted, the backers of Mr. Wilson now propose to play two games, one in Boston and one in New York, for \$500 a side each game, and to be played ten days apart. The balls to be 2½ inches in size, the fifteen ball to be placed outside of the bunch, and the games to be played on a Collender table. . . . Joseph Gerstel is working at his trade, that of a jeweller, in Newark, N. J. . . . Lawrence Farrell, formerly a partner with Maurice Daly, recently opened a wine room at 63 Nassau street. . . . William Zarringer, who marked the recent Burleigh-Maggioli game, is superintendent of the Jewell billiard room at New Orleans. Charles D. Quaid is at the Crescent hall, and John Oberlander at the St. Charles room, in the same city. . . . George F. Slosson ran 216 recently in a three ball game. . . . At Ypsilanti, Mich., December 15th, Albert Harrington, clerk of the Hawkins House, that city, ran 1,266 at the four ball game. . . . James Kernan, the veteran pin pool player, is now with John T. Reeves, 234 Broadway. He talks very seriously of getting up a pin pool tournament. . . . Neil Bryant was in Chicago on the 16th instant. . . . The Drew of Texas proves to be Schafer, of San Francisco, who, together with Gates, were at New Orleans last week. . . . Wm. Burleigh, considerably enriched in pocket, is back at Chicago. It is thought that Eugene Carter will be the next challenger for the badge unless Louis Shaw, of Indianapolis, Ind., has not changed his mind. . . . Frank Parker, who beat Rudolph at Buffalo for the four ball championship of the world, has opened a pin pool room at Tom Foley's place, Chicago. . . . Up to December 15th the result of the games played at Philip Tieman's, Cincinnati, for the amateur championship of the State of Ohio, were as follows: West won two and lost none, Graham and Meyer each won one and lost one, while Jones and Radcliff had each lost a game. A correspondent writes that the attendance has been large, and considerable interest was evinced by the billiard players of that city. . . . Cyrille Dion has published a card, giving his reasons for not accepting Garnier's challenge. . . . An amateur tournament is now in progress at Newark, N. J. . . . The tournament for the championship of the Fifth Avenue Hotel was concluded last week at the Columbia room. Mr. Wright won the first prize, Mr. Ives the second, and Mr. Massey the third. . . . The room of Van Cleaf, in Brooklyn, is offered for sale, the proprietor going into other business.

MILLER'S RECOIL CHECK FOR GUNS.

PATENTED NOVEMBER 2, 1875.

Fig. 1

Fig. 2

Repels and neutralizes the recoil, permits steadier aim, insures greater penetration, and can be attached to any gun. It is a great protection to the piece, and to those who use it.

It is the result of many years' study and experiment. It has been thoroughly tested by experienced and scientific men, and pronounced a wonder of simplicity, a perfect success, and as great an improvement in firearms as was the percussion lock. The inventor expects to be ready to fill orders by January 1st, 1876. The attention of experts and dealers in Europe and America is invited.

The inventor's agent in New York is
A. J. NORMAN,
825 Broadway.

Have now in store an extensive assortment of Breech Loading Shot Guns, made by JAMES PURDEY, E. M. REILLY & CO., WESTLEY RICHARDS, W. & C. SCOTT & SON, P. WEBLEY & SON, W. W. GREENER, and a large variety of cheaper grades. Also BREECH LOADING, CENTRAL FIRE, DOUBLE RIFLES, AND RIFLE AND SHOT GUNS of superior quality. Implements, ammunition, and all other articles appertaining to Breech or Muzzle Loading Fire-arms generally. Illustrated Circular sent by mail when requested.

Letter A, showing solid head; B B showing nickel anvils for Berdan Primer, Ely's central fire or Union Metallic Company's caps.

Hart's Sportsman's Favorite Metallic Shells.

Endorsed by the leading sportsmen in the United States, and pronounced superior to anything now offered to the public. A full description of Shells and Patent Loaders with prices, may be obtained from any of the leading sportsmen's depots throughout the country. Manufacturers of Aluminum, Celluloid, and Germanilver Reels for Trout, Salmon, and Bass fishing. **GEO. E. HART & CO.,** 363 and 365 Market st., Newark, N. J. may 13-ly

F. S. HARRISON, Agent.

From Captain Bogardus, Champion Wing Shot of America.

Messrs. George E. Hart & Co.,
Gentlemen—The fifty shells I received from you to-day suit me better than any I have ever used. They are stronger and better in every respect, and I shall use them in all my shooting hereafter. Yours truly,
A. H. BOGARDUS.

Paper and Metallic Shells

FOR

Breech Loading Shot Guns,

Manufactured by the

UNION METALLIC CARTRIDGE CO.,

BRIDGEPORT, CONN.

THE STURTEVANT SHELLS are the easiest reloaded. Do not have to unscrew the head nor use an awl to remove the exploded caps. THE PATENT MOVABLE ANVILS, made of steel wire, will not bend or break.

THE BERDAN PATENT SHELLS, new model, with Hobb's patent waterproof primers, never miss fire, and are highly prized by all that have used them.

PAPER SHELLS.—By repeated experiments and great outlay for improved materials, and machinery made expressly for the purpose, we can now warrant our BROWN PAPER SHELLS equal to any imported. They are sure fire, and will not burst in the gun.

Enquire of any of the dealers in sporting materials for the U. M. C. Co.'s Shells.

Not sold at retail by the manufacturers.

THE

HAZARD POWDER CO.,

MANUFACTURERS OF

GUNPOWDER.

Hazard's "Electric" Powder.

Nos. 1 (fine) to 5 (coarse). Unsurpassed in point of strength and cleanliness. Packed in square canisters of 1 lb. only.

Hazard's "American Sporting."

Nos. 1 (fine) to 3 (coarse). In 1 lb. canisters and 6 1/2 lb. kegs. A fine grain, quick and clean, for upland and prairie shooting. Well adapted to short guns.

Hazard's "Duck Shooting."

Nos. 1 (fine) to 5 (coarse). In 1 and 5 lb. canisters and 6 1/2 and 12 1/2 lb. kegs. Burns slowly and very clean, shooting remarkably close, and with great penetration. For field, forest and water shooting it ranks any other brand, and it is equally serviceable for muzzle or breech loader.

Hazard's "Kentucky Rifle."

FFFG, FFG, and "Sea Shooting" FG, in kegs of 25, 12 1/2, and 6 1/2 lbs. and cans of 5 lbs. FFG is also packed in 1 and 1/2 lb. canisters. Burns strong and moist. The FFG and FFG are favorite brands for ordinary sporting, and the "Sea Shooting" FG is the standard Rifle powder of the country.

SUPERIOR MINING AND BLASTING POWDER. GOVERNMENT CANNON AND MUSKET POWDER; ALSO SPECIAL GRADES FOR EXPORT, OF ANY REQUIRED GRAIN OR PROOF MANUFACTURED TO ORDER.

The above can be had of dealers, or of the Company's agents in every prominent city, or wholesale at our office.

88 Wall Street, New York.

THERE CAN BE NO GREATER PORTABILITY without serious defects. They are the only portable boats that are equal to the very best whole ones for local use.

Hotels and Resorts for Sportsmen.

TUBBS' HOTEL,
OAKLAND, California.

JOHN M. LAWLOR & CO., PROPRIETORS.
SITUATED AT THE TERMINUS OF
the great Trans-continental Railroad; 40 minutes from San Francisco; 200 rooms, with hot and cold water in every room; delightful drives and splendid scenery; a favorite home for tourists. July 22-6m

Rossin House, Toronto, Canada.
SHEARS & SON, Proprietors.

This house is a favorite resort for gentlemen sportsmen from all parts of the United States and Canada.

DUCK SHOOTING.—THE ATTENTION of sportsmen is called to the fact that the best shooting ground within three hundred miles of New York city is Shinnecock Bay. More ducks of all kinds in the bay now than has been for a number of years, and sportsmen are bringing in bags of birds daily. The most experienced guides and gunners, with boxes, battues, decoys, etc., furnished at the Bay View House. Address

For Florida.

PHILADELPHIA AND SOUTHERN
Mail Steamship Company's line to Savannah, Ga., sailing every Saturday, from Pier 22, below Pine street, Delaware River, at 12 o'clock noon, making close connections through to all points South. The line is composed of the steamships JUNIATA and WYOMING. The Wyoming does not carry passengers. The Juniata is a favorite ship with the traveling public, having passenger accommodations of the most superb character. She has recently been refitted and elegantly furnished with everything requisite to the comfort and convenience of passengers.

Families en route for FLORIDA, Georgia, Alabama, and even as far as New Orleans, will find the Savannah route the most desirable for comfort, as well as the most economical. Through trains of the Central Railroad of Georgia, and Atlantic and Gulf Railroad, Florida, leave Savannah every morning and evening. The Florida steamers leave Savannah three days in the week for all points on the coast.

For through passenger tickets and bills of lading to all points in Florida, Georgia, Alabama and Tennessee, apply to WM. L. JAMES, General Agent, 416 South Delaware avenue, Philadelphia.

July 22-17

Sportsmen's Goods.

Orange Sporting Powder.

ORANGE LIGHTNING POWDER,
The strongest and cleanest Powder made. Nos. 1 to 7, packed only in sealed 1 lb. canisters. The coarser sizes (higher numbers) especially are recommended to owners of fine breech-loading guns, giving great penetration with very slight recoil.

ORANGE DUCKING POWDER,
For water fowl. Very strong and clean. Nos. 1 to 5. Packed in metal kegs of 6 1/2 lbs. each, and in canisters of 1 and 5 lbs.

ORANGE RIFLE POWDER,
The best for rifles and for all ordinary purposes. Sizes F.g. FF.g. FFF.g, the last being the finest. Packed in wood and metal kegs of 25 lbs., 12 1/2 lbs., and 6 1/2 lbs., and in canisters of 1 lb. and 1/2 lb. All of the above give high velocities and less resiliency than any other brands made.
BLASTING, MINING, AND SHIPPING POWDER OF ALL GRADES AND SIZES PACKED IN WOOD OR METAL KEGS OF 25 LBS.
SAFETY FUSE AND ELECTRICAL BLASTING APPARATUS.

LAFLIN & RAND POWDER CO.,
21 Park Row, N. Y.

Sole proprietors and manufacturers of the celebrated ORANGE brand of GUNPOWDER. Recommended and used by Capt. A. H. BOGARDUS, the "Champion Wing Shot of the World."

DITTMAR POWDER
MANUFACTURING CO.

MY NEW IMPROVED POWDER
can now be loaded from an ordinary powder flask; grains hard. Use it now like Black Powder. No fear of overloading. Burns slow now. No fouling of the gun. Little or no smoke. Little or no recoil. Not very loud report. Less heating of the barrel in rapid firing. Good penetration and good pattern. Safe to keep, as it does not explode if set on fire except well confined. Shells furnished loaded with powder only, if desired. None genuine without my signature on the can. CARL DITTMAR.
NEPONSET, MASS.

HOLIDAY PRESENTS.

Received the Prize at the Paris Exposition, 1867.

Nov11-3m

TRY IT Vanity Fair.

It is shaved from the best Natural Leaf, for Meerschaum and Cigarettes. Does not make the tongue sore. Liberal sample on receipt of 20 cents. Highest award, Vienna, 1873. Send for circular.
WM. S. KIMBALL & CO.,
FEEBLESS TOBACCO WORKS, Rochester, N. Y.

From G. V. N. Ogden, Rye Neck.

The Vanity Fair tobacco arrived all right. There is only one fault I can find with it—it has a peculiar flavor, exclusively its own, unlike any tobacco I have heretofore smoked, and of such exquisite sweetness that it seduces a poor fellow human being into smoking much more than he would of any other tobacco. This fault is, however, counterbalanced by the fact that it does not burn or bite the tongue, nor affect the head as most all other tobacco does. The effect of smoking Vanity Fair is to permeate the smoker with a "good will-towards-all-men" sort of feeling.

Does not make the Tongue Sore.

SMOKE VANITY FAIR.—There must be some magical properties in it, akin to the wonderful Eastern plant that made captive those who inhaled it.

From Isaac I. Hite, Mellenville, Orange Co., Fla.

I have by accident gotten hold of a few packages of your Vanity Fair, and find it better than any brand in this market. It sells at double the price of any other tobacco.

I have a drug store, and would like to keep and sell your tobacco. Please quote price, &c.

Best in the World. Ask your Dealer for it.

With Vanity Fair you can commune sweetly all the day long; incense for your success; mourner in ashes for your disappointment. Best dealers have it.

VANITY FAIR.—We wish those who hear of this tobacco the first time to ask some friend about it. Many people know it; they invariably praise.

MAPLE SYRUP IN AIR-TIGHT
gallon cans, \$1.50 per gallon. No charge for cans. R. L. GRAVES, Sunderland, Vt.
Nov12-6t

CHAMPION GUNS OF ENGLAND
PAPE'S
Unrivalled Sporting Guns.

Stand unequalled in every contest. Their performance at the London Trials of 1875 beats the records of any maker in the world.

1875. 12-Gauge, Choke Boring.
Maker of Gun. Exhibitor.
1st—Greener. Greener.
2d—Pape. Davidson.
3d—Pape. Pape.

Out of a class of 68 guns, 3 out of the 6 best were made by Pape. The Greener gun was protested against on the spot for having its score false counted, the fact proven there, and afterwards confirmed by same gun being shot for two days per week for six weeks in succession, when its average score only took 24th place, its very best score being greatly below the scores of the best six guns.

1875. 12-Gauge, Old Sporting Bore.
Maker of Gun. Exhibitor.
1st—Pape. Davidson.
2d—Pape. Davidson.

1875. Long Range, 60 yards, Choke Bore.
1st—Pape. Davidson
60 yards, Long Range, Sporting Boring.
1st—Pape. Davidson
Those champion Long Range guns, only 7 pound weight, with a charge of 3 1/2 dr. to 1 1/2 oz. shot, beat the best 8 bore Greener gun at 60 yards; weight, 15 lbs.; 6 drachms and 2 1/2 oz. shot.

1875. The Sportsman's Sub. Cup, valued at £45, was also awarded to W. R. Pape, for the original invention of choke boring. Winner of the London Gun Trials of 1858, 1859, 1866. Address

H. C. Squires, No. 1, Courtlandt st.

New York.

THE GREAT
London Gun Trial,
1875.

W. W. GREENER begs to inform his numerous clients in the United States that he has been very successful in the above trial, having secured the first prize, a silver cup, value 40 guineas—class 2 for 12 bores; also winner in class 1 for 8 and 10 bores, and class 4 for 20 bores. He has won in all the classes for improved boring, which is upon a different plan to any other maker, and is far superior in the three most essential points, viz., PATTERN, PENETRATION, and REGULARITY OF SHOOTING.

Mr. HENRY C. SQUIRES, of No. 1 Cortlandt St., New York, is now importing my DOUBLE CLOSE-SHOOTING GUNS to order, an invoice of which will be shipped to him on the 1st July, and can be examined about the 15th. All special orders given to Mr. Squires will be carefully filled. A full report of the GREAT TRIAL, showing the marked superiority of my guns over guns made by Dougal, Pape, Tolley, and others, will shortly be published, and can be had on application at No. 1 Cortlandt St.

W. W. GREENER,
Champion Gun Maker,
St. Mary's Works, Birmingham, England.

HENRY C. SQUIRES, of No. 1 Cortlandt street has just received an invoice of these close-shooting guns, and from him any information in reference to the results of the Great Trial can be obtained on application

The Up-Town Sportsman's Depot.

aug5-6m

W. W. GREENER'S
DOUBLE CLOSE-SHOOTING
GUNS. Winner of the Silver Cup, value 40 guineas, at the Great London Field Trial 1875, beating 33 competitors with 68 guns, also winning in all the other classes for the Improved System of Boring. These guns will kill from 80 to 100 yards, loaded with large shot, and will shoot well with small shot with a less powder charge than guns bored upon the old system. For report of the Gun Trial apply to Messrs. McLaren, Williams & Co., Agents, St. Louis, U. S. A. Address
W. W. GREENER,
St. Mary's Works, Birmingham, England.

J. D. DOUGALL'S
EXPRESS SHOT GUNS.

(Title registered.)

SHOWN by trials at Wimbledon by Editor of the Field to possess the GREATEST PENETRATION and therefore LONGEST RANGE—thus: Circle, 30 inches; 800 pellets; average, 191; penetration, 37. The Editor's trial of Greener guns with 340 pellets of same shot and same charge of powder, gave 180, and penetration 30, although there were 40 more pellets in each charge. Should any controversy arise as to the durability of these new systems, we herewith warn all beforehand that our system is our own invention (though founded on the American idea) and is DURABLE, a fact remarked on by the Field, that the guns tried had been in use during last season, and references permitted to the owners. Send for Illustrated Circulars to
59 St. James's Street London.

WILLIAMS & POWELL,
Gun and Rifle Manufacturers,

Call the attention of the Sportsmen of America to the extreme SIMPLICITY, STRENGTH and DURABILITY of their New Patent "SIMPLEX" Breech loader and INDEPENDENT EXTRACTOR.

The parts in this new action are so few (only two,) its mechanical soundness so thorough, and the strength and simplicity of the action so great, that W. & P. feel sure it will supercede all the complicated and manifold grips now in use, its one powerful grip being far stronger than any double, treble or quadruple grip now used. In this new action LEVER and GRIP ARE ONE SOLID PIECE OF STEEL and the ANGLE OF THE BODY is left in its ENTIRE STRENGTH.

Drawings of action and extractor will be sent on application, and orders may be forwarded through any of the best houses in the States for execution in the Spring.

Guns guaranteed to make patterns of from 160 to 230 with No. 6 SHOT AT 40 YARDS, as desired.

Muzzle Loaders Altered to Breech Loaders.

REPAIRING OF EVERY DESCRIPTION.

Has constantly on hand a full assortment of Rods, Hooks, Lines, Baits, Reels, Fly Books, Salmon Flies, Waterproof Silk Lines, Silk and Hair Trout Lines, &c. Perch Snoods, China and Grass Lines. Also, a large lot of Cane Reeds, Bamboo and Japan.

Birds' Eggs and Birds' Skins in great varieties.—Taxidermy in all its branches.

SPRATT'S PATENT DOG BISCUITS. 4-1y

McBride Flies.

HAVING BEEN FOR THE PAST twelve years associated with my father, John McBride, in the manufacture of fishing tackle, I feel competent to continue the business and supply the custom with the same quality as heretofore. Parties supplied with casting lines and artificial flies for Pennsylvania trout streams, Adirondacks, the Maine Woods, Lake Superior, Thousand Islands, Canadian, and other waters. Anglers not acquainted with the nomenclature of these flies, by mentioning the locality where they intend fishing, will have the varieties best suited to those waters sent to them. Flies copied from any natural insect or pattern desired. SARA J. McBRIDE, (Successor to John McBride) Mumford, Monroe county, N. Y. Dec2-1y

ROD AND REEL.

UP and down, the range of the brook,
With artistic cast of feathered hook,
"Piscator Dapper" displayed his skill,
With spotted victims his creel to fill.

All lures but the fly he held in scorn;
Worms in boxes, or bugs in a horn;
Thus daily abjuring all grovelling things,
His taper line fluttered its dainty wings.

Quite confident he that no trout could swim,
But, sooner or later, would strike for him;
As thisledown soft in such plausible way,
His flies would hover, and touch, and play.

Nestling near the foot of the stream
Was a shady pool, where the flickering gleam
Stole through the green canopy overhead,
To kiss the place where the dimples spread.

Here dwelt, securely, in moss-grown hold,
Prince Trout, in vesture of red and gold,
Feeding on grasshopper, worm and bug,
Lusty and keen in his covert snug.

He was up to all the tricks of trade,
Knew every fly that was ever made;
When the gay deccits were near him thrown,
He watched and giggled—bent let alone.

Now and then rising, alert and sly,
He would lazily swallow a natural fly,
By way of a hint that for regular feed,
Artificial indulgence was not his need.

"Piscator Dapper" spent all one day
Changing his casts with dexterous play,
But all in vain, for at set of sun,
Safely Prince Trout was watching the fun.

To the mountain tavern there came that night
A pedestrian party in broad moonlight;
And among their rough knapsacks, thrown on the ground,
Leaf littered, and dusty, a trout was found.

'Twas the brave old prince of the shady pool,
Caught with a bait in the evening cool;
Exclusive science left empty dish,
But a common temptation beguiled the fish. T. W. A.

For Forest and Stream.

Hunting on the Illinois River.

THE most noted sporting grounds in Central Illinois, if not in the whole State, lie upon the Illinois River about twenty-five miles below Peoria. Hither come annually, Fall and Spring, but less in the latter, numerous sporting parties from all the surrounding country to hunt, fish, or trap. Indeed, this habit so long pursued, has finally passed into a regular custom throughout all the surrounding counties; hence the sportsman on every side, whether he hails from the city, village, or farm, now looks forward with the greatest anxiety and impatience for the "coming season;" the glorious October and November. Nor is this all, for hither come also other parties from distances more remote, from Chicago, Indianapolis, Ind., Rochester, N. Y., &c. All come armed and equipped "cap-à-pie," and fully prepared to enter, heart and soul, into the thrilling pastimes of these rural sports. Yes, they come indeed, till at times the whole forests and surrounding lakes seem peopled with their presence, and the air itself to be hallowed with the sweet music of their pleasures. And yet, I have never seen in your generous columns, any special notice of these grounds, or of the game in which they so richly abound. Hence I am assured that your numerous readers will rightly appreciate my motive, if I venture to post them upon this subject.

I am the better prepared, since I have just returned from my third Fall's sporting in this place, and speak from personal observation.

HUNTING GROUNDS.—These lie both on the east and west sides of the Illinois River, and nearly in equal portions. The part west of the river is in Fulton county, and that east in Mason county. Havana, a small village on the

river, is near the south end of them, and is a good initial point, either by railroad or the river. The United States is constructing a dam across the Illinois near their upper end. They are about eight miles long and three broad, or one and a half miles on each side of the stream. They are "bottom lands," and generally heavily timbered, but in some places open, except brush, flags, weeds, &c. They are lower back from the river than on its banks, which are open, hard, dry and fine for camping, with plenty of wood. Blind wagon roads intersect them generally, so they are easily entered on almost every side. The country back of this three mile belt of forest, is upland and divided into farms. Thus lies the land—now for the water.

THE LAKES, &c.—The river is generally about three hundred yards wide with a slow current, and has hard sloping banks, and is very pretty and pleasant indeed. On each side of this, and back at convenient distances for hunting, lie about twenty lakes, sloughs, and ponds, and varying in size and length from three miles and a half down to the ordinary pond. These, about ten on each side, stretch along at about equal distances apart, from north to south, throughout the eight miles of hunting grounds. As before stated, they are convenient from the river, where most of the tents are pitched, but many are located back on the different lakes, since the river does not afford much hunting. Camps are generally pitched so as to command several of these lakes. Each side of the river presents about equal advantages to the sportsman, and hence each generally has about the same number of camps and hunters. Persons living in the vicinity, either on the river or on the uplands, will always be ready to conduct strangers to the best camping grounds, or haul their camp equipment to and from the same. Steamboats from above and below often land parties right on the ground, hence Peoria or Pekin, from the north, are good initial points, besides a perfect outfit for camp may here be purchased. But when not too inconvenient I would recommend a full outfit to be taken from home. A small skiff or boat for crossing the waters and getting the game when killed, is almost indispensable, and should be brought along, as there are but few if any to hire. India rubber boots with high leggins, are another necessary article of outfit. Most of the game killed may be got by wading from the shore. The lakes are generally shallow and some may even be waded; some are open, but most are broadly belted with wild rice, flags, grass, &c. Indeed the shallow ones are sometimes covered with these throughout, especially in a dry season. These lakes during the Fall and Spring months are fairly alive with ducks, brant, geese, &c., which in passing south and north stop here to feed and recruit. Nowhere throughout the whole course of the river are so many waters found huddled together in so small a space, or none where the wild rice, &c., gives such ample food. I will now mention the names of a few of the game birds to be found here, and against which so many manly "braves" and "true knights" of the trigger love to contend.

DUCKS. 1.—Mallard, very abundant, and sometimes by the thousand; one of the principal ducks killed—very fat and delicious.

2. Wood, or Summer, very abundant, and breeds here during Summer; is the first hunted in early September; a beautiful but small duck, fat and good eating.

3. Teal, blue-winged, very numerous, large flocks come early in September before the mallard, and is hunted with the wood duck; color, brownish; very fat and the essence of good eating.

4. Teal, green-winged—remarks as above. Both are very rapid fliers—huddle in the water.

5. Widgeon, very abundant and comes early; not large, but a fat and fine duck; swift on the wing, and huddles.

6. Canvas back, common, but not abundant; he is the pride of the epicure. Give me the teal in preference.

7. Hooded merganser, small and very beautiful, has a "hood" (or crown) of white feathers on the head with a jet black border, the head (otherwise) and neck jet black; breast, white with a black belt around it; bill, straight, black and narrow, and hooked at the tip; he is a great diver and fish-eater. So beautiful is this little duck that I placed one in the hands of a taxidermist at Canton City, and had it mounted. Thanks to Gen. Pinegar for the bird;

the specimen is a prize to my collection. I especially admire the "dashing white" hood, &c.

8. Sheldrake, diver, rapid flier, fish eater, and not very good; fat.

The above named ducks are those generally killed; to this list might be added many others, and to include quite all our inland and some of the salt water species, but this I will omit.

Of geese, the brant and the common wild goose are the only kinds I saw. These are quite plenty and sometimes very numerous, especially late in the Fall, and again in the Spring. They sometimes make the whole welkin resound with their "honk-honk" music. This season there were less than usual.

OTHER BIRDS AND QUADRUPEDS.—The white pelican, sand hill crane, herons, water turkey, coot, plover, snipe, common hawk, owl, bittern, curlew, loon, dipper, quail, pinnated grouse, racoon, muskrat, mink, and large fox squirrels are some of the animals to be found here; some plenty in their season, and others scarce. In the proper season I think splendid woodcock, snipe, and plover shooting over a good dog could be had here. The grounds are favorable, beside we saw and killed some woodcock, &c., and have seen many snipe.

FISH.—nearly all these lakes and the river abound in fish, but they are seldom caught by sportsmen with hook and line, but mostly by net and seine for profit, and sold for about three cents a pound to the farmers, steamboat stewards, or village fish dealers. The main varieties sold are the cat, buffalo, pike, and bass. The other varieties include most of our ordinary fresh water fish. The best of bass, and, I think, pike fishing, may be had in most of the large waters of Illinois, but the country is generally level and agricultural, and not strikingly romantic, hence not much visited by the fishing tourist. These grounds amply supply in season, all the fish required by the surrounding country.

I have omitted to mention the names of these lakes. The most prominent are, Thomson's, Johnson's, Slim and Duck Island, in Fulton county; Flag, Spring, Mud, and Clear in Mason county. These are from a mile to four miles long, and two of them are of beautiful clear waters, the rest less clear.

From about the 10th to the 20th of October is the best time to camp here. The air is then purified and purged of mosquitoes by the frosts, and the country subdued and beautiful. Then all the lakes are stirred up by sportsmen and the game kept on the wing from lake to lake. Shooting is generally along the borders, and a retriever will add much to the sport. Come at this season of the year and I will warrant the game to be on hand, and the balance I leave with the sportsman. You will find shooting.

To the "Farmington Sportsmen's Association," of Fulton county, I desire to give my thanks for the many kindnesses received at their hands. They are always ready for action, and ever found well represented on the banks of the pleasant Illinois. OLD SCOUT.

December 12th, 1875.

A FAMOUS HUNTER KILLED.—Jackson Frailey, known throughout the State as the "Deerslayer," a Nimrod of the Conewago, was killed in a fight with an immense catamount on Welsh Mountain, near Martinsville, Penn., last week. His body, when found, was terribly lacerated and the clothing completely torn from it. A mile distant was discovered the catamount; it was shot between the left shoulder and had a deep stab made with a hunting knife. Near by the hunter's rifle, with both barrels discharged, and his knife, the blade covered with blood, were found. It is surmised that after shooting the animal and supposing him to be dead, he placed his gun against a tree and approached the catamount to turn him over, when the beast sprang upon him and a terrible fight ensued. Frailey is said to have killed over 2,000 deer, 200 bears, twenty catamounts, three panthers and numberless wolves and foxes. In his tenth year he killed one bear and six deer. His experience in the woods embraced many hand-to-hand contests with bears and wounded bucks, from all of which he came out victorious, and his body was covered with scars, the result of these battles. He was only forty years of age, but followed the calling of hunter and trapper for thirty years.

For Forest and Stream.

THE RIVERS OF COLORADO.

COLORADO, like many of the Western States and Territories, has a large number of long, winding and rapid streams, which have been raised to the dignity of rivers, although, except for their length, little deserving of the name. None of the rivers within the confines of the Territory are navigable, or of any use whatever to inland trade or commerce. They are to the country what the veins and arteries are to the human system—they supply health and vigor to the earth, they stimulate agriculture, are of vast benefit to mining undertakings, furnish power for mills, and supply the indispensable water to cities, towns and villages. On the map these rivers appear of great magnitude and importance, threading the country, as they do in all directions, and containing within themselves the germs of wealth for the future State. A short description of these rivers may perhaps interest the general reader, as they are somewhat different from those in the East or Europe.

The Platte River has its source immediately under the snowy crest of the main range of the Rocky Mountains, and is divided into two main branches—the South Platte and its north fork. The north fork of the South Platte and the river proper unite in Jefferson county, about twenty-four miles south and twelve miles west of Denver, not very far from where the turbulent waters of Elk Creek flow into the north fork. From their junction these two rivers receive the name of South Platte, and flow through the most picturesque mountain scenery until they reach the plains, at an elevation of about 5,600 feet above the level of the sea. In the mountains they are rapid, sinuous, narrow, of crystal clearness, and abounding in trout of the finest character. On reaching the plains, and on their way to Denver, these waters become shallow, of great width, and full of sand banks and quicksands. The tall pines and waving spruces disappear, and the banks of the river are fringed with a scanty growth of willow and cottonwood, with here and there the delicate foliage of the "quaking asp," a species of poplar. The country on both sides of the Platte is of varied character. On the banks of the little brook which forms its source are the log huts of the settlers, the board buildings of the miners, or the white tents of Summer tourists. On all sides rise dark, pine-clad mountains, gray precipices, snowy peaks and waving pines. All is nature—nature as undisturbed by the handiwork of man. Mountain sheep browse on the steep inclines of the mountains; the stately elk and timid deer peer from the willow thickets; the beaver is busy on his dam; the squirrel chirps from the top of the pine tree; grouse and ptarmigan flutter among the grass, and the waters of the bubbling brook seethe and foam in their moss-covered basins, as if impatient to be on their way to the great plains of the east. Further down, the waters increase in volume and pour past the lonely mountain farms, or skirt the mountain road. Here they are crossed by a rude bridge of unhewn logs. Down the opposite hill lumbers the red mail coach, with its freight of adventurous travelers; it rumbles over the bridge, the bright waters leap upwards and then pass on to the abode of man. Leaping over rocks, surging around stumps, boiling in deep holes, roaring over gravelly reaches, turning the wheels of many saw mills, past high mountains, through deep ravines, pleasant meadows, and by picturesque log houses, it pours through its final ravine and enters the wide spread plains below, just as the setting sun lights up the broad expanse of emerald with an effulgence which creates a sort of mirage on those pampas or steppes of the West. In the mountains

"'Twas pebble, rubble and fallen tree,
'Twas babbie, double, through every mile;
It battled on with a shout and shock,
And white with foam was the rugged rock,
And dark were the hemlocks all the while,
'Till the road grew broad and the creek ran free."

while here, on the plains,

"It creeps away in the tangled grass
With a voiceless flow and a wandering will."

The gap in the mountains from which the Platte enters upon the plains is a beautiful spot, and called the Cañon of the Platte. In the foreground are green meadows dotted with innumerable flowers of countless hues; tall grasses wave and nod in the passing breeze; the river ripples over its gravelly bed, and clumps of willows display their silvery buds and delicate foliage. Further back, to the right of the river, is a solitary farm house, surrounded by fields of grain and grass, and the background is formed by gently rising hills, bare of trees; pine-clad mountains and peaks covered with glistening snow. Over all is a clear, blue sky, dotted with fleecy white clouds, with here and there a flock of birds winging their silent way to their nests in the mountain solitude. Further down the river it is crossed by a long pile bridge, over which the heavy laden train rushes with a continuous roar on its way to the south. Farms, more or less cultivated, frame in the river on both sides. Waving fields of grain, serried plots of potatoes, emerald stretches of grass, bristly meadows dotted with mounds of fragrant hay, snug farm houses with their diminutive groves, herds of lowing kine, and long lines of freight wagons, like an Eastern caravan, form the chief features of the scenery of this portion of the Platte.

Beyond Denver the river passes through a vast expanse of prairie, dry, cactus grown, and full of the wild sage. Long irrigating ditches stretch out to the distant horizon; patches of glistening gravel or silvery sage dot the plains; to the right sit countless prairie dogs, barking and frisking in the sun. Here and there is a solitary farm house with outbuildings; the well has the old-fashioned sweep; fields of growing crops are scattered about, and many a tow-headed urchin waves his battered hat as the train from Cheyenne rushes by on its way to Denver, the "Queen City of the Plains." It would be useless to describe the lonely way stations, the thrifty villages, or the rising towns which overlook the turbid and shallow waters of the Platte, for they all have the same general character, and would not prove of interest to the reader. Out on the boundless plains the river, with its fringe of foliage, presents an agreeable change to the monotony of the grassy level. Herds of buffalo cross a ford; groups of graceful antelope bound over the plain; the shy coyote skulks among the sage brush; a long line of mounted Indians skirt the horizon, or a straggling train of white canvas-covered wagons toil along the river banks. It is difficult to give full justice to the scenery of the Platte, for it is of so varied a character that each view would seem to demand a separate description. To Eastern people, used to the grand scenery of the Hudson, the romantic views on the Susquehanna, or the rural beauty of the Houstonie, the

rivers of Colorado may appear tame and uninteresting; still, after a short residence in this country they will find many points of interest which they, in their nonchalance, have overlooked.

H. W. POLLITZ.

For Forest and Stream.

THE NOTTOWAY REGION.

DEER hunting, by this time, is getting rather unprofitable sport; not that the deer migrate or leave—but they seem to learn wisdom, and instead of being driven to certain points by the hounds, they run in erratic routes, and baffle the calculation of the sportsmen, who wait patiently for hours on a stand, in the hopes of getting a shot. In the Summer or early Autumn, five deer can be killed where one is now, and the explanation is simple: In warm weather, when started by the hounds, they strike in a direct line for the water, and whether it is a mill dam or a river, the huntsman knows exactly where his game will cross the road, and is nearly certain to get his shot. But in cold weather it is different. The deer take to water, it is true, when hard pressed; but in the usual drive they don't seem in a hurry to escape the hounds, and make for the woods and thickets, and the very number of animals is their safety in a long run. Other deer are certain to be started, and the tracks crossing and intermingling baffle the hounds, and confuse them so that they generally give up the chase.

As I said before in a former letter, notwithstanding their being hunted, the deer of this section are steadily increasing in numbers. They can only be killed by driving with dogs, and as but few farmers keep a pack, it is impossible to steal upon them, or to shoot them by night; the forests may be full of them, and one could walk the woods until doomsday and get but a chance look at them. Their hearing is good; the cracking of a twig, noise of a footstep—the very rustling of a leaf, makes them bound from their resting place and fly, even when the wind is from you; but their great safeguard is their scent. It is marvelous to see how they are gifted in this respect. I have seen them running at full speed directly for the spot where the huntsman lay concealed, with throbbing heart, bounding pulse and cocked gun in his eager hands, certain of his game; and I have seen them at a hundred yards detect their hidden enemy by their exquisite sense of smell, and turn obligingly without any reduction in their speed, leaving the patient but unlucky shooter staring with open eyes and drawn down mouth at the form fast vanishing in the distance. The rutting season commences now, and the bucks have desperate battles when they meet, and it is of common occurrence to come across plain evidences of the combat, the ground being torn up by their hoofs and the sod flecked with blood. The doe brings forth her young in the early Summer, one generally, sometimes twins at a birth; the fawns can keep up with their mother in a few days. They make beautiful pets, and are domesticated in a short time. Any one desiring to get these fawns can communicate with Capt. Wm. Blin, of Littleton, Sussex county, Va., who can obtain all he wants. The negroes catch many of them to sell in the Petersburg markets. I saw a gentleman in Sussex who found two pairs of antlers in the woods, so interlocked and so interlaced that he could not separate them. Near by was a pile of bones, the remains of the two bucks, who had clearly got into a struggle during the "rutting season," and in the furious battle their antlers had gotten the prongs so firmly fixed that they fell linked together, and died on the field from slow exhaustion and starvation. It is an exciting thing to see a deer running in full view, and I can understand easily why novices or the amateur hunters have what is called the "buck ague." Yet I think it is unjust to charge a man with having a tremor of the nerves and not being able to fire off his gun; the delay in shooting frequently arises from anything but nervousness. I can understand the feeling now. Not very long ago I was hunting partridges, and was slowly riding through a field, my pointers searching a cover of chestnut and oak at the bottom, and right before me jumped up a buck with at least ten points to his antlers. He did not see me, but stood for a moment, with starting eye and heaving flank, gazing at the dogs. As quick as thought I extracted my bird cartridges and slipped in a pair of Ely's wire cartridges, loaded with buckshot, which I had handy in my vest pocket, and then cocked the gun. The buck by this time was fifty yards away, running parallel to the fence, not going fast, but in an easy lope, with here and there a high bound. It was the most magnificent sight I ever saw in my life. The altered head thrown high in the air, the delicate figure, the movements—the very grace and poetry of motion. I did not fire, but only stared in honest admiration at the "monarch of the glades," and let him pass, free as the very air to go where he listeth. I could have as soon pulled trigger at a child playing in the abandon of glee, as to have shot that noble and graceful animal. I told my tale to the captain when I reached home, and in half an hour his pack of hounds was trailing his lordship splendidly. We had a fine run and that was all.

I believe I spoke in a former letter of the want of a game law for this section. The curse of this region is the negroes. The majority of them wont work, but squat on somebody's land, build a hovel, and live by hunting, trapping and stealing. They are generally armed with an old army musket, and will sit all day under the trees watching for a squirrel, and creep along all the paths in the late evening and shoot every old hare who is taking his evening prow; then they trap every living animal that can be caught. I was out hunting one day and I passed along the edge of a corn field about a mile in length, bordering the low grounds. A short distance away was the Nottoway River. In these low grounds are immense trees, that seem to have lived since the flood, and in them used to be countless hordes of squirrels, raccoons and 'possums; but now they are scarce indeed, and no wonder. They are baited and trapped out of all season. In this one cornfield bordering the swamp, in the distance mentioned, I counted sixty-eight log traps baited and set. They were placed at regular intervals of about ten yards distant; and this is just an instance—a thousand could be given. I gave sixty-eight kicks and sixty-eight traps fell. I performed this duty religiously. An old darkey, telling the Captain about it, said: "De debble must a bin a meddlin' wid dem traps; dey was all down, and no varmints caught, nuther!"

There is an old lady here—once the celebrated belle of the State—who lives near this place—a very old lady, one of the ancient matrons which many have seen in faded portraits, but few have met face to face—well, my friend has passed long since the limit of human life spoken of in

Holy Writ. She still retains the same remarkable mind, well stored with ancient lore, and her charming conversational powers that she was noted for in the Old Dominion a half a century ago. She is familiar with all the old traditions and historical records of Southeast Virginia, and can present a melange of facts that are worth knowing.

In the early days of Virginia, Col. Byrd, of Westover, a famous country seat lying on James River, afterward the manor of the Selden family, was selected by Virginia to run the dividing line between his State and the State of North Carolina. Col. Byrd was, at that time, one of the most learned and accomplished men of his day, and the high honor conferred on him was worthily bestowed. In the performance of his duty he selected the sites of the future city of Richmond, at the foot of the falls on James River, and also of Petersburg, on the Appomattox River. The size and prosperity of these twin cities show what marvelous judgment and far-reaching sight the Col. had. On his way back, he mentions in his chronicle—which was published in the old *Farmers' Register*, the great gentleman's sporting journal of that day, which was published in the State—that he camped on a stream called Sappony Creek, a branch of the Nottoway River, in the upper part of Sussex county, and gives a long account of the great profusion of game, and the large number of Indians, and also what excited his astonishment and wonder was the large specimen of silver ore which one of the Sappony Indians brought to him in exchange for knives and axes. Col. Byrd says he closely questioned those swarthy sons of the forest in regard to this silver ore, and they assured him that there were mines of incalculable wealth on the Nottoway River, but that their chiefs had forbidden them to reveal them to the whites, for fear that they would come and destroy their hunting grounds. Col. Byrd, in his memoirs, lays great stress upon the richness of the specimens in his possession, and affirmed his belief that there were rich veins known to the Indians. It was his intention to explore carefully the whole country, and to discover, if possible, the whereabouts of the silver, but old age and increasing infirmities prevented him from carrying out his plans; but he always, to the day of his death, spoke of his firm belief in these undiscovered mines. My historian believes it thoroughly now; she told me of an old hunter named Simmons, who lived on the banks of the Nottoway in her girlhood, who was very intimate with the Indians—indeed almost one of them. He "took up" with a squaw, and lived in a small hovel on the river. Simmons often brought deer, turkeys and coons to sell at her father's house, and the old huntsman was a great favorite of her brothers. Old Simmons used to bring back something besides the spoils of the chase—something that would be more eagerly coveted than the fattest buck that ever cleared a ten rail fence, and that was a nugget of silver. He said that he knew where the mines were situated, but that he was sworn to keep the secret undivulged. Every argument, threat and cajolery was used on old Simmons by her young brothers to get him to carry them and show the spot where he found the nugget, but all to no purpose. Old Simmons could not be bribed; fame or power he never heard of; money he did not know the value of; luxuries he had a contempt for, and so he kept his faith truly, and when he died his secret died with him. This is a true tale, and I write it for the benefit of those who desire a future easily won, and not for that class whose motto is, "By Industry We Thrive," and who are content to plod along, walking steady and hoping earnestly, and waiting trustingly for their "ships to come home from sea." From what I have heard, the old traditions have convinced me and I believe that there is a veritable "El Dorado" in this wild section which will make the discoverer richer and more powerful than the Genii of Aladdin's wonderful lamp, and will throw in the shade the Comstock and the Gunpowder lode.

During the Indian and French war there marched from this region six hundred warriors, by name called one of the six nations, to fight against Braddock's army, and but few returned from the war. It is a singular fact that in Southampton, the county adjoining Sussex, there is a tract of land of six thousand acres, which was granted to the Southampton Indians by the State of Virginia, which has never been revoked or repealed. The descendants of those Indians live on the track yet, but they have amalgamated so thoroughly with the negroes that the trace of their descent and lineage is nearly obliterated; they only show their blood by their hatred of labor and their love of the chase. It is a common thing to pick up relics of them in the shape of an arrowhead of flint, or a tomahawk of fieldspar. Whenever I find such relics it always sets me dreaming, and I picture to myself the noble red man, as he, in his primitive state, wild, untutored, yet with his savage virtues—not as he became after contact with the white men, who had cowed him, and the pale face's fire water had completely demoralized and brutalized him, until he became an Ishmael among men. I must confess that I have a strong sympathy for the Indian; he is as God made him, and he was robbed of the fairest inheritance on earth, his game killed, his lodges defiled, and he kept like Joe, in "Bleak House," always a moving on, with his face to the setting sun, seeking for rest and peace and finding it not. Is it any wonder that he turned at last and learned what his white friends taught him—that revenge was sweet?

But it is time I was putting on the brakes. In my next I will describe some of the fox hunts of the olden time—that same old glorious time when a Virginia youth had but three things to do, go to court on court days, ride and hunt, and drink the best of home-brewed apple jack. But as old Uncle Manuel used to say: "Dem times aint dese times," and we all sigh an affirmative. CHASSEUR.

HOME-MADE APOTHEGMS.—Hard work and no pay is bad enough, but no pay and no credit is worse than to die and be forgotten.

THE FOREST AND STREAM is much quoted, but seldom mentioned.

The *Toronto Sporting Times* of last week appropriates a column and a half of our editorial matter and gives no credit. This neglect is so habitual that no one now looks to it for original articles.

The Nashville (Tenn.) *Rural Sun* copies two full columns in like manner. We have exchanged with it just two weeks; and yet we are not happy!

The devil may get his due, but the rural newspaper exchange is a hard creditor.

Fish Culture.

THE PENNSYLVANIA STATE HATCHING HOUSE.

NEARLY A HALF MILLION OF YOUNG SALMON.

RECEIVING an invitation from the Superintendent, Mr. Jno. P. Creveling, to pay him a visit, I reached Marietta on the Susquehanna, a little after 12 M., on the 15th of December. I found him awaiting my arrival, and after an early dinner at the hotel, we jostled over the lumpy, frozen road four miles to Donegal Springs, where the State hatching house has been established.

This is a substantial wooden building one hundred feet long by thirty wide. The water, drawn by a six inch pipe from a copious spring a hundred yards above, is conducted to a tank outside the building, and then through a feed trough running the whole length of the house inside, is distributed by faucets through thirty-three hatching troughs, each of them fourteen feet long, and placed at right angles with the supply trough. In each of the hatching troughs, which are eighteen inches wide, there are six divisions, which receive as many trays just two feet long, the bottoms of which are covered with tarred woven wire, five wires to the inch lengthwise, and three-quarters of an inch apart crosswise, so as to allow the avelings to fall through the screen to the bottom of the trough as soon as they are free from the eggs. Mr. Creveling allows five thousand eggs to each screen, and as he can place them in double, *i. e.*, one above another, he can hatch sixty thousand in a trough. So the hatching capacity of the house is now little short of a million of eggs. By running a supply trough on the opposite side of the house, and doubling the number of troughs, he can hatch two million, and then by putting in tiers of trays three or four deep he can triplicate or quadruple his present hatching capacity. Having ample room and an abundant supply of clear spring water of uniform temperature, he does not think it expedient to use the Holton or Ferguson apparatus, as he can remove the fry and attend to them more easily by his present method.

I found his fry, which had absorbed the umbilical sacs a week before, all thrifty, uniform in size, and feeding heartily. The following is a summing up of his record kept from day to day:

Oct. 13. Received from California, ova.....	480,000
Loss in transportation, bad eggs.....	5,181
	474,869
Oct. 26. Commenced hatching.	
Dec. 8. Sacs absorbed.	
Loss in eggs in troughs.....	11,313
Loss in young fish.....	4,663— 15,976

Fry ready for distribution.....440,893

Of the loss in young fish there were about 2,000 malformed, some double headed, some joined in pairs at the sac, and some with tails drawn up to the head, all of which inevitably die, and which would reduce Mr. Creveling's loss to 13,976.

As soon after coming from the eggs as the fry can be moved—say within two or three days—they are brushed from the hatching trays into tin pans, the loose shells screened out, and the young fish placed in vacant troughs to await the absorption of the sac. So careful is Mr. Creveling to give his fry plenty of room that he already had fifteen boxes, 4x2 feet, with wire gauze bottoms and lids, floating in a pond outside, each of the boxes containing from three to four thousand. These he feeds as regularly, morning and evening, as those under roofs.

Mr. C. feeds daily to his fry a week old a beef's heart, which, with the nerves and veins out, weighs about four pounds. At two weeks old he doubles the allowance, gradually increasing the quantity until the fry are all distributed to the various streams to which they are allotted. He prefers the heart to the liver, which, as he justly says, does not run so much to liquid. His manner of preparing it is in a revolving upright cylindrical chopper, being careful to keep the knives very sharp. After a thorough chopping, the minced meat is mixed with water and strained through a fine wire gauze; all that will not pass through is chopped again. As the fry increase in size, coarser selves are used. The feed, mixed with water, is taken up in a bulb syringe with a wide nozzle, and squirted long the length of the troughs—the persons feeding passing backwards and forwards several times in doing so, that a glut of food may not be administered instantaneously.

The cans used in transportation hold each from four to five thousand fry. The water is aerated by means of a cylindrical plunger four or five inches in diameter, as long as the depth of the can, and perforated with minute holes. As the plunger is pressed down, the water in the cans rushes through the holes, and as it is pulled up the pressure of the air above causes it to rush back into the cans. This is the best invention I have ever seen for oxygenating the water. It is an invention of Mr. Creveling's. Mr. C. was proud in his commendation of Mr. Stone's method of packing salmon eggs, by which only one per cent. was lost in transporting them a day's travel over a rough road in a wagon, and three thousand miles by rail. Mr. C. practices dry impregnation in fecundating his trout eggs, and loses but a very small per centage. During a cold snap in November he visited a farmer, four miles or so away, who had some trout in his brook that were just beginning to spawn, and having no impregnating pans handy, or any way of taking the fecundated ova home, by considerable dexterity he pressed the ova into one bottle, and the milt into another, and an hour after doing so, put the two together in his pans, and, mixing them well, placed them in his hatching trough. The result was eighty per cent. of perfectly fecundated eggs, in which the embryos were easily seen.

I found in a partition in a pond adjoining the hatching house a number of wall-eyed pike (*Esox perca*), twenty-two of them, Mr. C. informed me, averaging two and a half pounds each. He intends trying to express the ova and milt, when they are in the proper condition, which will be in March or April, and, if successful, hatch the eggs in his troughs.

THADDEUS NORRIS.

TO REMOVE OBJECTIONABLE FISH FROM WATERS TO BE RE-STOCKED.

The question, so often asked, how to rid ponds and streams of pickerel and other objectionable fish, that trout may be substituted, is partly answered in the following letter from Mr. Milner, originally addressed to Hon. J. B. Beck, of Kentucky:

UNITED STATES COMMISSION, FISH AND FISHERIES, }
WAUKEGAN, ILL., November, 1875. }

DEAR SIR—Your letter of the 9th arrived yesterday, and I gladly send what information I can in the direction you desire.

To begin, there is an experiment very important and especially desirable to be carried out this season, that I have refrained from proposing to any locality we expect to visit this fall, because, unless it is rightly managed, it will be an unpopular measure.

The young fishes deposited in the streams of course have to run the gauntlet of the larger fishes of prey in the streams where they are put. The loss is more or less according to the various conditions of different streams. It would be very desirable to test results from a stream in which all the other species had been either removed or destroyed. This would not be impracticable if some small stream of not too much or too little current near the head is selected, and a good wire-screen placed at the proper distance below.

As destruction of life is a repulsive and rather heartless act, especially on so large a scale, some philanthropic, or philoethic citizens might volunteer to see the larger portion of the fishes seined out and the fishes carried below or to other waters. Then, by placing quick lime in the upper head waters, the lurkers that would not permit themselves to be taken with the seine could be destroyed, and the stream in a week or ten days would be clean and clear for a stock of healthy young salmon. These could, as well, be kept under such conditions until they had attained a year's growth. At this time they should be from five to eight inches long, and with the strength and activity of the species would be entirely able to save themselves from any enemies they would be likely to encounter.

By skillful management in turning the young salmon through the wire-screen at the time they are ready to migrate down the current, the number that had survived would be known precisely.

It is not alone because of the definite knowledge that would be obtained of the numbers surviving, but because of the survival of so large numbers, more rapid results might be expected in the waters.

The seeds of *coculus indicus* would perhaps answer better purpose than the lime. Considerable judgment and care will be necessary in applying either to prevent injuring further down the stream than is necessary.

It is easy to see that this measure would be very unpopular, unless managed by persons capable of explaining satisfactorily the greater advantages to ensue.

When the salmon descend toward the sea I think we could promise to restock the stream with some of our lately imported fishes, or rather their progeny.

This experiment will be an entirely new and original idea, and would give interest and note at once to the work of your Commission, if they carry it out. Though the suggestion is not entirely new, the gentleman who has urged its application in our work is Professor Albert D. Hager, an elderly and active man, and who expects to unite with me in our work this fall. He was formerly Geologist of Vermont, afterward of Missouri, and between times Fish Commissioner of the State of Vermont.

Yours truly,
JAS. W. MILNER.
Hon. James B. Beck, Lexington, Ky.

TERRE HAUTE, Ind., December 21st, 1875.

EDITOR FOREST AND STREAM:—

In reading the Report of several different State Fish Commissions, it has occurred to two or three of our fishermen to ask if we have any State Fish Commission in this State. None seem to know here. Can you tell us anything about it, how we should proceed to get one, if there is none, etc.? What we want is a start. Some shad spawn was put in our river (the Wabash) some two years ago, but by whom we here do not know.

CRUMBS.

[There is no Fish Commission in Indiana. Efforts have been repeatedly made through the Legislature (the proper source) to establish one. One of the most energetic and prominent workers in this movement is our friend W. H. Holabird, of Valparaiso, to whom our correspondent can apply for aid or information. Should a Fish Commission be established in Indiana, we should be pleased to see Mr. Holabird appointed thereto, as he would render disinterested and efficient service.—Ed.]

Natural History.

[This Department is now under the charge of a competent Naturalist, endorsed by the Smithsonian Institution, and will henceforth be made a special feature of this paper. All communications, notes, queries, remarks, and seasonal observations will receive careful attention.]

THE NESTING OF AMERICAN BIRDS.

III.—THE WOOD THRUSH—(*Turdus mustelinus* Gmelin, Audubon, Nuttall, Baird, Coues; *T. melodus*, Wilson.)

THE wood or song thrush breeds throughout its range in the United States, where it is distinctively an eastern bird. It is found north to New England and Canada West; west to Dakota, and south, in Winter, to Central America. Through the central portion of its range all have paired by May 1st, and the nest is usually completed by the 15th of the month, except in New England, where the date is somewhat later. Although very common in wooded and thickety districts, especially in the Ohio Valley and northward to the lakes, they are more shy than the robins, and conceal their houses with much greater care, often contriving to have long leaves and trailing vines curtain them.

The nest of this thrush is nearly as bulky as the robin's, but often has no mud in its composition. It is placed upon the horizontal branch of a forest tree, anywhere from six

to forty feet above the ground, or in the forks of a sapling. The materials are twigs, coarse grasses, and dried leaves—of which latter, in damp situations, there is often a great thickness underneath—finely combined, and lined with fine roots and grasses. While it is not common to find the wood thrush nesting away from the woods, Dr. Brewer and Mr. Burroughs both mention instances where it built in gardens close to the house so long as it was left undisturbed. Whatever its situation, the type is well adhered to, and the foundation of dead beech or oak leaves is a characteristic; but I remember one case in which ribbon-like grass had been used instead. The books say that but one brood is raised in New England, but I am inclined to think otherwise. Mr. Maynard says the usual time of nesting, near Boston, is June 1st, although he has found the young on the 4th. Mr. Samuels places the date as the 20th of May. During the Summer of 1873 I spent several weeks at Norwich, Conn., where these thrushes are abundant. On June 2d I found one of their nests, containing four eggs, which had been set upon, and on June 4th another similar one; the following day an unfinished nest was found; from this time constant search met with no wood thrush's nest until the 21st, when another was found, containing four fresh eggs, which I then considered a second brood, not seeing why this pair should have delayed their building until all their neighbor's young were hatched. This trip furnished another curious note. On the 5th of the month I found a nest of the wood thrush, nearly finished, on the lower limb of a large oak. Visiting it again on the 18th, it contained three eggs only slightly addled. Did these eggs belong to the original builders who were so dilatory; or had the nest been abandoned and afterwards taken possession of by another pair?

Along Lake Erie, where they breed in great numbers, the eggs are laid by May 15th, and are usually four in number, but sometimes only three. It not unfrequently happens that a cow-bird's eggs is also found with them. The eggs are uniform deep blue, not inclining to green so much as the robin's, and one-fifth smaller, more slender and pointed. Their behavior when the nest is approached is very different in different individuals. If the female is sitting she will usually remain upon the nest, watching you intently, until you reach out your hand to touch her, when she will suddenly slip away, and cannot be induced to show herself while you remain in the vicinity; but sometimes, with an unnatural courage born of her terror, she stands her ground, bristles up, and whistling, screaming and hissing, repeatedly darts at your head with the utmost fury.

—Watts T. Loomis, of Little Falls, N. Y., tells us, in answer to "C. S. W.," that a phoebe bird (*Contopus virens*) raised two broods of young in the same nest each year, for two successive years, building her nest on the top of a column under a piazza.

A LIST OF ALBINO BIRDS.—Mr. W. Russell Robinson, of Richmond, Va., sends us, in a communication which is unfortunately too long for us to print in full, a list of cases of albinism and melanism which have come under his observation. As he says, few persons who have not paid special attention to the subject, know how common the former variation from nature is, and how it may in some degree be accounted for as governed by laws of geographical variation. The only other list of albinos which we remember was published by Dr. Coues in the *American Naturalist* for May, 1868. He records only a single instance of melanism, the black guillemot, which had been described as a distinct species. Mr. J. A. Allen, last year, showed us a striking example of melanism in the red-headed woodpecker. The first on Mr. Robinson's list is the quail (*Ortyx Virginianus*), many of which have been found pure white, or mottled with white, by hunters in Virginia. Mr. Abbott, a taxidermist in Reading, Pa., had among his specimens a perfect case of melanism in this bird. It was evenly black everywhere. Two specimens each of the snipe (*Gallinago Wilsoni*), and of the sora rail (*Porzana Carolina*) and several of the meadow lark (*Sturnella magna*) and robin (*Turdus migratorius*), are also described. One of the robin was all white except its red breast. "A very beautiful specimen of albinism in my collection," says the writer, "is a cedar bird (*Ampelis cedrorum*). It was shot from among a normally colored flock, on one of the islands in the James River, in March, 1874. The wing-coverts are rich brown; the bend at each wing has a spot of the same color, and there is a round spot on the tips of three of the secondary quills on each wing; the abdomen ends of the tail feathers, and a narrow line immediately behind the crest, across the head, are pale yellow and very glossy; the red 'sealing-wax' appendages on the inner quills are very bright; everywhere else the bird is pure white." The snow-bird (*Junco hyemalis*), the English sparrow (*Pyrgita domestica*), and the chimney swallow (*Chaetura pelagica*), conclude the list. The list has an additional value, as coming from so southern a locality as Richmond.

BIRDS WITH TEETH.—Prof. O. C. Marsh prints in the *American Naturalist* an account of the fossil birds with teeth (*Odontorhynchus*), which occur in the cretaceous rocks of this country. Among them are figured and described two, probably aquatic, species of birds about the size of a pigeon, with long powerful wings, and many teeth set in sockets in the lower jaw, indicating carnivorous habits. A very interesting one is the *Hesperornis*, a gigantic diver, first found in Kansas in 1870. Its skull is similar to that of the loon. The jaws are massive, and have throughout their length a deep, inferior groove, which was thickly set with sharp-pointed teeth. These teeth had no true sockets, and in some other respects resemble those of some fossil reptiles. But the jaws were covered with a horny beak. The *Hesperornis* was larger than any known aquatic bird, the length from the tip of the bill to the end of the toes being between five and six feet. The habits are clearly indicated. "The rudimentary wings prove that flight was impossible, while the powerful swimming legs and feet were peculiarly adapted to rapid motion through the water. The tail appears to have been much expanded horizontally, as in the beaver, and doubtless was an efficient aid in diving, perhaps compensating in part for the want of wings, which the penguins use with so much effect in swimming under water." Its food was probably fishes.

—Among the variations from the normal markings in butterflies and moths, lately observed in England, W. A. Forbes has exhibited to the members of the British Entomological Society, as reported in *Nature*, a specimen of *zygaena filipendula* with yellow spots. J. M. Wood, of London, has reared a variety of *Vanessa io* without the minute black stræ on the costa of the fore wings, and on the whole under surface, which is somewhat lighter in color than usual, some of the nervures being marked with a light ochreous tint.

—Prof. F. H. Snow, of Lawrence, Kansas, has found a full sized horny crest, hitherto supposed peculiar to the male, upon the beak of a female white pelican (*Pelecanus erythrorhynchus*.)

—According to the abstract of the report of the English Fish Commissioner on the fishes of Norfolk, given in *Nature*, it appears, as a remarkable fact, that large numbers of sea trout are annually caught off the coasts of that county, though the rivers which flow through it are naturally incapable of producing *Salmonidae*. The fish thus caught are visitors from the salmon rivers in the north, viz.: the Tyne, the Tees, the Coquet, and the Tweed. The object of this visit to the coasts of Norfolk and Suffolk is to find food, which exists in abundance in the shape of the spawn and fry of the many varieties of fish which abound in those waters.

—The weather was extraordinarily warm last week, the mercury rising almost to 60°. As a consequence the bats recovered from their torpidity, and came out in the dusk; and the sparrows pursued their wooing with Spring-like vigor.

Woodland, Farm and Garden.

TO BAKE CANVAS BACK DUCKS.—Have the duck dry picked, the head left on. No dressing is to be put into the bird, except a little pepper and salt. Place the duck in the pan on its back; if you care to add a slice of dried English bacon, not smoked, do so. Put no water in the pan. Your oven must be hot, but not enough to burn. Baste the duck frequently while cooking. About thirty minutes is the allotted time. During the last few minutes dredge some flour on the bird and quicken the fire, in order to brown the outside.

The above are general directions for an ordinary range or cook stove; but it is impossible to give the exact time that a canvas back duck should remain in the oven, as this depends altogether on the size of the oven, the condition of the fire, the number of ducks to be cooked at the same time, whether the ducks have just come off of the ice, etc. You can tell the temperature of the oven by holding your hand in it a moment, and if you are familiar with your oven you will know just what it will accomplish. If you have baked the canvas back as it should be baked, it must have a plump appearance when taken out of the oven; in color it must be a delicate brown. The flesh, when cut in two, should be moist and juicy, and in color somewhat red—not blue.

Game birds in general, and canvas back ducks in particular, must be subjected to a certain amount of heat for a certain length of time before that chemical transformation can take place in their flesh and blood necessary to make apparent to the human palate that flavor peculiar to the bird. In the uncooked bird the flavor is present in a dilute form; it needs heat to drive off the water and thereby concentrate the juices. In the overcooked bird you have approached too near to charcoal, a substance without flavor. Just where to stop between these extremes we have endeavored to instruct you.

The man that wants his bird dried to a crisp does not like the flavor of that bird, and would have you destroy that flavor with fire. The man that says, "cook my canvas back twenty minutes by the clock," and then to eat it covers a warm slice of the raw, blue flesh with currant jelly, or Worcestershire sauce, does not know much about the delicious and delicate flavor of the canvas back duck. A tender sheldrake, or anything to form a foundation for jelly or sauce, will do for him. Have all your game as fresh as you can get it after the animal heat has passed off. Putrefaction does not add to the flavor of any game. To any one fortunate enough to possess a "spit," to him I say, never trouble your oven with a game bird.—H. DeG., in *Forest and Stream*.

IMPROVED FLOWERS.—A Mississippi correspondent comments as follows on the extract from the *Germantown Telegraph* on improved flowers, which appeared in this column a few weeks ago:—

That article must have been written by the same old gentleman who never ate a finer apple than that grown in his grandfather's garden; who sighs for the locomotion in the old stage coach, for steam takes his breath away; who thinks the old firelock the *ne plus ultra* of firearms. He misses the flash in the pan, sighs over the retrogression to the percussion, and thinks breech loaders playthings. The old gentleman sighs—think of it, ye floriculturists—for a "cabbage" rose. Ye gods and little fishes! Cabbage is what smells so sweetly to the nostrils that he cannot not detect a rose when he walks through rose-bedecked (*sic*) gardens, and hence hardly knows what a real rose is. He says: "What we have for roses now are as much like real roses as coffee is like beans." Really he is hard to satisfy. I never saw coffee not composed of beans, except in Confederate times. If the old gentleman were here to-day (November 27th) I could show him sweet williams, carnation and other plunks, verbenas as pretty as any that grew beside his cabbage, roses that even he would recognize as such—aye, and praise, too—chrysanthemums everywhere, oceans of violets perfuming the air, sweet olive (*Olea fragrans*), with its unpretending blossoms gladdening every passer-by with its fragrance; mignonette, self-sown from early plants gone to seed, and a few cape jessamine (*Gardenia florida*), with beautiful zinnias for a background, and all in the open air.

To decry improved flowers, in view of such results, is unjust to the horticulturist who succeeds in his endeavor to give us a new flower, and who sends us seed for a small sum that will sprout into plants with innumerable beautiful eyes turned to heaven to praise the Giver of all for letting the sun shine on them as well as on old fogies.

GEORGE C. EYBROH.

Our Germantown contemporary, who is fully able to defend his own views on horticultural, as well as other topics, probably did not intend to decry all progress in floriculture, but simply to enter a playful protest against the mania for new varieties, which, it must be admitted, has opened up an expensive field of experiment, and does not always result in an improved quality or quantity of flowers. It is akin to the "chicken fever," which a rural friend declares has prevailed with him until it takes half his corn crop to feed his overgrown "blue-blooded" varieties, while eggs are not as plentiful with him as in the days of the plain old dunghills.

Is FLORIDA HEALTHY?—Correspondents who purpose settling in Florida ask us almost every week if Florida is healthy. We give herewith the opinion of a Northern man who is wholly disinterested, and whose knowledge of Florida enables him to answer *ex cathedra*.—

JAMAICA PLAINS, Mass., December 20th, 1875.

EDITOR FOREST AND STREAM:—

Take it all the year round, I believe Florida to be the healthiest State in the Union. The proportion of deaths among young children, I think, is smaller there than elsewhere, as well may be the case where scarlet fever and diphtheria are almost unknown. The remarkably low death rate among United States troops stationed in Florida has often been mentioned as a proof of the salubrity of the climate, and it is a convincing one. Among the diseases of adults to which the climate of Florida brings relief are rheumatism, neuralgia, and affections of the throat and lungs.

I knew a middle aged man who came to East Florida from Illinois four years ago, being, as it seemed, a confirmed consumptive. He was poor, and was obliged for many weeks to live with his wife and children in a tent, which had been loaned to him. But he continued to improve in health, and after awhile got some land under the homestead law, on which, with the aid of his neighbors, he built a hut of palmetto leaves. In this he has lived, and has recovered his health, so that now he has gone into the orange business.

I myself was driven to Florida five Winters ago by rheumatism and neuralgia, which made my life a burden. Since I landed on Florida soil I have never known a day's illness from either of these diseases, soiling, however, continued to visit the State every Winter.

Much has been written by casual visitors about the low, swampy, and malarious character of the country, and the dampness of the climate; but it must be remembered that nine tenths of the Winter visitors see little of Florida. They ascend the St. John as far as Enterprise, or Salt Lake at the farthest. So a man might go up the Mississippi, from New Orleans to St. Paul, and know little of the West. I think there is less malaria in Florida than in the Mississippi Valley, and for the reason that in Florida the soil is much less rich. There are plenty of swamps, but they are not bottomless, like those on the Western rivers. Under a few inches of mud you find usually a solid bottom of sand or limestone.

All over the State of Florida one finds beautiful clear lakes, with bottom and shores of clean white sand, and surrounded with pine forest. Even the low and often submerged lands are not usually boggy. I have ridden miles upon miles over low prairies in East Florida, where the water lay from one to two feet deep, without getting "slewed," as they call it in the West, where the wagon and horses disappear in a mud hole. As to fog, one can see more of it in a week of Summer on the coast of Maine than one would find in a Florida Winter. S. C. C.

Remark.—The Government sanitary maps indicate that some portions of Florida are as healthy as any in the world, while others are subject to yellow fever and malarious affections.—ED.

WATERING POULTRY.—It is the belief of the writer that many of the diseases incident to poultry are due to neglect in providing them with pure water; particularly do I believe such to be the case in the majority of instances where chicken cholera prevails. The omission to furnish fowls with suitable drinking water is one of the worst features of cruelty to animals. It is a neglect that is decidedly adverse to success, hence tends to diminish individual fancy for fowls, and works detriment to poultry interests. Those whom we occasionally hear say that "there is no profit in poultry" are not qualified to have the management of the same, and in their attentions may be classed with the thrifless and neglected parties who keep fowls that get drink when it rains.—*Farmer's Journal*.

ARTIFICIAL INCUBATION.

ENGLEWOOD, New Jersey, December 15th, 1875.

EDITOR FOREST AND STREAM:—

While artificial fish hatching is absorbing so much attention, an account of a visit to the chicken hatching establishment of W. C. Baker, Esq., at Alpine, on the Hudson, may be interesting to your readers from the novelty of its conception. Mr. Baker for years has been experimenting in hatching in a quiet way, and as the result of his experiments he has lately erected an establishment at a cost of over \$50,000, and now purposes to breed chickens and eggs for market on a scale heretofore unprecedented in artificial culture, and we have no doubt but that his investment will pay him a handsome rate of interest, judging by what we saw. Mr. Baker was soon found, and in answer to our request that we might be permitted to look through his establishment, a courteous "Certainly, I will accompany you myself," was vouchsafed.

Our first visit was to the spacious house wherein the incubation is carried on. Here, also, is the work shop, boiler room, nurses' apartments—as Mr. Baker facetiously calls his attendants—offices, &c. Following Mr. Baker up stairs, we are ushered into the hatching room, a light, spacious and well ventilated apartment, across which run the tables, eight in number, each capable of holding 1,000 eggs, which are placed in trays one above another, and through which run the hot water pipes. The great trouble in artificial hatching has been the difficulty of preserving an even temperature during the entire period of incubation. Mr. Baker entirely obviated this by a most ingenious automatic connection from his hatching trays and the gas jet which furnishes the heat for the large tin boilers. A variation of one quarter of a degree will either turn the gas higher or lower as required until the proper temperature is again attained. The heat, dryness, or moisture is also regulated in a similar manner. Should anything get out of working order in the room, an annunciator connecting with the attendant's room loudly proclaims the fact, and a dial at once locates the room where the trouble occurs.

Mr. Baker showed us several eggs in different stages of advancement, through a strong light in a little darkened closet. The young bird showed unmistakable signs of disgust at this unusual treatment by squirming about in the shell in a most animated manner. The minute the chick is hatched it is placed in a large warming box until it is completely dried, thence it is transferred to a large glass house, to which Mr. Baker then conducted us. This building is laid out somewhat in the manner of a green house, with rose buds growing in great profusion for the sake of the parasites which devour them, and which in turn are devoured by the chicks. It is divided into nurseries, each capable of accommodating about a hundred of the young fledglings, and a fine wire screen separates them from each other. All are furnished with a foster mother—a low, flat cylinder, filled with hot air, and covered with a blanket, under which the chicks appear even more contented than under a natural mother, for here there is no crowding or jostling one another out into the cold. The building is kept at a pleasant Summer heat the year round. Numbers of little Maltese kittens were playing about, and in answer to our inquiry as to why they were there, Mr. Baker informed us that they were for the purpose of keeping out all vermin in the shape of

rats and mice, and by being brought up among the chickens they would never molest them. After a three weeks' probation here the young birds are removed to the hennery, which we next visited.

Here we found chickens in all stages of maturity, and seemingly delighted with their warm, comfortable lodgings, and a noisy cackling as we entered proclaimed the fact that laying was still going on. The building is 456 feet long by about twenty-five feet deep. Mr. Baker's intention is to lengthen it to 800 feet next Spring. A tramway runs the entire length, on which is conveyed the food, and eggs and offal from the coops, for the same system is preserved here of confining only so many chickens together, about twenty-five to each coop being the allotted number. Water is conveyed to each coop, or, more properly speaking, perhaps we should say pen, by iron pipes. The use of wire partitions is resorted to to secure better ventilation, and each coop of birds has a corresponding coop outside, where they are allowed to run during fine weather. This is covered with a wire netting, to protect the chickens from the inroads of hawks and other rapacious birds.

Turkeys, as all your agricultural readers are aware, are very difficult to rear in the natural way, the young birds being so susceptible to wet and cold. By Mr. Baker's process it is no more difficult to raise them than other fowls. Ducks also come in for their share of attention. We saw one very handsome coop of muscovies. Mr. Baker even contemplates at no distant day the raising of ostriches, if he can procure a few eggs to start with. The feathers of one bird alone are worth yearly about \$150, so Mr. B. says. He is very enthusiastic over what he has accomplished, and certainly everything that experience could suggest or money accomplish has been done. In his first attempts Mr. Baker made many failures from inexperience, but by his untiring energy and ingenuity in perfecting and devising new machinery, much of which he has letters patent on, he has overcome all trouble of a serious nature, and now his path will be one of ease. He will put about 250,000 fowls and Spring chickens on the market yearly, to say nothing of the eggs. His establishment is undoubtedly the largest in the world, and may he reap all the benefit he deserves for his efforts. We left with the hope that at some future day we might be enabled to again visit this unique place and enjoy the ride above the Hudson. G. M. FAIRCHILD, JR.

The Kennel.

IMPORTED AND AMERICAN BRED DOGS.

THIS subject has received much attention recently, not only through the sporting papers, but the *New York Times* and the *Graphic* have given considerable space in their columns to the discussion. But let us say that the writers alluded to, with a few exceptions, have, in our opinion, overrated many English breeders, and underrated the breeders of this country. The English breeders, it is true, have kept a record of the pedigree of their dogs, which we approve of; but from our long experience with imported and home-bred dogs, we do not believe that even those dogs which have been imported from what are said to be the best kennels in England, are to be compared with ours, either in appearance, or for service in the field. We allude now to the importations of the past two or three years. We recently asked the question of an English gentleman residing in this country, who has made his name prominent as an importer of dogs with very long pedigrees, "How is it that better specimens of setters and pointers are not sent to this country?" His reply was this: "They do not send their best specimens, but keep them for their own use." If this is the case the importation of dogs by practical sportsmen will soon cease. We admit there have been a few right good specimens of setters imported within a few years; but of the pointers we have seen, they certainly are not desirable. Those imported twenty, thirty, and even forty years ago, were much better in every respect; and then, too, many years ago, during the life-time of Col. John Hare Powell, of Philadelphia, the Messrs. Logan, of Germantown, and the late Henry Becket, who purchased and lived on the Bonaparte property at Bordentown, N. J., imported many full-sized stylish dogs, some of which fell into our hands, and from which we bred such stock as any sportsmen would be proud to own.

Although but few sportsmen and breeders of this country have kept a recorded pedigree of their dogs, it does not follow that the thousands of dogs bred here are not thoroughly bred. We doubt if any breeder in Europe has taken more care than we have during the past forty or fifty years to breed the right kind of setters and pointers, constantly keeping in view their style and usefulness, never inbreeding, nor from dogs whose only merit was their pedigree. Among the best breeders that we have known intimately are Mr. George W. McKelway, of Trenton, N. J.; Mr. Theo. Morford, of Newton, N. J.; and Mr. R. V. Drake, of Mercer county, N. J., and the dogs they have turned out from their kennels, very many of which have fallen into our hands, were just such as would fill the eye of any skillful field sportsman. The latter gentleman bred decidedly the finest litter of pups which ever came under our observation. They were from a dark liver colored setter bitch, and by Chief Justice Beasley's famous dog, Rolla. The litter consisted of nine dog pups, all of which were raised and broken, and most of them, with the bitch, fell into our hands. Three of that litter, after they were broken—Arch, Cain and Pilot—we sold to the late Mr. Andrew Staley, of Philadelphia, an English gentleman of large experience as a field sportsman, both in this country and in England, who has frequently told us he never saw in England as good and as stylish dogs as those. Rolla was a large-sized, deep chestnut and white, ticked on the legs, and with a well feathered, silky coat, and was in all probability as good a dog as ever has been seen in this country. That fact arose from his fine nose, his sagacity, his industry, and from his having fallen into the hands of one of the most accomplished and skillful sportsmen of our country, with whom we did much shooting for fifteen years, and until his professional duties called him from the field.

—The dogs of the Pawnee Indians refuse to follow their masters to the new reservation in Indian Territory, so the old haunts are occupied by a legion of howling, starving creatures.

WEST PENNSYLVANIA POULTRY SOCIETY.—We have received the premium list of this society for their poultry, pigeon and dog show, to be held at Pittsburgh, Pa., on January 12th. Prizes of \$10 each are offered for the best native and imported setters, also for the best pointer dog. There are also prizes of \$5 each and second premiums of \$2.50 each for almost every variety of dog. Some of our sportsmen might take this fair in while en route to the great Chicago Bench Show, which commences on January 20th. It would be a pleasant break to the journey, and the dogs would be none the worse for the rest.

THE ROD AND GUN CLUB, of Springfield, Mass., whose bench show last Spring will long be remembered as a most successful affair, have assumed the management of a poultry show of grand dimensions, to be held at Springfield in February next. All New England will be interested. In March the Rod and Gun Club will give their second bench show, which promises to be as successful as last year's. The gentlemen having the matter in charge are sportsmen of energy and will spare no pains.

THE CHICAGO BENCH SHOW which opens on the 20th January promises to be a very grand and successful affair. We hear from all parts of the country of sportsmen who propose visiting in person and exhibiting their dogs. The prizes are more numerous and valuable than have ever before been offered in this, or probably in any other country.

BOWERS BANDIT.—In an extract from the Birmingham Herald, published in last week's issue, it was stated that Mr. Bowers' Bandit was by Mr. Lorts' Jack, etc. This was a mistake on the part of our English contemporary, as Bandit is by Pride of the Border. The error probably arose from copying from the Kennel Club Stud Book, the pedigree of the dog following Bandit being that given.

SIR WALTER SCOTT'S DOG "CAMP."—"The wisest dog I ever had," said Sir Walter Scott, "was what is called the bull dog terrier. I taught him to understand a great many words, inasmuch that I am positive that the communication betwixt the canine species and ourselves might be greatly enlarged. Camp once bit the baker, who was bringing bread to the family. I chastised him and explained the enormity of his offense; after which, to the last moment of his life, he never heard the least allusion to the story, in whatever voice or tone it was mentioned, without getting up and retiring to the darkest corner of the room with great appearance of distress. Then if you said the baker was well paid, or the baker was not hurt after all, Camp came forth from his hiding place, capered, barked and rejoiced. When he was unable, towards the end of his life, to attend me when on horseback, he used to watch for my return, and the servant would tell him his master was coming down the hill, although he did not use any gesture to explain his meaning. Camp was never known to mistake him, but either went out at the front to go up the hill, or at the back to get down to the moor side."—Dr. F. O. Morris, B. A., in *Dogs and their Doings*.

A STAUNCH DOG.

Mercer county, N. J., December 20th, 1875.

EDITOR FOREST AND STREAM:—

Last Fall Algernon and Hervey went to Mr. Fisher's, on the Hunterdon county side of the mountain, to shoot, taking with them Bragg, Jr., his sons, Spy and Fashion, out of Fannie, both Bragg, Jr., and Fannie being by Old Bragg (inbred). After a long walk to Rainbow and back by Rattlesnake Hill, and nearing the starting point, the dogs pointed. They put up the birds, killing three. The first flight took them to where four large oak trees had fallen with the leaves on, making a dense cover. As the dogs approached the spot, they pointed. Upon coming up a bird was flushed and killed and Bragg brought it in, Spy still at his point. After considerable beating about, another quail was raised, killed and bagged, Spy still leading. After thrashing the tree tops without success, Algernon took Bragg and Jack and went under the "fire wood." Bragg soon retrieved a crippled bird, when Algernon saw a quail run in the crotch of a limb and he caught it. It fluttered like everything, of course—Spy as staunch as a rock—and it was not until the bird that Spy was pointing was put up, would he move.

FARMER.

—Mr. W. R. Hobart's red Irish bitch Ruby has visited Judge Pratt's Dan. Ruby is from a pair of red Irish setters imported by Gen. A. C. Ducat, of Chicago. Dan is by Rodman's Dash out of Susan, a red Irish bitch. The pups bid fair to be A1.

Game Bag and Gun.

GAME IN SEASON IN JANUARY.

Hares, brown and gray.

Wild duck, geese, brant, &c.

FOR FLORIDA.

Deer, Wild Turkey, Woodcock, Quail, Snipe, Ducks, and Wild Fowl.

GAME IN MARKET.—Game has been easier during the last week and prices are somewhat lower. Ruffed grouse (partridges) are worth \$1 per pair; pinnated grouse (prairie chickens), \$1.25, the receipts from the West being somewhat larger. Quail bring \$2.50 for Western and \$3 for Long Island birds. Dealers will note that the close season for this State commences on the 1st January, and that for longer period they will be required to prove the time and locality of killing. Canvas back ducks bring \$2.50 to \$3 per pair; red-heads, \$1 to \$1.50; mallards, \$1 to \$1.50; brant, \$1.50; black ducks, 90 cents to \$1; widgeon, 60 to 75 cents; broad bills, 60 to 75 cents; sprig tails, \$1; wild geese, 75 cents to \$1 per pair; hares, 50 to 60 cents per pair; rabbits, 50 to 60 cents.

—The many friends of Messrs. Eaton & Co., Sportsmen's Emporium and Camp Outfitting Establishment, will be glad to learn that they are fast recovering from the effects of the disastrous fire in Nassau street. They have fitted up their salesrooms at No. 17 Ann street, where they will be pleased to fill orders or welcome their sporting friends. Mr. Eaton, an old camper-out, knows just what is requisite for comfort and a good time in the woods, and takes

pleasure in imparting that knowledge to his patrons, these experiences oftentimes adding very materially to the pleasure of a party in camp.

DUCK SHOOTING AT CURRITUCK.—Members of the Monkey Isle Club have been and are now making their annual pilgrimage to that paradise for duck shooting, the sporting grounds at Monkey Isle, Currituck Sound, N. C. To give our readers an idea of the sport they enjoy, we append a copy of the scores of Messrs. C. P. Keeler, B. F. Ricker, and Noah Curtis, three members of the club from Boston, during the twenty-three days shooting they had there together during November and the first of December, aggregating in all 1,489 duck, 881 of which were canvas back, 21 geese and 8 swans.

Date.	Ducks.		Geese.	Swan.	Numbers of stand Made.
	Can. back	Other var.			
November 6.....		102			2
November 8.....	70	30	2		1
November 9.....		44		1	2

December 4.....	14	2			1
December 6.....		33	3	1	2
Total.....	863	638	21	8	

* Denotes rainy days; no shooting done.
Eighteen canvas backs were shot on the island during the above time, making a grand total of 881.

The best individual scores were: Nov. 8, by Mr. Keeler, 98 ducks (70 canvas-backs) and 2 geese; Nov. 26, by Mr. Ricker, 100 ducks (79 canvas backs); Nov. 30, by Mr. Curtis, 95 ducks (71 canvas-backs) and 1 swan.

Members of the club are still there enjoying the grand sport the locality affords.

MODERN FOX HUNTING.

STATEN ISLAND, December 13th, 1875.

EDITOR FOREST AND STREAM:—

In several of the leading local newspapers in the vicinity of New York considerable attention and angry discussion has arisen between the philanthropic President Bergh and the New Jersey lovers of fox hunting. What fox hunting is in Canada, New Jersey, South America or Long Island I know not, but of my native country (Scotland) I can speak with assurance. Throughout the lower parts of Scotland there are meetings twice every week, and such meetings are attended by the most respectable, responsible, and intelligent gentlemen of the district, the majority being practical country farmers and men of honesty and moral worth. Such meetings there are not attended by the class of humanity represented by President Bergh—"the perfumed, the drowsy, the hangers on of society, the frequenters of taverns," &c.—but by the worthiest representatives of the country, namely, the Johnsons, Dalziells, Griersons, Scotts, &c.; men whose ancestors fought with the cold steel to secure their rights and privileges. Over the heather of Scotland, where now the fox is hunted, have been enacted some of the most tragic wars that have rung in the ears of humanity. Over that heather and among those glens has been spilt more Christian blood, and more bravery has been displayed, more real heroism and self-sacrifice, than many pages of recorded history can boast of. I feel certain that any one acquainted with the primary principles of physiognomy will attest to this fact: that very little degeneration has occurred in that nation, that the Scotch people would not descend to any so called sport unworthy of their character, their nature, or their time honored nobleness. It will be necessary and sufficient for Mr. Bergh in the meantime to show by natural and forcible proof that fox hunting, in any way or form by hounds, is a violation of natural laws, or not consistent with the order of creation. Throughout the whole phase of human and animal existence we find the principle of destruction. Small fish are devoured by larger fish, and they in turn succumb to others; flies are devoured by spiders and birds, and they in turn succumb to other destroyers, such as hawks, eagles, &c. The whole ocean, air, and earth is one struggle for existence, the fittest being the survivor. In short, the vast universe is one immensity of destruction, of death, and to exist in perfect harmony and maintain its equilibrium must ever be so, for the decrees of the Eternal are fixed, unchanging, and unchangeable. By fox hunting, then, we destroy a destroyer by natural means, and so assist in adjusting the harmony of the universe. Nature will accomplish her own work and produce better agents and detectives than can the hand of the human artificers. Could Mr. Bergh only hunt down the thousands of human foxes who frequent our corners, byways, and places of nocturnal dissipation; could he only trap with steel, iron, or gunpowder the myriads of parasitical public officials who daily and hourly swindle, cheat, and steal the hard earned money of the industrious millions of this country! Our human fox hounds cannot trace them, cannot find out their secret hiding places. The former hounds are true to their trusts and instincts. Let the latter, or the human, speak for themselves. Actions speak louder than words.

JAMES DEMPSTER, M. D.

DEER HUNTING IN CANADA.

EDITOR FOREST AND STREAM:—

The Doctor and I started alone with Grisley, the hound. We struck the G. W. R. R. at Clifton. By nine o'clock P. M. we were in Petrolia, our destination, having been on the road since one o'clock. We slept soundly that night, and used up the following forenoon in getting ready and chatting with friends. After dinner we made two runs, but failed in starting anything. The next day we bounced a deer or two out of the forest, but in the opposite direction from where we had carefully selected our runnings. It was lucky for them, I think, that they doubled on the dogs. The next day we had the same ill luck. The old hunters we found were equally as unsuccessful as we had been, so we still had hopes. On the day following the Doctor and I made another run or two. The dogs started deer again, but they would not run our way. On our arrival home we heard that Monie, the Doctor's brother, had returned from the Red River country? I saw a new light in the Doctor's eye as he whispered, "A deer over yonder to-morrow, sure, boy; Monie knows where they sleep." So we laid our plans that night, and sure enough ere nightfall on the succeeding day we were the owners of a fine buck. The day after was stormy, so we did not go out, but helped Monie unpack a small pair of horns that had followed him from the Northwest, the result of a careless shot among the mountains. Said horns were five feet across the flat horn, and some fifteen inches wide, with thirteen prongs on each side. The animal's head measured two feet three inches from

the nose to the ear—a trophy the like of which I think no other man owns.

Sunday evening we went to Oil City, meeting our good friend Hector, whom we induced, after much persuasion, to accompany us. Daylight saw us breaking our fast, and I was shortly after posted at a black stub, which Monie called a dead run, and which it proved to be before eleven o'clock, as I killed a fine doe, dropping her with the first barrel full fifty yards from me. After lunch we started the dogs again, but without success. In the evening friend Crosby joined us. Tuesday the Doctor got a fine spike horn buck before noon, and in the afternoon we saw the rare sight of a wounded stag at bay, which stag the Doctor, after crossing and recrossing the creek, with water to his waist, felled with his fowling piece.

On Wednesday friends Hector and Crosby returned home, but the day was full of excitement. The pony had a load of two bucks and a fawn to go in with that night, and we all had a seven mile walk after dark. We made what perhaps you have heard of when we got in—a square meal. Thursday we started to return to Petrolia, with the intention of making two or three runs on our way, but ere we had gone the eighth of a mile the dogs winded a deer and broke from us; and away they went, six noble fellows that made the woods ring, and we, too, scattered lively for the runways; but the deer and dogs crossed ahead of us, and our hunt was over for the day. Friday we packed up, and on Saturday started for home, after bidding friends good bye. Monie, Hector, and Crosby were at the station to see us off. Farewell, good friends, may we meet again.

HIRAM E. GRIFFITH.

GLOAN'S REPLY TO E. L.

EDITOR FOREST AND STREAM:—

If E. L. has read my article carefully, as he says, I regret that he has not read it more understandingly, for I will not think he has perverted its meaning intentionally. I said that Mr. Pape was not the inventor of the choke bore system, and was not entitled to receive the Field prize for inventing it. E. L. says that he was, and that I have misstated the facts; and, going beyond that, he offers to bet, and stoops to personal innuendoes. I shall utterly disregard these. I desire to hold E. L. to the proof of his assertion, and am not to be let off by any such devices.

If I believed in any private trials, such as E. L. proposes (and I do not, because they settle nothing, and their only result is to serve as gratuitous advertisements), I would nevertheless wait until Mr. Pape makes his defiance good. He is a manufacturer, and naturally desires to bring his gun before the public. He issued a challenge, which was instantly accepted by telegraph, I am told, by a gentleman of St. Louis, who started to New York on the first train. It is reported that as he stepped on the cars Mr. Pape stepped on a steamer, and I see by this morning's paper that "the gun which caused Mr. Pape to sail for England in the first steamer can be seen on exhibition in Cortlandt street." Whether this report is true or not is nothing to me, and does not in the least alter my opinion either of the utility of such private trials or of betting bombast, whether emanating from Mr. Pape, or E. L., or anybody else. I am not in such business, and when it comes to pass that discussions as to priority of inventions, or as to the merits of guns, or as to any other topic which should be dealt with only as elevating sport and sportsmen, in the highest and best sense, are to be carried on with acrimony, or loaded with personalities, or bullied through by bets, I shall immediately decline any further participation with them.

To come therefore to the points in issue. First: Mr. Pape says he had invented the choke bore, and it was in use by his customers for some time prior to the issuing of his patent. I denied that, and said no owner in England had a Pape gun which at that time was celebrated for its wonderful shooting; that is to say, for shooting with as much superiority as the present choke bore would have shown over an ordinary gun of that date. Second: Mr. Pape's patent was issued to him before the Field trial. His winning gun only won by a small margin of pellets, and did not show the present immense choke bore patterns. I said if he knew of choke boring then he would have demonstrated the system for that trial, as it has been demonstrated since. But he did not do it, although it would have given him fame and fortune. Not only did he not do it, but neither any of his patrons, nor yet any gunmaker in the country, ever suspected the wonderful discovery. Third: I said that choke boring was known in this country long before the Roper gun, and that consequently the principle of the Roper antedated Pape.

E. L. denies these propositions. The simple way by which he can refute them, if he is correct, must be plain to him and to all others. He has voluntarily taken the affirmative, now let him do that which throughout all these controversies Mr. Pape has persistently omitted to do. Let him produce Pape's patent! Then we can see the date of it, and we can see whether it mentions or includes modern choke boring at all, which I doubt. The written instrument is the best evidence, and the only proper way to determine what Mr. Pape invented and when he invented it, is to produce the instrument or an authenticated copy of it. When E. L. does this we can get the date of the Roper patent and see what it claims, and Mr. Pape can, if he wishes it, get the early history of choke boring among the pioneers of the West, and learn when they commenced it. It may be of interest to him.

As to the Field prize. In the first place, it was not given by the Field. It was the offering of an anonymous contributor, and sent to the Field to be awarded. In the second place, no American competed for it (the Roper Company having dissolved long since), and no Englishman but Pape had the hardihood to claim it, and it was given to him solely on the assumption of his patent.

Everybody seemed to recognize that the choke bore was an American invention, and I account for the delay of the Field in holding the award two months, upon the theory that they knew Pape was not entitled to it, and were in hopes that some other claimant would appear. Certain it is, that they were strongly remonstrated with for giving it to Pape. They did not attempt to deny its American origin, but excused themselves by saying that he was the only claimant, and they could not help themselves.

Of all the mistakes E. L. has made, he has made none greater than to suppose I have any prejudice against the Pape gun, or any but good feeling for Mr. Pape himself. If I have a preference for any one maker, it is because I believe his gun to be worthy of my preference. And I submit to E. L. that it is better to be actuated by this feeling, even though there may be an error of judgement in it, than to indulge in detraction because of a business misunderstanding and a personal disappointment. When E. L. produces the proof I have mentioned, he can make it known.

GLOAN.

NIAGARA FALLS, Dec. 27th, 1875.

EDITOR FOREST AND STREAM:—

I enclose herewith the score of two shooting matches that came off on Christmas. The first was by boys under nineteen years of age for a purse; 10 birds each, New York State rules, 14 oz. shot, usual rise and boundary.

Name.	Total.	Name.	Total.
James H. Evans.....	8	W. Utz.....	6
C. S. Rice.....	8	H. H. Seldon.....	6

The wind was blowing very hard from the score, and carried the birds a good ways, even if they were killed. The first two used Parker guns, the others muzzle loaders. The second match was for \$5 a side, ten birds each, between Messrs. George E. Curtis and S. T. Murray, of the Niagara Falls Shooting Club. Mr. Curtis killed two out of ten, 21 yards, and Mr. Murray 6 out of 10 at 26 yards. Mr. Curtis shot a small 16-bore pinfire French breech loader, while Mr. Murray shot his heavy Greener muzzle loader. Next came a shoot at two birds each, \$1 entrance fee. S. T. Murray won first money, \$5; James Pierce, second, \$4; H. T. Fulton, third, \$3. Then came a chicken and turkey shoot, in which the chickens brought about 30 cents and the turkey 20 cents. And this is not the first time, either, that the Juniors have beaten the score of the older shooters.

JUNIOR.

ined as to cleanliness, and found to contain less deposit than do shells cleaned with acid, after the use of ordinary gunpowder.

From these tests the following facts may be safely laid down:—1. The recoil is about one third as great as compared with Hazard FG. 2. Uniformity of composition in the contents of one can. 3. The rending or bursting force is no greater than in black powder. 4. Wiping the rifle is entirely unnecessary. 5. The shells can be reloaded without cleaning. 6. Heaped up loosely Dittmar powder will sputter and burn, but not flash like ordinary gunpowder; it is therefore much safer to handle. 7. The explosion in the gun is quick—a disadvantage, as if made to burn more slowly it would have greater projecting force and less recoil. 8. A decided lack of power. The only means of judging this fact were by the elevations on the scale, and although these do not admit of nicety in calculating the force, they give a very tolerable idea of the difference between the two powders. At 500 yards a charge of 1½ grains Hazard FG takes an average elevation of fifty-five and a half points; at 500 yards a charge of forty grains Dittmar F takes an average elevation of sixty-six points; at 500 yards a charge of forty-four grains Dittmar F takes an average elevation of sixty-four and a half points. From which we conclude that four grains Dittmar—one and a half points elevation; that the difference between forty-four grains Dittmar and 102 Hazard—nine points, and that sixty-eight grains Dittmar would about equal 102 grains Hazard in elevation. From this rough estimate two grains Dittmar—three grains Hazard in power, or at least will give the same flat trajectory. But in equal bulks the Dittmar appears to be one third the weight of Hazard, or one grain Dittmar—in power one and a half grains Hazard; but one grain Dittmar—in bulk three grains Hazard. Therefore with equal bulks the Dittmar has one half the force of Hazard. Notwithstanding this difference in force the Dittmar seems to be sufficiently powerful for 500 yards. At 1,000 yards it would probably require about thirty points more than the ordinary elevation at that distance, giving a very high trajectory, and making accuracy impossible except on a perfectly calm day. Improvements, it is said, are being made, both in reducing the bulk and quickness of this powder, which are absolutely necessary to warrant its introduction into long ranges. Of the perfect accuracy, docility, and cleanliness of this powder, as used at 500 yards, there can be no question. Now let it be made equally serviceable for 1,000 and 1,500 yards, and a great improvement will have been made over our ordinary ammunition.

It is necessary to state that there has been a difference of opinion in the change of elevation needed for a higher charge, some claiming that a heavier charge needs a greater elevation. This fact, if proved, would destroy the conclusions arrived at above. Experiments were made on a calm day to decide that point. Twenty shells were filled, five each with 85, 95, 105, and 115 grains Hazard FG, all poured in loosely except the last, which had to be tapped. They were all fired at 500 yards, with 500 grain balls, within a short space of time, the rifle being cleaned after each discharge. The elevations were found with perfect accuracy, four shots being fired with each weight of powder, and finally four shots were fired, one of each different charge, the elevation being changed before firing, and giving with four different elevations (with a total variation of eight points) four successive bullseyes. The elevations were—with 85 grains, 60 points; with 95 grains, 57½ points; with 105 grains, 55 points; with 115 grains, 52 points. Showing a decrease of about two and a half points in elevation for every additional ten grains of powder; the extra difference of one half point in elevation between the two last charges is owing to the fact that the 115 grains were packed more closely than the 105 grains, having therefore greater power. These conclusions, carried out, would give about seventy grains Hazard as an equivalent to forty-five grains Dittmar in power, which would seem to prove the opinions reached above. There was very little perceptible difference between the recoil from 85 grains and that from 115 grains, which, by analogy, would suggest that the recoil of 45 grains of Dittmar being very slight, that of 68 grains Dittmar would be not much increased, and consequently much less than that of its equivalent, 102 grains Hazard.

Experiments were also made with four charges similar to the above, with a short or 414 grain bullet, which gave less recoil, and from four to five points less elevation than the same charges with 500 grain bullets. This lessened recoil and lower trajectory would seem to be in favor of using a light ball at 500 yard ranges, and would be an apparent contradiction of the theory that the recoil of a gun is in the ratio of the propelling force of the charge.

DOUGLASS SMYTH.

SHAKOPEE, MINN., Dec., 1875.

EDITOR FOREST AND STREAM:—

At a turkey shoot held here recently, under the management of the Rifle Practice Club, open to all comers, a fair field and no favor, the result was that of seventeen turkeys set up and knocked down, fifteen were killed by the writer. Sharp rifle with the Beach combination open sight, in the hands of parties, most of whom never shot it before; thus satisfactorily proving to all present that breech loading rifles, as made in these days, are unexcelled, I may say, in any particular. But I am thoroughly convinced that these old fashioned chicken and turkey shoots savor too much of the unmerciful, and ought not to be allowed, as they belong more properly to more ancient and barbaric times. In fact, 'tis but cruelty in its fullest sense. Target shooting is by far more satisfactory, and besides the hen or turkey not only escapes a sore trial, but is awarded to the winner in good order, live and sound, instead of, being bruised and mutilated, as is the case in the not good old way. For one I would like to see this practice of setting up the "live bird" discontinued tetotally, and I am glad to add that others hereaway to whom I have urged my protest indorse my views in this respect. A friend has a \$45 Remington shot gun, purchased on my recommendation on the strength of FOREST AND STREAM's advertisement, and has used the same right along since last Spring, and thus far it stands the wear and tear apparently as well as any, and shoots as strong, too. One word for the Bridgeport shells: The brown ones we used to get here were good enough, strong and durable; the white ones we now get (only we don't buy them when we can get Ely's) are a nuisance. S.

Sea and River Fishing.

FISH IN SEASON IN JANUARY.

SOUTHERN WATERS.

Pompano, *Trachinotus carolinus*. Grouper, *Epinephelus nigritus*, Drum (two species.) Family *Scia*-Trout (black bass,) *Centropomus niger*. Kingfish, *Menticorvus nebulosus*. Striped Bass or Rockfish, *Roccus lineatus*. Sea Bass, *Sciaenops ocellatus*. Tailorfish, *Pomatomus saltatrix*. Sheepshead, *Archosargus probatocephalus*. Black bass, *Micropterus salmoides*; Snapper, *Lutjanus carus*. *M. nigricans*.

[Under the head of "Game and Fish in Season" we can only specify in general terms the several varieties, because the laws of States vary so much that were we to attempt to particularize we could do no less than publish those entire sections that relate to the kinds of game in question. This would require a great amount of our space. In designating game we are guided by the laws of nature, upon which all legislation is founded, and our readers would do well to provide themselves with the laws of their respective States for constant reference. Otherwise, our attempts to assist them will only create confusion.]

FISH IN MARKET.—The supply during the week has been plentiful, particularly that of shad, which are unusually abundant and cheap for this season of the year. Fine shad can be bought for 50 cents each; last year at this time they brought \$1.50. On the 23d inst., near Oregon Inlet, on the North Carolina shore, a large school of bluefish weighing 8 to 10 pounds each were taken, and are now coming into market; an unusually late catch; they sell for

12 cents per pound. Striped bass are worth 22 to 25 cents; smelts, 15 cents; salmon, frozen, 50 cents; mackerel, 20 cents each; white perch, 15 cents per pound; Spanish mackerel, 40 cents; frost fish 8 cents; halibut, 20 cents; haddock, 8 cents; codfish, 8 to 10 cents; blackfish, 12 to 15 cents; flounders, 12½ cents; sea bass, from Charleston, 15 cents; whitefish, 18 cents; perch (yellow), 12 cents; salmon trout, 18 cents; black bass, 18 cents; ciscoes, 10 cents; pompano, \$1; green turtle, 20 cents; terrapin, \$12 per dozen; lobsters 10 to 12 cents per pound; scollops, \$1 per gallon; soft clams 30 to 60 per 100; hard shell crabs, \$4 per 100; soft shell crabs, \$1 per dozen.

—The latest novelty is a *braided* fly rod, sold by Abbey & Imbrie, of 48 Maiden Lane. We have the assurance that they possess all the requisites of a perfect rod, while it is quite impossible to break them by roughest usage. They are made of ash and lancewood at present, but it is expected that any of the usual materials can be employed, such as split bamboo, cedar, greenheart, majaja, etc. The rod we have examined is quite a curiosity in its way, and an ingenious piece of work. The price is \$20.

FISHES AND FISHING OF THE GREAT LAKES.

THIRD PAPER.—MASKINONGE, PIKE PERCH, GAR PIKE AND STURGEON.

EDITOR FOREST AND STREAM:—

THE Maskinonge (*esox nobilior*). What may be the proper mode of spelling the common name of this fish, I am unable to decide, for there are at least half a dozen different methods. Mr. Thompson, in his appendix to the "History of Vermont" (1853), says the word is not of Indian origin as generally supposed, but of Canadian French, being derived from *masque* (face), and *allongé* (elongated); hence, he spells it masquallonge. The maskinonge is peculiar to the basin of the Great Lakes and is the largest of pickerels, weighing from ten to eighty pounds. It is a very handsome and game fish, and is the tyrant of these waters, devouring everything smaller than itself, even of its own species, though its favorite food is the whitefish, which is supposed by many to account for its superior flavor. It is one of the best of fresh water fishes. The Northern pike—first described by the late Agassiz—is sometimes confounded with this fish, but may be easily detected, as it has the lower jaw filled with teeth, whereas the anterior half of the maskinonge is toothless.

Another fine fish is the pike perch (*luco-perca*), better known as the glass or wall-eyed pike. This is called by the fishermen of Lake Huron and our Canadian brethren the pickerel, and with like perversity they call the true pickerel a pike. Again, it is known to the Lake Erie fishermen as a salmon. This is a fine and well-flavored fish, weighing from two to ten pounds, and, excepting herring and suckers, is the most plentiful of all lake fish. Although common to all these waters, it congregates in largest numbers in Saginaw and Green Bays. The catch is enormous. The spawning season is in April and May. Although the pickerel proper is found, they are not in sufficient numbers to disturb the better fishes.

The gar pike (*Lepidosteus*) is occasionally found in these waters. It is a singular animal, and the only living representative of the fishes that existed in the early ages of the earth's history, and which by its formidable array of teeth, its impenetrable armor, and its swiftness and voracity, gives us a faint idea of the terrible creatures that peopled the waters of that period. According to Prof. Wilder, the young gar possesses two tails, the one serpent-like and the other fish-like. The first is snake-like in motion as well as in form, and is largest and most active in the very young. As the fish increases in size and age so this serpentine appendage correspondingly decreases, until at adult age it is obsolete. Prof. Wilder's investigations show that this temporary tail is a vestige, a reminiscence, a survival. The ancestor of the gar was a reptile, and the young fish still carries the reptilian tail ("Popular Science Monthly"). The manner in which the gar pike seizes his prey differs from all known fishes, resembling more the act of reptiles, as it does not swallow immediately after seizing, but by a series of movements places it in the most convenient position and disposes of it similar to the *saurians*, while the food is seen to distend the body in passing, as with *ophidians*. The gar is often discovered sleeping, apparently, upon the surface of the water and gently carried around by an eddy for half an hour at a time, particularly on warm and sunny days. When in pursuit of prey he often leaps high out of water, and is so swift and strong a swimmer as to stem the most furious rapids. It is well that these fishes are not numerous. Though not a food fish, I have inserted this pike because it is but little known as an inhabitant of these waters.

The sturgeon (*acipenser rubicundus*) is the leviathan of the lakes, and is abundant in localities; more particularly near the Apostle Islands in Green Bay and the Western Lake Erie and Lake St. Clair. He is often caught in nets, but is no desirable customer, as in the eyes of fishermen he has no value, besides the liability of breaking the nets and allowing the smaller and more profitable fish to escape, and when caught is killed and usually thrown upon the offal heap. Sturgeon are generally taken in four to eight fathoms. The quality of the flesh is very fine, and when properly cooked is said to be with difficulty distinguished from veal cutlets. Of late smoked sturgeon has become quite an article of commerce, the demand being far greater than the supply, and it is said to be superior to halibut. Caviar is also prepared, but to no great extent. The sturgeon is an exception among cartilaginous fish, being oviparous and depositing spawn in a similar manner to the bony fishes. This act takes place in June in the confluent streams, at which time they are followed by vast schools of herring and wall-eyed pike for the purpose of feasting on the ova. A very superior quality of lamp oil may be obtained from this fish, but whether the enterprise would be profitable or not, I am no judge.

ARCHER.

DOINGS OF THE FISHING FLEET.—The shore fleet have not done much the past week, owing to a scarcity of bait. There have been five arrivals from La Have Bank, bringing 110,000 pounds of codfish and 11,000 pounds of halibut. The number of vessels in the herring business comprises 63, 31 of which have sailed for Fortune Bay, Newfoundland, and 32 for New Brunswick and Nova Scotia. These vessels are among the staunchest of the fleet. Reports from Newfoundland show a scarcity of herring in that section, and many of the vessels are expected to go to Fortune Bay to finish their cargoes.—*Cape May Advertiser*, December 24th.

WILLOW BASS RODS.

WALNUT HILL, Fayette county, Ky., Dec. 13th, 1875.

EDITOR FOREST AND STREAM:—

I wish to call your attention to the common yellow willow as a material for bass rods. I had a walking stick of willow, and was struck with its extreme lightness, great strength and elasticity—all necessary qualities for bass rods. I made a rod of it and tried it on black bass this Fall, when it performed to my entire satisfaction. The entire rod was of willow. Rods of different wood are necessarily imperfect from the difference in weight, density, elasticity, etc. Another serious objection to the rods as now made, is the enlargement behind the reel for hand hold, which throws an increased strain in front of the reel, which is the weakest part of the rod.

I have not written this with a view to publication, but would prefer your experimenting with the wood and, if satisfactory, give the result. The willow is common to all the streams of the Mississippi valley. I don't know if it grows east of the mountains or not. It will season sufficiently for use in one month from the green tree. In putting up a rod of this wood certain conditions are necessary to be observed. Try a single experiment. Take a crooked willow stick and bend it with force in the opposite direction; notice the spring and whether it returns to its original shape. Next note the strength, by bending with sufficient force to break the stick. If these simple experiments give you any confidence, I will give you all necessary information.

DR. T. J. C.

Answers To Correspondents.

No Notice Taken of Anonymous Communications.

H. H. THOMAS, Randolph, N. Y.—When does the close season for brook trout commence and close in the State of New York? Ans. Close season from 15th September to 15th March.

G. B., Rochester.—Can you tell me who manufactures the Ward-Burton magazine rifle, and give me the address? Ans. The arrangements for the manufacture of this rifle, we are informed, are not yet completed.

M. H. L., Decatur, Ill.—Will Pride of the Border be taken to Chicago during the exhibition in January, 1876? Ans. Pride having been worked pretty steadily in the field this Fall he will probably not go to Chicago. Fairy and some of her progeny will go.

SUBSCRIBER, Long Branch.—Is there anything I can use to remove fly stains from the leaves of a book? Ans. Nothing will remove the stains without more or less injury to the paper. By binding the leaves tightly together and rubbing gently one way with alcohol and water in the proportion of one part to three, you might accomplish it without any serious damage.

F. W., Lexington, Ky.—I saw in one of your issues some time since that a deer was killed on a railroad, and its "saddles" weighed 200 pounds. How was that? The largest I ever knew of was in Nebraska, and the whole carcass, dressed, weighed 219 pounds. A deer whose saddles weighed 200 pounds ought to weigh, whole, over 300 pounds. Are your Northern deer larger than our Western and Southern ones? Ans. Northern deer are larger, especially those of Pennsylvania. We have seen a Pike county doe that weighed 250 pounds, dressed.

F. C. W. W. Co.—1. Do you know a gunmaker by the name of J. Hollis & Son, London; does he make a good gun, and what are his guns worth? 2. Do you think the papers (FOREST AND STREAM) of one year, two volumes, can be bound into one book, or will it make the book too large and heavy? Ans. 1. They are good, reliable makers of Birmingham, having a branch of their business in London. Their prices are moderate, but vary according to material and finish. 2. We would not advise you to have two volumes bound in one, as the binding would be expensive, and the book too large.

TOR BOOTS, Newark, N. J.—1. Is the all red setter the only true type of the Irish breed, or can they be of any other colors. 2. Is it so considered that a pup born from Rake and Fan a full brother to a pup born of the same pair two years later, or an indefinite period afterwards, so long as the father and mother are the same. Ans. 1. There are undoubtedly thoroughbred Irish setters of all colors. The predominant color of those imported to this country is red, but it does not follow that those of other colors are not equally as pure bred. The best Irish setter we have ever met with was Shot, a splendid deep red and white dog, imported for us by the late R. Gamble, Esq., of N. A. 2. Yes; a full brother.

S. M. F., Philadelphia.—Does your answer in last FOREST AND STREAM, to the question relating to centreboards, apply to cat rigged boats? If not, what is the rule for them? To obtain the length for centreboard on a cat rigged boat twenty-seven feet long on deck and twenty-four feet on the water line, do you take one third of the length on deck or of the length on the water line? What should the length of mast be for such a boat? Ans. The same rule applies, the length on water line always being taken. Sometimes, however, in the case of small boats to be used for fishing, the centreboard is placed forward of the middle thwart, in order to give more room. The length of a mast depends much upon the model of a boat, and the purposes for which she is to be used. About the right thing for cruising would be a mast twenty-seven feet long, with twenty-two feet hoist of sail.

T. W., Lexington, Ky.—Do you hear any complaint about choke bores not shooting buck shot. My Scott gun, 32-inch, No. 12, 7½ pounds, will not shoot loose buck shot; have to use concentrators, or run fallow on the shot in the shell. Eley's wire cartridges are too irregular. Have tried several choke bores—Greener's and others—but all have the same fault. Ans. Yours is the first experiment we have heard of in the way of using buckshot in choke bore guns, consequently it is a new thing to us. In getting the opinion of a practical gunmaker upon the subject, he thinks that if the size of the buckshot is selected so as to chamber evenly in the cartridge it will shoot very close in a choke bored gun. In the use of Eley's cartridges we have found the same difficulty you complain of—their shooting being very irregular. They sometimes make a magnificent target, and at other times break up in the gun, and are not equal to loose shot.

PLANKERS, Hudson, N. Y.—1. Do you think that a spayed bitch (setter) would be as good, generally speaking, as one that was not; would it not have a tendency to make them fat and lazy? 2. Can you give me Joseph E. Fisher's address? Ans. 1. We have repeatedly tried the experiment of having bitches spayed, and are fully convinced that for any one who does not wish to use dogs for stock purposes there is no kind of dog for service more desirable than a spayed bitch, if she is spayed at the proper age, and they should by all means have the operation performed before they are ten weeks old. A skillful person can successfully perform the operation after they are four weeks old, and then they grow up in proper shape, and have no more tendency to get lazy or run to fat than other dogs. But if they are allowed to become fully developed before the alteration they run to fat and become lazy and of little use. 2. No. 102 Sackett street, Brooklyn.

A WEEKLY JOURNAL,

DEVOTED TO FIELD AND AQUATIC SPORTS, PRACTICAL NATURAL HISTORY, FISH-CULTURE, THE PROTECTION OF GAME, PRESERVATION OF FORESTS, AND THE INCUCLATION IN MEN AND WOMEN OF A HEALTHY INTEREST IN OUT-DOOR RECREATION AND STUDY:

PUBLISHED BY

Forest and Stream Publishing Company,

—AT—

17 CHATHAM STREET, (CITY HALL SQUARE) NEW YORK,
[Post Office Box 2832.]
127 SOUTH THIRD STREET, PHILADELPHIA.

Terms, Five Dollars a Year, Strictly in Advance.

A discount of twenty-five per cent. allowed for five copies and upwards.

Advertising Rates.

In regular advertising columns, nonpareil type, 12 lines to the inch, 25 cents per line. Advertisements on outside page, 40 cents per line. Reading notices, 50 cents per line. Advertisements in double column 25 per cent. extra. Where advertisements are inserted over 1 month, a discount of 10 per cent. will be made; over three months, 20 per cent; over six months, 30 per cent.

NEW YORK, THURSDAY, DECEMBER 30, 1875.

To Correspondents.

All communications whatever, whether relating to business or literary correspondence, must be addressed to THE FOREST AND STREAM PUBLISHING COMPANY. Personal or private letters of course excepted.

All communications intended for publication must be accompanied with real name, as a guaranty of good faith. Names will not be published if objection be made. No anonymous contributions will be regarded.

Articles relating to any topic within the scope of this paper are solicited. We cannot promise to return rejected manuscripts.

Secretaries of Clubs and Associations are urged to favor us with brief notes of their movements and transactions, as it is the aim of this paper to become a medium of useful and reliable information between gentlemen sportsmen from one end of the country to the other; and they will find our columns a desirable medium for advertising announcements.

The Publishers of FOREST AND STREAM aim to merit and secure the patronage and countenance of that portion of the community whose refined intelligence enables them to properly appreciate and enjoy all that is beautiful in Nature. It will pander to no depraved tastes, nor pervert the legitimate sports of land and water to those base uses which always tend to make them unpopular with the virtuous and good. No advertisement or business notice of an immoral character will be received on any terms; and nothing will be admitted to any department of the paper that may not be read with propriety in the home circle.

We cannot be responsible for the dereliction of the mail service, if money remitted to us is lost.

Advertisements should be sent in by Saturday of each week, if possible.
CHARLES HALLOCK, Editor.

WILLIAM C. HARRIS, Business Manager.

1876. HAPPY NEW YEAR! 1876.

FOR the third time the FOREST AND STREAM is permitted to extend its congratulations to its patrons, and wish them, according to time honored and gracious custom, a Happy New Year! The intercourse that we have had from the beginning we trust has proved mutually pleasant and advantageous. The times have been distressing, and fatal to the vitality of special publications, whose existence is at the best precarious; for statistics show that of each fifty that spring into existence, forty-nine die in their infancy. The law of natural selection asserts its supremacy here as elsewhere, and the weaker go to the wall. Nevertheless, our journal has been favored with a steady accession of subscribers from the date of its announcement, and to-day its success is more fully assured than ever. It is a pleasant duty we owe to the hundreds of contributors who have voluntarily aided us, to thank them for their friendly and inestimable services. We shall endeavor by assiduous exertions to continue deserving of this most comfortable support.

This is the season of the year for renewing good resolutions; the time for wiping off old scores. Metaphorically, it is the period when every man may be said to "spit on his hands and take a fresh hold;" and if all is not lost in the letting go, there is certainly much encouragement for the future. We, in common with the great mass of the people, hope for a marked improvement in business in the course of this Centennial Year; and if the proud consciousness of a completed Century do not brace up and stiffen the energies of our semi-demoralized nation, and stimulate the wisdom and action of our law makers and tariff manipulators, then we have no faith in the efficacy of age to make good wine better, or to improve the quality of the spirit of 1776. There are some who place no trust in the bow of promise that hangs over the great exposition at Philadelphia, and who will affect as much surprise at the return of universal prosperity, as the friends of Jonah did when he was thrown up on shore! But since no one can tell what a day or a year may bring forth, who shall say what contingencies and happenings may not hang upon a Century! Momentous suggestions of what may be dwarf and obliterate the speculations as to what might have been. One thing is certain; the New Year's cup of promise is always full, and ardent hopes are interwoven with the chaplet of flowers that twines about it. So, then, a bumper to the fickle Goddess, and a wish to all for a "Happy New Year!"

GAME PROTECTION.

THE FLORIDA SNAP LAW.

WE have been notified of a law now in operation in Florida, that imposes a penalty of not less than \$50, nor more than \$500 upon any non-resident detected in shooting game of any kind, for the purpose of carrying it out of the State, unless he has paid a license of \$35, secured from the county in which he proposes to hunt. We question the validity of this law, believing it to be entirely unconstitutional, and in this opinion are backed by the most eminent legal counsel of several States. Its hardship is insufferable and its provisions ludicrous, for, as very few sportsmen would be likely to confine their hunting and fishing to any one county, the license expenses for the half dozen counties they would wish to visit would amount to a large sum.

We believe in the letter and spirit of our Constitution, which guarantees the same privileges and immunities to the citizens of one State that it does to another. We believe that the regulation of internal commerce belongs to the General Government and not to individual States. We believe that no State has the right to station Custom House Officers upon its border, to levy a tax or duty of \$25 dollars upon every quail and egret carried out of the State; else we should soon be able to stop the wholesale shipment of prairie fowl, quail, and ruffed grouse from sundry States to our metropolitan markets, where dealers stand ready to buy and sell them out of season, in defiance of law, thus offering premium and pretext for disobedience. While we are anxious that some method shall be devised to prevent this shipment we feel that it cannot be accomplished by such a measure as the one in force in Florida. It will not meet the necessities of the case, nor the expectations of those who secured it. The detention or arrest of supposed offenders is usually left to the discretion of ignorant, inpecunious, and avaricious men, who have always in mind the reward of one-half the fine collected, which the law adjudges to them, and who will not readily discriminate between the market hunter and the scientist who is shooting only for specimens. Naturally, every man with a gun will be challenged and examined for his license, and if found without it, arrested on the slightest suspicion that he is something else than an innocent pleasure seeker spending his Winter vacation in the pastime of shooting and fishing. Such proceedings will keep every sportsman out of Florida, and shut up all the hotels and sources of revenue that are now making that lately impoverished State rich.

A case was brought to our notice last Spring, where an eminent entomologist was brought to a halt with his bug-portfolio, in Brevard county, the ardent prosecutor insisting that he required a license under the game laws—he maintaining that insects were game!

We commend this matter to the attention of the Florida Legislature and shall personally press it next month.

DETECTIVE LEAGUES FOR THE PROTECTION OF GAME.—It has long been a prevailing impression on the part of sportsmen in various parts of the State that an appeal to the New York City Association for the Protection of Game, and the reporting of any violation of the game laws, was all that was necessary to insure the prosecution of the offender by that organization. Not even an offer of co-operation is usually made by the country sportsman, but he assumes that gentlemen residing hundreds of miles from his own district will undertake to redress his wrongs and preserve the game for his own delectation and amusement. The work of the above mentioned association has been bravely done in prosecuting dealers, who are after all the evil geniuses of the pot hunter, and by providing a market for his unlawfully captured birds and fishes, aid, abet and encourage him. Country sportsmen should either form themselves into Game Protective Societies or into "Leagues," after the model of the one alluded to below.

There is another method, one that we have advocated before, and that we hope soon to see adopted, more particularly with regard to the Adirondack region. Here, over a vast expanse of thinly settled country, the individual sportsman could scarcely be expected to act either as detective or prosecutor; what is required then, is the appointment by the State of an official, or officials, who shall be above the fear of local disrepute or odium, and who shall be invested with full powers to arrest and prosecute to conviction any offenders. He, or they, should be appointed from some other locality than the one in which they are to officiate, on the principle adopted by the Chinese, who never send a man to govern in his own province, arguing very justly that ties of locality are the first and most apt to cause dereliction of duty. What we want are detectives, appointed, in secrecy if need be, who will ferret out offenders and bring them to justice:—

PROVIDENCE, R. I., December 10th, 1875.

EDITOR FOREST AND STREAM:—

The "Forest and Stream League, Elk Horn Lodge," of Providence, R. I., was organized Thursday evening, December 9th, by the Chief Com. and officers of the National Lodge. The following were gazetted officers of the lodge for the ensuing year:—

Chief, Vincent W. Wilson; Vice Chief, Wm. H. Carlisle; Deputy, Charles H. Hodges; Clerk, Wm. Green; Guide, James Murpa; Sentinel, Thomas Carlisle; Picket, Edward Green.

Elk Horn Lodge of this League is organized for defending our game laws, and for the protection of game in this State. The main feature of the League is the formation of an independent detective force for the ferreting out of violators of the law, with power to bring the offenders to justice. We are all young men from eighteen to thirty years of age who are engaged in this work, and fully determined to enforce the law (with the means at our command) to its fullest extent. Our motto is "Death to Pot Hunters," and before another season has passed and gone

you will no doubt hear of us as a power where we are now hardly known. As regards our name, it was one among a dozen presented, and was adopted by a unanimous vote. We are all lovers of the FOREST AND STREAM, and *Rod and Gun*, and the *Field* comes in for its share of our favor.

Our rooms are open every evening from 9 to 11 o'clock; our location, Burlingame's Block, No. 18 Cranston street, where we would be pleased to see all true sportsmen, whether resident or visiting, at any time. All the popular papers and magazines, games, foils, dumb bells, and other articles of amusement, always on hand. We receive members with a form of initiation, full of instruction and reality, which binds us more closely together in the mystic tie of fidelity. The Deputy Commander is prepared to furnish full information to those desirous of organizing a lodge of this League. His address is V. W. Wilson, D. C. C., No. 236 Washington street. These lodges should be established in every city and town throughout the country. More anon.

KEPOTAH.

JANESVILLE, Wis., December 18th, 1875.

EDITOR FOREST AND STREAM:—

It is desired to secure, during the coming session of the Wisconsin Legislature, the passage of a law prohibiting the use on Wisconsin waters of batteries, sneak boats, scull boats, and in fact all illegitimate means for hunting waterfowl.

In order to overcome any opposition that may arise to the passage of such a law, it is thought best to prepare petitions, to be presented to the Legislature. I wish to state to the sportsmen of Wisconsin, therefore, through your columns, that printed heads for such petitions are being prepared here, and applications for them to the writer will be promptly attended to. If the sporting clubs throughout the State will take hold of the matter, there will be no difficulty in securing the passage of such a law, which we all know is much needed, if we would protect our water fowl from the depredations of the market hunters.

You will remember that this matter was talked over during your visit to our club house at Koshkonong this Fall, and I am sure your sympathy is with us in the matter, and that you will aid us as much as possible. Our lakes, and especially Koshkonong, are becoming more and more celebrated for canvas back shooting, and if the ducks can be protected from all but legitimate shooting, the sport will grow better instead of worse. Let us hear from other sportsmen who are interested in the matter.

A. M. VALENTINE.

For several years we did much shooting in Maryland, upon Chesapeake Bay, and the rivers emptying into that bay, and have had ample opportunity of observing the effect of shooting wild fowl from batteries and sneak boats; and we are fully convinced that if the State had not passed laws prohibiting such shooting, and had those laws not been strictly enforced, those splendid game water fowl, the canvas backs, red-heads, and other delicious ducks, would have been exterminated or driven from those waters long ere this. You have our full sympathy and shall have our warmest support.

—The "Capital Sportsmen's Club," of Topeka, Kansas, have resolved not to shoot any more quail during the remainder of the open season, which continues until March 1st; this in view of the present scarcity of these birds. The same club is striving to secure a law to prevent wholesale destruction of game and its shipment to markets outside the State, an effort which should be imitated throughout the whole West.

—The Fish and Game Protection Club of the Province of Quebec, Canada, held its annual meeting, last week, McPherson Lemoine, Esq., in the Chair. The following gentlemen were elected officers:—

McPherson Lemoine, President; E. M. Copeland, Vice-President; A. N. Shewan, Secretary; W. H. Rintoul, Treasurer; Maurice Cuvillier, R. A. Alloway, D. D. S., George A. Drummond, W. H. Kerr (legal adviser of the club), F. W. L. Pentou, F. J. Brady, James Esdaile, H. W. King, D. B. Willy, and R. H. Kilby, Committee. The Chairman stated that "the club is determined to use every effort to see that the fishing and game laws are carried out, both by offering rewards for the conviction of offenders, by employing detectives to watch suspected persons and places, and by circulating copies of the laws concerning fish and game printed in both the English and French languages."

In view of the noble and persistent efforts that the Secretary, Mr. Shewan, has made for the protection of game in Canada for years past, we are proud to be able to state that he has served as the general agent of FOREST AND STREAM in Quebec and Ontario for a long period.

—The following amendments were made in the Quebec game laws during the present session:—Elk, moose, caribou and red deer or their fawns are not to be killed or taken between the 1st of March and the 1st of September for the districts of Quebec, Chicoutimi and Saguenay, and between the 1st of February and the 1st of September for the rest of the Province; no otter to be taken between the 1st of May and the 1st of October; no beaver between the 30th of April and the 30th of September, and no muskrat between the 1st of June and the 1st of April following for the districts of Quebec, Chicoutimi, Saguenay, Montmagny, Kamouraska, Rimouski and Gaspé, and between the 1st of May and the 1st of April following for the rest of the Province. No wild duck to be killed between the 1st of May and the 20th of August, nor any wild swan, teal, &c., &c., between the 1st of May and the 1st of September in the parts of the Province west of Three Rivers, nor between the 15th of May and the 20th of August for wild duck, and between the 15th of May and the 1st of September for other game above mentioned in the section east of Three Rivers. No snipe to be shot between the 1st of May and the 20th of August, nor any grouse, ptarmigan, partridge and woodcock between the 1st of March and the 1st of September.

—Within two weeks past a party from Winooski, Vt., have killed a dozen deer among the Adirondacks, and another party from Burlington destroyed nearly as many. Too much waste, gentlemen!

—Any persons having spare copies of the issue of FOREST AND STREAM of March 5th, 1874, will render us a great service by mailing them to us, as we cannot bind volume II complete without them. We will cheerfully refund the price.

FLORIDA.—Parties who buy our "Camp Life in Florida" can save twenty-five per cent. of their travelling expenses, by its purchase

THE CENTENNIAL.

WE have received from the Bureau of Administration an advance copy of the classification for prizes to be awarded to exhibitors of live stock at the International Exhibition. This display will be held within the months of September and October, fifteen days being allowed to each division, as follows:—Horses, mules and asses, from September 1st to 15th; horned cattle (of all varieties), from September 20th to October 5th; sheep, swine, goats and dogs, from October 10th to 25th. Poultry will be exhibited from October 28th to November 10th.

With certain exceptions, such as trotting stock, matched teams, fat and draught cattle, pedigrees will be required, in accordance with the printed list issued.

BREEDING HORSES.—Includes running, trotting, and draught mares and stallions from two to four years old.

RUNNING AND TROTTING HORSES.—Are to be judged by their record up to August 15th, 1876, and awards will be made for running horses having made fastest record; trotting stallions having trotted a mile within 2:30; mares and geldings having trotted a mile within 2:25. Walking horses will compete in the matched teams. Awards will be made for matched teams, looking to speed, height and weight.

BREEDING ASSES.—Jacks and asses from three to six years old and over.

NEAT CATTLE.—Awards will be made for the best herd of each respective breed, consisting as follows:—One bull, four cows, none under fifteen months, and bulls and cows of various ages.

FAT AND DRAUGHT CATTLE.—Fat cattle must be weighed, and in general those will be judged best which have the greatest weight with the least surface and offal. Awards will be made for: best fattest steer of any age or breed; most powerful yoke of oxen; most rapidly walking yoke of oxen; most thoroughly trained yoke of oxen; most thoroughly trained team of three or more yokes of oxen.

BREEDING SHEEP.—Awards will be made to respective breeds for the best pen of five animals of same flock and including one ram, the ewes all having had living lambs the past spring, also rams two years and over; ewes in pens of three, all having had living lambs.

FAT SHEEP.—Awards will be made for pen of three best fattest sheep of each breed; pen of three best fattest sheep of any breed.

BREEDING SWINE.—Every competing sow above one year old must have had a litter, or be in pig, and the owner must bring proof of these facts, if required. Awards will be made to respective breeds for: the best pen of one boar and two breeding sows; for pen of sow and litter, also boars and breeding sows of various ages.

FAT SWINE.—1st, 2nd and 3rd prizes will be awarded for pair of best fattest hogs of each breed; pair of best fattest hogs of any breed.

DOGS.—Awards will be made to respective breeds for dogs of two years and over; dogs of one year and under two; pups.

A sweepstake award will be awarded for the best dog of any breed displayed by a foreign exhibitor. A sweepstake award will be awarded for best home-bred dog of any breed. Awards will be made to respective breeds for bitches of two years and over; bitches of one year and under two; bitch pups.

A sweepstake award will be awarded for the best bitch of any breed displayed by a foreign exhibitor. A sweepstake award will be awarded for the best home-bred bitch of any breed.

POULTRY.—Poultry can only be exhibited in coops made after specifications furnished by the Bureau of Agriculture. Awards will be made to respective breeds for: pairs of one year and over, of chickens, turkeys, ducks, geese, swans, pigeons, guineas and ornamental birds; for pairs under one year.

FISH.—Living fishes will be displayed in both fresh and salt water aquaria. Awards will be made for largest display of fish of each species; largest display of fish of all species.

The following circular is addressed to those who may feel disposed to aid the Bureau in their efforts to have the display of food fishes as comprehensive as possible:—

PHILADELPHIA, December 10th, 1875.

SIR: The Bureau of Agriculture, International Exhibition, is charged with the display of all foods in the various conditions and processes of management of wild, cultivated, and manufactured forms. Under such a comprehensive system is included an exhibition of fish, both alive and preserved in their various commercial conditions.

It is admitted by all who have made a study of fish culture that food can be much more cheaply produced from the water than from the land, and to familiarize the people with the best food producing species of fish, and the appliances used in their propagation, culture, and capture, will certainly be the pleasure of all friends of pisciculture. To thoroughly illustrate the vast extent and importance of fish foods, it is necessary that the exhibition of living fish in tanks, be made as comprehensive as possible. A very satisfactory display can be made by the expenditure of a sum insignificant as compared with the interests involved.

The regulations of the Commission require all exhibitors to provide at their own cost all show cases necessary to the display of their products, and even in the exhibition of fish these rules will be adhered to. Fish breeders, however, have not the same incentive to make a display as have breeders of cattle, and can hardly be expected to assume a corresponding expense in providing apparatus for an exhibition of six months. If they furnish the fish in quantity and variety it may be all that can be expected.

The Bureau has received propositions for the erection of twenty-five tanks of approved construction, ranging from two to twenty feet in length, and from one to six feet in depth, the aggregate affording three thousand cubic feet of water. The estimated cost of these aquaria, the apparatus for erecting and altering the water, cost of freight in specimens, and cost of attendance, amounts to six thousand dollars. The Bureau is promised from responsible parties constant supplies of both fresh and salt water fish, the list ranging from the smallest minnow as stock food to sharks and porpoises of largest size.

To make this exhibition a success, will you present this circular and the accompanying form to such parties of your acquaintance as would be favorably disposed to contribute to this purpose by the purchase of one or more ten dollar shares of Centennial stock, the money, though going into the general fund, to be understood as contributed to the fish exhibition. Very respectfully,

JOHN WELSH, Chief of Bureau of Agriculture.
President Centennial Board of Finance.

FISHING TACKLE AT THE CENTENNIAL.—A misapprehension has been created in the minds of some of our dealers in fishing tackle, as to the character of the exhibition, that is to be under the charge of Prof. Baird. It is in no way competitive in its character. It is intended rather to be illustrative of the art of angling and seining, and of American progress and proficiency therein, both as to acquired knowledge and invented modes and methods of capture. The competitive exhibition, which will include all the appliances for taking fish will be in the Agricultural Hall. The printed form of exhibitor's application for space, with rules to be observed, of which we have a few copies, can be had by addressing Gen. A. T. Goshorn, Director General, or Mr. Burnet Landreth, Chief of Bureau of Agriculture, 904 Walnut street, Philadelphia.

The governmental display, under the direction of Prof. Baird, will not be competitive, and only include articles of American manufacture, while that in the Agricultural Hall will be open to foreigners. In the governmental display it is not desired to have duplicates of the minor tackle, such as floats, sinkers, spinning bait, &c., or numerous contributions of rods and flies of the same kind. The object of Prof. Baird, if we understand him right, is, to have a complete collection of such articles as are made in this country. Some, it is supposed, will be presented and a small portion may be purchased. At the close of the exhibition this collection will be transferred to Washington to form a museum of all the appliances for taking fish, made in this country; those of the aborigines as well as the white man's. Those who wish to exhibit in the Government Building should write Prof. Spencer F. Baird at Washington. Exhibitors can send their wares to either or both of the displays mentioned.

[Letter from "Al Fresco"]

FLORIDA EXPLORATIONS.

JACKSONVILLE, Dec. 12th.

IN one of my former letters I referred to an interesting route or trip for adventurous sportsmen and tourists; that of reaching the Gulf Coast via St. Johns River to Melonville; wagon, 32 miles to La-hop-ta-li-ga, Kissimmee River, Lake Okeechobee, and the Caloosahatchie River to Charlotte Harbor. I fully intended taking the trip this Winter; and proposed erecting a guide post at that much sought after point, the outlet of Lake Okeechobee. But from the best information attainable, I must postpone my trip until the Fall of '76. To prevent, as far as possible, others being disappointed, I shall quote from a letter received to-day from Capt. McQuaig, of Orlando, who is one of the best guides for Central Florida and the Okeechobee region. I communicated with him in order that I might arrange for the transportation of a Bond's boat and provisions to the outlet of Lake O. The Captain is the owner of the "Forest and Stream," the boat used by Fred. Ober in his explorations on the lake. The Captain and others have vainly searched for the outlet, which, as far as I am aware, is unknown. The Captain writes as follows:—

"I received your letter to-day with Mr. Ingram Fletcher's enclosed. I am pleased to read such letters, more especially from one who is determined to know the outlet of Okeechobee. I have just returned from a short trip, as I went down as far as the Kissimmee Lake. My object in taking the trip was to ascertain the condition of the Little River from Lake To-hop-ta-li-ga to Lake Cypress. I found it completely closed up with lettuce and grass. I left my boat there, as it is impossible to get through Little River without considerable work. I guess the balance of the rivers are clear of drifts, except a small one below Lake Kissimmee."

Having enjoyed some experience working a passage through such obstructions as those referred to in the Captain's letter, and, as he states in another portion of his letter, "that he is not disposed to undertake the job," I shall not reach the outlet this Winter. In this connection, I cannot resist the temptation of quoting from a private letter received two days since from a wealthy gentleman of Indianapolis, one who is a lover of nature, one who can enjoy life, "Al Fresco," and one who has thoroughly explored and examined Okeechobee in the Winters of '72 and '73, and '73 and '74. He was piloted by Capt. McQuaig, and for days examined every indentation and bayou around the margin of the northern and western portions of the lake; but owing to the collection of large masses of floating lettuce they failed to find the outlet. The gentleman referred to writes as follows:—

"In regard to maps, I forgot to say to you that my experience was similar to yours, as to the corrections of those lines and tracings made by various gentlemen supposed to know a great deal about Florida."

"You can make the entire circuit of Lake Okeechobee in three days in fine weather. But all these lakes are treacherous! Really the specific gravity of the water seems lighter in these Florida lakes. I have explored three years in the region from Marquette on Lake Superior to Selkirk's settlement in the north, and in the west to Devil's Lake, and yet I never saw a sea get up so quick and so unexpectedly as in the lakes connected together by the Kissimmee River."

"When you shall have gone the entire length of the Kissimmee, and circumnavigated that large lake, Okeechobee, you will fully agree with me, that it will be the future line of travel for tourists, who will take a railroad or stage at Melonville or Lake Joseph running to Lake La-hop-ta-li-ga; thence by steamer or rail on those Summer seas, and down that wonderful river (the Caloosahatchie) skirted by such lovely hammocks!"

"I have decided to do some missionary work down there. It is my intention to see that a steamer shall gladden those solitary places."

AL. FRESKO.

ANCIENT MOUNDS OF INTERIOR FLORIDA.

INDIANAPOLIS, Ind., Dec. 20th, 1875.

EDITOR FOREST AND STREAM:—

Some weeks ago a gentleman of this city, who has spent six Winters hunting and fishing in Florida, wrote to me on the subject of my own observations in the State, more especially in reference to the mounds and remains of the interior. His letter and my reply are herewith enclosed:

I find two serious mistakes in all maps of Florida. The Kissimmee River runs through, not by, Lake Hachinnahaw, which is very near both Lake Cypress and Lake Kissimmee. Neither does the river enter Lake Okeechobee at the extreme northwestern part; on the contrary, it enters a bay five miles south of the False Bay at the north-west.

I have two objects in furnishing the accompanying map. The first is to point out the location of the mounds; the second is to call the attention of hunters and travelers to the fact that below the oaks on the Kissimmee River there is no place fit for a camp. At the mouth of the river on the point is one place marked E, that will do for a camp, but is hard to find. On the south of the bay down to island marked "Good Camp," good camping places may be found. Bird, or Observation Island, and an island ten miles southeast, also afford camps. All the rest from "Good Camp" to Cypress Point is a mangrove swamp. Not a square yard of dry ground. Your commissioners while exploring this part of the lake had to lie in their boat two nights. No party should come to the lake without a map like this.

From False Bay, six miles north of the mouth of the river clear around to Cypress Point is one almost continuous clear white sandy beach, the finest in the world.

Tourists may as well abandon the idea of reaching Okeechobee by any other than the Kissimmee River route, while the river route affords a fine field for observation and sport.

A. M. C.

INDIANAPOLIS, Ind., Sept. 9th, 1875.

A. M. Conklin, Esq.:—

MY DEAR SIR—The interesting letters in the FOREST AND STREAM, written from South Florida by "Al Fresco" have brought up afresh the pleasant trips we took down the Kissimmee River, and the explorations in and around Lake Okeechobee. The discussions we then had relative to the apparent cuts and artificial canals made along the prairies and hammocks, and about some of the Indian mounds, are again revived. Will you please give me your theory in regard to these excavations and channels, as well as your views as to the Indian mounds?

Very truly,

INGRAM FLETCHER.

Mr. Ingram Fletcher:—

DEAR SIR—Your kind note calls up pleasant recollections of our first meeting under the old live oak at Daugherty's, on the lower Kissimmee, and the enjoyments incident to our subsequent voyaging on lake and river. Your reference to the FOREST AND STREAM brings vividly to mind my meeting on Lake Okeechobee with the party, headed by Fred. Ober, sent out by that enterprising periodical, and it gives a zest to the pleasure, adds, as it were, a finer flavor to the recollection, to know that the gallant Col. Von Buskirk, that mountain of a man, thought me a native in search of a cow range, instead of an enterprising Bohemian, in search of that variety which is alike the spice of life and the life of a wideawake progressive journal. The mere mention of the mounds and ancient remains of the Kissimmee country, brings even more vividly to mind a year of wandering in the "Summer Land," amid such an infinite variety of strange new beauties that the recollection even now is perfectly bewildering.

Of the tens of thousands of persons who each Winter go to Florida in search of health and pleasure, few, if any even hear of this delightful interior country, which is as little known to the outside world as Amazonian forests, East Indian jungles, or the lakes of equatorial Africa. The southern terminus of the line of travel usually followed is at Melonville, on Lake Monroe, and here the tourist stands on the border of the unexplored region, which, when its beauties and many attractions become known will be the most popular resort in America. Thirty-five miles south of Melonville, in Orange county, commences a chain of lakes, Summer seas, consisting of Little Ta-ho-pe-ka-li-ga, Ta-ho-pe-ka-li-ga, Cypress, Hach-in-a-haw, Kis-sim-mee (mi) and O-kee-cho-bee, (ki-bi) "The Great Unknown," which together with the connecting river, and its various windings extend more than four hundred miles, although the distance in a direct line is but one-third as far. Rolling pine clad hills, dotted with deep clear lakes; the broad savanna, level as a meadow, with the river or lakes on one hand, and the dark background of pines on the other, studded with groves of live oaks, palm and magnolia, like islands in the ocean, marked with clumps, or crossed with lines of tall stately feather-crowned palms, while here and there a line of a purplish tint, delicate as frost work, indicates the position of the huge cypress bordering some water course; lakes reflecting the blue of the cloudless skies above in the limpid depths below; islands like emeralds, a mass of verdure from the top of the tallest palm, down, down, clear to the water's edge, the deep green of the foliage relieved by the many colored flowers of the huge climbing vines which twine themselves into a thousand fantastic forms; land-locked bays on the unruffled bosoms of which float the huge leaves of aquatic plants and the large white flowers of the water lilies, and deep narrow streams, mark the promi-

ment features of the country. Merely to mention the pine, the stately palm, the live oak—the king, as the magnolia is the true queen of trees—the cypress and the water loving bay tree, crowned with flowering vines and draped with the funereal Spanish moss, calls up visions of beauty, while the infinite variety of forms under which they are presented are as indescribable as are the charms of the magnificent semi-tropical climate. The air fresh with the salt of the ocean, and balmy with the breath of the pines, is invigorating as in the Northern Spring time. Lights and shadows, gorgeous beauties of sunset, and tints and coloring worthy of famed Italy, and a soft summery haze making every object look dim, distant, and unreal, like the figures of mirage, invite the pen of the poet or the brush of the painter to no unworthy labor. Flowers bloom in the wild wood and nature's miracles of life and growth go on for ever. Hunting, fishing, boating, bathing, walking in the warm sunshine, or camping beneath the light of the stars, furnish occupation for all, where there is no fear of Winter's cold or storms, and where, as in the island of the blessed, it is always afternoon.

It was amid these beauties of nature that my researches were made, and although not rich in matter for scientists, they were full of interest to myself personally, and a history of them, may serve to please the readers of the *FOREST AND STREAM*, and may even succeed in turning in that direction, the attention of some one better qualified than myself to carry on an investigation, which will no doubt yield an abundant return in facts of scientific and historic importance.

The first of the Kissimmee system of mounds is near the south bank of Boggy Creek, a stream which flows to the southeast and empties into the northwestern bend of Little Ta-ho-pe-ka-li-ga. The second mound is about four miles farther south, near the edge of Fennel prairie, which is a marshy savanna serving as an outlet for the waters of Little Ta-ho-pe-ka-li-ga. These mounds are very much alike, being about fifty feet in diameter and not over ten feet high. Fennel prairie is a half mile wide and with Cross prairie, which is a mile wide, and the lakes, bounds Barber's or Parton's island, which is a mile and a half from north to south and three from east to west. On this island are to be seen a greater number and variety of mounds than any other place.

Near the center of the island is a mound which has received more attention and provoked more inquiry than any other. For convenience, I shall call it Parton's Mound and a rough plan of the works is herewith presented:—

A—Mound. B—Space enclosed. C—Incomplete work. K—Way to top of wall. c c c—Ditch. x h y—Approaches. t—Trees in wall.

They consist of a mound (A) fifty feet in diameter, ten feet above the general level and partly surrounded by a ditch (c c) five feet in depth. To the northwest of the mound is a level space enclosed by a breast-work, from three to five feet high. The length of the enclosed space is seventy yards, and the greatest breadths twenty-two yards. The interior of the space is clear of trees, but on the north wall near the mound are three trees (t t t) evidently hundreds of years old. The incomplete circle (C) at the northwestern extremity is twenty yards in diameter, thrown up about two feet above the level and surrounded by a shallow ditch. At (K) a walk leads to the top of the wall. So far this work does not differ materially from many others, but parts of the work are worthy of special attention. On the north of the mound is a crescent shaped work (x) (h) (y) about fifty yards in length with the convex side toward the mound, which it approaches to within about fifty feet; the highest part of the bank being at (h), directly over against the mound. The earth from the interior of the work has been carried forward to form the bank, as is done in running a sap. From (h) a level way extends back about fifty yards to the edge of the pine woods; all of these works being in a hammock. The deepest excavations are at (x) and (y), where the earth has been taken to form the level way and the embankment.

The purpose for which the mound was originally built is entirely a matter of conjecture, but the outwork as it now exists, was evidently a fortification, of which the mound served as the citadel, while the works on the north are the approaches of a besieging enemy; the banks being constructed by digging the earth and carrying it forward as is done in modern engineering, while the level way in the rear of (h) served as a road on which was brought up the heavy material used in the siege.

One mile to the northwest of the above described works, in the edge of a hammock overlooking Pleasant Lake, are the remains of a very large fortification, of which I could trace out but one angle, shaped like the letter V, the point being toward the southwest. The walls are nearly twenty feet in thickness and from three to eight feet high. The interior work, or mound, is a little higher than the walls. Owing to the density of the hammock I failed to

trace out the remainder of this work. About a mile to the southwest, across Pleasant Lake, on a hill, are other remains, but rather indefinite in character and extent.

One mile farther west, on Pine Island, is another work worthy of special notice. It is situated at the edge of the marsh which separates the islands, and consists of a mound surrounded by a wall. On the west and north narrow openings, or gateways were left in the walls, and the southeast is a wide opening, which was evidently intended for the reception of a fleet of canoes or small boats when there was more water in the wash than there is at this time. A

feet in height. They probably mark the places where once stood the dwellings of the race which reared these works.

Four miles south of Pine Island, on the west side of a beautiful peninsula, which extends into the waters of Lake Ta-ho-pe-ka-li-ga, is a work similar to the one at Pleasant Lake. It is located in a hammock and is near a fine landing place. Along the eastern side of Ta-ho-pe-ka-li-ga are a number of small mounds, and at the place of Charles McQuaig on Lake Cypress, are two of the ordinary round topped mounds. Twenty miles southeast of Lake Kissim-

few yards to the north of the mound there is a passage through the tall marsh grass, to the main island, and it is still used in crossing cattle from one island to the other. In the interior of the island, which is two or three miles in diameter, other mounds may be found which do not differ materially from the one at Boggy Creek and many others. In addition to these larger remains, the main island has on its surface some two or three hundred smaller mounds, usually about thirty feet in diameter and two or three

mees is another large mound. It is at the southwestern extremity of a sand ridge, at the edge of the pine land, but not far from the prairie, above which it rises to a height of thirty-five feet. From the top of the mound, were there no trees in the way, a view could be had of all the country to the pine hills beyond the lake and river, and it is probable that the pine trees have grown up since the mound was abandoned. It is built of sand taken from the ridge, and is forty yards in diameter, level on top, and quite steep

on all sides except toward the southwest, where there is a long slope and two walls which extend to a pond, distant one hundred and fifty yards, where they gradually decline in height and approach each other. The way is broad and the ascent easy, as if for the march of a whole people to the services of a temple of the sun, and the man who will walk from the pond, along the covered way, and up the slope, will not need a very vivid imagination to enable him to repeople the solitude with the train of vanished worshippers, the robed priests, the swinging censers and the victims ready for the sacrificial altar.

About a dozen miles southeast of this mound, which is called the Hope Mound, in the neighborhood of Old Fort Drum, are two other mounds similar to it, but I had not time to visit them.

All down the Kissimmee, mounds are to be found, of which the largest and most important is at Daughtery's, on the west side of the river, four miles northwest of Fort Bassenger, the place at which Gen. Taylor crossed the river on the way to the disastrous battle field of Okeechobee. This fort, like all others in this part of the country, exists only in name.

Before proceeding to describe the mound, it is necessary to say a few words in regard to the lay of the land, which is a kind of island, called Istokpoga (commonly pronounced *Is-tu-po-ga*), bounded on the northwest by Lake Istokpoga and a creek of the same name, which empties into the Kissimmee River. The river bounds the island on the north-east and east. On the south is Lake O-kee-cho-bee, with its impassable five-mile-wide marshes, and on the west a marshy prairie dotted with palm islands, the whole forming an almost absolute protection against the approach of any enemy, except one coming by water. The island is about twenty five miles in length from northwest to south-east, and about fifteen miles in extreme breadth.

The mound is situated at the northeastern extremity of the island, of which a good bird's eye view may be had from the summit. It is forty yards in diameter, thirty-five feet high, and with a double crown, the northern one (c), being four feet higher than the other (d).

The sides are quite steep, except to the west, where there is a gradual ascent from the enclosed space (B), which is forty-five yards from north to south and thirty-five from east to west, and is enclosed by an embankment five feet in height. The covered way (C) extends north to the river, a distance of one-fourth of a mile. The mound is built of a clean-washed sand which must have been brought from the river. It is evident that the occupants of these works obtained their supply of water from the river, and the covered way was built, no doubt, for protection, like the long walls at Athens. At a distance of one hundred yards to the west of the mound is a singular bank, which is half as high as the large mound, and is fifty yards in length from north to south. For what purpose was that isolated embankment constructed? I must confess my inability to solve the problem. It may have been raised by enemies, or it may have had some connection with theological system of these sun worshippers, and was possibly intended to teach the doctrine of the perpetual conflict between the powers of light and darkness. So at each of their temples or sacred places a counter work was erected representing the approach of evil. If this is the true theory it will aid in explaining some seeming inconsistencies which otherwise I cannot understand. The FOREST AND STREAM party, of which Dr. Palmer was a member, visited the Istokpoga mound in February, 1874, but were not able to discover anything worthy of mention in its position or surroundings, and did not, I believe, give any account of it in the history of their voyage and explorations.

Eighteen miles to the southwest of this mound, in the marsh which bounds the island, is a part of a wall, which is a mile in length, if it is correctly described to me by keen-eyed, cool-headed cow hunters, who know all about the mounds and remains, and only require a little questioning to cause them to furnish many facts of interest, but at the same time they consider the mounds so much of an everyday matter that they would lead the traveler right by any of the mounds or walls, and never mention the fact of their existence, except to ask for an opinion of the why or wherefore of their construction while gathered at the camp fire preparing supper. Hereafter this will be changed, and the smallest boy in the range will point out the mounds as objects of interest.

A gentleman named Smith, an old resident, described a remarkable work on the Ca-loo-sa-hat-chee River, which he supposed was part of a canal around the rapids of that stream, and which he thought had been dug by the Spaniards, forgetting that they only dig for gold. At the southeastern extremity of Little Ta-ho-pe-ka-li-ga Lake is

a work similar to the Parton Mound already described, but larger and with approaches more distinctly marked. Mr. Bass, the gentleman who described it to me, had served in the army, and spoke of the main work as a fort and of the outer works as the approaches of an enemy, similar to those he had seen in the army.

So far, my work has been plain sailing. These works were evidently constructed by a long-vanished and almost forgotten race, of which remains nothing save these monuments and faint echoes of shadowy legends that ever float farther and farther away, like mournful music in the depths of limitless forests, yet still the echo remains, and doubtless, here and there among the Seminoles, an old man may be found who knows, by tradition, of the fate of these sun worshippers, driven out by cruel and warlike enemies who have in turn given place to the merciless Spaniards as they to another aggressive, domineering northern race. But there are other works more difficult of classification, and it cannot be certainly determined whether they are works of nature or of art. Along the Kissimmee River are embankments, apparently raised by the hand of man, but Mr. Fletcher and Mr. Humphrey, of the party which visited Lake O-kee-cho-bee in the boat sold by the FOREST AND STREAM party to Col. Parker, decided against me, holding that the banks had been thrown up by the action of the river, which may be accepted as one solution of the problem, but, on the other hand, the fact remains that in many places these embankments run for long distances in a straight line and have been cut across in two, three, or many places by the current of this, the very crookedest stream in all creation. Some at least of these same keen-eyed cow hunters, who dread being ridiculed, stoutly maintain that they are levees thrown up to protect the prairie from inundation, and even now they look as though they might, with a very little labor, be utilized for the protection of rice fields, and they will no doubt be made useful when the Kissimmee prairie is reclaimed and again brought under cultivation.

While all agree that the mounds were erected by the hand of man, the date of their construction remains an impenetrable mystery. They were ancient, venerable, sacred to the untutored Indians, when De Soto found the chief building of the tribe erected on one of them when he landed at Tampa in 1548, and as little was known about them then as is known now. In many places articles have been discovered which, had they been properly preserved, might have aided in clearing up the mystery. In most of the mounds glass beads and other articles, evidently modern, have been discovered near the surface, while at a greater depth articles of an ancient date have been found. In one of the mounds on the St. Johns River, Mr. W. M. Humphrey, of Mellowville, found a skeleton of a man buried in a sitting posture, facing the east. In the Parton Mound, on the Little Tahopekaliga, John Evans, ex-sheriff of Queens County, exhumed fifty-four skulls which had been buried close, together forming a circle. Some of the skulls were of a large size, and one that I found in the same place would cover an ordinarily large head like a cap. Bones have been found which must have belonged to men eight or nine feet high, a femur being long enough to reach from my hip down half way from my knee to my ankle. Mr. Humphrey was very reticent, but if I understood him rightly, expressed the opinion that some, at least, of the mound builders were giants, and that opinion is concurred in by all with whom I have conversed who have any knowledge of the subject. At McQuaig's Mound on Lake Cypress, the point at which the Kissimmee explorers have begun their voyages, a piece of gold, inscribed with characters in some unknown tongue, was found. It was hammered, not coined, and sold for sixteen dollars, which was probably much less than its value.

The Hope Mound, near old Fort Drum, has not been disturbed, and offers, with others near it, a fine field for the antiquarian. The articles taken from the Daughtery Mound are all modern, consisting of an immense variety of beads. Some small as a pin head, and others an inch in length, of various colors, some of them gilded; glass ear drops, a piece of silver about three inches in diameter, and about equal in thickness to a silver half dollar beaten out to that size; two steel axes, each one ten inches in length, one four and a half and the other five and a half inches on the blade. On the sides of the axe are several markings made with a cold chisel. All of these articles were found near the surface. Were the mound dug into, others of greater antiquity, if not of greater value, would no doubt be found.

This lower country contains objects of interest for persons beside the antiquarian, who, dry as dust himself, delves into dust piles for broken fragments, mementoes of long-forgotten ages.

For the man who is tired of civilization and wishes for once to give free play to the Bohemian roving spirit which at times possesses all of us, there is no finer field under the sun than is afforded by the chain of "Summer seas" through which the Kissimmee River, like a ribbon of silver through a row of brilliants, winds its way down to the American tropics. The man who can not swim, wade, walk and carry a load, handle fishing tackle, or a gun and ammunition, or an axe, or an oar; who can't drive an ox team, sleep on the ground without protection, and dine contentedly on fried cabbage and jerked beef, or even make a supper of raw cabbage (the cabbage being the edible bud of the palm tree, as is known to all lovers of Xenophon), will not be able to extract all the pleasure that is to be found, although he may make the trip and obtain a fair share of enjoyment.

Interior Florida is the true hunter's paradise, in which every form of animal life, of earth, air and water ply, hoof, wing and fin. High over head bald eagles circle, uttering from time to time their shrill startling screams; huge blue herons fly slowly along; fish hawks perch on the branches of old dead cypresses, ready to dart on their finny prey, with which the waters below fairly teem. Great crowned cranes and gannets stalk in the pools and shallows; flocks of bright winged paroquets flit through the forests with discordant cries; mocking birds build their nests near the settler's cabins; and all our northern birds make their winter homes and sing their songs in the hammocks; in the tall marsh grass the rice birds utter their tinkling call as they weave their breeze-rocked nests; the tall sand-hill cranes march through the high pine land, but

so wary and shy that it tests the skill of the best of hunters to bring one of them down; wild cats, wolves and panthers skulk in the depths of the hammocks. Occasionally a bear is seen, while wild turkeys are found in the forests or timbered islands of the prairie, and herds of deer dash over the savannas and through the pine lands. Fred. Beverly's FOREST AND STREAM party were not fortunate as hunters, but the parties who have since used their splendid little boat have been more successful. In coming up the Kissimmee, we saw two bears swimming the river, but they escaped to the hammock and we had not time to pursue them. While we were at Daughtery's the dogs were heard baying, just at daylight, and Mr. Fletcher went out and in a quarter of an hour brought in a fine wild cat; wild turkeys were heard the same morning, but the wild cat was a greater attraction. The next morning a fine large wild turkey was shot by the same member of the party. On Istokpoga deer are usually found in herds of but five or six at a time, while forty miles to the west in Manatee County, thirty or forty pairs of antlers are often seen together. With fishing tackle wonderful catches are made, but the ordinary troll abundantly supplied the wants of our party, eight or ten fish being frequently caught in going a short distance. One of the fish caught with the troll, a bass, was twenty-six inches in length and twenty-one inches around, and it was really good eating.

A married sister of the Daughtery's lives near the crossing. One night, when her husband was away from home, a panther, here called a tiger, killed a hog within twenty yards of the house. Tom Daughtery went up and killed the tiger, and its skin, nicely dressed, is in possession of Mr. Gus Bergner, of Indianapolis. It must be confessed, however, that the crowning pleasure is a dash across the prairie on a hardy Cuban pony after a wild turkey, which is run down and captured before it reaches the timber, or after the half wild cattle which are as shy and fleet footed as deer, or finally, a chase after a wild cat, such as we had one day. After a brisk run over the prairie, and many windings and attempts to hide in the palmetto scrub, it was at last brought to bay and then we had a chance to assist the dogs, and with the butts of our cow whips forced it to yield each of its nine lives. The cat was as tall as a dog and measured over four feet in length.

These disjointed sketches cannot be considered as in any sense a description of interior Florida, but if they contain enough of interest to direct the attention of hunters, pleasure seekers and invalids to the attractions of this delightful country I shall feel that my object has been abundantly and successfully accomplished.

A. M. CONKLIN.

Pachting and Boating.

HIGH WATER, FOR THE WEEK.

All communications from Secretaries and friends should be mailed no later than Monday in each week.

THE WITHDRAWAL OF YALE.—Considering how soon it followed the Convention at Springfield, the withdrawal of Yale from the Rowing Association of American Colleges was as unexpected as, we are forced to admit, it was premature. With challenges issued to the great English Universities, in the name of the association, still unreplied to; with the Centennial year close at hand, when the full resources of the organization would be required to give *clout* to the regattas to be held, this split in the camp, which threatened at one time to break up the college regatta, was, we consider, to say the least, adopted at a very inauspicious time. That Harvard will follow the example of Yale there appears but little room to doubt, as at the recent meeting of students, held for the purpose of considering the question, as well as that of the challenge of Yale to an eight-oared race, the majority were in favor of withdrawal, although the matter was finally left to a committee of students and graduates to report upon.

It was reported that the example of Yale would be followed by Columbia, Bowdoin and Princeton. The manly letter of Capt. Nicholl, of the latter, dispels any such intention on the part of Princeton. In fact, the pith of the question is reached in two paragraphs of Capt. Nicoll's letter, which read as follows:—

"We are resolutely opposed to following the footsteps of Yale and Harvard. On the contrary, every consideration of duty and courtesy forbids us deserting the Intercollegiate Association. Notwithstanding the very natural wish to avoid the public gaze on the part of the seceding universities, and their horror of degrading their contest into a mere spectacle, it will not be denied that the regatta, as now constituted is a respectable and manly method of competition, and not only to collegians, but to many others, a great and attractive feature of the Summer season. Next year every phase of American life will acquire increased importance by being submitted to the friendly criticisms of all foreign nations.

A proper respect for our visitors compels us (as we had hoped it would compel every other member of the Rowing Association) to sacrifice individual preferences, and to lend our aid toward making the '76 regatta a memorable success. Moreover, the Intercollegiate Rowing Association, at its last convention, invited the English universities to be present at the regatta of '76 and challenged them to race. How, in common courtesy, can we, unless the challenge is declined, abandon, or in any way impair the existence of this association, whose invitation and challenge our English cousins will probably accept?"

We have reason to believe that the sentiments of the majority of Columbia coincide with those expressed above. As the case stands, then, the Rowing Association of American colleges will continue to exist, in spite of the action of Yale and Harvard.

That everything connected with the last regatta was as it should have been, or that all the colleges have complied with the requirements of the rules of the Association, we cannot admit, and if the obligations contained in the now celebrated Boston *Advertiser* letter are correct, the matter

calls for immediate attention on the part of the colleges now forming the Association. It is asserted that last year Amherst, Cornell and Columbia were improperly represented—Amherst, because two members of their crew, M. A. Goodnow and S. R. Johnson were not studying for any degree; Columbia, because G. M. Hammond was not studying for any degree; Cornell, because not a single man allowed to row, except J. N. Ostrom, who is to be an engineer, was studying for a degree. Of those allowed to row, King was studying for a degree in architecture, Jarvis in natural history, Gillis in the mechanical arts, Barto in literature, Waterman in mechanic arts. At Brown, Amherst, Williams, Hamilton and Trinity, all the undergraduates study for an A. B. At Harvard, Yale, Princeton, Cornell, Union, Columbia, Dartmouth, Wesleyan and Bowdoin, the undergraduates study for various degrees, but in all of them there is a department which studies for an A. B. Thus it will be seen that the department that gives a degree of bachelor of arts is the only one which they all have in common. Hence it would be the fairest and simplest to require all the crew to be of this department; then there could be no mistake. Neither would there be any greater discrepancy in numbers than exists in the present division, by which Harvard has over a thousand to choose from, and Trinity sixty-six. To show the number which each college would have had to select from, the number of students studying for an A. B. in each college is appended:—Columbia, 151; Dartmouth, 265; Yale, 537; Wesleyan, 170; Bowdoin, 105; Harvard, 716; Trinity, 66; Brown, 218; Williams, 160; Union, 52; Princeton, 383; Amherst, 325; Hamilton, 138; Cornell, 33.

The above suggestion is sound and worthy the attention of the Convention which is to be held at the Fifth Avenue Hotel, in this city, on the 4th of January.

An enthusiastic meeting of the Dartmouth Boat Club was held at Hanover Monday night, and delegates to the new Convention were instructed to vote for New London for the next regatta. It was unanimously decided to stand by the association.

NATIONAL ASSOCIATION OF AMATEUR OARSMEN.—In accordance with a request signed by a large number of the members of this organization, a special meeting will be held at the Metropolitan Hotel, on Thursday, the 20th of January, the object being the consideration of certain amendments to Article 3 of the Constitution. Each club is requested to send delegates, furnished with proper credentials, and as business of vital importance to the amateur fraternity will be transacted, the committee hope to see a full representation.

EMPIRE BOAT CLUB.—This enterprising rowing organization, whose headquarters are at Hoboken, have recently contracted for four new boats, and have put their boat-house in thorough order. The Empires will be heard from next summer, when the boating season opens. The officers elected a short time since are as follows:—W. S. Church, President; Dick Hill, Jr., Vice President; B. F. Quackinbush, Recording Secretary; T. J. Moran, Financial Secretary; J. T. Headley, Jr., Treasurer; H. E. Babcock, Captain; Will H. Michales, Lieutenant; Executive Committee—Hill, Church, Garrett, Headley, Van Court.

OFFER TO ROW AGAINST THE WORLD.—At a meeting of boating men at St. John, New Brunswick, last Monday, it was decided to raise the necessary funds to send the celebrated Paris crew, of St. John, N. B., to compete in the four-oared shell race for \$5,000 at the Philadelphia centennial regatta. A sum of \$5,000 is also to be raised to match the Paris crew against the champion four-oared crews in the race for the championship of the world.

—An International Regatta, under the auspices of the Centennial Commission, will take place in the harbor of New York on or about June 23, 1876, open to all yachts belonging to organized yacht clubs. The Commission will award medals and diplomas to the winning yachts of each class, in addition to the prizes offered by the yachting organizations. The arrangements for the regatta have been placed in the hands of the following committee: George S. Kingsland, Commodore of the New York Yacht Club, Chairman; John S. Dickenson, Commodore Brooklyn Yacht Club, Secretary; John M. Forbes, Commodore Eastern Yacht Club, Boston; W. L. Swan, Commodore Seawanhaka Yacht Club; W. T. Garner, Vice Commodore New York Yacht Club; S. Nicholson Kane, Rear Commodore New York Yacht Club.

It is hoped that some of the representative yachts from across the water will be present to compete, and that the affair will be so conducted as to give general satisfaction.

Rational Pastimes.

GRECO-ROMAN WRESTLING.—Professor Wm. Miller and M. Louis Carteron, the latter of whom has been in this country only a fortnight, wrestled in this now popular style at the Brooklyn Rink on Christmas night for a stake of \$1,000. After five closely contested rounds, Miller was declared the winner, he having gained three falls in five.

—The New Haven Club, fully re-organized, is now ready to open the Centennial campaign in April next. The club has elected new officers, has increased its capital stock, and will present the following team for 1876: Seward, Nichols, Cassidy, Somerville, Spence, S. Wright, Paber, Waitt and Herbert, with Goldsmith and Knowdell to assist.

—Lettlin was in Brooklyn before Christmas. He wants to go to California. He says he is tired of Philadelphia.

—The Chelsea team of Brooklyn for 1876 will be Clare, Rule, Dunn, W. West, McCabe, Haurigan, Cassidy, Devyn and Dodge.

—The Lowell Club will be semi-professional in 1876, with the following team: Michael Doyle, Manager; Charles Foley, Louis Brown, James Woodhead and Michael Doyle, Jr., of the Lowell Baseball Club; John Firth, of the Bartletts, of Lowell; Lewis Say and Wesley Blegg, of the Experts of Harrisburg, Pa.; James Macular, of the Rhode Island Club, of Providence; Edward Cogswell, of the Rollstones, of Fitchburg; and Thorndike Hawks, formerly of the Live Oak Club, of Lynn.

—The Chicago Club has released Jones from the contract by which he bound himself to play with it in 1876, and he will now engage with Cincinnati.

—Gilden, who alternated between pitcher and fielder of the Chicago last season, will be with the Covington Stars in the coming campaign.

—An interesting match at American Rackets was played at McQuade's December 27th, the result of which was a victory for Messrs. Malloy and Sullivan over Hicks and Gleason as will be seen by the appended score:

First Game—Malloy and Sullivan, 21; Hicks and Gleason, 20.

Second Game—Hicks and Gleason, 21; Malloy and Sullivan, 9.

Third Game—Malloy and Sullivan, 21; Hicks and Gleason, 18.

To-morrow Messrs. James Moore and R. M. Dore play a match of handball against Arthur McQuade and James Kirby for \$100 to the winners of the first five games. Another match for \$100 is to be played on Friday, when Messrs. Carry and Sullivan test their skill against Messrs. Barry and Reagan, the best of five games.

Billiards.

SLOSSON AND SEXTON MATCHED.—On Dec. 23d William Sexton covered the money put up by George F. Slosson, as per the latter's challenge published in our last number. The match is consequently now on. The date of play is fixed for Thursday evening, January 27th, 1876, and Tammany Hall has been secured for the purpose. We anticipate this match will be one of more than usual interest, as both players are young, American born, and in the front rank of professionals. In the tournament last November Slosson defeated Garnier, Daly and Rudolphe, while Sexton, who made his debut to the public, beat Daly, Rudolphe and his present challenger. Slosson came from St. Louis to participate at that time, and he and Sexton were slated for the third game, the former being beaten by 68 points in 300. Slosson having had only a week's practice, felt that he had not met Sexton on unequal ground, and hence his desire to have another show. This match has been made without any of the wrangling and bickering that have of late characterized match-making, but in the good old-fashioned way when our four ball champions were in the field. Sexton's letter of acceptance appears in the last number of the *Sportsman*.

AMATEUR CHAMPIONSHIP OF OHIO.—The late tournament held at Cincinnati met the fullest anticipations of its projector, Phillip Tieman. His place, 210 Vine street, was crowded nightly, many being unable to see the games. Frank Jones won the first prize (\$100) and the title of Amateur Champion of Ohio, he having won three games out of four, being beaten by Myers. Myers, West and Graham tied, each winning two, and in the play-off West captured both his men and the second prize of \$50. Graham then defeated Myers and won third prize—\$25. The games were 200 points up, three-ball, played on a Brunswick Balke table, furnished with H. W. Collender's cushions. The prizes were presented in a happy speech by the veteran, Tieman, when all present joined hands in toasting one another's health, and requesting "Phil" to institute a like affair at an early date.

ALL SORTS.—Messrs. Stedeker & Gleason's room, No. 384 Third avenue, which was opened on the night of Dec. 23d, is elegantly fitted up, and contains seven H. W. Collender tables. Joseph Dion and William Sexton "obliged" with a game of three-ball, 250 points. Result: Sexton, 250; Dion, 236. A display of fancy shots by Dion wound up the entertainment. Among the celebrities present were John Gleason, Tim Flynn, Clarke Wilson, Jim Kernan, and Robt. E. Willmarth. . . . Wm. H. Marshall (ironsides) recently, at the Dean Bros. room, Brooklyn, counted forty-one at a single shot in skittle-pool. This is the best we have ever heard of. The pins in the aggregate count fifty-one. . . . Capt. D. A. Moore, of Providence, R. I., died on the 17th inst. at his place of business, from apoplexy. He was well known in billiard circles throughout the country, and served with distinction during the late war. He lost a leg at the battle of Antietam. . . . Robt. E. Willmarth has the fifteen-ball pool table at the Columbia Room. . . . M. Bensinger, of Chicago, is in town. . . . The frog tournament on exhibition in the window of the Thomas Bros., is attracting considerable notice. It is immensely funny, and must be seen to be appreciated. . . . Louis Shaw, of Indianapolis, has challenged Eugene Carter, of Toledo, Ohio, to play him for \$250 or \$500 a side. Carter is professional champion of Ohio.

CHRISTMAS FOR OUR PRINTERS.—Our cheerful composers beg to acknowledge with many thanks the following unexpected and gratifying favor from Messrs. Kimball & Co., and to wish him many returns of this Holiday season. We join in the hope that this life may prove to them something more than a "Vanity Fair," and that their anticipations of the future may not end unhappily in smoke:—

W. S. KIMBALL & Co.'s Peerless Tobacco Works, }
ROCHESTER, N. Y., December 23d, 1875. }

CHAS. HALLOCK, Esq., New York:—

DEAR SIR—Yours of yesterday at hand, in reply beg leave to say that we send you by Am. Express Co. to-day, six boxes "Vanity Fair," as requested, and beg to be allowed the privilege of contributing our little mite for the pleasure and gratification of your printers.

With our best wishes for the continued success of your valuable paper, and the compliments of the season, we are,
Yours very truly, Wm. S. KIMBALL & Co.

HOLABIRD'S SHOOTING SUITS are justly very popular all over the country. One of these days they will be just as much a requisite to the smoking sportsman as his pipe and tobacco are, and much more prized by those who don't smoke. They are a very acceptable Holiday Present.

—The hand organ and monkey have already reached the ancient precincts of St. Augustine, Florida.

—There are twice as many visitors now in Florida as there were at the same time last year.

CAMP LIFE IN FLORIDA.—Our Handbook for Sportsmen, Tourists, Invalids, and Settlers, should be in the hands of every visitor to Florida. Price \$1.50—for sale by dealers and at this office.

—The petty and quarrelsome Central American States now contemplate a Union. Guatemala originated the proposal, which is a good one.

New Publications.

BOOKS RECEIVED.

FLORIDA. By George J. Alden. Mr. Alden, in his little pamphlet, has compiled much that is of interest and value to the intending settler in Florida. In a series of questions and answers all information regarding routes, localities, modes of agriculture and general topics is given, and it also contains valuable papers regarding the cultivation of specialties, such as sugar cane, etc. The address of the author is New Smyrna, Volusia county, Fla.

WRINKLES AND RECIPTS is the title of a handy little book compiled from the *Scientific American* by Park Benjamin. To the artisan in particular it is of immense value, as presenting in compact and concise form a great number of valuable hints and recipes, while the amateur mechanic, the engineer and the farmer will find in its pages a store of useful knowledge. Even taxidermy is treated of, and every branch of practical technology.

THE TRAVELERS' GRAB-BAG. The Authors' Publishing Company: New York.

"An Old Traveler" has compiled in this pamphlet a number of sketches, some light and others more serious in their nature, the object being to provide his brother travelers with entertaining reading matter, and at the same time to protect his purse. Fifty cents invested in a book of this description will sometimes enable one to pleasantly while away the otherwise tedious hours of a journey, and even soothe the disappointment caused by a belated train. No traveler should be without it.

NEARER MY GOD TO THEE. Lee & Shepard. Boston.

The letter press of this beautiful little holiday volume consists merely of the words of the familiar hymn taken for its title. Every verse, however, is accompanied by an engraving designed, by Miss Humphrey and executed by John Andrew and Son. There are in all fifteen typical designs, graceful in conception and execution. The book is printed on highly finished paper, so thick that the twenty leaves contained within the covers make up quite a volume. It is one of the prettiest holiday gifts of the year.

A NEW WAY TO WIN A FORTUNE. By Miss Eliza A. Dupuy: T. B. Peterson & Bro., Philadelphia.

Miss Dupuy is already favorably known as an authoress of several entertaining works of fiction, and this, her latest book, is also her best. The plot is carefully constructed, and the characters drawn with great fidelity, and the story told easily and gracefully.

BROUGHT TO THE FRONT. By Elijah Kellogg; Lee, Shepard & Dillingham, New York.

It has been our pleasant duty to review others of Mr. Kellogg's works, and always with great satisfaction. The present work is one of the "Forest Glen" series, being a story of frontier life descriptive of the adventures of boys who were born in the wilderness, with natures developed only by the wildest associations, and yet self sacrificing and brave. It will be found of great interest by young readers, though, if anything, a little too full of the horrors of scalping and other Indian atrocities.

GOING WEST. By Oliver Optic: Lee & Shepard, Boston.

The name of the author of this book is such a household word all over this broad continent, that the mere announcement of another work from his pen is sufficient. "Going West" is the first of a new series to be known as the "Great Western," and is dedicated to the boys of the West. The story, however, is complete in itself, and can be read without reference to the other volumes to follow. The scene is located on one of the great lakes, and the hero, a young sailor, passes through many vicissitudes and adventures. The works of this author are not only entertaining, but invariably healthy in tone.

BALLADS OF HOME. Edited by J. M. Baker: Lee & Shepard, Boston.

This is a beautifully gotten up holiday book with forty full page illustrations. The table of contents comprises five selected poems by well known authors, all bearing on the subject of home and its joys. Of course the best of all, John Howard Payne's sweet song is not omitted and Mrs. Hemans, Longfellow, Tennyson, Dr. Holmes and others of almost equal note have contributed some of these choicest verses in illustration of the title of the book.

COURTING AND FARMING. By Julie P. Smith: G. W. Carleton & Co., New York.

The previous works of this authoress have obtained a degree of popularity which will be greatly enhanced by her latest production. Impossible as the plot is, there is something happy in the idea of the college student hiring himself out as a farm hand, and winning a wife and upholding the dignity of labor at the same time. Of course it is impossible to prevent novelists making youths of twenty exhibit a degree of knowledge and thoroughness which is only occasionally attained by exceptionally gifted individuals when their hairs have turned to silver; but we condone this very general fault for the sake of the pleasure afforded by an entertaining story.

RUNNING THE BLOCKADE. By W. H. Thomas: Lee & Shepard, Boston, and Lee, Shepard & Dillingham, New York.

This is a very handsome work, descriptive of stirring scenes in the secret service during the "late unpleasantness." The author, Mr. Thomas, is well known as the "Gold Hunter of Australia," and his other works descriptive of sea adventure have attained a wide celebrity. The book is very handsomely bound, and will be among the most attractive of the holiday productions.

THE AMATEUR TRAPPER AND TRAP MAKER'S GUIDE, by Stanley Harding. New York: Dick and Fitzgerald. This useful little book is a complete treatise on the art of trapping, snaring, and nesting, and will be found of great assistance by the young trapper not only in guiding him as to the manufacture and disposition of his traps, but in preparing his skins when captured. It also contains lessons in taxidermy, and useful recipes for the various preparations used in that art.

Dr. Samuel Kneeland, Professor of Zoology and Physiology in the Massachusetts Institute, Boston, is out with a new book, entitled "An American in Iceland." Dr. Kneeland was one of the party of Americans who visited Iceland at its millennial celebration in Aug. 1874, and his description of the island and its inhabitants is very instructive and interesting.

The Illustrated Household Magazine. It is a satisfaction to us to be able to speak with unreserved praise of "The Illustrated Household Magazine," with which has been incorporated "Wood's Household Magazine." The eighteenth volume begins with the present number. It is the cheapest and most attractive magazine printed in the country, giving 50 pages of illustrated reading matter each month at the very low rate of \$1 per year. While it is readable and interesting to the most cultivated reader, it is peculiarly adapted to meet the wants of a large class of readers who cannot afford the luxury of a four dollar periodical. For this reason its circulation is very large, and often it is the only book of light literature found in the humble cabin. Its original stories have a pure and healthy tone. The selections are made with taste and judgment; combining fancy and humor with instructive facts. It has a fashion department, illustrated children's corner, a housekeeper's department and an editor's study. Notably prominent among its January contributions are: "The Nature, Importance and Management of Time," by Rev. E. DePuy, of this city; the commencement of a serial story, entitled "Centennial Fruits; a Romantic Story of To-day," by the author of the "Dream Picture." "A Day's Gleaning," etc., etc. There appears in this number also a timely article on the Public Schools (second article) by Helen Radcliffe. We notice that an English edition has been issued, commencing with this (January) number, for circulation in Great Britain. Published by Household Publishing Co., 41 Park Row, N. Y.

THE
HAZARD POWDER CO.,
MANUFACTURERS OF
GUNPOWDER.

Hazard's "Electric" Powder.

Nos. 1 (fine) to 5 (coarse). Unsurpassed in point of strength and cleanliness. Packed in square canisters of 1 lb. only.

Hazard's "American Sporting."

Nos. 1 (fine) to 5 (coarse). In 1 lb. canisters and 6 1/2 lb. kegs. A fine grain, quick and clean, for upland and prairie shooting. Well adapted to short guns.

Hazard's "Duck Shooting."

Nos. 1 (fine) to 5 (coarse). In 1 and 5 lb. canisters and 6 1/2 and 12 1/2 lb. kegs. Burns slowly and very clean, shooting remarkably close, and with great penetration. For field, forest and water shooting it ranks any other brand, and it is equally serviceable for muzzle or breech loader.

Hazard's "Kentucky Rifle."

FFFG, FFG, and "Sea Shooting" FG, in kegs of 25, 12 1/2 and 6 1/2 lbs. and cans of 5 lbs. FFG is also packed in 1 and 1/2 lb. canisters. Burns strong and moist. The FFG and FFG are favorite brands for ordinary sporting, and the "Sea Shooting" FG is the standard rifle powder of the country.

SUPERIOR MINING AND BLASTING POWDER. GOVERNMENT CANNON AND MUSKET POWDER; ALSO SPECIAL GRADES FOR EXPORT, OF ANY REQUIRED GRAIN OR PROOF MANUFACTURED TO ORDER.

The above can be had of dealers, or of the Company's agents in every prominent city, or wholesale at our office.

For Florida.

PHILADELPHIA and SOUTHERN
Mail Steamship Company's line to Savannah,
Ga., sailing every Saturday, from Pier 22, below Pine
street, Delaware River, at 12 o'clock noon, making
close connections through to all points South. The
line is composed of the steamships JUNIATA and WY-
OMING. The Wyoming does not carry passengers.
The Juniata is a favorite ship with the traveling pub-
lic, having passenger accommodations of the most
superb character. She has recently been refitted and
elegantly furnished with everything requisite to the
comfort and convenience of passengers.

Families en route for FLORIDA, Georgia, Alabama,
and even as far as New Orleans, will find the Savan-
nah route the most desirable for comfort, as well as
the most economical. Through trains of the Central
Railroad of Georgia, and Atlantic and Gulf Railroad,
Florida, leave Savannah every morning and evening.
The Florida steamers leave Savannah three days in the
week for all points on the coast.

For through passenger tickets and bills of lading to
all points in Florida, Georgia, Alabama and Tennes-
see, apply to WM. L. JAMES, General Agent, 416
South Delaware avenue, Philadelphia.

TRY IT Vanity Fair.

It is shaved from the best Natu-
ral Leaf, for Meerschaum and Cigarettes. Does not
make the tongue sore. Sample on receipt of 20
cents. Highest award, Vienna, 1873. Send for cir-
cular.
WM. S. KIMBALL & CO.,
PEERLESS TOBACCO WORKS,
Rochester, N. Y.

From an Officer U. S. A., Fort Yuma, Cal.

I have the honor to acknowledge the receipt of
your favor of Sept. 13th, 1875, also of the Vanity Fair
sent by you same date of the letter. I can only say
that it is delicious and surpasses all my expectations.
Please not delay in forwarding my order, as I do
not want to smoke any other tobacco again, especial-
ly the stuff we get here for three times the price of
Vanity Fair.

For Cigarettes.

There are times and places tolerant only of the
Cigarette; tenderly white and sweetly fragrant. Van-
ity Fair is the correct thing for Cigarettes.

From Assistant Observer U. S. Signal Service.

Having tested thoroughly the Vanity Fair you kind-
ly sent me, I have come to the conclusion that it is
the best smoking tobacco I have ever tried. I have
been in the habit of smoking Perique and Granulated
mixed for the last two years, but greatly prefer your
Vanity Fair. I have shown the tobacco to several of
my friends, and they are very favorably impressed
with it.

I have had more solid comfort out of your tobacco
than I have had for some time. Please accept thanks
for your promptness in answering my letter.

For Meerschaums.

Smoking is an elevated mental and psychological
pleasure, when one uses that splendid article, Van-
ity Fair. Best dealers have it.

Vanity Fair will be your constant companion by
day and night; in merriment and in distress.

CHAMPION GUNS OF ENGLAND**PAPE'S****Unrivalled Sporting Guns.**

Stand unequalled in every contest. Their perform-
ance at the London Trials of 1875 beats the records of
any maker in the world.

1875. 12-Gauge, Choke Boring.

Maker of Gun. Exhibitor.

1st—Greener. Greener.

2d—Pape. Davidson.

3d—Pape. Pape.

Out of a class of 68 guns, 3 out of the 6 best were
made by Pape. The Greener gun was protested
against on the spot for having its score false counted,
the fact proven there, and afterwards confirmed by
same gun being shot for two days per week for six
weeks in succession, when its average score only took
24th place, its very best score being greatly below the
scores of the best six guns.

1875. 12-Gauge, Old Sporting Bore.

Maker of Gun. Exhibitor.

1st—Pape. Davidson.

2d—Pape. Davidson.

1875. Long Range, 60 yards, Choke Bore.

1st—Pape. Davidson.

60 yards, Long Range, Sporting Boring.

1st—Pape. Davidson.

Those champion Long Range guns, only 7 pound
weight, with a charge of ¾ dr. to 1½ oz. shot, beat the
best 8 bore Greener gun at 60 yards; weight, 15 lbs.;
6 drachms and 2½ oz. shot.

1875. The Sportsman's Sub. Cup, valued at £45,
was also awarded to W. R. Pape, for the original in-
vention of choke boring. Winner of the London Gun
Trials of 1858, 1859, 1866. Address

H. C. Squires,

No. 1, Courtlandt st.

New York.

THE GREAT

London Gun Trial,

1875.

W. W. GREENER begs to inform his numerous

clients in the United States that he has been very suc-
cessful in the above trial, having secured the first
prize, a silver cup, value 40 guineas—class 2 for 12
bores; also winner in class 1 for 8 and 10 bores, and
class 4 for 20 bores. He has won in all the classes for
improved boring, which is upon a different plan to any
other maker, and is far superior in the three most es-
sential points, viz., PATTERN, PENETRATION,
and REGULARITY OF SHOOTING.

Mr. HENRY C. SQUIRES, of No. 1 Cortlandt St.,
New York, is now importing my DOUBLE CLOSE-
SHOOTING GUNS to order, an invoice of which
will be shipped to him on the 1st July, and can be ex-
amined about the 15th. All special orders given to
Mr. Squires will be carefully filled. A full report of
the GREAT TRIAL, showing the marked superiority
of my guns over guns made by Dougal, Pape,
Tolley, and others, will shortly be published, and can
be had on application at No. 1 Cortlandt St.

W. W. GREENER,

Champion Gun Maker,

St. Mary's Works, Birmingham, England.

HENRY C. SQUIRES, of No. 1 Cortlandt street
has just received an invoice of these close-shooting
guns, and from him any information in reference to
the results of the Great Trial can be obtained on ap-
plication

The Up-Town Sportsman's Depot.

aug5-6m

**W. W. GREENER'S**

DOUBLE CLOSE-SHOOTING
GUNS. Winner of the Silver Cup,
value 40 guineas, at the Great Lon-
don Field Trial 1875, beating 33 com-
petitors with 68 guns, also winning
in all the other classes for the Im-
proved System of Boring. These
guns will kill from 80 to 100 yards,
loaded with large shot, and will
shoot well with small shot with a
less powder charge than guns bored
upon the old system. For report of
the Gun Trial apply to Messrs. Mc-
Laran, Williams & Co., Agents, St.
Louis, U. S. A. Address
W. W. GREENER,
St. Mary's Works, Birmingham, England.

**J. D. DOUGALL'S****EXPRESS SHOT GUNS.**

(Title registered.)

SHOWN by trials at Wimbledon by Editor
of the Field to possess the GREATEST PENE-
TRATION and therefore LONGEST RANGE—thus:
Circle, 30 inches; 300 pellets; average, 191; penetra-
tion, 37. The Editor's trial of Greener guns with 340
pellets of same shot and same charge of powder, gave
180, and penetration 30, although there were 40 more pel-
lets in each charge. Should any controversy arise as
to the durability of these new systems, we herewith
warn all beforehand that our system is our own inven-
tion (though founded on the American idea) and is DU-
RABLE, a fact remarked on by the Field, that the
guns tried had been in use during last season, and re-
ferences permitted to the owners. Send for Illustrated
Circulars to
59 St. James's Street London.

WILLIAMS & POWELL,**Gun and Rifle Manufacturers,**

Call the attention of the Sportsmen of America to the
extreme SIMPLICITY, STRENGTH and DURABIL-
ITY of their New Patent "SIMPLEX" Breech loader
and INDEPENDENT EXTRACTOR.

The parts in this new action are so few (only two,)
its mechanical soundness so thorough, and the
strength and simplicity of the action so great, that
W. & P. feel sure it will supercede all the complicated
and manifold grips now in use, its one powerful grip
being far stronger than any double, treble or quadruple
grip now used. In this new action LEVER and GRIP
ARE ONE SOLID PIECE OF STEEL and the AN-
GLE of the BODY is left in its ENTIRE STRENGTH.

Drawings of action and extractor will be sent on ap-
plication, and orders may be forwarded through any
of the best houses in the States for execution in the
Spring.

Guns guaranteed to make patterns of from 160 to
280 with No. 6 SHOT AT 40 YARDS, as desired.

THE PAPER STEM PIPE.
Just the Thing for Home and Camp Use.

Supplies a want which smokers have long felt—a pipe which shall give simply the taste and odor of tobacco smoke. This pipe never accumulates rank smelling liquid in stem or bowl, but is always clean and sweet. The bowl and mouthpiece are permanent, and the stem is of porous paper, to be laid aside after few days' use and a new one fitted. Extra stems company each pipe. The price of extra stems, when not furnished with the pipe, is as follows: Four and a half and seven inches, 5c.; twelve inches, 15c. Sold by pipe and cigar dealers generally, or a complete sample sent by mail for \$1 by

McBride Flies.

HAVING BEEN FOR THE PAST twelve years associated with my father, John McBride, in the manufacture of fishing tackle, I feel competent to continue the business and supply the custom with the same quality as heretofore. Parties supplied with casting lines and artificial flies for Pennsylvania trout streams, Adirondacks, the Maine Woods, Lake Superior, Thousand Islands, Canadian, and other waters. Anglers not acquainted with the nomenclature of these flies, by mentioning the locality where they intend fishing, will have the varieties best suited to those waters sent to them. Flies copied from any natural insect or pattern desired. SARA J. McBRIDE, (Successor to John McBride) Mumford, Monroe county, N. Y. Dec2-1y

THE FLIGHT OF THE WILD GEESE.

BY ISAAC M'CLELLAN.

HOWN! hark! on stormy wings they cleave the upper air,
On gusty breeze, above the seas, their onward cohorts fare;
They come from frosty solitudes, where broods the Arctic night,
Where deserts grim, spread vast and dim, in the auroral light.

The Esquimaux with bended bow, fast paddling his canoe,
Their flocks hath chas'd, o'er icy waste of waters heavenly blue;
On frozen shore of Labrador the Indian's steel hath sped,
But vain the shaft, and vain the craft, and vain the fowler's lead.

In twinkling gleam of cold moonbeam, their dusky files I trace;
In wedge-like throng, in column long, they speed the tireless race;
O'er craggy mountain sides, and over torrent tides,
The shadow of each column, in swift procession glides.

O'er the far-resounding surge, on the dim horizon's verge,
I see their dark battalions on winnowing pinions urge;
O'er Lake Superior's sheet their clanging pinions beat,
Where Western plain and golden grain spread sumptuous pastures sweet.

The bleak November cloud casts down its snowy shroud,
And the throbblings and the sobbings of the wind are swelling loud;
The snowdrift hides the grass, the lakes are crystal glass,
So warned the geese-flock legions to gentler regions pass.

To the balmy Southern clime, where the orange and the lime,
With blossom'd fruits, perennial shoots, are ever in their prime;
To paradise ambrosial, to banks of spice'd perfume,
Where forests wide and river side are prodigal with bloom.

For Forest and Stream.

Ramblings in Washington Territory.

THAT great region which borders the Pacific Ocean north of California is now the most alluring field for immigrants, tourists, and the lovers of the rod and gun, it cannot be excelled for agriculture and stock raising, and is possessed of scenic attractions that are not surpassed by any portion of the world, while its immense forests teem with a profusion of animal life, and its many streams, cold as snow and pure as crystal, swarm with so many finny denizens that the angler is lost in wonder at their number and variety.

Of all that magnificent area, Washington Territory is one of the most interesting sections, as it is yet a virgin country, being occupied principally by a few farmers, some stock raisers, and half breeds and Indians, who are too inert to utilize the wealth that surrounds them. As "westward ho!" is now the cry with a large number of persons who wish to forsake the sterile fields and inhospitable climate of the Eastern States, I have concluded to treat this territory from three standpoints for the FOREST AND STREAM—namely, its topography, its mineral and agricultural resources and climate, its scenery, and the opportunities it presents to the lover of the chase and the flouters of Walton and Cotton.

The Territory has an area of 65,000 square miles, or about 41,000,000 acres, and of this over one third is covered with forests so dense that only the tropics will show anything to compare with them in luxuriance of growth, while they are only exceeded in altitude and dimensions by the redwood forests of California. The wooded portion, which occupies the entire area between the Cascade Range and the Pacific Ocean, is known as Western Washington, and for the present I shall devote my special attention to it, it being the most interesting to all classes except those who desire to learn the extent of the grazing districts. This region joins the State of Oregon on the south, being divided from it by the Columbia River, which acts as a boundary line between both commonwealths for a distance of 300 miles. Its physical conformation is similar to that of Western Oregon, being a series of wooded valleys, formed by erosion in, apparently, the Miocene epoch, as it abounds in fossiliferous shales and metamorphic rocks having a basaltic base.

In gazing at it from an elevated ridge it seems one mass of dark green leaves, which extend to the horizon in every direction, and whose gloomy, monotonous hue is only

broken by a range of snowy peaks, which loom upwards to the sky on the east and north, and the heavy masses of white flecked, cumulus clouds that loiter along their crests during the Summer and Autumn months. These contrasts of color, and the lack of the more pleasing hues, impress the traveler most forcibly with a feeling of strangeness which it takes some time to overcome, as everything seems to have been created on the largest scale; and whoever has analyzed the effects of scenery upon himself must know that subdued, gloomy tints, combined with wildness, expanse, and altitude, arouse emotions akin to awe and a weary loneliness. If one wishes to thoroughly learn how insignificant an atom he is in life, he has only to visit that primitive solitude to be made aware of it, as he is there surrounded on every side by rugged grandeur and cold, stern sublimity.

I entered the Territory from Oregon, and made my first tarry at Vancouver, a small hamlet situated on the Columbia River, about 120 miles from its mouth. This was called after Vancouver, the celebrated English navigator, who surveyed the Columbia as far as this point in the year 1796, immediately after its discovery by Captain Gray, of Boston. It was from the fact that the survey was made by a British officer that England laid claim to the entire region watered by the noble river of the West; but as the assumption was a mere quibble, the case was of course decided against her when she subjected it to arbitration. She made a strong effort to retain the country, however, by giving the Hudson Bay Company the exclusive privilege of hunting in the region, and governing the Indians by British laws. They erected a chain of forts throughout the entire area, from the Pacific Ocean to the Rocky Mountains, and garrisoned them with Canadian *voyageurs*, friendly swashes, and adventurers from Caledonia, whose duties were to not only defend the country from the attacks of the treacherous red men, but also to trap for fur-bearing animals, and to barter with their dusky foes. Vancouver was the most important of these posts, its situation being central, so that the furs could be shipped directly to England, as vessels of 5,000 tons burthen could load at its wharves. Since the vacation of the country by this British monopoly, the town has lost its prestige, and is now remarkable only for being a military post and the Athens of the Territory. Its inhabitants are largely composed of ex-United States soldiers, and their occupation in nearly every instance is to sell whiskey whose merits are open to criticism. The garrison grounds afford, I think, the handsomest view of any military post in the world, for water, forest, and snowy pinnacles greet the eye on every side.

I visited the town to enjoy a deer with my friend Major W—, who was kind enough to consider that my love for the chase should be bestowed upon some worthy object. After spending a night among congenial companions, whose hospitality is proverbial, I retired to the simple couch in use among bachelor officers, and slept soundly until the boom of the cannon aroused me in the morning. A hasty breakfast was soon dispatched, and I was ready for the sport which promised so much buoyant, virile pleasure. Our party was composed of five persons, including an orderly, who had charge of half a dozen borrowed hounds, and a French half breed, who acted as guide. In half an hour after leaving camp we were in the midst of a dense forest of those gigantic firs for which the Northwest is famous, and a few moments later the dogs were set to work on a fresh trail. They soon gave tongue, and their melodious tones rang through the silent woods with a clearness I had never before heard equalled. This was the signal for a scurrying race to get to some convenient points in order to have a shot. The guide, who accompanied me, placed me on a promising runway, and I had scarcely taken my place ere a magnificent black-tailed stag (*Cervus Columbianus*) broke cover not twenty paces from me. His head was high in the air, and his antlers were thrown back, so that he appeared in his most majestic view. I gave him a low whistle; he halted to learn its import, and ere he could decide upon moving I planted a load of buckshot in his neck and shoulders. Before I could give him the second barrel he was bounding through the shrubbery with those

long, high jumps for which he is noted, and the last I saw of him was an erect caudal clearing the branches of a fallen tree. I was of course much piqued at my bad shooting, and still more so when I was rejoined by my companions, who commenced chaffing me most unmercifully, and predicting that we should have no luck that day, as I had missed the first deer. The feeling of chagrin was bad enough, but to be taunted good-naturedly with spoiling the day's amusement was the acme of depressing pride. I insisted that I had wounded the animal so seriously that he could not run very far, but this only elicited a sarcastic laugh, and the query if I did not think I ought to challenge Buffalo Bill and other presumptuously redoubled hunters to engage in a week's contest to test superiority. My victory soon came, however, for the guide, who was sounding a mellow cow's horn to bring the pack, reported that they must have overtaken the quarry, or they would have returned in answer to his peremptory summons. This induced two of us to follow the trail, which we did quite readily by noting the condition of the fallen leaves, and we had not proceeded half a mile ere we came to a brook, and on its bank we found the animal dead as a stone, and the hounds grouped about him. A joyous halloo from our party soon brought the others, and I was the recipient of theatrical congratulations, which were given demonstratively as an antidote to the previous wounds. We dressed the stag in a few moments, gave the entrails to the hounds, placed the carcass on the limb of a tree, and then resumed our sport.

The dogs were next sent into a dense fern brake that reached nearly to our necks. They were there about a minute when a simultaneous cry from all startled us, and ere we could recover our wits two does of the white-tailed deer species (*Cervus leucurus*) bounded into our midst with such suddenness that they were twenty yards away before any one thought of shooting. It was then too late, as the shrubbery was so dense that no shot could penetrate it, except by mere accident, so we contented ourselves by expressing how surprised we were, for each person seemed anxious to have some excuse.

"We can get them yet, sir," said the half breed," for they are white-tailed deer, and after running a short time they will make for the river, and we can get there before them."

To the river we accordingly ran at our best speed, but that was slow enough, owing to the quantity of fallen timber that strewed the ground, and the tropical luxuriance of the salmon and whortleberries that were entwined together in thick, tangled masses. We were there, however, and had our posts taken, before the musical chorus of the pack began to approach us. Every eye then peered vigilantly into the gloomy, silent woods as if they would penetrate the leafy coverts, and all assumed an air that indicated a thorough determination not to be caught napping again. The cry now became loud and clamorous, and very close, so every weapon was held near the shoulder. Bang! went a gun in the glades, and bang! went another to my right. These were followed by a joyous "hoo-pee," which indicated that the nimrods were successful. On arriving on the ground we found both animals dead, and their slayers proudly gazing upon them. Congratulations were bestowed upon them, which they received as a matter of course. One curious incident about the run was that both animals kept together from the start, for nothing of the sort had ever before come under the notice of our experienced guide. The only way in which he could account for it was that they were pressed so closely by the hounds, who were famous for their fleetness, that their wits were scattered so that they were not able to employ their usual stratagems. They were, besides, quite young, so that their inexperience, as much as any other circumstance, was the means of leading them to death. One peculiar fact in connection with the running of the two species of deer common in Western Oregon and Washington Territory is that the black-tailed species heads for the hills and ravines the moment he is started, and makes for the water only when all other stratagems have failed, while the white-tailed prefers to run on the lowlands and in the forest, and

resorts to a brook or river as soon as he can get the opportunity. Hunters avail themselves of these characteristics, and act accordingly; and so quick are they in detecting which species is started that the pack will not be in motion five minutes ere they hie either to the hills or the stream. The white-tailed deer also runs in a more direct line than his congener, as if he would outstrip the dogs by his fleetness, but the other doubles like a hare, and chooses the most rocky and difficult ground, as if he knew that the scent would be lost more readily in such places, and that his means of escape would therefore be greater. The former has also the greater speed, but lacks the endurance of the other, who is a splendid type of cervidean strength and power, and, in my opinion, the best of his family for giving the dogs a run that will test their pace and bottom. The white-tailed species is the most abundant, and is usually found in clearings and in the fir groves bordering prairies, while his congener prefers the heavy forests, whose silence is disturbed only by the notes of the little peewee, or the scream of the wild cat and panther. The former is also less timid, and the result is that the groups are so numerous around the cabins of pioneers that they have to be poisoned, or constantly worried by dogs, to prevent them from destroying the tender vegetables and cereals, of which they are very fond. The slaying of a deer, which is so uncommon an event in many of the Eastern States as to induce hunters to dwell with self-satisfied unction upon it, is there so ordinary an occurrence that those who have brought hundreds to the green sward hardly ever think of referring to the matter, hence I would add, parenthetically, that he who desires to satiate himself with deer stalking should hie away to the shores of the Pacific. One week there will cause him to listen with contemptuous disregard to such tales as refer to the slaughter of one or two in a month, or even in a week, for he can in most instances do better than that in a day if he has the most ordinary luck. To those who desire hunting to their hearts' content, from hare coursing to slaying the panther in his leafy retreat, I would then say by all means "go West," and do not stop until you reach the shores of the Pacific, and when you return you will be a veritable nimrod among the pigmy chasseurs of your acquaintance. I would give the same advice to anglers, but as I hope ere long to show them the rich treasures of the region, I shall postpone any remarks on their loved subject at present. And now to return to my first hunt in the Territory.

Having cleansed the last animals, we suspended them from trees and left that section, as we presumed that the dogs had scared away all the deer in the vicinity. We had not proceeded half a mile before a fine buck leaped out of a glade in front of us, but the guide brought him down before he had gone thirty paces. A little further and another full grown stag bounded from his foliaceous retreat and dashed away with the hounds in full cry behind him.

"No use going after him," said the guide; "he'll go for the hills, so we had better wait here until the dogs lose him, and then go for another."

We sat down accordingly, like men who were powerless, and devoted half an hour of our time to discussing the points of each dog according as we detected his rich notes echoing through the soughing forest, and the merits of eigers that would not burn. At the end of that time we heard new canine Richmonds in the field, and as they were approaching us we jumped to our feet and eagerly ran for cover, as we expected the quarry at any moment. We waited about five minutes, when a buck dashed past, but ere he could disappear four barrels had sent their contents into his palpitating sides, and he fell crying piteously. Ere we could reach him the hounds had throttled him, and were fighting for a mouthful of his tender flesh. We soon appeased their hunger, and they threw their wearied bodies on the ground beside their prey, while we prepared it for transportation.

As the day was declining, we concluded to return home, for we were well content with our day's amusement, which enabled us to enjoy some fine runs, and at the same time to reap the reward of vigilance. We hired a farmer's wagon to take the animals to town, and in the evening, over a dish of savory venison, washed down with some "Veuve Clicquot," we discussed the events of the day, and brought from the perspective of memory recollections of former hunts which had long laid dormant. From the conversation of that evening, and my own experience, I have concluded that to hunt deer successfully in the forest one must use buckshot, as the shrubbery and undergrowth is so dense and matted that a rifle ball is apt to be swerved from its course. But apart from that, is the fact that all shooting is done at from forty to sixty yards, for beyond that distance one cannot see very well, owing to the cause already stated.

From Vancouver I went back to Portland, Oregon, thence took the little stern-wheel steamer that plies to Kalama, the headquarters of the Northern Pacific Railroad. This is a hamlet composed of unpainted, primitive, wooden structures, devoted almost exclusively to the sale of intemperate drinks and pioneer edibles. The scenery *en route* is magnificent in the literal sense of the word, as the Columbia River reflects the mighty forests on its banks with mirror-like fidelity, and high above all other objects loom the white-shrouded peaks of Hood, St. Helens, and Rainier, while interest is added to the trip by some trap terraces that were formerly used as burial grounds by the Flathead Indians. The most remarkable of these is called Coffin Rock, and upon its sloping sides may be seen the remnants of canoes in which reposed the bones of the rude forefathers of the present children of the forest.

At Kalama I took the cars for Olympia, the capital of the Territory, distant about sixty miles. The train consisted of one car and the locomotive, and the passengers were confined to a squaw, two Chinamen, and myself. The route the entire way led through a heavy forest of firs and spruces, whose gloom was only relieved by dingles of cornel, ash, or maple trees, but along the Cowlitz River an occasional coppice of cottonwoods appeared. One peculiar fact in relation to these attracted my attention, and that was that they grew only on one side of the river, while the coniferæ occupied the other. Had they been confined to lowland I could have readily surmised the cause to be the fear of the firs to approach the water, but I saw that they were not, and that they first appeared on one bank and then on another, as if they grew without any affinity for soil and humidity. Having no opportunity of inspecting their surroundings, I could only indulge in speculations, but out of them my botanical lore could not extricate me, so I refer to it to learn if anybody else has noticed the same thing. At a station on the road I also encountered another botanical peculiarity of the region, in which I was

much interested. This was a shrub from three to five feet high, with broad, smooth leaves, reddish flowers, and covered with stout thorns, that looked as if they would prove disagreeable opponents. On examination, I found it to be the *Epinanonox horridum*, or devil's walking stick, a cognomen worthily bestowed, and richly deserved, as I subsequently learned by experience. On this journey—as elsewhere in the wooded portion of the Territory—I found the red flowering currant (*Ritus sanguineum*) exceedingly abundant, and noted that each species of flower guarded its own ground with a combativeness worthy of the buffalo grass of the Wyoming plains; and the latter I concede to be the most tenacious of its habitat of any species of the graminæ I have ever seen, if not of the vegetable kingdom. After traveling about forty miles we emerged on an open, sandy prairie, covered with a short thin grass, which affords a meagre pabulum to sheep for three or four months in the year. A few houses dotted it in several places, so I felt glad that we were approaching the abode of man. This is called Mound Prairie, from a large mound some forty feet high, and containing several acres of land, which rises at its western terminus. It is also covered with smaller mounds, varying from a few inches to a couple of feet in height, and having a circumference of from ten to one hundred feet. Their origin has been the cause of much speculation among scientists, but nearly all differ in their deductions. The lamented Agassiz stated that they were the nests of a species of fish, now extinct, that inhabited the region when it was covered with water, while others attribute them to the uprooting of trees. A little study and examination would have caused all these theorists to have changed their opinion, for they were evidently formed by whirlpools in, probably, the Miocene epoch, when the Puget Sound basin formed a portion of that great inland sea which extended from British Columbia to California. That they were not produced by a fish is evident from the fact that they are confined to a very small area, and that they differ in form, extent, and altitude; and that they are not the result of the uprooting of trees I should deduce from the mode in which the forest grows; while in contradistinction to these theories the evidence of their being the result of eddies is quite apparent in their distribution, the material of which they are formed—rounded pebbles of shales, schists, and sedimentary fragments—and their paucity of vegetation, for nothing thrives upon them but a species of fern (*Pteris aquilina*) and that expression of meagre nutrition, the pycnanthemum. It therefore follows that if they could afford support to the economical fir in the past they could at present; but that they do not, carries its own lesson, and proves that they could not have been formed by the uprooting of trees. I refer to this fact in detail, because they are frequent subjects of speculation among travelers who have seen them. I took the stage at this point to go to Olympia, fifteen or twenty miles distant, the railroad not approaching any nearer the town, as it continues its way directly north of Tacoma, the terminus on Puget Sound. The route led me over several small prairies, composed of such poor soil that it is capable of producing only a meagre growth of grass and a few vegetables, but it abounds with that curse of the country, the pugnacious fern. Farmers settled on these prairies at one time, but hunger soon made them leave, for they found that they could raise only a small quantity of tuberous roots and some cabbage. They are not even fit for grazing, except during a couple of months in the year, and the poor cayuses, or mustangs, that are forced to live upon them are as sorry specimens of their race as can be found on the Continent. Passing beyond them, the stage dashed through woods of plutonian darkness, then emerged on a hill which gave me the first view of Olympia and the Mediterranean of this country—Puget Sound—whose beauties are so numerous and unique as to defy description.

JOHN MORTIMER MURPHY.

For Forest and Stream.

SPORTS IN TEXAS.

SIX of us, with a two horse wagon and a two horse back, started about ten o'clock for Red River and vicinity for a few days' camp. It was a beautiful, clear, frosty morning on the 24th of November, 1875. Ed. F. and I were on horseback, and as we rode leisurely along he recounted many of his adventures in the early settling of Cooke county, also how he had stalked the black-tail deer in Colorado. He carried across his saddle bow an old-fashioned muzzle loading rifle of a suitable calibre for deer. As we passed a wheat field we observed a large flock of wild geese picking at the tender wheat near the road. Hastily dismounting, Ed. began to load, and here I gained a new idea for capping guns. He was in the act of pushing down the ball when the whole flock took wing (being some 150 paces distant), and came almost directly towards us. I hastily felt in my pocket for a cap, and was surprised to see Ed. raise his gun and fire before I could produce the caps from my pocket. On asking how he capped his gun so quickly he showed me a leathern tag attached to his belt, which had ten or twelve caps fastened to its lower extremity, each on a separate nipple, or tube.

We soon came to Fish Creek, a clear, bold stream, abounding in black bass, perch, catfish, etc. Here we stopped for a lunch. Late in the afternoon we came to Red River, just where some five years since I killed a panther in the night. I had never seen the place in daylight, and was surprised at the denseness and extent of the jungle. All the scenes were vividly recalled to my mind, and I realized how much danger I would have been in had I broken a leg and brought the panther to a hand to hand combat in those briars. The bed of Red River here is about 600 yards wide, but only seventy-five or 100 yards of this space was covered with water, and it was quite shallow. If it was not so wide, and the channel did not change with every freshet, there might be some hope of making it navigable, for it drains a tremendous amount of territory. T. and I were in the hack when we observed a covey of quail run across the road into some grass that was almost waist high. Seizing our shot guns we jumped out of the hack and waded into them. We both fired as they rose, but got only one bird. Ed. had killed a prairie chicken just before we reached the river. We now went into camp for the night on a small creek, and I killed a squirrel to make out a "mess." We built a roaring fire beside a huge log, ate supper, cracked jokes for some time, and, as the night was clear and warm, instead of stretching our tent over a pole we spread it on the ground before the fire, laid down our blankets, and went to sleep. Next morning we awoke to find it thick, cloudy, and thundering. By daybreak we had eaten breakfast, and, loading our guns, each man chose

his course and plunged into the wild woods, all on horseback except Esquire F. and D., who went up the creek bottom. Crossing the creek I rode up through the bottom on the opposite side. The leaves were damp, and I made very little noise. I had not gone more than a "quarter" when I discovered an open prairie valley to my left, and thought I would go and see if there was not an old buck scampering around the edges of that prairie. I had advanced to within about 100 yards of it when the sharp report of a rifle broke the stillness of the morning very close to me and in the edge of that prairie. I knew it was the Squire and D., so I called out, "What are you shooting at?" Squire F. answered back, "I've killed a fine buck, come over and help hang him up." Dismounting I crossed the creek, and just in the edge of that prairie lay a nice four pointer, with the hot blood spouting from an incision made by the Squire's knife. "Pretty well done, Squire, how old are you?" "Sixty-five." "You shoot well for a cloudy day; did you kill him in his tracks?" "Yes; he was standing looking at you." By this time the Squire had taken out his entrails, and we hung him up in a tree. I now concluded to advance on foot, and, sticking my shot gun under a log, I hitched my horse, loosed my Ballard rifle from the saddle, and traveled up the creek for a mile without seeing any game larger than squirrels. Yes! except once I got a glimpse of a turkey, running like a streak of lightning. Looking at my watch, I saw that my time was nearly up, and hastily returned to camp to find that W. P. had killed a turkey, and Ed. soon returned with another. We had concluded to advance farther up the creek, and were soon under way. We traveled until near twelve o'clock, when it began to rain, and we stopped and stretched our tent, and eat dinner. We started out again after finishing our meal, and Ed. fired at a doe within 300 yards of camp, but missed it. We advanced for half a mile, when I heard both barrels of T.'s gun down to my right. Looking that way I saw a flock of turkeys sailing directly towards me, which alighted before they got to where I was, and as I dismounted, two of them hove in sight. Without thinking, I fired my right (charged with buckshot), and missed. This caused the second to stop in the tall grass, when I advanced and brought him down with my left. I now recharged my right with buckshot and my left with No. 1's, and when flushing the first one I had shot at, I again fired the buck at him and missed. Just previous to this I had heard Ed.'s rifle to my left, and now heard him calling for help. P. rode up and found he had killed a large buck. As I was crossing a ravine a turkey flew over my head, and I fired from my horse, but without effect. T. now came up with three turkeys tied on his saddle, which he had killed at his first shot. It looked so much like rain that we returned to camp to find the Squire frying some venison with fresh pork, which he had brought along. He was also roasting his deer's head for the brains. A couple of gentlemen living within a few miles of camp visited us, and invited us to partake of their hospitality, but we were doing well enough, and declined. They promised to come over at night and go turkey hunting. Our turkey hunt at night did not promise much, as it was cloudy, and no moonshine. Just before night Ed. brought in his deer, and P. brought in another turkey. We had quite an argument about the best kind of shot to be used. Ed. and I were in favor of small shot (No. 1), and T. was in favor of No. 1's, mixed with the smallest size of buckshot.

It was now time to start, and we mounted our horses and rode up the creek for about a mile to the roost. It was not quite dark when we arrived there, and they began to fly at our approach. It soon became dark, and Ed. and T. began to advance. I remained behind lest I should cause them to fly, and bring down their swift imprecations upon my head. But when T.'s 10-gauge, laminated steel, broke the silence of twilight with a report but little less than that of a young mortar, and a turkey came with a thug to the ground, I could no longer desist, and advanced hastily. Ed.'s gun next broke the silence, and thrash, quit, quit! came another turkey. The firing now became general, and caused the birds to seek the tops of the tallest trees. I came on one of them in the top of a large burr oak, and as I had my right charged with buckshot and bone dust from a wire cartridge, that I had torn up in the evening, I used that barrel and brought down a fine gobbler. I now charged with four and half drachms of powder and one and a half ounces No. 1 shot, for across the creek in the very tops of some large cottonwoods I saw several turkeys, and knew it would take lots of powder to reach them. I was soon under them, and fired first the right and then the left without even making them fly. I recharged my gun the same way, but at this juncture they all flew but one. I fired twice at him before he flew, and I then thought it time to change my tactics, so pouring down four and a half drachms powder I scooped up a handful of small buckshot out of my pocket and counted eighteen into each barrel. It was now quite dark, although the clouds had blown off, and the stars were shining. Ed. and T. were keeping up a constant fire down the creeks. With each barrel I now brought down a turkey, and as I had got off some distance from my horse I concluded not to kill any more. Having on two coats I had become quite warm, and thought best to shed them before taking up the line of march. Two coats, a nine pound gun, and three turkeys that would weigh forty-five pounds were as much as I could drag through the briars in the dark. I finally reached my horse, but found that I had lost one coat. Ed. had four, and F. had five, which, with my three, made twelve turkeys in less than an hour. Just as we got to camp the boys that had promised to come and hunt with us rode up with a turkey they had killed on the way. Mr. P. went out with them, and they killed eight more, making for the day's hunt two deer and twenty-eight turkeys. During the night a norther blew up. I stayed with the boys till twelve o'clock, and the bag for that day was two turkeys by T., and two wounded deer. With many good wishes I left them and turned my course homeward, wishing that I could stay a week. On the night of the 28th it rained heavily, and turned severely cold, then I was not sorry I was at home. The day after I left the party T. succeeded in killing a doe, and at night they killed quite a lot of turkeys.

Captain J. T. Rowland and nine others have just returned from a two weeks' hunt. They killed seventy-three deer and sixty-eight turkeys, the Captain killing forty of the deer. I do not see why some of your Florida visitors might not spend a Winter pleasantly in Texas. We are only thirty miles from the M. K. and T. R. R., with a daily stage. But I must close, for it is likely that this article is already too well itemized.

Gainesville, Cooke county, Texas, Dec. 2d, 1875.

Fish Culture.

REPORT OF THE COMMISSIONERS OF FISHERIES OF THE STATE OF MAINE FOR 1875.

WE are in receipt of the ninth annual report of the Maine Commissioners which recites in detail their operations for the past year. The demands made upon them for surveys and plans for fishways by wealthy corporations and mill-owners, the continued and never ceasing application for black bass, land-locked salmon, and sea salmon, to stock rivers and ponds, the requests for information, instruction, and advice, have occupied all of their time, and show no signs of diminution. Observation during the past year would indicate that salmon do not return every year to spawn, from the fact that certain fishes that were marked at Bucksport two years since, after being spawned, (stripped?) and then turned back into the Penobscot, did not again make their appearance until this year, when they were again caught in the weirs; and the hitherto prevailing opinion among ichthyologists that salmon returned to the ocean soon after spawning, to recuperate, would seemingly be contradicted by their having caught several marked fishes at Veazie, some twenty-five miles above Bucksport, the Spring after they were turned loose at the latter place. Mr. Lewis Lazell, of this city, also informed them that the rivermen of Canada were unanimous in the statement that the spawning fish stayed in the river the whole Winter, and did not go down until the breaking up of the ice in the Spring.

There were this year distributed in the waters of Maine some 700,000 salmon fry. From the United States there were received, through Mr. Livingston Stone, 100,000 eggs of the California salmon (*Salmo gairdneri*), from these were hatched 30,000 healthy young fry. These eggs were a free gift from the U. S. Fishery Commissioner.

Of the quota of Penobscot salmon from the Bucksport Works, 30,000 were put into the Sebours river at and near Howland; 15,000 in the Penobscot at the mouth of the Madawaskum stream; 5,000 in Salmon stream four miles from Medway; 45,000 in the Mattawamkeag river at Bancroft; 45,000 at Danforth; 84,000 at Kingman. Two hundred thousand salmon eggs were sent to the Sebec Hatching Works. Of these, 45,000 were turned into Salmon stream, a tributary of the Piscataquis river; 35,000 into Ship Pond stream, the connecting stream of Ship Pond and Sebec lake; 25,000 in Wilson stream, a tributary of Sebec lake; 5,000 into Bear brook; 5,000 into Salmon brook, a tributary of Sebec river; and 5,000 into Beaver Bank cove. Fifty thousand eggs were sent respectively to Machias and Dobsie to be hatched and turned into the streams at those places. Fifty thousand salmon eggs were hatched at Dixfield and turned into the Androscoggin river at that place. Fifty thousand were hatched at Norway, intended for the Presumpscot river. Ten thousand were distributed in Bear brook, Harrison. The balance were turned into Crooked river at Byfield Bridge. Two hundred thousand salmon eggs from Bucksport were hatched and distributed in the Penmaquan river and tributaries.

The correspondence which has appeared in these columns at various times relative to the land-locked salmon and its various cognomens and habitat is reproduced, and the Commissioners repeat from their report of last year the remarks of Prof. Agassiz on the same subject, that whether known as the *Salmo gloveri*, the winninish, or by any other name, the land-locked salmon, whether of Sebago, Sebec, or St. Croix, is a distinct species. The Commissioners here explain, for the information of the public, that the State of Maine, through her Commissioners of Fisheries, can have no traffic in her fishes. Permits to take spawn at proper seasons will be freely given, upon the condition that the parent fish is returned to the water alive after being used, and that they hatch and return to the same waters twenty-five per cent. of the spawn taken from them. The Commissioners last year purchased 14,000 ova of the Sebago salmon. One of the fish from whom these eggs were taken weighed 17 pounds. A small hatching house has been erected for the experimental hatching of these fish, which, if successful, will be continued on a larger scale. A small stock of these fishes have been distributed in Ship Pond stream. Two thousand of the Sebago salmon fry were turned into Weld pond, Franklin County; the remainder into Rangely and Mooselucmaguntic lakes. Seven thousand were turned into Mattanacook pond in Lincoln. The Commissioners state that the great size and excellence of flavor of the *salmo gloveri* have led to a proposition to substitute it for introduction into New England rivers in place of pushing any further the experiment of restoring the sea salmon. But it must be borne in mind that the sea salmon is an anadromous fish and does not feed when it comes into our fresh water streams. The *salmo gloveri* is a large feeder, as is also the trout, the white perch, the pickerel, etc. The presence of anadromous fishes in our rivers to breed, not only does not infringe upon the supply of the food of our native fishes, but largely increases it. There is, there can be, no substitute in our rivers for our anadromous fishes.

Six years since several ponds were stocked with black bass, and this year many other ponds have been stocked, the Commissioners taking the fish themselves for the purpose. They do not deem the bass more destructive to the young of other fishes than the trout, and much less so than the white or yellow perch, for both the trout and bass feed largely on flies.

The Commissioners think it important that the blue-back trout should be introduced into all ponds that are stocked with either trout or fresh water salmon. Its fe-

cundity is remarkable. They have been introduced into various waters as follows: Weld pond, 2,000; Wilton pond, 1,500; Songolook, 500; Bear brook, (Long Pond, Harrison), 1,000; Whitney pond, Canton, 1,000.

Petitions having been received asking for fishways to be constructed over the dams on the Narragausus river, orders will be served upon the parties interested to erect five fishways before the Autumn of 1876. Three very ingenious fishways, with an arrangement by which a stated amount of water is always admitted, without regard to the water in the stream, have been constructed by Dr. Everleth, of Waldoboro, on the Medomac. Two new ones are required at Warren, which it is hoped will be erected before Spring. The fishway on the Presumpscot was finished last Spring, and two have been built at Saccarappa; four others on the Presumpscot will be completed by May. Fishways are petitioned for from different parts of the State faster than the Commissioners can find time to attend to them, in connection with the pressure of the large amount of other work, that the enthusiasm of the people in the restoration of fish, their ponds and streams, has precipitated upon them. The desired fishway over the dam on the Kennebec at Augusta has not yet been built, although an order had been served upon the agent of the A. and W. Sprague Manufacturing Company to build the Brackett fishway, according to certain plans and specifications, before the 1st of September, 1875. No attention, however, has been paid to the order, and the dam at Augusta still remains without any passage for fish.

The Commissioners call for additional legislation relating to the taking and breeding of fish, as well as the enforcement of our fish laws when infractions are committed; and the report concludes with a letter from Mr. Chas. G. Atkins relative to the work at Bucksport and Grand Lake stream establishments, and an abstract of the laws relating to game and fish.

The Commissioners are to be complimented, not only on the success of their efforts to increase the supply of food fishes, but upon the energy and discrimination which they have brought to bear upon their work.

FISHWAYS.—Seth Green, Esq., has sent us a model of a fishway for inspection, which he thinks will serve its purpose if the dam be not too high. It is simply a sluiceway of wood or stone, cut through the dam; or rather the fishway should be constructed first, and the dam then built over it. We copy the description in Mr. Green's words:—

"The water forced through the hole would make a gentle current through the passage, and the question is, can the fish force themselves through the hole? I know they can in a four foot dam. The passageway must be all under water, so that when the water passes through the hole that it strikes solid water, the fish will have an easy passage to the hole, and will make a run and go through. The upper end of sluice should be covered with plank two or four inches thick and should be four feet long, and the width of the plank according to the depth of the water. If the water was one foot deep at the lower end, the plank should be one foot wide. If the sluice was four feet wide at the upper end, it should be twelve or fifteen feet wide at the lower end. The hole in the plank should have a gate so that it could be left open or shut, and should be built of an oval shape. I have experimented some. I send you this to set the people thinking, and perhaps some one will work it out. It is more difficult to get an idea of what we want than it is to work it out. If you can straighten the model and set it on a table, you will get the idea."

THE HOLYOKE FISHWAY.—In our issue of December 2d we published a letter from Mr. E. A. Brackett, one of the Commissioners of Inland Fisheries, referring to a statement which appeared in the *Rod and Gun* and attributed to Mr. Fred. Mather, reflecting upon the Holyoke fishway and its inventor. We are now in receipt of a communication from Mr. Brackett enclosing another from Mr. Mather, in which the latter emphatically contradicts the statement attributed to him by the *Rod and Gun*. He says:—

"I feel it due to us both, that I should say to you, that I did not write the article in question; it was originally sent to me through the *Live Stock Journal*. I believe I have never heard you say anything about the 'way,' that I remember, but have heard more from others; in fact, I do not remember to have expressed an opinion as to its merits or demerits, even in private, most certainly not in public. FRED MATHER."

—Mr. A. S. Collins, the former proprietor of the Caldonian hatching houses, is editing the Fish Column in the *Rochester Express*.

LIFTING TROUT SPAWN.—The disadvantage of lifting trout spawn in the natural way is this: the large old trout commence to run up the stream in this latitude the middle of September, and in about two weeks they have done spawning and gone back. Next comes a smaller or younger class; and the last some time in November or December—two-year-olds. Now, trout will not eat their own eggs, but are sure to choose the very nests where others have laid, and will eat them up and lay their own, so that it happens that most of those that finally remain are a small class; and if it were not for the fact that Nature's laws are always compensating, trout would degenerate; but after hatching they soon show a vast difference in size, as the first season the large eat up the small ones; this keeps them of regular size.

I can endorse the fact set in the *Telegraph* that fish, and especially trout, will readily adapt themselves to vegetable diet, such as bread, Indian pudding, pancakes, &c. Curd or Dutch cheese, without salt, is as good food as can be obtained, and diluted with water is good enough for young fry. There is no easier or surer stock to keep for a farmer, or any one with a brook or spring, than brook trout. In this section some have buildings one hundred or two hundred feet long, covering their ponds or canals, so they can be locked up as safe as goods in a store, and make it pay largely. All trout need is pure cold water and plenty of food, and they will fatten up the soonest of any animal known.—A. J. Hinds, of Patchogue, L. I., in *German Town Telegraph*.

FISH CULTURE IN KENTUCKY.—A number of prominent citizens will meet in convention at Frankfort, Ky., on January 20th, for the protection of fish culture throughout the State. Kentucky is far behind most of her sister States in this most important enterprise. We expect the convention to take such steps as will place this subject in its proper light before the Legislature, and secure from it such an appropriation as will stock the principal waters in the State. At the same time we would suggest to the convention the propriety of framing a more efficient law, one that will prevent the wanton destruction of our game, and punish offenders.—*Live Stock Record*.

CALIFORNIA SALMON FOR NEW HAMPSHIRE.—Fish Commissioner O. H. Noyes, of Henniker, has received 25,000 California salmon, which he proposes to plant in the headwaters of the Merrimack. They were 50 days old on the 1st inst. and are about 1½ inches long. Fifty thousand more are to arrive soon. These salmon return to the sea in from two to four years, and are said to be better adapted to these waters than the Penobscot salmon. The fishway over the dam at Lawrence has lately been repaired at considerable expense, and it is hoped is now passable.

Natural History.

[This Department is now under the charge of a competent Naturalist, Indorsed by the Smithsonian Institution, and will henceforth be made a special feature of this paper. All communications, notes, queries, remarks, and seasonal observations will receive careful attention.]

THE NATURAL HISTORY OF LONG ISLAND.

THE Natural History Section of the Long Island Historical Society met at their rooms at Court and Jeralmon streets, Brooklyn, last Thursday night, Mr. E. Lewis, Jr., in the chair. The meeting was held in the museum of the society, and various accessions were announced. Among them were a bald eagle, a peregrine falcon, a great blue heron, a dusky shearwater, an English widgeon and several thrushes; a large saw of the sawfish; a horseshoe crab (*Limulus*) with two distinct tails; a fine preparation showing the tunnels of the carpenter bee; and a large number of geological and mineralogical specimens. Particular attention has been paid lately to fossils from Long Island deposits, but thus far the tooth of a shark (*Carcharodon megalodon*), and some fine pieces of lignite, from the clays near Huntington, have alone awarded the search. These fossils prove the tertiary age of those clays. In the sands overlying these clays, shells of recent species (clam and oyster) are found embedded. In the unmodified drift no fossil shells whatever have been found; but in the stratified sands and gravels shells have been found at Lakeville, Flatbush, and several other points in digging wells, at a considerable height above tide level. All the geological investigations and collections made by Mr. Lewis and other members fully confirm Mather's previous conclusions respecting this and the Connecticut shore. Many minerals have been acquired by breaking up the boulders of the drift. No place affords a better chance for observing the character of this glacial drift than the excavations for the boulevards at Prospect Park, Brooklyn; there may be seen boulders scratched, scored and polished by the ice in every way. The swamps, in many places in the island, yield good examples of ferruginous conglomerates and wood, the latter with the appearance of the grain well preserved. The principal topic of the evening was the geological history of Long Island, presented by Mr. Lewis, who has recently studied the subject with care. It has long been known that the stratified gravel and sand of the plains was also to be found on the ridges and low hills. It is now found that the very highest hills—Harbor Hill, 384 feet high, and Wheatley Hill, 376 feet high—consist of, and are topped with, this same stratified sand and gravel. This proves satisfactorily that Long Island has been entirely submerged since the glacial period. During the Champlain period it was all under water. After that time it rose, and is now again undergoing a process of gradual submersion in common with the whole Atlantic coast from Labrador to Florida. Much interesting evidence of this was brought out in the discussion, showing that, on both sides of the island, but particularly on the south shore, salt-meadows, forests, and even cultivated lands have been flooded by the sea; and in many places yet, at low tide, the stumps of the trees may be seen near shore. Especially is this true of the region about Fire Island Inlet, where the whole bay was once, it is well known, a fresh-water swamp. The Hackensack meadows between Jersey City and Newark were once covered with heavy pine timber; but none would grow there now. Along the whole coast heavy storms every year tear up sods and pieces of sunken logs and cast them ashore, showing that the bottom for some distance from shore was formerly a peat bog. Westward from Islip, Indian shell heaps abound along the shores; but eastward from that point, not one has ever been found, showing that that part of the bay is of recent origin, and that the beach where once the Indians roasted clams has since been eaten away by the sea.

The next meeting of the Section will be held on the last Thursday in January, when Dr. Raymond will read a paper, illustrated by the stereopticon, upon the horseshoe crab and other crustacea.

HYBRID DUCK.—There are living in Mount Auburn Cemetery, near Boston, nine individuals of different generations of a hybrid duck, which is a cross between a male mallard and female Muscovy, or Cayuga Lake duck. This hybrid is sometimes met with in a wild state also. It has the reproductive powers perfectly developed, and is said to transmit its peculiarities with great fidelity.

—During a recent exploration of the Baxter River in New Guinea, a boa-constrictor was shot 15 ft. 3 in. long, having a protuberance in his body 14½ inches in diameter, which, when cut open, proved to be the body of a whole kangaroo only partially digested.

—We learn from *Nature* of Dec. 16th that a large new rapacious bird has been recently discovered by the naturalist E. Albertis in New Guinea, which is described by Count Salvadori under the name of *Harpyopsis noveae Guineae*. The existence of this bird probably gave rise to the exaggerated report of the enormous "eagles" which were seen during the voyage up an unexplored river in New Guinea, recently published in several papers.

THE RED-TAILED HAWK.

THE red-tailed hawk is generally called the hen-hawk. The adult and young of this species differs so greatly that no one except an experienced naturalist would be apt to recognize them as the same. Its length is from nineteen to twenty inches, and its wings expand from forty-five to fifty inches. The female, as is the case with all our rapacious birds, is considerably larger than the male. The head of the adult is large and flat; tip of the bill much incurved, with the entire upper parts brown, with fulvous edging on the head and neck. The tail is bright rufous, tipped with white, and a little rounded, with the subterminal band of black. The throat is white with longitudinal strips of brown, and the under parts yellowish white with longitudinal brown spots; the under tail-coverts are yellowish, legs yellow, and the iris hazel. In the young the upper parts are lighter brown than in the adult, with more white and fulvous spots; the tail has nine or ten transverse brownish black bands, and is tipped with white; the subterminal band is about an inch wide; the under parts are white with large ovate spots of brownish black; the under tail-coverts are spotted with brown. The smaller wing-coverts are rufous, and similar to the red-shouldered hawks, only not as bright rufous.

From the above it will be seen that there is very little resemblance between the adult and young. The only distinguishable resemblance is in the general form of the head, bill, legs and claws. Is it, then, any wonder that eminent naturalists have mistaken them for some other species? Nuttall took, and described them as the American buzzard (*Falco buteo*); Pennant as the great hen-hawk (*Buteo vulgaris*); while Wilson named it *Falco leverianus*, but says, however, "It is with some doubt and hesitation that I introduce the present as a distinct species from the *Buteo borealis*. My reason for inclining to consider this a distinct species is the circumstance of having found the present *Falco leverianus* two or three inches larger than the former, *B. borealis*."

Ornithology in those days was not advanced to the exact science of the present day, and its devotees were not generally aware that the young of many of our birds of prey were longer than the adult, which absurdity is explained by the fact that, after moulting, the long feathers never attain their former length. This is very marked in the case of the goshawk and bald eagle.

The bill of fare of the red-tailed hawk is made up of a variety of food, according to the season. In the Spring and Summer months snakes form a prominent item, but in the cold season, the wild game of the woods and the poultry-yard are drawn upon to satisfy the cravings of hunger. From the fact of its making frequent inroads among our domestic fowls the name of "hen-hawk" is derived. The nests of these birds are composed mostly of sticks and twigs, are large and somewhat flat, and generally located where it is almost impossible for any human being to get at them. In these nests they lay from two to four or five eggs, of a dull white color sparsely covered with dark brown spots. The male assists the female in the duties of incubation.

H. W.

REPETITION OF NESTING IN BIRDS.

THE subject of the repetition of incubation in our birds being under discussion in the FOREST AND STREAM, I will quote irregularly from my field notes of several Summer's back, with reference to this matter, for the benefit of your readers. The birds that I know of as breeding twice in a single season, may be arranged under two headings: First, those that regularly do so; second, those that occasionally do so. Of the species that I have found breeding twice, as a rule, I have the following noted down, with details of circumstances, making it quite certain that such was the case. These details will perhaps be given in a separate article on the subject of the breeding habits of some of our birds. Those usually breeding twice are:—

1. Robin. (*Turdus migratorius*).
2. Cat-bird. (*Galeoscoptes Carolinensis*).
3. Blue-bird. (*Sialia sialis*).
4. House wren. (*Troglodytes aedon*).
5. Yellow warbler. (*Dendroica aestiva*).
6. English sparrow. (*Pyrrhula domestica*).
7. Bay-winged bunting. (*Pooecetes gramineus*).
8. Chipping sparrow. (*Spizella socialis*).
9. Song sparrow. (*Melospiza melodia*).
10. Orchard oriole. (*Icterus spurius*).

Those occasionally breeding twice are:—

1. White breasted nuthatch. (*Sitta Carolinensis*).
2. Scarlet tanager. (*Pyrrhula rubra*).
3. Yellow-bird. (*Chrysomitris tristis*).
4. Chewink. (*Philo erythrophthalmus*).
5. Baltimore oriole. (*Icterus Baltimore*).
6. Purple grackle. (*Quiscalus purpureus*).

Of the list of ten species that I believe, at least generally, raise two broods in New Jersey, and more likely habitually do so, I believe all will build new nests, unless they are kept in the immediate vicinity of the first nest by an abundance of food, and the nest itself escapes injury from rains and occupation by spiders, etc. Indeed, I have long thought that birds would always build a new nest rather than clean out an old one. Cleaning out and re-fitting an injured nest is not an undertaking for which a bird is physically well adapted; and nest building *de novo* "comes natural" to them. Any how, it is not a very difficult process, nor half so wonderful as many people think it. The cat-bird I have known, in one instance, to commence laying while the first brood were yet hovering about the parent birds; and the second brood were hatched and ready to fly within a week of the day I last noticed the old and the young of the first brood together. The blue-bird, house wren, English sparrow, and orchard oriole remain about their first nest during the Summer, and simply add a few additional bits of lining of feathers, hair or fine grass, as the case may be, the latter bird not doing even so much.

A pair of orchard orioles built in a pine tree in my yard, the past Summer, 1875, raising two broods. The first appeared about the 20th of June; the second brood about the 1st of September. The parent birds and both broods remained about the yard and its tall pine trees until November 3d, after which date I have not noticed them. I think there is no doubt but that the Summer warbler raises two broods. If so, the same nest is not used. The more restless habits of this bird have made it more difficult to determine.

Of those birds that I have mentioned as occasionally breeding twice, a word in conclusion. The second brood follows immediately after the first, and seems to have been caused by some unusual excitement of the ovaries, causing a second series of eggs to mature. My attention was called to this subject several times, by observing marked nests of the species mentioned, to note down length of period of incubation, etc., and I was surprised to find that occasionally eggs were laid within a day or two of the departure of the first brood. I occasionally noticed a somewhat similar case in the common chicken, where a setting hen will occasionally drop a shellless, but otherwise perfect egg, towards the close of the period.

CHAS. C. ABBOTT, M. D.

Prospect Hill, Trenton, New Jersey.

HABITS OF FOXES.—We found the following paragraph circulating, and having doubts of its correctness, sought the opinion of one whose familiarity with these creatures enables him to speak with accuracy:—

"Some one has informed a correspondent that red foxes run out the grays wherever they go, and he writes to us for information on the subject. This is true to a certain extent. The grays seem to live in terror of the reds, and unless hard pushed by dogs never encroach upon the range of the latter. One pair of reds (the species being in some sort migratory) will drive out an entire colony of grays. The reds are slowly going in a westerly direction. The peculiarities here mentioned are notorious among fox-hunters." We append our correspondent's letter:—

FERRISBURGH, Vt., December 23d, 1875.

EDITOR FOREST AND STREAM:—

If the gray fox referred to in the inclosed slip is *Vulpes Virginianus*, I can tell you nothing about it, as this species, if not quite unknown here, is so rare that Thompson was unable to obtain a specimen when preparing his description of the animals of Vermont. If the silver gray fox is meant, I should say most decidedly that the statement is incorrect. As this fox is only a variety (*argentatus*) of the red fox, as is the cross fox (*var. decussatus*), it is not at all likely that any such antipathy exists between them, any more than between horses of different colors. A man—whose word in this instance I have no reason to doubt—told me that he once saw a red and silver gray fox trotting amicably through the fields together. They crossed the road so near him that he could not be mistaken in them. The silver gray fox and the cross fox are both rare here, as I believe they are every-where, but are sometimes seen and killed, the cross fox oftenest.

THE FOOD OF SALMON—HOW THEY DIGEST.

SAN FRANCISCO, Cal., December 17th, 1875.

EDITOR FOREST AND STREAM:—

I have read the article headed "On What Do Salmon Feed?" published in your issue of the 9th inst. Mr. E. J. Hooper, of this place, states that he has "never found any food in the stomachs of the salmon he has caught." It seems to me that Mr. Hooper should know that salmon, on the Pacific coast, at least, feed in large part on young fish. In common with myself and others, he caught a great many salmon last season at Oakland Railroad Pier, where the bait most successful was young smelt and belly strips of the adult fish. He has also caught salmon in the Nozo River and other places with the spoon or spinning bait. These, when in motion, resemble a young fish. His own observation at Oakland Pier must have shown salmon making rushes at the young fish swimming near the surface, which indicates the latter was the former's food. To settle the question definitely, I will state that Mr. Joseph Perkins, of Oakland, has frequently found young smelt in the stomachs of the salmon he has caught, some being in a partly digested state, and others apparently just swallowed. I have never made a personal examination, so cannot speak of my own knowledge. It has also been remarked by many persons catching salmon at Oakland, that when schools of young fish were numerous the former could rarely be taken with hook and line.

As regards salmon vomiting up the contents of their stomachs when hooked, I believe such is the case where the fish has gorged the hook, and it is fast in some vital place. When hooked in the mouth I think they retain their food in their stomachs. That fish digest their food rapidly, I can readily believe, as an instance occurred giving proof within my own knowledge. A few weeks since I was fishing for what is here known as the blue codfish, at Fort Point Wharf. About 10 A. M. I baited my hook with a young live sea trout, about five inches long. In a short time the bait was gone, and I renewed it with another young fish of a different variety. Probably an hour and a half elapsed from my first baiting, when I caught a blue cod weighing about five pounds. While holding it with my foot to disengage my hook from its jaws, it threw up the body of a small fish, which, from its shape, I knew to be a sea trout, and from a hook which was in its body I recognized as the one which I had first baited with. When disgorged, the skin, fins, entrails and head were gone, and the flesh whitened and tender, as if boiled for a long time. I judged that in half an hour the entire mass of flesh would have been dissolved in the cod's stomach.

As regards what salmon feed on at sea, I believe they live on the young of herring, sardines, smelts, and other small fish, countless millions of which frequent the northern seas during the Summer months. These fish are so abundant in the North Pacific that salmon could have an inexhaustible supply of food, taken without much exertion or labor. One variety of these small fish that frequents the coast of Alaska is extremely fat, and is known as the candle fish, the Indians in the vicinity of Stickeen River drying them for use as candles. The salmon of this coast have a horny substance with small teeth on the tongue, and a similar substance and teeth on the roof of the mouth, some little distance inside of the jaw teeth proper. The tongue is very muscular, and I can readily believe that the salmon has force to crush shrimps and small crustacea, and, at times, doubtless does use them for food purposes.

While on the subject I may state that young salmon have been caught at Oakland Pier for nearly a month past. They are not very numerous as yet, from fifteen to twenty being caught daily, varying in weight from one and a half to six pounds. Some larger ones have been hooked, but owing to improper tackle, have in every instance escaped. The tackle generally used is a bamboo pole, with a line of some length tied to the tip, the party fishing standing on the pier, from six to ten feet above water, with a four-foot fence in front of him. Under such circumstances nine-tenths of the fishing for salmon is done, and it is no wonder that the largest always escape.

H. D. DUNN.

—A very graphic description of the Brighton Aquarium from our correspondent Druid, who is now in England, will appear in our next issue.

KINGLETS AND WARBLERS IN CAPTIVITY.

JERSEY CITY, N. J., December 24th, 1875.

EDITOR FOREST AND STREAM:—

My husband brought home, at different times, last October, several kinglets, one of which was the ruby-crowned, and the other the golden-crested, that had flown into his office in the top of the building, at midnight. They were all let loose in the house, and soon became very tame. At one time a gold-crest and a pine-creeping warbler were brought home by him, which we had for a night and day. For the first five or six hours they kept flying from the top of one door or window coming to the top of another; but after that the kinglet became bolder, and began to investigate the premises, and later in the day he would alight on the heads of any and every person entering, and allow himself to be handled even by our little two-year old. For food, he appeared to pick up crumbs, and helped himself to lice on some plants in the window. Catching sight of himself in a hand mirror lying on the table, he immediately hopped upon the glass, and began an energetic flapping of his wings, at the same time chirping loudly, as though to attract the attention of his *vis a vis*. I remarked it as a curious fact that, while he paid so much attention to his reflection, returning again and again to the mirror, he never noticed the warbler, or attempted to strike up an acquaintance with him. This kinglet, like all the rest, seemed entirely at home, and even when the window was opened and he was pushed out, he came flying back several times before he could make up his mind to leave us. But at last he did, and the last we saw of the gay little chap he was gleaming among the grape vines. Meanwhile the warbler seemed perfectly untamable, and would let no one come near enough to touch him. As night came on he became very restless, and threw himself against the window panes in frantic efforts to get out. This violence was very different from his demeanor during the day, since, although sad and shy, he made no attempt to escape from the room, and I regarded it as an indication that it was his invariable habit to migrate at night, remaining quiet during the day. Seeing his distress, we opened the window and the captive joyfully darted out, and shot like a rocket up into the southern sky. Two white-throated sparrows were also caught at the office, and are mentioned, among others, in FOREST AND STREAM of November 4th. They were taken home by a gentleman of our acquaintance and caged. He succeeded in reconciling them to confinement, but one died without any apparent cause, after four or five weeks. The other became so tame that he was given the liberty of the room, and would not leave even when the window was open. At last, only a few days ago, as he was standing on the sill of the open window, a sudden movement frightened him, and he hastily flew away.

MRS. E. I.

Woodland, Farm and Garden.

ORANGE CULTURE IN FLORIDA.

FLORIDA oranges are rapidly superseding Havana and Sicilian in New York and Philadelphia. A single retail house in the latter city advertises 15,000 just received from Col. Harts' Grove, Palatka. The large profit connected with the business will probably induce many to embark in it, and for their benefit we append a few general remarks on the culture of the whole *Citrus* tribe which embraces the orange, lime and lemon, &c. All this family are gross feeders, and therefore their growth and productiveness are greatly promoted by a liberal supply of manure in liquid form, or a top dressing of recent horse manure, some three or four inches deep over the roots, or of an inch or two of night soil mixed with an equal part of swamp muck, or rich earth. If wild orange plants can be obtained with stems of say an inch in diameter within two feet of the ground, the lower branches should be carefully removed, then the top should be cut off in a slightly slanting direction with a sharp fine-tooth saw; then with a sharp chisel, make an incision of about half an inch deep, and across the whole stem; then with the same chisel making another incision of the same depth at right angles with the first; both these incisions should reach from these, and through the bark on one side to the other. Then procure four grafting scions, and from one to three inches long, with stems the size of a goose quill. They should be taken from bearing trees of a good variety. The ends should be sharpened with a sharp knife into a wedge shape, and inserted in the clefts made by the chisel so that the bark of the scion shall unite, or join the bark of the stock, then have some good grafting wax made by melting equal parts of rosin, and beeswax together, heat it so as to be almost in a liquid state, and when the scions are secured in their proper places with a band of soft lamp wick, a small quantity of the grafting wax is poured over them to exclude the air; then to prevent the sun from scorching the scions before they begin to grow tie a piece of muslin over all, and let it remain until growth commences. Do not allow any buds or leaves to grow below the grafts, and rub or cut them off as soon as they appear; they rob the scions of their proper share of the sap of the plant. This is called cleft-grafting, and should only be resorted to when stocks of a large size can be had. By this mode large bearing trees can be had in a much shorter time than in any other way.

Another, and much the easiest mode is by grafting by approach, or in-arching. A small stock about a foot high, raised from seed is grown in a small flower pot, and the pot set on a shelf or propped up by a stick so that it is on a level with the bearing tree. Then with a sharp knife make a shallow cut in the side of the bark of the stock, and a cut of exactly the same size in the side of a small shoot of the bearing tree. The cuts should be of an oval shape and deep enough to remove the bark, and a very little of the woody part; then the two cuts are accurately matched together so that the bark of the scion shall join the bark of the stock. Then bind them together with soft lamp wick, but not too tightly, cover with wax, and in about six weeks they will unite and commence to grow when the scion should be cut from the bearing tree, and the process is complete. There is a third mode of grafting called budding or inoculation which cannot be described without a woodcut, but the quickest and easiest and most certain is by inarching. Before leaving the subject let me again urge the importance of enriching the ground intended for an orange grove. For without this you are sure to be disappointed in the result. Almost any kind of animal manure is good. If sandy peat can be procured burn it and mix the charred remains with rich soil. Horse or cow manure makes an excellent dressing.

December, 1875.

EDITOR FOREST AND STREAM:—

So much has been written on this subject, and often with more enthusiasm than judgment, that many persons come to Florida expecting to grow rich in a few years from the profits of an orange grove, and many

of them—two-thirds, I should estimate—are doomed to disappointment. As in gold mining, we hear of instances of great success; but the failures are not spoken of. If one-half the groves which have been planted since the war had borne fruit as quickly and freely as we are told by newspaper correspondents and land speculators, the whole United States could have been supplied with oranges from Florida, and the fruit vessels could be now running to Jacksonville and St. Augustine, instead of to Sicily and Palermo. Such is my impression, after five Winters spent in various parts of East Florida. Here is the experience of a sober, industrious and intelligent Northern man, who settled seven or eight years ago in a rich hammock a few miles from Musquito Inlet. He has planted many thousands of small seedlings, and budded many hundreds of wild stocks with buds from the sweet orange, and according to all theories he ought to be at this time sitting under the shade of full bearing trees, and receiving an income of ten or fifteen thousand dollars a year—but he has not had an orange to sell. His enemies have been insects, drought, and blight, the last caused apparently by the cold north winds, which often occur in Winter. Worse than these has been the plague of bad neighbors, who have three times in six years attempted, with more or less success, to burn him out, and last Winter they succeeded in this way in destroying a fine young grove of several hundred thrifty trees. This man had been tempted by the richness of the soil to settle in a neighborhood of Florida crackers. His hogs and poultry disappeared, but that he was willing to attribute to the bears and wild cats; but these beasts, however rapacious, do not drop matches in the dry scrub, and always to the windward of the fields and groves. The moral of this is, that immigrants to Florida should settle in communities, where they can protect each other.

I have lived many years in Illinois, and I know that not all who settle on those rich prairies succeed in making themselves independent. But many do succeed, and I believe that the same amount of industry, perseverance and common sense, which commands success in the West, would as surely and easily do the same in Florida, whether it be exercised in the cultivation of oranges, figs, grapes, or sugar. I do not believe that pine apples or bananas can be grown with profit north of 27° N. latitude. I have seen many trials, but no successful ones. S. C. C.

COMMISSIONS ALLOWED GARDENERS.—A case recently before the English courts disclosed the fact that a custom prevailed extensively among nursery and seedsmen of allowing a commission to gardeners on all purchases, and we have reason to know that this custom is not confined to England but is also largely prevalent in this country. We would therefore advise all employers to do their own purchasing.

THE POTATO BUG has proved to belong to the *lumpbug* species, as potatoes are now more plentiful, and of better quality than usual, and also selling at very low prices; good potatoes are now selling in Philadelphia market in lots of not less than one hundred bushels as low as forty cents per bushel.

—On the 22d day of February next Florida will hold her first state fair.

—The Commissioner of the Land Office decides that the planting of seeds or cuttings is not a compliance with the Timber Culture act, but the General Land Office does not inquire how the required trees are produced. If seeds or cuttings produce healthy growing trees, the law is complied with. Lands containing valuable deposits of mica may be patented on mining claims. Such deposits are excepted from all railroad land grants.

—Ripe strawberries, some of them three and a quarter inches in circumference, were picked on the 13th of December, near Nevada, California, grown in the open air at an altitude of 2,350 feet above the ocean, with huge banks of snow three or four feet deep in sight, and not thirty miles distant.

The Kennel.

AN ELEGANT WORK OF ART.—The cup presented by this paper as the principal prize to be given at the Bench Show of dogs, to be held in Chicago this month, under the auspices of the National Poultry Association, will be on exhibition, during the coming week, at the New York office of the manufacturers, the Meriden Britannia Company, No. 550 Broadway. That we may not be accused of ostentation in the matter of this prize, we would mention that its magnificence is due largely to the manufacturers, who, desirous that we of this section should be represented at the West by a work of art worthy of the largest Bench Show yet held in America, have spared no expense, and gone far beyond our modest limits in its preparation. Every casting or model used in this cup is original and made for the purpose. The engravings ornamenting its panels are portraits of celebrated dogs, as are also the medalion heads which surround it, and the solid figures at its base. A more detailed description will appear in a future issue.

"LET DOGS DELIGHT TO BARK AND BITE."—Contrary to this sentiment of the poet, the Aldermen of New York have this week adopted an ordinance making it unlawful for any person to own or keep upon his premises any dog or other animal "whose barking, howling, or any offensive noise in any out-house, yard, or in the street may be annoying, disagreeable, or injurious to any person or persons residing in the vicinity." The penalty for the violation of this ordinance is \$5. The ordinance also provides that any police magistrate may order the removal "from beyond the city limits, or the killing of any such animal," upon the complaint of any two or more reputable citizen.

A great many of the old boots hitherto wasted upon disagreeable canines can now be given to the poor. One of our afflicted neighbors reports that a disreputable cur that is never seen in the day-time, comes regularly to his house to howl at night. We now recommend an ordinance to suppress Cat Concerts.

—Mr. Wm. H. Archer, of Sharon, Pa., has purchased a dog puppy named Koenig, out of the imported Irish bitch Kitty. The puppy is by the celebrated Plunket, as is, also, the dam Kitty.

DEATH OF RUBY.—Mr. Chas. H. Raymond, of Fox Farm, has met with a sad loss in the death of his pure Laverack bitch Ruby, who died on the 28th ult. of inflammation or congestion of the lungs, notwithstanding that she received the best of care, medical attendance, and nursing. Ruby was bred by Mr. Laverack, was by Mystery out of Cora, and was imported by Dr. Gantier. Among her offspring were Crown Prince (Mohawks), Daisy Dean, owned by Mr. Thos. Rodman, of Frankfort, Ky., and Diamond, the property of Mr. J. T. Blackburn, of Marshalltown, Iowa.

MR. MILNER'S DOGS.—We were asked the question, recently, whether the Irish team brought any dogs to this country with them, but from the way the query was worded understood it to apply to the returned American team, and replied in the negative. We are aware that Mr. Milner of the original Irish team brought over a pair of dogs, as we offered him a shelter for them at the time. With regard to their future disposition, a correspondent writes us as follows:—

December, 1875.

EDITOR FOREST AND STREAM:—

I write to say that Mr. Milner, of the Team, brought over two red Irish setters, and that they are, and have been since arrival, in possession of Robert Sullivan, Esq., of this city (Brooklyn).

Respectfully yours,

F. S. M.

—Mr. W. T. Harlan, of Barnesville, Ohio, has just received a brace of red Irish setter puppies out of the imported Irish bitch Kitty, by her sire Plunket. The puppies, a dog and bitch, are named Khan and Katrine.

SETTERS AT BIRMINGHAM.—"Peverill," in *Bell's Life*, thus describes the winner at the late great show at Birmingham:—

"Amongst the English setters were some well worth notice. Messrs. Furness and Sudall's Dash is a beautiful dog, but I fancy too small, as all the present generation of the same breed are. Dash is darker in color than most of the blue beltons. His head is short and not well cut, nothing like his brother Peter's, but with this exception he beats that dog, for he has more bone and is slightly bigger. His sides are too flat. With these exceptions he is one of the best dogs which have come out for years; he has, notwithstanding the want of spring in his back ribs, a good back and no lumber anywhere. His brother Peter is a lighter and, in my opinion, nicer color. He is very like Dash in shape, and I could not see how one could win without the other getting second at Birmingham, so, utterly different is the type of these dogs from that which was second, that it is certain they cannot both be right. I should have no hesitation in declaring strongly against the hollow-backed, long-loined, out-at-elbow type, but that I see your reporter is against me. But to return to Peter, I see some one has called his head bitch-like. Were I his owner I should try and breed them all bitch-like then. I thought it most beautiful. His neck is shorter and thicker than I like them, and he has the same fault about the back ribs as his brother Dash, but with the same powerful back, a combination not often seen. I do not know whether either of these young dogs is yet a sire, but they cannot fail in that respect, their sire, Pride of the Border, having done well at the stud, and their dam, Belle, being one of the best bitches that ever won at Birmingham, and a Dash and Moll too. Mr. Fletcher's Dash has distinguished himself as a sire of winners at Field Trials. He is a big, strong dog of blue belton color, but is of a different type to the Dogs just described; he is taller and not so long, with good shoulders and quarters, nevertheless. He has more bone, and is, unfortunately for him, thicker through the chest, but his thickness is carried well back, and he beats Peter and his brother in the back ribs and loin and in power behind. His head is not nice; it is badly cut under the eyes, and his ears are set higher than they should be; but a dog which can get a Sam and a Diamond in one litter ought to be remembered, and would, no doubt, if his pedigree was not kept a secret, for which there can be no object, as he is known to be a Laverack."

FATAL DISTEMPER AMONG DOGS.—The Hamilton (Canada) Times says: A well-known dog fancier informs us that a distemper resembling the epizootic is committing ravages among dogs in this city, and that some very valuable animals have died. He himself has buried four thoroughbred imported setters, thus sustaining considerable loss. Two veterinary surgeons pronounced the distemper to be contagious and fatal, owing to the choking up of the breathing tubes and lungs with matter. The disease commences with a cold and runs its course in a day or two, few or no cases recovering if remedial measures are delayed. It is recommended that as soon as a dog loses the brightness of his eyes, refuses to eat, and looks ill, he should be given a small dose (say half a teaspoonful) of sweet nitre in milk, because this medicine has been found to be good in checking the distemper. If the animal is sufficiently valuable the assistance of a veterinary surgeon should be secured. It would be well if owners of dogs bore this in mind and made endeavors to protect their pets from the contagion.

DISTEMPER IN DOGS.

PORTLAND, Me., December 13th, 1875.

EDITOR FOREST AND STREAM:—

I saw in your last number that some correspondent recommends garlic as a preventive of distemper, and should be glad to hear of cases—if there are any—where it has worked a cure. The remedies for distemper are legion, but the cures are few. I do not pretend to be an expert in the treatment of this disease, but unfortunately have had a good deal of experience therein, both in my own kennel and those of my friends, and have tried, or seen tried, most of the "popular remedies." I have come to the conclusion that the safest cure is good nursing—i. e., clean bed, warm quarters and careful diet—generally a low diet, rice I prefer in the early stages, and in the latter stages, when the dog is dying from exhaustion, strong beef tea in small and frequent doses, with no solid food. Of course these are simply general rules. The particular treatment of each case must vary with the symptoms, and I have never yet seen two cases of distemper where the symptoms were alike, or where (in several cases) the treatment should be the same. I would only say to the unfortunate owner of a dog suffering from distemper: Don't kill him with nostrums, but nurse him carefully, and if he has a good constitution he will probably recover.

As to garlic, I have never tried it for distemper, but know that it is a

good remedy for the common maw-worm (*Ascaris vermicularis*), but my self prefer Indian Pink (*Spigdia Marylandica*). The areca nut I have never seen tried, and only know it through the columns of your paper, and through "Stonehenge's" "British Rural Sports," well called the "Sportsman's Bible." He recommends it for the common red and white worms, but doubts its efficiency for the tapeworm. I wish, as you are distributing the areca nut generally, that you would send me a small modicum thereof, that I may try it personally. Why does not some one write a book on "diseases of dogs and their treatment?" It seems to me there is a wide field open, and that Dinks, Mayhew, Hutchinson, etc., are now behind the age of modern discoveries. (This is a hint to your Kennel Editor).

MAC.

If all those having dogs affected with distemper would carefully follow the suggestions of our correspondent many valuable dogs would be saved, particularly during cold weather. We have scarcely ever known a dog to recover from that disease unless he was kept comfortably warm. In regard to the areca nut, we have assurances from persons in all sections of the country, to whom we have sent it, of its wonderful good results, not only in cases of common red and white worm, but also in cases of tape worm. Nothing but the want of time has prevented us from publishing such a book as you mention.—Ed.

SAVANNAH, Ga., December 30th, 1875.

EDITOR FOREST AND STREAM:—

I send you a receipt which was given to me by an ardent sportsman and physician, Dr. J. M. Schley, (now dead), for the cure of distemper, and in all cases where the medicine was given in time, and no other drug used to interfere, have never known it to fail: First, make the dog comfortable in his kennel, by cleanliness and bedding, and feed with proper strengthening food—(strong beef soup). If he will not eat, pour it down his throat, for his strength has to be kept up to resist the disease. Then give, according to the strength of the dog, from five to ten drops tinct. nux vomica in a saucer of water, alternating with tinct. aconite, given in same way and same dose, each three times a day for one week. By that time you will find the discharge from the nose more thin. Then smoke the dog's nose with tar and feathers, to entirely remove the ball of mucus that clogs the brain. After that stop the other medicines, and give ten drops three times a day for one week of tinct. pulsatilla, to dry up the discharge. If the above is carried out, you will not fear the distemper.

G. T. N.

[Distemper in dogs appears to be more difficult to cure of late years than formerly, and we are frequently appealed to for a remedy. The above recipe we consider well worth a trial.—Ed.]

ARECA NUT FOR WORMS.—Our Boston correspondent, "Nimrod," says:—

"I have tried almost every remedy known to canine therapeutics, but have found nothing equal to the powdered areca nut for the relief and cure of worms among my dogs. I have seen it mentioned several times in your paper with favor, but too much cannot be said for it. Its action is quick and decisive. It is a sure cure for that annoying disorder, worms, so common among our canine friends."

LAVERACKS IN AMERICA.

LONDON, December 17th, 1875.

EDITOR FOREST AND STREAM:—

Although it is your wish to see the end of the controversy on the ownership of Fairy—a matter of no importance to anyone—I must beg for space to defend myself as publicly as you have allowed me to be attacked in your paper.

Your remark, that Mr. Laverack has corroborated your correspondent, seems to me unjust. Your correspondent said Fairy was "never the property of Mr. Llewellyn." Mr. Laverack says, "never was out and out the bona fide property of Mr. Llewellyn." This is qualifying the former, and in as much as Mr. Laverack has an interest in half her puppies, as I told you in my former letter, is perfectly true, and I confess it would have been more correct to have given you the history of Fairy, when I had occasion to name her, but life is too short for such extreme accuracy about trifles.

I have just disposed of a brace of setters to an old friend on condition he shall never get rid of either of them. Were I to say the dogs were not his property, it would be ridiculously untrue, and analogous to your former correspondent's statements, but were I to use the words, Mr. Laverack has qualified these statements with, it would be true enough.

In writing you, I had no intention of doing more than show the true state of things with regard to Laverack setters. If Mr. Laverack chooses to take offence because a man gives his experience of the various breeds of dogs he has thoroughly tried, he can do so; of course it is nothing to me, but allow me to say, had I intended to attack Mr. Laverack, which, contrary to his assertion, I have never done, either in England or America, or anywhere else, I should not have done so by attacking his dogs, but himself, in a way which, now that he has attacked me, I shall consider myself at liberty to do, although he is a very old man. My only reason for having kept dark what I know, and can prove to his disadvantage, but since he sneers at me for attacking him (as he calls it) so far off, I will indulge him, when I begin, in England.

Mr. Laverack thinks I attack Mr. Raymond's dogs. Why, I don't know, I merely gave that part of the history of Fairy and Pride which it appeared to me Mr. Laverack had kept dark, that history was as much to the advantage of Fairy as the reverse to Pride—where was the attack? I showed one had been successful, the other unsuccessful, at English shows.

Mr. Laverack says I know nothing of Pride. I saw him out at Mr. Laverack's place, in his field, and saw what his action was. I know nothing of his work, nor did I hint that I did. I will say now what I have never said before to my knowledge. In comparison with other dogs of the breed I do not like him; he is too thick and heavy, but his stock are very beautiful when they come from light framed active bitches, like Mr. Dicken's Belle. And I have, ever since Pride has been in America, named him as one of the three best imported sires to every one I have had occasion to write to on the subject. Whether I have attacked Mr. Raymond's dogs, his friends in America are best able to let him know. Indeed, that gentleman is indebted to me through Mr. Arnold Burgess for the correction of the pedigree of Pride from Fred II. to Dash II. as his sire.

As to the best Laveracks of late years not having been bred by Mr. Laverack, I have only to say, I have only seen one first-rate animal bred by him since his loss of old Moll, that is Mr. Price's Bess. I did not intend to distort the fact into a triumph over him; if he feels it as such I cannot help it. I did not look at it in that light.

In saying it is nearly impossible to breed Laveracks, I only give my own experience, confirmed by the words of Sir R. Garth (Lord Chief Justice of Calcutta) and Mr. Statter, among all others who have spoken to me on the subject. Mr. Statter's words were: "Not half the puppies can be brought to suck the dam." I said nothing against the strength of them when reared; that is another subject.

Mr. Laverack suggests that I do not know how to mate, or breed, or rear them. Mr. Llewellyn, with the assistance I have been delighted to give him, has bred three better Laverack bitches in one litter than in any three (the off-spring of one litter) Mr. Laverack has ever bred. They are Petrel, Phantom and Princess. They have between them, though only just over two years old, succeeded in winning two first and one champion at Birmingham, one first at the Crystal Palace, and dividing first and extra cup at Wolverhampton, the only places any of them have been to.

As to its being unfair to sell Laveracks, let those I have sold them to complain if they don't like it. Not Mr. Laverack, I am, and always have been, a great admirer of Laverack setters; if I like another breed more, it is not because I like the Laveracks less, but the others better. In this I am corroborated by the only man in America in a position to judge between the two sorts; the only man who owns first-rate imported dogs of each breed, Mr. L. H. Smith, of Strathroy. He has Victress, who Mr. Laverack has often advised Mr. Llewellyn to buy, and he also has Dart, Leicester, and Paris, of the Field Trial Breed.

G. T. TEASDALE-BUCKELL.

PLURALITY OF SIRE.

December, 1875.

EDITOR FOREST AND STREAM:

The possibility of a plurality of sires has already been discussed at some length in your columns, and I will not re-open the subject, but for the very positive assertion of one of your correspondents that such a thing cannot be, and that there is a decided variation between the pups of any litter; this is due to throwing back; that the first dog to which the bitch is bred gets all the whelps of that litter, etc. Your correspondent would do well to write more modestly, or else get better posted, since every man who has had any experience in breeding knows well that superfetation is not only possible, but certain, if the two connections occur within a reasonable time. The best medical authorities of the world cite cases where this has occurred in animals and the human family, and any man can satisfy himself, if he will experiment, selecting for his sire dogs of such marked differences, both from each other and from the bitch, that the pups got by each may be easily recognized. I have seen several undeniable cases of superfetation, and unintentionally had two cases of it in my own kennel. In 1860 I owned a very fine black setter bitch. She came from a stock that for twelve years had thrown only black or black and white whelps. This bitch I bred to her own brother, belonging to a friend of mine. When he brought the dog to my kennel he had with him a white Pomeranian dog belonging to his wife. Just before leaving, this dog was missing, and we found him in the very act of connection with the bitch. From this litter came six pups—four all black setters, and two veritable Pomeranians, one pure white, and one white with a black head. Every mark of the Pomeranian sire—his size, shape of head, ears, even the cut of his tail, was faithfully reproduced in these two. This was no case of throwing back; for the stock had been owned by my friend and myself for twelve years, and in all that time the bitch had been carefully bred, and no variation from the true line had appeared in even a single instance. One of these nondescripts died before leaving the dam; the other, the white one with black head, was alive when I last heard from my friend, some seven years since. In the second instance an imported pointer bitch, which had thrown a number of fine litters, all free from marks of impure blood, was bred to a fine pointer dog, owned in my neighborhood. I owned at the time a blue squire terrier, very heavily haired, and a strongly marked dog in all respects. This dog escaped from my yard and went to the barn where the pointer bitch was kept, where some boys put them together. The litter consisted of three good-looking pointers and one nondescript, blue in color, haired so that his eyes could scarcely be seen; a long body and short legs—in fact a squire in all but size, which was somewhat too large. I kept this dog three years, till he was killed by a colt. During his life I showed him to a number of persons who knew the bitch and the dog, to which, besides my own, she was bred, and all recognized this as a true case of superfetation. I could name a number of other instances as strongly marked as these, but will not, simply because they are the very ones in which I have had an ownership; but I will say that, so certain am I of the possibility of this dual conception, that I would agree to demonstrate it in nine cases out of ten, where the connections followed close upon each other. I say this because I don't pretend to assign any time to which this impregnation is possible or impossible, and I prefer to confine my assertions within the limits of what I believe certain.

ARNOLD BURGESS.

BOSTON, Mass., December 30th, 1875.

EDITOR FOREST AND STREAM:

Dog advertisements in our sporting journals always have a certain charm for me, notwithstanding an experience of some thirty years has proved many of them to be but shadowy illusions. But Waddell has revived my waning faith, by sending me, in answer to an order, a brace of superb pointer whelps, three months old, by Old Phil, out of Queen, a Dream bitch. Good blood, surely, and these handsome pups would do honor to the kennel of even the great and invincible White house, and certainly reflects great credit upon Mr. Waddell's stock. For the benefit of my brother sportsmen who may meditate purchasing, I wish to express my sense of the very handsome manner in which Mr. Waddell has treated me, as also my high opinion of his breed of pointers. Nothing can be finer than these whelps. I believe I can the more gracefully say this, as there is not the slightest taint of puffery about it, but only simple justice to Mr. Waddell, to whom I am an entire stranger—but he did not take me in. My only knowledge of him arises from the fact that he had the good sense to advertise in FOREST AND STREAM. He has used me like a gentleman, and I wish him the success his fair dealing deserves.

UNDER GRIP.

FOOD FOR LARGE KENNELS.

POMFRET CENTRE, Conn., December 24th, 1875.

EDITOR FOREST AND STREAM:

As I proposed, I now give you my experience in feeding dogs, with the result. I do not claim that some other mode is not equally as good, or perhaps better, than mine, yet the health and thrift of the majority of my kennel will compare favorably with any within my knowledge.

To gentlemen keeping only one or two dogs, the scraps from his own table will generally furnish a sufficiency of the best of food to keep them in as good condition as any one can possibly have, and this without any seeming cost or extra outlay. But when we come to multiply in numbers, some substitute is needed to take the place of the refuse of the dining table, on account of the insufficiency of the amount required. In years past, in my younger days, I was taught to believe that Indian meal made into hasty pudding, and served with sweet milk was the proper thing to take the place of the refuse from the table, until experience taught me better. This experience cost me the loss of many a fine dog that a proper mode of feeding would have prevented. In those days my dogs were constantly getting sick, and scarcely a season passed without the loss of several, not only with the distemper, but dropsy. Palsy and blain were of frequent occurrence, and frequently terminated fatally. I then practiced feeding three times per day. They consequently often got cloyed, and were seldom thrifty in appearance. Accordingly came to the conclusion that Indian meal without animal food to counteract its tendency to produce costiveness was alone the cause of nine-tenths of the ills that afflicted my kennel. Canned meat is the most relished, and consequently the most natural food for dogs, and a certain amount of animal food is, in my opinion, absolutely necessary to secure the health of the canine race. I also found that, though a certain amount of milk was beneficial, too much milk combined with cooked Indian meal alone tended to irritate the bowels and often injured the coatings and produced dysentery in many cases.

Now, the question arose, What could I obtain as a substitute without incurring too much expense. It occurred to me that scraps would supply this want, consequently I gave them a trial, with the best results. Both pork and beef scraps are good, mixed in proper quantities in Indian meal pudding. But scraps fed alone relax the bowels too much. One part scraps to four parts meal, well cooked in hasty pudding form, constitute one of the most healthy diets, and this, with an occasional addition of sweet milk, for young, growing puppies, is all that is necessary, if properly fed, to insure both health and thrift. I would

further say that, although I often see salt recommended to season food for dogs, I never use it, believing it has a tendency to generate mange and other diseases of the skin. I feed grown dogs that are unworked but once per day, but growing puppies and hard worked dogs I feed twice.

I prefer beef scraps to pork, especially in the warm season of the year, as there is less fatty and more lean matter, and they are generally better relished by the dog. Those that are ground are most convenient to buy. They are then ready for use without the labor required to reduce the whole cakes to a proper form for use. During the winter months I buy and kill maimed and worn-out horses, and carcasses of cattle that die from accident or disease, and feed some of the meat occasionally to the dogs. Dogs kept in this way not only remain in a good healthy state, but often, if not restricted, get too fat. My dogs are kept chained to separate kennels in the open air, each one having only a warm nest of clean straw, with a daily supply of fresh water. Since I have adopted this mode of feeding I seldom have a sick dog. For the last ten years I have not had a case of distemper, palsy, dropsy, or mange requiring the least care or medical treatment. I breed my own dogs, and never use a mangy or diseased dog or bitch to breed from, nor would I allow a mangy dog yard room, however valuable he might otherwise be.

Young puppies, as soon as they are old enough to lap milk, I feed liberally with the scrap and Indian meal pudding, adding what warm milk, just from the cow, they will consume without cloying. Many are of the opinion that new milk, unless it has been previously been boiled, generates pin worms; but my experience is to the contrary—that its tendency is to expel them. I have never lost a dog by this kind of worm, and I generally raise from two to three litters per year. I let my young pups run loose until from four to five months old, and by this means get them used to domestic fowls and accustomed to outside people. My kennel now numbers sixteen setters, from five and one-half months to six years old, and one St. Bernard, all in good health and fine condition, and all reared and grown in this manner. Yours,

ETHAN ALLIN.

Sea and River Fishing.

FISH IN SEASON IN JANUARY.

SOUTHERN WATERS.

Pompano, *Trachynotus carolinus*. Grouper, *Epinephelus nigritus*, Drum (two species.) Family *Sciaenidae* (black bass,) *Centropomus niger*. Kingfish, *Menticorax nebulosus*. Striped Bass or Rockfish, *Roccus lineatus*. Sea Bass, *Sciaenops ocellatus*. Tailorfish, *Pomatomus saltatrix*. Sheepshead, *Archosargus probatocephalus*. Black bass, *Micropterus salmoides*; Snapper, *Lutjanus caxus*. *M. nigricans*.

[Under the head of "Game and Fish in Season" we can only specify in general terms the several varieties, because the laws of States vary so much that were we to attempt to particularize we could do no less than publish those entire sections that relate to the kinds of game in question. This would require a great amount of our space. In designating game we are guided by the laws of nature, upon which all legislation is founded, and our readers would do well to provide themselves with the laws of their respective States for constant reference. Otherwise, our attempts to assist them will only create confusion.]

FISH IN MARKET.—The supply of fish during the past week has been unusually liberal, the mild weather permitting active operations on the part of the fishermen. A large number of codfish have been caught off the Fire Island beach, close in shore, the fishermen using long set lines, baited with the sea clam found on the surf beach. Shad continue to be unusually cheap and abundant for the season. Our quotations vary but little from those of last week, and are as follows: Striped bass, 20 cents per pound; smelts, 15 cents; bluefish, 12 cents; salmon, frozen, 50 cents; mackerel, 20 cents each; shad 50 cents each; white perch, 15 cents per pound; Spanish mackerel, 40 cents; frost fish, 8 cents; halibut, 20 cents; haddock, 8 cents; codfish, 10 cents; blackfish 12½ cents; flounders, 12 cents; eels, 18 cents; sheepshead, 25 cents; whitefish, 18 cents; pickerel, 18 cents; perch (yellow), 12½ cents; salmon trout, 18 cents; black bass, 15 cents; green turtle, 20 cents; terrapin, \$12 per dozen; scallops, \$1 per gallon; soft clams, 35 to 60 cents per 100; hard shell crabs, 50 cents per dozen; soft shell crabs, 75 cents; pompano, \$1 per pound.

—Large catches of "Christmas fish" (flounders), have been made along the shores of the inlets at Danversport, Mass., the past week. Two persons took eighteen dozen at one run of the tide, and all have been well rewarded. At this particular season the flounders run close to the shore, and are readily taken with a dip net having red flannel fastened in the meshes near the bottom.

—Messrs. C. H. Read, of the Hoffman House, and Dr. Geo. H. Glenney, caught 34 fine pickerel through the ice on Lake Giles at Blooming Grove Park, last week. The Club House is open all the year round.

—The latest news from Eastport, Maine, reports the winter fishing there almost entirely a failure. Over sixty vessels are there, but none have a cargo. There are no herring between that port and Back Bay.

—It seems to be certain, from absolute statistics shown, that the Canadian fishermen, so far from having suffered under the Fisheries Treaty, have been largely benefited by its workings. The profit is on their side; the Yankees have the worst of the bargain.

—That veteran angler, Geo. Dawson, Esq., of the Albany Journal, than whom few ever whipped a trout stream more deftly, has been discoursing charmingly in a few brief chapters upon his last Summer's vacation, passed beside that famous Canadian salmon river, the Caspapeda. Discoursing as veterans do who have grown old in the service which early engaged their heart and enthusiasm, he holds out his hands toward the great father of anglers, conscious that the lapse of years is carrying him on toward the time that bounds the "land of ailments and decrepitude," and exultantly says: "It is the glory of the exhilarating art that its devotees never grow old. The muscles may relax and the beloved rod become a burthen, but the fire of enthusiasm kindled in youth is never extinguished."

Of the pursuit of angling he avers: "There is nothing so invigorating as the pure air of the mountains; nothing so soothing, after the toil and worry and fret of business, as the silence of the woods; nothing so pervading in its mellowing influence upon nerve and brain and spirits as the pleasant murmurs of the flowing river; nothing so

health-giving as the aroma of nature's grand forest laboratory; and nothing so exhilarating as the rise and swirl and rush of trout or salmon."

It is satisfying to hear such testimony from so great a witness. It should stir the desires of those who have never experienced a longing for such pure and unadulterated beneficence: "Angling scatters no seeds from which the nettle of remorse may grow to sting the conscience or drive sunshine from the heart; but like the unclouded friendship of youth, it leaves only joyous memories." It is true enough that the pleasure of angling does not lie in the mere catching of fish. "Half the pleasure and nerve of camp life," he says, "depends upon where you pitch your tent. Whoever has imbibed the gentle and poetic spirit of the old masters must have pleasant surroundings or they soon weary of the sport. To enjoy the pastime in full measure there must be rapid and cascade, rock and mountain, forest and flower; song-bird and murmuring waters. The rise and strike and play of a mammoth trout or salmon is to the angler what the stir and bustle and push of commerce is to the man of business. They give buoyancy to the spirits; elasticity to the step, activity to the brain, and a quicker flow of the life-currents of the whole system. But this season of busy activity finds delightful relief in the quiet repose of a pleasant home. The tug and swirl and lusty play of a twenty-pound salmon thrills the nerves like an electric current, makes every muscle tingle with ecstasy, and sends the blood coursing through the body as if each particular vein was the highway of an aurora borealis. But even in the midst of the fierce struggle his eye takes in the scenic beauties with which he is encompassed. He sees the deep pool encircled by the white foam of the swift moving waters; the ponderous boulders which rise like water-giants all around him; the foaming rapid whose approach is as smooth as glass, and which reflects back the sun's rays like a polished mirror; the luxuriant foliage which fringe the stream and which is re-produced in even richer hues by the transparent water into which it casts its refreshing shadows; and the cloud-capped hills which are around him 'as the mountains are round about Jerusalem.'"

—Capt. N. W. Beckwith, who is pretty well known as a story teller by this time, contributes the following incident for our Angler's column. It tells how Billy Smith ketched it for going a-fishing on Sunday:—

"B-b-b-billy, S-a-sa-mith was, as he used to say himself, the 'cuc-cuc-ussidest s-s-s-t-t-t-utiterer between the t-t-to hoo-h-h-oceans.' However, his defective speech is less the subject of consideration herein than a certain angling feat of his in boyhood's happy hour. It was on a certain calm and holy Sabbath, when the village bell's were summoning to the sweet hour of prayer, that Billy Smith, instead of going reverentially to Sabbath school, went off a-fishing. Now, Billy was the son of a godly man—a good, pious deacon, too, which enhances Billy's enormity beyond measure. He cribbed the old man's chalk line, attached thereto a trout hook, stolen the day before from Tommy Jones (who always went to Sunday school), crammed the pockets of his go-to-meetin' pants with nasty, muddy angle worms and odoriferous sow bugs, skeddaddled over the back fence, levanted up the pasture, whooping like an Injun—and all to go a-troutin' on that holy day, like the unregenerate boy he was. Let no reflections be made upon the memory of Billy's puerile, pious reader. As deacons do, he has tried his level best to bring 'that boy up' in the way he should go—and this was the result! But then the old man's name was also Billy, and he stuttered, t-t-t-t-too. Deacon William went to meetin'. There he discovered that William, Jr., was not amidst the congregation. Then he instituted an inquiry; which elicited the fact that his hopeful progeny had'n't been to Sunday school, either. Then the deacon swore

—as deacons do,

With an "I do yum," and an "I tell yeou,"

that he'd make it lively for Billy when he did come to time, by which the reader will infer—as the culprit himself might have done could he have heard his wrathful sire—that the best thing for him, under the circumstances, would be not to come to time. But he, all unconscious, pursued the even tenor of his way along the brook side, and didn't even tumble in once, let alone getting drowned, as he should have done, to point the moral and adorn the tale of the Rev. Brimstone Blueblazes' next contribution to the literature of the Sunday school. But such is the way of the transgressor. No, not a darn tumble did Billy tum. He didn't so much as tangle that solitary hook in his trousers, or have a 'judgment' of any sort fall upon him that was worth the expense. But he just dived into the bushes, yanked out an alder rod, slapped the old chalk line on to the end of it, rove a squirm along the hook, and went to snaking out the trout at a rate unparalleled since the days of Izaak Walton. Such luck as that graceless young reprobate met with! Six mortal hours of steady killing punished him for his sin. At the end of that time, tired, splashed, muddy, hungry, and happy he desisted from further sport, and reckoning up his catch, found that he had taken no less than twelve dozen red spotted beauties. Then Billy shouldered his string and trudged homeward, trusting for a continuation of his good luck to slip into the house unobserved, and get behind marm before dad knew anything about it. But it was not so to be. 'Dad' was on the watch for the Sabbath violator, and as he stole miching up the back lane, rose suddenly before him, armed with a rod of a different complexion. 'Woo-o-o-o-illyum!' thundered the outraged deacon, 'cuc-cuc-come here! I'll larn ye t'go a tut-tut-ut-ut-r-r-r-outin' on a Suttin-uttin-n-n-unday. H-h-heow many did ye kek-kek-etch, hey?' 'Tut-tut-welve didd-oden, didd-addy.' 'Twelve dozen! Gee whiniger! that's a smart boy! Go in, my son, and tell yer mar ter cook ye some fur yer s-s-nittin-itten-titten-n-n-n-upper.'"

N. W. BECKWITH.

NEEDLE POINTS.—Here is some gratifying testimony for Seth Green's fish-hooks:—

ENGLEWOOD, N. J., January 1st, 1876.

EDITOR FOREST AND STREAM:

Uncle Seth Green is not far wrong about needle hooks. In times past I used them frequently for taking goldfish for the home aquarium, and rarely missed a fish with one after he once bit; besides, the fish thus taken thrived much better than when caught with a barbed hook, as it inflicted a much slighter wound, and the fish were taken off with little or no handling. I have also taken perch in some of our Long Island ponds in a similar manner, and with much success. I prepared my needles by burning over a lighted paper, when they were easily bent the required shape.

G. M. FAIRCHILD, JR.

DOINGS OF THE FISHING FLEET.—During the past week there have been ten arrivals of the fleet—five from La Have Bank, three from Western Bank, and two from Newfoundland, with salt herring. The receipts are 135,000 pounds of codfish and 49,000 pounds of halibut. The latter were sold at 15½ and 10½ cents for white and gray.—Cape Ann Advertiser, December 30th.

FISHES AND FISHING OF THE GREAT LAKES.

FOURTH PAPER—BASS, PERCH, HERRING AND SUCKERS.

EDITOR FOREST AND STREAM:—

PERCH abound in all waters except mere brooks, and are constantly caught, but never preserved in any way. They are taken in incredible quantities with hooks and spears, and with so much facility that even children hook them with bent pins, and spear with sharpened rods. By the way, do any of the readers of the FOREST AND STREAM know anything of the poisonous properties of the first dorsal fin of the perch? I have met, in a professional way, with several such cases, and all quite severe; in one case causing the loss of the hand. It is always the sharp spines of the first dorsal fin that causes the trouble; so say fishermen.

Of bass, there are several varieties caught the year round, the black bass (*Grystes fasciatus*) being the most prominent. The St. Clair Flats furnish excellent bass fishing, and are annually resorted to by numerous sportsmen for the purpose and the pursuit of wild fowl. The black bass is a very active and voracious fish, with large hard mouth, and is very gamy. The average weight is from three-fourths of a pound to three pounds, occasionally "kicking the beam" at six and seven. Their food, when small, seems to be worms, minnows, and insects of all kinds; when older, the smaller varieties of other fish, although they never abandon entirely their early habits. In the Winter, the bass retires to the deep, still waters, and apparently hide under rocks and logs; anything, in fact, which will afford them shelter, and there remain until about the 1st of April, when they ascend the small streams to find suitable places for spawning, which commences about the middle of May, varying a little, according to the warmth of the season. When this event is about to take place they separate into pairs, male and female, and together seek some retired place or nook where the water is about eighteen inches in depth, and still, but adjoining deep water.

The herring (*Argyrosomus harengus*) is probably the most numerous of all lake fishes. This may be accounted for in part from the fact that they are least sought after by fishermen, as they are not a favorite fish in the market, and the low price and expense of dressing is so great that the profit is far less than on other fish. Lake herring, when smoked, are far superior to those of salt water. As these fish are spawn eaters of the worst character, and in conjunction with suckers and sturgeon are always hovering after whitefish during their spawning season, the damage done by them is incalculable. As herring spawn about the same time with whitefish, it is not uncommon to find the spawn intermingled.

The lake suckers (*Catostomus*), though presenting many things in common to the inferior fish of the same name of most western rivers, are very superior in quality for eating. To avoid the ill-repute attached to the name sucker, they are usually sold under the name of lake shad, a name founded merely on caprice and for the purpose of fraud, for they are not supposed to bear the least resemblance to shad. Suckers are usually taken with seines, early in the Spring, at the mouth of rivers and creeks. They frequent particular shores in June, but whether for spawning or some other purpose I have been unable to ascertain. They are taken in enormous quantities, and often secured for fertilizing purposes alone.

The annual capture of fish of all kinds is almost incredible. I hoped to obtain positive statistics, but find it impossible. The amount passing through first hands, as reported by Mr. Milner, is upwards of thirty-two million of pounds, with a value of one million six hundred dollars.

ARCHER.

PRODIGIOUS SALMON SCORES.

NEW YORK, December 27th, 1875.

EDITOR FOREST AND STREAM:—

In FOREST AND STREAM of last week I read that the guardian of the River Godbout took in one day's fishing fifty-seven salmon, weighing six hundred and thirty-four pounds, an average weight of about eleven and one-eighth pounds. Do the people who furnish these reports expect that they will be believed by any one who has been salmon fishing? Some time since I ventured to ask an explanation of these immense scores, *apropos* of the feat accredited to Mr. Gilmour, forty-six fish in one day, and after a little cyphering, raised the question whether salmon had not been overestimated as a game fish, if they could be body-snatched at any such rate. Premising that from some experience on another stream, I know that this explanation will not hold good. Let us examine this last fish story in the light of a little common sense and arithmetic, and see how it looks.

Suppose the angler to be a very strong man and capable of wielding his salmon rod for twelve hours in the day. Every one who has had experience knows that a salmon is not hooked at every cast; that not every fish that is hooked is landed; that in catching fifty-seven fish there must have been a good many changes of fly, renewals of casting lines, and other things to reduce the time actually consumed in killing the fish. One hour would be a very moderate allowance for all this. We have then eleven hours left for taking fifty-seven salmon, averaging more than eleven pounds, or at the rate of more than five per hour, or less than twelve minutes for each fish. Is not the absurdity of such a story palpable? Of course we know that much larger fish than these are sometimes killed in as short a time; but, on the other hand, some would fight twice or thrice as long. I say, then, that it is not possible to hook and kill in one day the number of fish of the weight stated. It is almost incredible that a man should have strength and endurance to go through such a day's fishing, if it were otherwise possible. And if the story were true, how would you like to have such a guardian on a river of which you were lessee?

LITTELL.

It seems to us that the points of our correspondent are very well taken. We venture no further criticisms, although we observe that there is a remarkable agreement or correspondence in several of the published scores, as respects magnitude of weight and number. For comparative scores, see FOREST AND STREAM, vol. 1, 363 and 412; vol. 3, 70 and 108; vol. 4, 408; vol. 5, 117.—ED.]

—Upwards of seventy-five deer have been slaughtered in the vicinity of Elizabethtown, New York, through the Fall months.

OUR FISH AND GAME.—In conversation with the old inhabitants we are informed that there is a great falling off in the supply of fish from what it was a few years ago. This they attribute to the use of gill nets, and the fish being caught out of season. We have ourselves seen mullets caught for the purpose of extracting the roe, the flesh being thrown away. Schools of mullets have been blown up by torpedoes, the dead bodies floating about the river in a putrid state. The destruction by birds, sharks, and porpoises is prodigious, and this, with the help of man, is lessening our supply of cheap food. Our lakes and rivers are public farms, furnishing us with nutriment without any labor, except that of gathering it. They should then be protected by the public. There is already a law in existence to that effect, but it does not cover the matter sufficiently. The fish should be protected in the breeding season, and their catching and sale at those times prohibited. The sorts of nets used should be defined by law, and certain kinds prohibited, and the seasons defined. Those who are now occupied in the fisheries should call a convention, and consult as to the best manner of protecting the fish, or they will find that their business will decrease year by year.

As with fish, so is it with game. They are killed at all times of the year. Quail can be seen on sale in our market in the breeding season. Deer are killed at the same time, and it is no unusual thing to see a hunter carrying a young fawn in his arms, while the carcass of the mother is hanging across his saddle, and others are shot when in young. Other States of the Union have found out too late the injury they have suffered by not protecting their game, and are now turning their attention to it. We must not be behind hand, but take care to protect ours in good time.—*Florida Agriculturist*.

Don't fail to buy a copy of "CAMP LIFE IN FLORIDA" before going South. It is a hand-book for settlers, tourists, and invalids, as well as for sportsmen. Appleton's *Journal* says: "Its title, suggesting as it does, a simple narrative of adventure, does scant justice to a very useful book."

HERBERT'S GUN.—Our special correspondent, M. M. Barker, has picked up an old relic of Frank Forester's at Hollidaysburg, Pa. He writes:—

"H. S. Van Tries, Esq., of this place,—by the way an accomplished sportsman—has in his possession a veritable gun of 'Frank Forester,' which was presented to him by Maj. J. W. Duncan, of Pittsburgh, who advanced \$100 on it. Poor Herbert! like many other men of genius, he was afflicted with impecuniosity and could never redeem it. It is a double barrel muzzle loader, 30-inch barrels, No. 15 gauge, platinum vents, free bar locks and box triggers. It is handsomely engraved, having as many as nine pointers and setters on the locks and mountings. The maker was 'James Spurling, gunmaker to the Royal Family, England.' Your veteran Kennel Editor, H. S., will quite likely remember the gun by the description, as he has probably many a time had a tilt with Herbert through the fields and marshes in Jersey. The case is of solid mahogany, with solid brass corners, lined with morocco, having the name of Henry W. Herbert elaborately engraved on a brass plate on the cover. The whole has been preserved with great care and attention, and is as good to-day as when it was parted with, and will continue so as long as in the possession of one who almost defies the name of 'Frank Forester.' Its shooting qualities are pre-eminently superb, as it is pronounced by the owner, who has challenged, at divers times, the best guns in this section of the country. From the kit of implements connected therewith I secured a relic which I shall bear home to H. S., who, I am impelled to believe, will prize it highly."

Answers To Correspondents.

No Notice Taken of Anonymous Communications.

TRAPPER, Altoona, Pa.—What can I buy an Irish setter pup three months old for? Ans. For \$20; address H. Smith, at this office.

JENLENS.—Spearing is an art to be learned only by practice, as the refraction in the water always makes a fish appear to be where he is not.

J. L., Kanawha, Va.—The price of "Camp Life in Florida" is \$1.25. If not sold by your book dealers, it can be obtained at this office. Dealers are supplied by the American News Company.

N. P. L., Montreal.—In your Answers to Correspondents will you kindly give me the address of the Commissioner of Fisheries for the State of Vermont? Ans. M. C. Edmonds, Weston, and M. Goldsmith, Rutland.

J. S. W., Gloucester, Mass.—The inclosed pearl is a specimen from a large number in my possession. I send the same to you in order to find out its value and the species to which it belongs. Ans. This is simply the inner layer of some nacreous shell—perhaps the pearl oyster—and has no commercial value of consequence.

J. J., New York.—Please decide the following bet: A and B are throwing dice (raffles). A throws two sixes and an ace; B throws two fives and a four. Who wins? Ans. In throwing raffles the highest pair wins. A, therefore, wins, in the same manner as though he held a pair of sixes against a pair of fives in playing poker.

H. B. S., Chestnut Hill, Mass.—Please give me the address of the company which manufactures and sells the Ballard rifle. What is the best calibre for a rifle for all kinds of shooting, *viz*: hunting and target practice? Ans. 1. Messrs. Schoverling & Dal'y, No. 84 Chambers street, are manufacturing the Ballard rifle. 2. 44-calibre.

C. W., Danbury, Conn.—1. I wish to inquire of the standing of the Barber gun, made at Syracuse. 2. The gun offered at \$35—what is the length, weight, calibre, etc.? Ans. Barber & LaFevre, of Syracuse, are good reliable gunmakers. 3. The gun at \$35 is a second-hand Whitney breech loader, 12 gauge, 30-inch barrels, and weighs about eight pounds.

H. G. FOWLER, Auburn, N. Y.—1. The nearest point at which you would be tolerably sure to find the Bohemian waxwing at this season is among the highest Adirondacks; but if cold weather and deep snow come together, you may find a few in your own region. If so, let us know. 2. For a taxidermist in California, address C. A. Allen, Nicasio, Marin county.

HENRY, Syracuse, N. Y.—I think of having a Whitehall boat made here. How can I get a model to work by; do you think this the safest boat made for family use; and have you any illustration showing the shape of said boat, as there is none here that I know of? Ans. Address Messrs. Ingersoll & Co., boat builders, No. 159 South street, for price list, which probably contains model. No. safer boat.

J. L., Quebec.—I see that P. Powell & Co. advertise a \$21 gun. What do you think of it, and have you ever seen any of them? Ans. The gun you allude to is said to be cheap at the price, but it will be a long time before any practical knowledge of their safety can be obtained from us. Such low-priced guns may be entirely safe, but we intend to rely upon the judgment of others as to the certainty of it.

H. W., Chicago.—Is the Remington double shot gun a choke bore, and if so, could I use Ely's or Kays' shot cartridges in the same, and where can the latter be bought? Ans. The Remington gun is not choke bored; but their 12-gauge guns could be choke bored by almost any good

gunmaker. Ely's and Kays' shot cartridges are sold by all gun dealers advertising in our columns. A gun properly choke bored does not require any kind of concentrators.

P., Peterboro, Canada.—Kay, in advertising in FOREST AND STREAM his concentrating cartridges, says: "No creasers, turners, or toproads required," and in his printed instructions for their use says; "Ram down with the rabbetted end of the loader, and invariably crease or turn the shell in." How is this thusly? Ans. In shooting light loads we have found Kays' concentrators to answer very well without the shell being creased or turned down; but in shooting heavy loads it is better to crease or turn down the shells.

J. H. K., Bayfield, Wis.—What has been the result, financially, of raising brook trout in private ponds and streams to those who have engaged in it for making money? I own large tracts of land, through which run magnificent streams that abound in brook trout, and have been tempted to try the experiment for its financial advantage, but have been told that it will not pay. Ans. Testimony is quite conflicting on this point. The preponderance of evidence is to the effect that more money can be made by raising fry for stocking other ponds than by growing fish for the table or for breeders.

BRECH LOADER, New York.—1. What length and weight barrels are preferable for 10 bore, for general shooting? 2. Are pistol stocks any better than old style? 3. Which is the best material for shells, metal or paper, as far as shooting qualities are concerned? Ans. 1. 30-inch barrels and about eight pounds weight. 2. With large guns and heavy loads the gun may be held firmer in pistol grip; but for guns of eight pounds or under, we would not recommend it. 3. There is very little difference between metallic and paper shells as to the shooting, if both are loaded properly. We use paper shells because we do not care to reload them. For ducks and large game, metallic shells are generally preferred; and then they are less expensive.

F. G., New York.—I have a hound of rather questionable parentage that runs so close to any unfortunate deer he may find that when it reaches water, which is generally done without much time being wasted, the dog is at its heels, and plunges in without paying the slightest regard to distances. Fearing the dog will some day be drowned in a vain endeavor to follow a deer across the Atlantic, I should like to know how to put a stop to this little nautical amusement of his. Is this a common thing for a hound to do, or is it only a common hound that would be guilty of such a thing? Ans. It is no unusual thing for hounds to follow deer into the water, and if your's contemplates a trip across the Atlantic, it would be well to provide him with one of Capt. Boyton's swimming suits.

G., New Bedford.—Which target, Wimbledon or Creedmoor, is now most generally used in America; which is now used at Creedmoor, and please state the dimensions of each. The reports of matches puzzle me sometimes by not stating which target was used. Ans. The target now generally used throughout the United States, and which was adopted at Creedmoor last year, is what is known as the "new Wimbledon," having circular bullseyes, centres, and outers; instead of the old square ones. The sizes are as follows: Up to and including 300 yards—bullseye, 8 inches in diameter; centre, 24 inches do.; inner, 46 inches do.; outer, (square), 4 feet by 6, or rest of target. Over 300 and including 600 yards—bullseye, 22 inches in diameter; centre, 38 inches do.; inner, 54 inches do.; outer, 70 inches. All distances over 600 yards—bullseye, 36 inches in diameter; centre, 54 inches do.; inner, (square), 6 feet by 6; outer, 6 feet by 12, or rest of target.

OLIVE, St. Louis.—Has a Remington rifle 44 cal. He asks: 1. Can I reduce charge in order to make hunting rifle of it? Orange Lightning, No. 5, fills the shell nearly full. 2. What is the best grade and weight of powder? 3. What is the weight, length and shape of ball? 4. Is patched or cannellured ball best? 5. My shell has a movable anvil, liable to lose on extracting primer. Is there a better one made, and who makes it? Would a nicked shell work well? 6. How far will Winchester rifle, new model, shoot accurately? Ans. 1. Use 50 or 60 grains. 2. We prefer FG Orange rifle, instead of Orange Lightning, which is almost too quick. 3. A conical ball, weight about 400 grains, 1½ inch in length; 4 either would answer; patched would do best. 5. The Union Metallic Cartridge Company make a shell having primer fastened to a cross bar instead of anvil; the Remingtons are making similar ones, we understand. 6. Good shooting has been done with it up to 500 yards.

SUBSCRIBER, Columbus, Ohio.—Six gentlemen—one gunsmith, two boss machinists, one jeweler, one hardware and tin and stove merchant, and the undersigned—all, more or less, experienced men, have "cussed" and discussed the "D. W., Chicago," article 5th, in your Answers to Correspondents of last week, and all agree that the large bore gun shoots the strongest; yet insist that, all things being equal, the large bore will recoil more than the small bore—just the reverse of what you have it. What say you now? Ans. All we have to say is, that we have shot with all sized guns, running from ¼ up to 18 gauge, but never have tested them carefully as to recoil, being well convinced that in all modern guns the recoil depends upon the quantity of powder, shot and wadding used. If the gun is properly loaded, the recoil is of no great consequence. Those persons who complain so much about recoil are bunglers, and use too much powder or lead for the size of the gun.

J. H. D., Nashua.—I have a very fine English setter dog, 2½ years old, well broken in the field, but he has got the habit of running away from home, and will not come back. I have to keep him tied all the time. I have thought of castrating him, but am afraid to, for fear it will spoil him for hunting. What do you advise? Ans. We have occasionally been afflicted with dogs given to the bad habit of running away from home to hunt on their own "hooks," or for some other purpose, but have broken up their "little game" by investing a shilling or two in a four-foot rawhide, and placing it in the hands of one who would catch the dog from home, and give him a good baker's dozen the full length of his back. No dog will often leave the protection of his home, if this remedy is properly administered. The other remedy you suggest would, in all probability, in a considerable degree, destroy his usefulness in the field.

SINBAD, New York.—My friend's setter will stand over a warm trail, and nothing will induce him to go ahead, unless his master takes the lead a step or two and urges him, when he will move on, but so slowly, by reason of the extreme caution he appears to exercise, that after passing over a hundred yards of ground and seeing no birds, one's impatience begins to be aroused. In some instances he has trailed birds in this way 300 yards. This behavior on the dog's part is a sure sign we shall see birds. But is not he too slow? He has had no training to speak of, but seems to know his business as well as the "collegians" when he gets where the birds are. Ans. It is not an unusual thing for a pup or young dog having a fine nose to be too cautious in approaching game; with such, a little time and work on game gives them confidence in themselves, and the difficulty is overcome. But when this trouble exists in aged dogs, the shooter must have more patience than ourselves to continue to shoot over him.

R. A. S., Doylestown, Pa.—We have a lemon tree, now about twenty years old, and five years ago changed it from its earthen pot to a wooden box. We tarred the box inside, and set the tree, dirt and all, into the box. Just before Fall it withers up, but does not freeze, and we have to keep a fire where it sits in Winter. What is the matter with it? 2. Is there any law to prevent shooting pike in the Spring, when they are rutting? 3. What kind of bait can be used instead of live bait for fishing for pike through the ice? Ans. 1. Old age is probably the difficulty. Possibly by pruning some of the superfluous roots you might induce a healthier upper growth, but your tree is undoubtedly past bearing. 2. There is no law to prevent the shooting of pike, except during the close season, which is from the 1st of March to the 1st of June. 3. In Lake Huron, where pike fishing through the ice is carried on very extensively, a wooden lure fish, or a herring prepared for the purpose, is used; but then a spear is used. We should think an artificial minnow might answer.

A WEEKLY JOURNAL,

DEVOTED TO FIELD AND AQUATIC SPORTS, PRACTICAL NATURAL HISTORY, FISH-CULTURE, THE PROTECTION OF GAME, PRESERVATION OF FORESTS, AND THE INSTRUCTION IN MEN AND WOMEN OF A HEALTHY INTEREST IN OUT-DOOR RECREATION AND STUDY.

PUBLISHED BY

Forest and Stream Publishing Company.

17 CHATHAM STREET, (CITY HALL SQUARE) NEW YORK,
[Post Office Box 2832.]
127 SOUTH THIRD STREET, PHILADELPHIA.

Terms, Five Dollars a Year, Strictly in Advance.

A discount of twenty-five per cent. allowed for five copies and upwards.

Advertising Rates.

In regular advertising columns, nonpareil type, 12 lines to the inch, 25 cents per line. Advertisements on outside page, 40 cents per line. Reading notices, 50 cents per line. Advertisements in double column 25 per cent. extra. Where advertisements are inserted over 1 month, a discount of 10 per cent. will be made; over three months, 20 per cent; over six months, 30 per cent.

NEW YORK, THURSDAY, JANUARY 6, 1876.

To Correspondents.

All communications whatever, whether relating to business or literary correspondence, must be addressed to THE FOREST AND STREAM PUBLISHING COMPANY. Personal or private letters of course excepted.

All communications intended for publication must be accompanied with real name, as a guaranty of good faith. Names will not be published if objection be made. No anonymous contributions will be regarded.

Articles relating to any topic within the scope of this paper are solicited. We cannot promise to return rejected manuscripts.

Secretaries of Clubs and Associations are urged to favor us with brief notes of their movements and transactions, as it is the aim of this paper to become a medium of useful and reliable information between gentlemen sportsmen from one end of the country to the other; and they will find our columns a desirable medium for advertising announcements.

The Publishers of FOREST AND STREAM aim to merit and secure the patronage and countenance of that portion of the community whose refined intelligence enables them to properly appreciate and enjoy all that is beautiful in Nature. It will pander to no depraved tastes, nor pervert the legitimate sports of land and water to those base uses which always tend to make them unpopular with the virtuous and good. No advertisement or business notice of an immoral character will be received on any terms; and nothing will be admitted to any department of the paper that may not be read with propriety in the home circle.

We cannot be responsible for the dereliction of the mail service, if money remitted to us is lost.

Advertisements should be sent in by Saturday of each week, if possible.

CHARLES HALLOCK, Editor.

WILLIAM C. HARRIS, Business Manager.

FLORIDA CURIOSITIES.

WHEN the traveler to Florida returns with what appears to be one of his own incisors, handsomely mounted in gold, dangling at his watch chain, and informs his admiring auditors, with a sportsman's nonchalance, that it is only the tooth of a big alligator "I killed on Indian River," his hearers can have no conception of the amount of business transacted in these and like curiosities and souvenirs; and the mighty hunter may be getting credit for a prowess, the trophy of which first caught his admiring gaze in Damon Greenleaf's "Free Museum of Curiosities" or Gilbert's jewelry store, both at Jacksonville. It is estimated, says the Florida *Agriculturist*, that at least one hundred thousand dollars is invested yearly by visitors to Florida in curiosities of every description. Next to alligator's teeth, sea-beans are in demand. These, when polished, are made into charms, lockets, sleeve buttons and ear-rings, mounted in gold, and form very attractive ornaments. These beans grow in the West Indies, and being washed into the sea by freshets, are afterwards thrown up by the Gulf Stream on the Florida coast. The new comer, however, can always be indicated by the possession of an orange wood cane; these are made, usually, from the roots of the wild orange tree, although the lemon and other trees are sometimes used, and they are frequently very handsomely carved. Feather flowers are also made to a considerable extent, the variety of birds of gay plumage being so large as to furnish an almost endless supply. Fish scale work is also done, and some shell work, although most of the latter is imported from Nassau. At St. Augustine and Fernandina a large business is done in palmetto work, hats, baskets, napkin-rings, etc., being made of it.

Some of the stores will remind the visitor of Niagara Falls, although we are thankful to say that the extortions of that favored spot have not yet traveled so far south; when they do, may the alligators retire to the deepest recesses of the swamps, and the sea cease to throw its beans upon the Florida sands; may the palmetto wither ere the knife of the basket maker can reach their stacks, and may all the beautiful birds fly away to some undiscovered land where they may keep their feathers for their own adornment.

—Gentlemen purposing to exhibit dogs at the Chicago Bench Show, and desiring premium lists, can procure them at this office.

CALIPASH AND CALIPEE.

THE art of preserving edibles by air-tight canning has reached a point which almost entitles it to be ranked among the sciences. It is very natural, therefore, that to California, in whose interest the great advances in the canning business were first made, should furnish us with the latter delicacy, which is by this means brought within the reach of the weary traveler in the desert or off the Cape, as well as the gourmand who takes his turtle at Delmonico's. In fact, it occurs to us that the solid comfort, almost blessings, we now enjoy through the increased cuisine facilities afforded by the canning process are not sufficiently acknowledged or appreciated. To be sure, steam has shortened sea voyages, but even now a large proportion of the vegetables served to the passengers are first canned. We read of the horrors of scurvy in the old days when Jack had nothing perhaps for months at a time but salt beef and pork; now an occasional allowance of vegetables spares him this curse, and in the cabin there is scarcely a delicacy with which the skipper cannot regale himself.

On the west coast of Mexico experiments have been repeatedly made in canning the green turtle which thereabouts abound, and after many failures we now learn that success has at length been achieved and the first lot of 200 dozen cans has been received at San Francisco from Guayamas. The Gulf of California is well known as a great resort for turtles, and their flavor is said to be quite equal to those taken in the Gulf of Mexico or in the West Indies. It is said that Guayamas can alone furnish 200 tons of the meat annually, and that already received in San Francisco is reported to be excellent. Alluding to the subject the *Alta-California* says:—

"The cans so far used weigh, when full, two and a half pounds. The meat is boiled in its own abundant juice, without the addition of any water, and the can, when opened cold, is found to be filled with meat inclosed in jelly. The meat is thoroughly cooked and slightly salted and spiced before the can is sealed, so that it can be eaten without further preparation. The green turtle of the western coast of Mexico is called *Caluma* in Spanish. Now that the art of canning is understood in Guayamas, we may expect to receive also canned lobster, cuttle-fish (*Calamaries*), rock cod, totoba—a fish like a rock cod—and other delicacies caught in the Gulf of California."

We wonder that this experiment has never been tried on our coast. The eastern shore of Florida, as well as the Gulf, furnishes an abundant supply. Many of those received here, that have been shipped alive, are dead on arrival, and the very mention of turtle as an article of ordinary diet conjures up visions of extravagance, to say nothing of subsequent aldermanic proportions. Then, again, to prepare a turtle for cooking is a piece of work beyond the ability of the average cook, an objection that would be obviated could it be purchased in cans. Let us have cheap turtle, and who knows what effect it might have in restoring a condition of political honesty.

GAME PROTECTION.

Importing English Hares and Rabbits.

RUTLAND, Vt., December 24th, 1875.

EDITOR FOREST AND STREAM:—

Allow me to throw out, throw your paper, a suggestion: would it not be well worth the trial to import the English hare? The habits of this animal are, in many things unlike those of our mountain hares, which turn white in the winter. The range of the English hare is very wide—from Italy away to Denmark, if my memory serves me. There is hardly a State in the Union in which it would not do well. It lives upon the rudest fare; it thrives well in forest as well as in cultivated fields; the food it would consume in our country is not worth reckoning; it affords fine sport, either with dog or gun; it weighs from seven to nine pounds, and its flesh is most excellent for the table; it breeds rapidly, though not as fast as the rabbit does; it is not so easy a prey to the foxes or hawks, as our coney and mountain hare; and unlike the coney, it does not run to earth; it does not stick to covert as our hare does, but runs free and wild, like a fox almost; it is more easily followed; it has more speed than the fox, but less bottom; it may be shot over setter and pointers. The cost of importing them would be small; whether they carry well I do not know; they could hardly be turned out at any place in the country amiss, and it would take but few colonies and a few years for them to have a fixed place in our game list.

Would not the English rabbit be, too, an acquisition. This animal can be carried to any distance. Its fecundity is as proverbial as its value for food. What do you think about it Mr. Editor?

A. TRAVELER.

We once thought so well of our correspondent's suggestion that, as an officer of the Blooming Grove Park Association some years ago, we attempted the introduction of these species into the Association's territory. Some twenty pairs were shipped from England in 1872, but only a single individual arrived alive, and the attempt has not been since renewed. With ordinary care no risk need attend their transportation. Of late, however, we have regarded the propagation of hares and rabbits with some apprehension. In our early life we devoted many years to rabbit culture, and then learned, at some pecuniary cost how destructive they were to orchards and garden patches, and how difficult it was to eradicate them when once established. Lately we have remarked the devastations in Nevada, of rabbits or hares, where they are regarded with about the same consideration as the grasshoppers are, owing to their extreme abundance and boldness. So, also in parts of Kentucky. The destruction they cause annually seems almost incredible, and astonishing. Instances of their depredations are given in the local papers. Certainly, it does not seem necessary to go to the trouble and expense of importing, since we have a superabundance within our own limits.

—The Rochester *Express* commends constable Brown for his efforts, in large part at his own expense, during the past year in causing the arrest and conviction of a large

number of violators of the game law in Monroe county. Last week Mr. Brown served summons upon ten different parties for fishing with nets in the Bay. The *Express* says that "the wagon loads of fish almost daily brought into Rochester show conclusively that nets are being drawn almost every night, causing the destruction of thousands of fish which happen to be unseasonable."

ALTONA, Penn., December 30th, 1875.

EDITOR FOREST AND STREAM:—

Being well aware of your interest in the preservation and increase of game in our country, I would ask leave to call your attention, or more properly the Sportsmen's Club of Pittsburgh, through your columns, to the fact, that there is an effort being made to prolong the game laws of Pennsylvania, particularly that clause relating to deer: that no deer shall be taken or killed after the 1st of December, and that petitions are now being circulated, asking our Legislature to extend the time to January 1st. I think the present law the best we have ever had, and am perfectly willing to give up this genuine sport, and to me, my greatest enjoyment, on the 1st of December, and could I, or did I have the power, would have or make the law read November 1st for at least five years to come, to allow this noble animal to propagate and populate our forests. An amendment to our State law, making it a penalty for running deer with dogs, would meet the approbation of many sportsmen, who hunt not for the market, but for the pleasure it affords. Hoping the Sportsmen's Club of Pittsburgh will take a note of this, and use their influence to defeat any amendment of the kind.

SPORTSMAN.

Where restrictive measures of an extraordinary character are required to enable barren districts to recuperate, most any sacrifice of pleasure or convenience may be submitted to. In New Jersey there is a five year fence season for pinnated grouse; on Long Island a total prohibition of deer shooting excepting for the first fifteen days in November and recently a five years close season for quail; in Nova Scotia a three years total prohibition of moose killing; and like restrictions in other localities. If a temporary prohibition of deer killing is needed in Pennsylvania, to cover, say two or three years, an act to that effect could probably be gotten through the Legislature; but unless its provisions are made to apply to the whole State, it will be found practically inoperative.

EDITOR FOREST AND STREAM:—

As many of your subscribers are members of The West Jersey Game Protection Society, and no doubt would be pleased to learn what has been done by the Committee on Purchase of Live Game and Fish since the annual meeting of the society, held September 15th last, please give the following statement a place in the columns of your paper, if possible. Since the 9th of October, 830 live black bass have been obtained from the upper part of the Delaware and Potomac rivers and distributed as follows:—

Lake at Malaga.....	80	Cotransey Creek.....	50
Lake at Hammonton.....	100	Salem Creek.....	50
Headwaters Great Egg Harbor		Alloway's Creek.....	49
River.....	40	Cooper's Creek.....	50
Headwaters Tuckahoe River.....	51	Mantua Creek.....	84
Maurice River.....	75	Lake at Wenonah.....	25
Woodbury Creek.....	46	Died in transporting and after	
Raccoon Creek.....	50	arrival.....	30
Oldman's Creek.....	50		
Total.....	830		

Four hundred belonged to the State of New Jersey, and were placed in the hands of the committee for distribution through Doctor Banj. P. Howell, of Woodbury, one of the Commissioners of Fisheries, and were let out in such streams as he directed. Much more would have been accomplished if the committee had been able to commence earlier. Great credit is due to Mr. Milton E. Peirce, of Wenonah, New Jersey, for his efforts in obtaining the fish and distributing them, and it was through his exertions and care, that the percentage of loss was so small.

The committee have made arrangements to secure a large number of live grouse and quail, which are to be kept through the season until the proper time arrives in the Spring to let them out.

Inclosed you have articles taken from several of the newspapers of South Jersey, showing how the efforts of the society are regarded.

Yours,

A. MEMBER.

We are convinced that the West Jersey Game Protective Association is accomplishing a great deal of good. We do not endorse all its measures, or rather the methods it has chosen, to correct and prevent abuse, but we wish its energy and efficiency could be imitated all over the country. It would soon make poaching as unprofitable and unfashionable as child-stealing. The favorable testimony of the local press is before us.

VALPARAISO, Ind., December 29th, 1875.

EDITOR FOREST AND STREAM:—

The long rainy season has effectually protected game from extermination. But few quail have been killed, and deer, which are quite numerous in the Kankakee swamps, are still living in perfect safety. They are absolutely out of reach. Were they to be let alone two years we would have fine shooting. The mildness of the season thus far leads me to think that birds will be abundant next year. I wish I could be sure of January and February, but there's the rub.

W. H. HOLABIRD.

—Too much praise cannot be awarded to the Canadians for the energy with which they are enforcing the game laws across the line. We hear of arrests being made in all directions and in every Province, of men who have taken fish and game out of season. The wholesale arrest recently of forty deer slayers at once will have a most salutary effect on all offenders. Every proceeding of this kind aids very materially the efforts of our own prosecutors, by preventing the sale here of unseasonable game. It shows also that the laws can be enforced if we are disposed to take the matter seriously in hand. It cannot be denied that there is great apathy and negligence on the part of our clubs that have been formed avowedly for the protection of game—the very associations to which we look for efficient service. There is no end to the complaints we receive against the inaction and indifference of these clubs. One gentleman residing in Central New York, who has spent much time and money in individual effort to punish violations of the law, asserts that he applied to two of the leading clubs in his section to assist him in presenting guilty parties who had been detected in the act of spear-fishing lake trout, but could get no help, except from one or two individual members. This is a serious charge. We cannot wonder at the continuation of abuses and the laxity of laws, when we are made cognizant of such facts, which do not apply to one section only, but to all parts of the country.

—The annual meeting of the Mississippi State Association for the Protection of Fish and Game, will be held at Madison on the third Wednesday of January, 1876, (January 19th, 1876). R. H. Strong, President, M. T. Bailey, Secretary.

BUFFALO.—The report on the geology and resources of the region of the thirty-ninth parallel, from the Lake of the Woods to the Rocky Mountains, by Mr. Dawson, says: "From what I could learn, I believe that at the present rate of extermination, twelve to fourteen years will see the destruction of what now remains of the great northern band of buffalo, and the termination of the trade in robes and pemican, in so far as regards the country north of the Missouri River."

—The people of Islip have been in the habit of fishing with pound nets, and those of Patchogue with fly nets, and each has insisted that the practice of the other was ruinous. It is understood that Supervisor John Wood, of Islip, and the Hon G. F. Carman, of Patchogue, have decided that the difficulty can best be settled by entirely prohibiting the use of nets of any description until the close of the spawning season, or until the 1st of July. It is probable that the baymen of both towns will accede to this proposition, as it is regarded as directly in their own interest by tending to promote the continued success of the fisheries.—*Babylon Signal.*

AMERICAN AMMUNITION.

WE have received a number of communications from our readers on the subject of paper shells of American manufacture, from which we make the following extracts. It must be admitted that the balance of opinion is in favor of the home made article, and when a uniform system of boring the chambers of guns shall have been adopted we have no doubt that the Bridgeport shell will be the one generally used. One correspondent, writing from Randolph, Mass., thinks that the superiority of English ammunition over ours lies in the fact that across the water sportsmen are willing to pay more for a good article than are our own. We think that he is wrong, or why the enormous sale of Ely's production? The fact is, that the difference in the price of labor between the two countries enables the English manufacturer to produce an equally good, if not better, article at far less cost to himself, and some compete with us in our own market. When the increased use of American ammunition will enable our makers to realize a profit from larger sales, any difference there may now be will disappear. Our correspondent adds:—

"But, in justice to one American firm, I am bound to state that I have bought of various dealers, (and to all of whom I am unknown, thus precluding all chance for partiality), and shot during the four months ending October 1st, 1875, four thousand rim fire, No. 38 calibre, rifle cartridges, without a single misfire or misfire; cartridges made by Union Metallic Cartridge Company, of Bridgeport, Conn., and I have never succeeded in making so good even shooting (at target) with any other make of fixed ammunition, whether American or foreign made."

F. R.

WORCESTER, Mass., December 13th, 1875.

EDITOR FOREST AND STREAM:—

As you wish to hear from some person that has used the Bridgeport shell in the Parker gun, I will give you my experience in that line. My gun is 10 bore, 9½ pounds. I have always used the Bridgeport shell, and have used five hundred this season, and I have not had any trouble with them, and not one misfire as yet.

HOLDEN BIRD SHOOTER.

CLINTON, Iowa, December 13th, 1875.

EDITOR FOREST AND STREAM:—

I have got a Parker gun, and have used these shells and others. I never had a misfire. I am greatly troubled with the shells bursting, or rather ripping, apparently up the seam. Now the shells fit the chamber of my gun as nice as any one could wish. Where the trouble lays I don't know. I have thought that they were a poor material, or were not fastened right. If any others have had the same experience I should like to know their views on this subject.

GEO. DIXNIE.

We published some time since a letter from Mr. W. B. Hanworth, of Quincy, Ill., who had had much difficulty with misfires. He now writes:—

"I can now say that I have shot over two hundred of the Bridgeport paper shells since I had my gun fixed by Joseph Batter, of Chicago, and over three hundred of the Ely shells, and have not had a single misfire. I use the 2½ inch shell in the field, and 3 inch blue shells over the trap. Before my gun was repaired I used to average about six out of a hundred misfires with Ely's shells, and of the Bridgeport shells, at least one-fourth of them would miss fire. I am glad to say that the fault lay in the gun, and that I found it out, and that I have now got something reliable. I think the American shells just as good as the Ely shells, and would just as soon have them, and if they do not make any No. 12, 3 inches and 2½ inches long they ought to do so, as these lengths are used in No. 12 guns for trap shooting and ducking."

W. B. H.

The Union Metallic Cartridge Company are now making the 2½ and 3 inch shells.

PORT RICHMOND, December 3d, 1875.

EDITOR FOREST AND STREAM:—

Last Spring I purchased 1,000 of the U. M. Co. cartridge paper shells, and had at that time a first-class breech loader. For the first two or three days every cap exploded, and I felt well pleased to think that we would now be supplied with American paper shells; but the next morning American shells had lost all favor with us, as I pulled on a wood duck and both barrels misfired. The same thing happened on an English snipe, and I began to get provoked, and would have sold the balance of shells I had for a song, but I did not know but that I had made some mistake in loading, and that evening I loaded some more, being very particular. Out of eleven shots that day one shell misfired, and I never used any more until last Fall, when I tried them in my new "Greener." She never allows any misfires, and I shot nearly every day the first part of the season, using and giving away something like 1,200 of these shells, and never a misfire. But now my objection to them, and that is, their not being uniform in size. I have two shells to send you that you may judge for yourself. One of them fits the chamber very nicely and the other jams, and when once in, it is impossible to extract it. I have had to take my gun across my knee to unlock it for the purpose of putting a new cartridge in after firing. At first I attributed the fault to my using too large a wad, and never discovered the cause until recently; so I use no more U. M. C. shells until I am sure I can get them out of the chamber without being obliged to fire them off or use a stick. The latter is a method I don't approve of, and I caution all sportsmen not to try it too often. As for parties loading them twice, it may be done, but I never used, or saw one used, that was suitable for unloading; and a "treble wedge fastening" I consider more likely to

save a cartridge from bursting than the ordinary double bolt, and the former is what I use. I fully agree with Mr. Hobbs, that there should be a standard for the chambers of breech loaders, and when I can get American ammunition to suit me, will use no other. As for the head pulling off, I never saw that happen. The complaint I have is, that some of them fit my gun "too much." Does any sportsman who has ever read the FOREST AND STREAM believe it anything but an impartial journal, Mr. Holden?

MORTIMER.

THE DITTMAR POWDER.

A CORRESPONDENT who has recently visited Mr. Dittmar's works near Boston writes us the following description of the mode of manufacturing the explosive. As it is a secret, we presume Mr. Dittmar alone knows the proportions of the different ingredients. With regard to its safety we are assured, by Mr. Dittmar, that on that point there is nothing to fear, but we agree with our correspondent that the results of various tests, as already published, do not decide the question entirely in the affirmative. It would be very satisfactory if some decisive tests could be made, of a nature to set at rest the vexed question, is, or is not, the Dittmar a safe powder to be used in shot guns:—

HARTFORD, Conn., December 10th, 1875.

EDITOR FOREST AND STREAM:—

Recently while in Boston I met Mr. Dittmar, and although I did not at that time learn much of the composition of his new powder, I was struck with the many advantages it had if it equalled his expectations. The following description of its composition and method of manufacture may enable many to understand its working, and why there were so many different opinions. It consists in taking any suitable kind of vegetable fibre, in the raw or manufactured state, such as flax or old linen or cotton rags, reducing them to a fine pulp, pressing this pulp into sheets of suitable thickness, which are properly dried and then reduced to grains or powder of suitable size in a cutting or grinding machine. These grains are then treated with acid, or a mixture of nitric and sulphuric acids, in the same manner in which gun cotton is made. Before subjecting it to the action of the acids it may be soaked in a solution of sugar, mannite, amylum, or inuline, taking care to clear it of any superfluous acid by applying to it a solution of alkali or soda. It may also be soaked in a solution of nitrate or chlorate of potash. After being subjected to the action of the acids, and dried and desiccated, it is ready for use. The mixture of the vegetable pulp with the sugar, etc., produces a very powerful explosive compound, and overcomes the difficulty experienced in preparing, without the pulp, either of such matters with acids. For improving the powder for blasting purposes, it may be soaked in nitro-glycerine, or have applied to it soda or saltpetre in a fine state after it is dried. All the above compounds, without the use of nitro-glycerine, can be used for gunning or artillery purposes, and can be kept wet and transported in that condition with safety, it being impossible to set it on fire or explode it by concussion. Before use it is to be dried in the sun or otherwise, the grains remaining whole, and losing none of their strength. Owing to the elasticity of the material, it is claimed to be safer than any other similar explosive, and it may be so. The only similar explosives I can find are Shultz's sawdust powder, and gun felt, which I believe are sold only in loaded cases for sporting purposes and not in bulk, as they are considered too dangerous to be used by persons not acquainted with the proper methods of using them. In appearance the Dittmar powder resembles fine cork, being of nearly the same color and specific gravity. I am not acquainted with the English laws regarding gun cotton, etc., but as I find it advertised in a London paper—"sold only in loaded cases, with or without shot"—I am led to the conclusion that it is subject to some special restraint.

W. R. C.

December, 1875.

EDITOR FOREST AND STREAM:—

I have watched with much interest the experiments made by your correspondents with Dittmar's powder. Beyond all question, if the powder can be made safe, and as effective as black powder, its other qualities will rank it far above the old explosive. My own experience with the new powder was most disagreeable. I sent last year to Mr. Dittmar for a sample, hoping to find it all that it was represented. I received by mail a small can, and loaded some metallic shells with 3½ drachms, (by measure, not weight), using a Dixox charger. I put one red-edged wad over the powder, and struck the loading plug twice only with the palm of my hand, so that the powder could not have been too tightly compressed. Six of those shells, fired from two different guns, burst both! They were fine breech loaders, of high price and approved makers, so that the fault did not lie in the guns. As I am not a millionaire, or desirous of going to the happy hunting grounds yet, I shall let others experiment for the future, and stick to the black powder till I see better reports of the new than I have seen yet. As for the comparative shooting of the black and Dittmar, I can only say, that I was out one day this season with a friend who was shooting Dittmar powder, and he constantly wounded birds that he failed to kill, while mine fell dead. I told him that his powder did not shoot, etc., gave him some of my shells, after which he killed his birds as cleanly as myself.

ARNOLD BURGESS.

TRANSPORTATION OF GAME.—Live game is a kind of freight not much coveted by express companies, some of which we think decline to receive it on any terms. Therefore we are not quite sure that we shall do our friends of the United States Express Company, a kindness by volunteering an expression of satisfaction at the very excellent condition in which consignments of game, both dead and alive, is received by their lines. We have had occasion to ship at one load as many as ten live deer a 1,200 miles journey; while our receipts of dead birds, fish, &c., have been many. In no case have we known of suffering or loss through neglect or inattention. We understand that a great deal of this kind of freight passes through their hands, and inasmuch as the Company is now "in for it," and in view of the probable increase of game and fish all over the country by attempted propagation by artificial culture, it may possibly result that we shall have improved methods of transportation and special trains running. Indeed, many attempts to obtain portable refrigerators for dead game, and suitable conveyances for live animals, have been, and are being made, but we believe that no result has been reached that is perfectly satisfactory, if we except the one or two cars built by the Alligrett Refrigerator Company. It has been definitely settled that as a means of preserving meats or fish, the new method in which, by a packing of ice, an equal temperature of about 20° is maintained, is far superior to the old. Trout have been kept fresh by the Alligrett process for a year or more, and strawberries and other fruits are preserved so that even the leaves retain their freshness for a very long period. Indeed, the immense refrigerators used by our large fish and game dealers, have entirely superceded the old ice

chests. Now, by means of a hollow casing or iron tubes filled with ice, this low temperature is maintained without that disastrous loss of juices which is the result of actual contact with ice. The exigencies of trade demand a more perfect system of transportation for fish and game, and it will be found in the construction of these double framed cars.

"CAMP LIFE IN FLORIDA."—When the agents for the sale of this valuable book offer it to the new-comers at the Jacksonville depots, they are very often met with the negative reply that they bought the book before they left the North. No visitor to Florida who possesses a copy would be without it, and every one who has heard of the book purchase it before leaving home. It is a volume of 350 pages, and is sold for \$1 50. One hundred times its cost can often be saved by buying it. Copies can be supplied at this office. Dealers are furnished by the American News Company.

ADVERTISE IN FOREST AND STREAM!—Mr. H. H. Thomas, pisciculturist, of Randolph, N. Y., in renewing an advertisement says: "The advertisement which I recently put into your paper of '20,000 Brook Trout eggs for Sale,' has brought me a sale of 260,000 eggs." This is the testimony that we receive from nearly all who have tested the utility and advantage of our columns as an advertising medium; and yet there are some dealers who probably would not believe "even Moses and the prophets." The advantage in using our paper is that nearly every one of its readers are purchasers; they are men who can afford to buy luxuries; and needing what they deem essential to their gratification, they are constantly searching our columns for those articles they desire. For this reason each 1,000 circulation of FOREST AND STREAM is equal to 10,000 circulation of the daily newspapers, as a very large proportion of those who buy the latter can scarcely afford the cost, much less the money for luxuries of life. Let any one who chances to glance at these lines, make a note of it.

OBITUARY.—Robert G. Scott, of North Elba, so well known to the readers of Headley's & Street's fascinating volumes on the Adirondacks, recently died, after a long illness. His age was nearly seventy-one years, and this patriarch of the mountains had spent the most of his life in the sublimely mountain-girded home, from which "his spirit took its flight."

WARM!—The warm weather of the past week opened windows, set vegetation to sprouting, brought out the wasps, flies, and garter snakes, liberated frozen-up craft, spoiled market truck, and retained the tide of travel to Florida. There is scarcely any snow in New England anywhere now. At Danversport, Mass., last Saturday the mercury indicated 110° in the sun; so a correspondent writes, but we guess he pinched the thermometer a little.

—Richard Henry Lee, of Clarke county, Va., has been selected to read the Declaration of Independence at the Centennial celebration at Philadelphia July 4th, 1876. Col. Lee is a grandson of the Richard Henry Lee, who, in the Continental Congress, moved "that these United Colonies are, and of a right ought to be free and independent States." He is the nephew of Charles Lee, Washington's Attorney-General, and nephew, also, of Light Horse Harry Lee, the father of General Robert E. Lee. He was a gallant soldier, and is universally respected as a gentleman of irreproachable character and great intelligence.

MORE FOXES.—Mr. Clarence H. Johnson of the Staten Island Sportsmen' Association, who is now in Virginia, writes us that he has been presented by Mr. Wm. H. Martin of Gloucester Co., with two live foxes which he will bring on with him for a hunt on Staten Island on his return. They are, he says, in good condition, and will afford some capital runs.

A party of thirty gentlemen started out from Norfolk, Virginia on New Years day for an old time fox hunt. They had two brace of hounds with them. When last heard from, the fox was ahead and likely to run until the next Centennial.

A NOBLE CHARITY.—The Infant Asylum Grand Ball will be held at the Academy of Music in this city on the 13th inst. Of all our many charities none are more deserving of countenance and encouragement than this, the one that provides a home for little waifs of fortune thrown adrift on the world's wide sea. The ball itself is under the direction of ladies and gentlemen who hold the first position in our social and business circles, and those of previous years have been noted for their elegance and success.

THE HEALTH LIFT.—Known also as the Cumulative Exercise and Lifting Cure is an invaluable aid to boating men, and others who desire to fit their frames and lungs for continued exertion. It is said that ten minutes a day with one of these machines will double the actual strength in three months, while it does not fatigue or exhaust, but rather refreshes and invigorates. For those suffering from the effects of sedentary occupations it must be invaluable.

—No wonder so much is said about the blubber of whales when they have often such a right trying time of it.

—Stories of panther encounters are current now. We have two from Vermont, two from Pennsylvania, and one from Texas. Bear adventures are too common to mention; in fact, there is trouble *bréwin'* all over the woods.

The Rifle.

CONLIN'S GALLERY.—The FOREST AND STREAM Badges were shot for on Thursday, December 30th, 1875. It was a spirited contest and many of the best "off-hand" shots participated. The conditions were: 10 shots; rifle; 200 yards target reduced for the 110 feet range; Wimbledon rules. The following are the best scores for the respective badges:—1st badge, best score, T. C. Noone, 43; John D. Cheever, 41. 2d badge, average centres, A. G. Hellwig, 40; Chas. A. Cheever, 38; L. V. Sone, 37. 3d badge, average inners, F. N. DeWitt, 30; H. A. Hynes, 29; T. G. Moore, 29.

The Turf, Field and Farm cups will be shot for Thursday, Jan. 6th, 1876, commencing at four P. M. Shooters are invited.

—The fifth weekly competition shooting, lying position, for a gold medal, a rifle, and a revolver, took place at Hellwig's new gallery, No. 273 Eighth avenue, under the Grand Opera House, on December 29th, 1875. The following is the score:—

Name.	Score.	Name.	Score.
John Tragesser, first prize.	47	John Duttill.	42
Captain Joseph Ross.	47	Capt. William Lindsey.	42
M. L. Riggs.	47	T. C. Banks.	41
Dr. T. B. Austin.	46	F. N. McGlensey, second prize.	40
A. B. Vanhusen.	46	F. N. DeWitt.	40
J. Brodigan.	45	D. E. Vannett.	40
Capt. L. C. Bruce.	45	F. Carpenter.	40
D. L. Beckwith.	45	B. Ginger.	38
A. G. Holcomb.	44	W. P. Gillette.	35
Frederick Kesler.	43	Geo. Grentzer, third prize.	32
P. Fenning.	42	William Grentzer.	20
John Bryan.	42		

Mr. Hellwig has added another prize of a double barrel shot gun, to be won three times by the second best score, the same as all the other prizes. The next competition will take place Wednesday evening at 6 o'clock P. M., January 5th, 1876.

GLEN DRAKE RANGE.—The matches of the American Rifle Association in honor of the opening of the centennial year, drew together a large number of the members of the club. The first day of the year bright, clear, and warm, was just the day to shoot; the result was a day of pleasure, good scores and a certainty that the marksman would awake the next morning with clear heads and bright eyes, which might have been otherwise had they followed the time honored custom of the day. Col. J. F. Underhill, the President, was first upon the ground; under his superintendence the range has been prepared for the day, presenting an unusually attractive appearance. The contests were for the Association cup, valued at \$50, and a subscription match. We give a summary of the shooting.

Association Cup Match.—Distance, 500 yards; any rifle; 10 scoring shots; military rifles allowed five points if of fifty calibre; cup to be won twice before property passes. The best scores were:—

Name.	Score.	Total.
David F. Davids.	35 4 5 5 5 5 5 5	47
C. A. Hodgeman.	5 3 5 5 3 5 5 5	46
H. Fisher.	4 5 5 4 5 2 4 5 5	43
R. Rathbone.	5 5 4 5 2 5 4 4 4	43
C. Dusenbury.	5 5 4 4 0 4 5 5 4	41
Col. J. T. Underhill.	5 3 4 3 4 4 3 4 2 5	37

Mr. Dusenbury would have been second if he had not had the misfortune to make a bulls-eye on the wrong target. In the subscription match there were thirty-seven entries. It was also shot at 500 yards, open to any rifle; entries not limited; five scoring shots; one half of entrance money to Association; balance to three highest scores; entrance fee, \$1. Best scores were:—

Name.	Score.	Total.
H. Fisher.	5 5 5 5 4	21
H. Fisher.	4 5 4 5 5	21
G. H. Thompson.	5 4 4 5 5	21
C. A. Hodgeman.	5 5 5 4 4	21

The arrangements are such that practice can be kept up all Winter at this range, comfortable quarters having been provided from which the shooter can fire without exposure to the weather. The election for officers for the ensuing year will take place at Mount Vernon, on Thursday, Jan. 11th, 1876 at 5 P. M.

CREEDMOOR JR. RANGE.—The second of the popular subscription matches inaugurated at this gallery (corner Warren street Broadway) was shot on Wednesday the 29th ult. All day long the riflemen thronged the 100 yard under ground range. The "ninety and nine" could have been found there as there were just that number of entries. The lost odd one put in appearance after six P. M., but "It was too late to enter now." The winning scores were as follows:—

Name.	Score.	Total.
T. C. Banks, best score.	4 4 5 5 5	23
W. H. Sabin, 5th best score.	5 4 4 5 4	22
F. Backofen, W. H. DeHart, and F. H. Holton tied for third prize, 10th best score.	4 4 4 5 4	21
H. B. Farwell, 15th best score.	4 5 4 4 4	21
W. S. Jewell, 20th best score.	5 4 5 3 4	21

In deference to the wishes of many of the contestants in these matches the entrance hereafter will be \$1, and the number of shots 10, as there will be less tying of scores. Also the day of shooting will be changed to Tuesdays, both for subscription and badge matches. There will be matches shortly arranged for any position shooting with something unique and elegant in the way of prizes.

MORSEMERE.—The dense fog which prevailed on this range during Christmas day, prevented the shooting of the matches which were arranged. On the Tuesday following George Langran won, for the third time, the Marksman's Match, and the prize became his personal property. His score was the best yet made. At 200 yards he scored 23 out of 35, and 500 yards 34 out of 35, making a grand total of 57.

The Harris Trophy was shot for on Wednesday, under the rule which makes it obligatory to shoot all matches postponed on account of the weather, on the first day on which shooting may be possible. Capt. Douglas Smyth

was the winner with a score of 75 out of 100. The score list was as follows, the distance being 309 yards:—

Name.	Score.	Name.	Score.
D. Smyth.	75	B. Cullen.	44
H. J. Quinn.	70	J. W. Goodale.	40
H. Maynard.	68	G. W. Malison.	38
R. Cornell.	59	S. S. Leo.	16
G. L. Morse.	56		

On New Year's day, this range was open for off-hand shooting only. Two matches were in progress all day. The Harris match for an elegant short range Sharpe rifle. The conditions were 20 shots, standing, 300 yards. H. Quinn was the winner with the very handsome score of 79 out of a possible 100. The four best scores were as follows:—

Name.	Score.	Total.
H. Quinn.	3 3 4 4 3 5 4 5 4 4 5 4 4 3 4 4 4 3	79
Geo. Frazier.	4 4 3 4 4 4 4 4 4 4 4 4 4 5 3 3 0 5	73
D. Smyth.	4 3 3 3 4 3 3 4 3 4 4 5 4 4 4 3 3 4	72
H. L. Gaarison.	3 3 4 3 4 4 3 4 3 4 3 4 4 5 3 4 4 3	71

This trophy must be won three times before becoming the property of the holder. Capt. D. Smyth won at the first competition on a score of 75.

An all-comers match for a nickle plated revolver was shot at the same time. The conditions were 10 shots, off-hand, at 200 yards, the prize to go to the best score made during the day; competitors being allowed to enter more than once. There were thirty-six entries. Mr. Morse was twice the victor, having made on his first score 44 out of 50, and on his second entry, 41. The best six scores were as follows:—

Name.	Score.	Total.
G. L. Morse.	3 5 4 4 5 4 5 4 5 5	44
G. L. Morse.	4 4 4 4 4 4 5 4 4 4	41
H. Maynard.	4 5 4 4 4 4 4 4 4 4	41
F. Shonnard.	3 4 4 5 4 4 5 4 4 4	41
E. Connell.	4 4 4 4 3 4 5 4 4 4	40
W. P. Constable.	5 4 3 5 4 5 4 4 3	40

—As our item, a week or two ago, concerning the relations of the Yonkers Rifle Association with the American Rifle Association, of Mount Vernon, was misunderstood by some to mean that our riflemen had "backed out" of the proposed match, we will correct that impression by giving the facts. The Yonkers Rifle Association challenged the American Rifle Association to shoot a match at 500 yards. The latter club returned an answer proposing that instead of 500 yards the range be 300 yards, off-hand shooting. The Yonkers Rifle Association replied proposing to settle the affair satisfactorily to both sides by shooting a certain number of shots at both 500 and 300 yards. To this letter they have received no answer.—Yonkers Gazette.

HARTFORD.—The Connecticut Rifle Association has now been formally organized with the following officers and a good membership:—President, Gen. Joseph R. Hawley; Vice President, Nathan Washburn; Secretary and Treasurer, B. F. Blakeslee; Executive Committee, O. E. Pilard, G. W. Yale, J. C. Linney, Major L. A. Barbour and T. F. Plunkett. The Manchester range has been decided upon, for the present at least, as it offers better advantages for long range practice than any other brought before the notice of the committee appointed to make the selection. The initiation fee to the association is \$3 with monthly dues of fifty cents.

CHICAGO.—The Inter-State Rifle match between clubs from Chicago, Jackson, Mich., and Fort Wayne, Ind., came off on the 29th ult. at the range of the Chicago Rifle Club, South Park. The prizes consisted of a magnificent silver urn, presented by Giles Brother's, jewelers of Chicago, and a beautiful gold and silver mounted revolver, presented by Mr. Alford, agent for Messrs. Remington. The range was 500 yards, and shooting commenced at 11 o'clock, Chicago taking the target to the right, Jackson the centre, and Fort Wayne the left. Major Fulton was present, as were many others prominently interested in rifle shooting. The following are the scores, there being two sighting and fifteen scoring shots:—

Name.	Score.	Name.	Score.
G. H. Wolcott.	58	J. T. Harrington.	54
J. A. Parkinson.	61	J. L. Parkinson.	42
T. J. Conley.	52	R. J. Haire.	52
Total.	319		

Name.	Score.	Name.	Score.
J. A. Shaffer.	68	O. C. Blackmer.	69
S. B. Sexton.	64	George Willard.	57
A. G. Alford.	64	R. S. Thompson.	64
Total.	386		

Name.	Score.	Name.	Score.
W. W. Stinnets.	46	D. D. Weisell.	65
J. C. Beeks.	39	J. H. Stopplet.	59
C. Bundel.	65	A. F. Devereux.	36
Total.	310		

The Chicago team winning by 67 points over the Michigan team. In the afternoon a thick mist almost obscured the targets, materially affecting the scores. At the club room, in the evening, Mr. J. A. Parkinson, of Jackson, moved that the Chicago Rifle Club Association be empowered to make preliminary arrangements for the organization of a Northwestern Club, and that they call a convention of all clubs organized in the West at as early a date as possible, each club to have an equal vote in said convention; and, further, that the Chicago Association draft a constitution and by-laws to be submitted when the convention is held. The motion was unanimously adopted.

In a match for prizes, shot at Fuller's Shooting Gallery December 30th, the following scores were made at sixty feet range; Creedmoor target reduced:—

Name.	Score.	Name.	Score.
S. B. Sexton, 1st prize.	47	C. S. Gerrish.	38
T. J. Conley.	43	S. A. Murray.	38
S. B. Knight.	42	T. J. Conley.	35
G. Buttenmuller.	40	J. Hyde Fisher.	35
S. B. Sexton.	40	S. A. Murray.	35
M. W. Lyman.	39	T. J. Conley, 4th prize.	31
T. E. McFarland.	31		

THE CENTENNIAL.—Major Gen. Shaler, commanding the First Division N. Y. S. N. G.; Gen. Woodward, Adjutant General on Governor Tilden's staff; George W. Wingate, Secretary of the American Rifle Team, and Gen. K. Knox, Chief of Ordnance on Governor Tilden's staff,

were in Philadelphia last week, as an executive committee of the Rifle Association of New York, trying to get ground for a rifle match at the Exposition. They require 1,000 yards for a match in which all the foreign teams are expected to join. Prizes reaching \$25,000 in value are to be offered.

THE USE OF THE STRAP.—This question, which has been discussed in these columns, is likely to be brought more prominently forward, as the riflemen of Great Britain have adopted it and desire to use it in the next international match. Says the Times: Sir Henry Halford, Bart., of Leicester, England, has written a letter to Col. Gildersleeve, in which he announces that he has been chosen Captain of the English team which will be selected to contest in the international rifle match during the Centennial celebration at Philadelphia next year. Sir Henry states that the British marksmen have adopted the back position in shooting, and to lessen the recoil, use a stirrup which they attach to the trigger guard and in which they place the foot, and requested information as to whether such a contrivance would be permitted in this country. It is probable that it would not be allowed in an international match. Col. Gildersleeve states that while he will devote all the time possible to the selection of a competent team to represent the United States in the Centennial matches, he will be unable to take any active part in the contest.

MILWAUKEE, WISCONSIN.—A Rifle Association has recently been organized here with over fifty members. The following gentlemen were elected officers: President, John Nagro; Vice-President, Gen. Edward W. Hincks; Secretary, Q. B. Frankhnburger; Treasurer, John Johnston. Executive Committee—John Nagro, Chas. L. Pence, D. B. Franknburger, James H. Walker, Rev. Myron Reed. Finance Committee—O. B. Hopkins, W. A. Collins, H. H. West. Range Committee—Col. J. M. Arnold; J. C. Welles, C. Simonds. Through the courtesy of General Hincks, the Association has one of the finest ranges in the country, at Wauwatosa. The members have so far principally practiced at 200 and 400 yards, and a good many can now make 48 out of a possible 50, at the latter distance. They now intend to practice at the 500 and 600 ranges, and by-and-by some first rate shots at all ranges may be looked for at the Wauwatosa Range. As there are now clubs at Chicago, Elgin, Jackson, Milwaukee, and other prominent cities, it would be a capital idea to get up a Northwestern tournament for a badge, or some other prize to be shot for by teams next Summer.

Game Bag and Gun.

GAME IN SEASON IN JANUARY.

Hares, brown and gray. Wild duck, geese, brant, &c.

FOR FLORIDA.

Deer, Wild Turkey, Woodcock, Quail, Snipe, Ducks, and Wild Fowl.

GAME IN MARKET.—Fair receipts of game during the week and prices are somewhat lower. Ruffed grouse (partridges) are being received largely from Maine, and sell for 75 cents to \$1 per pair; pinnated grouse (prairie chickens) are worth \$1 to \$1 25 per pair; quail, \$3 per dozen; canvas-back ducks are much lower, many of the birds received from Havre de Grace and Currituck not being in first-rate condition, they sell for \$1 50 to \$2 50 per pair; red-heads, \$1 to \$1 25; mallards, 75 cents to \$1; widgeon, 50 cents to 75 cents; black ducks, 75 cents to \$1; broad bills, 50 to 75 cents; sprig-tails, 75 cents to \$1; teal, very scarce, 75 cents to \$1 25; brant are also scarce and sell for \$1 to \$1 50 per pair; wild geese, 75 cents to \$1 25 per pair; hares, 40 to 60 cents per pair; venison, saddles, 20 to 25 cents; steak, 25 to 30 cents.

—We have just had the pleasure of inspecting a gun made to order, for Mr. N. P. White, of Palatka, Florida, by J. & W. Tolley. The gun is of their Paragon brand, and in poise and workmanship we have rarely ever seen one more desirable.

KANSAS.—Fort Scott, Dec. 27th.—As I predicted last September, we have more quail than ever before for six or eight years, and the finest sport ever known. Prairie chickens are here by the thousand. On bright sunny days, at noon, they lie as close to the dog in the grass as in September.

TEXAS.—Gainesville, Cooke Co., Dec. 20th.—William True-love, Dr. Salmon and Ed. Fletcher spent one day and two nights in the "Nation" last week, and killed two deer and twelve turkeys. The Winter has been very mild and dry so far, and geese and ducks have not been so plentiful as they generally are at this season. I saw a mocking-bird (*Mimus Polyglottus*) yesterday, and do not remember ever to have seen one so late in the season before, and what is more strange, only one bird, appearing to remain "solitary and alone."

CHOKE-BORES.—A correspondent of Turf, Field and Farm, writing from London under date of December 8th, does not speak very enthusiastically regarding choke-bores, as we find the following paragraph in his letter: "My object in writing this letter is to give publicity, through your ubiquitous columns, to the many American sportsmen whose minds may be in suspense, to the fact that choke-bores have failed here as they have done with you, that the Field trial has established nothing, and that a great deal of worry, trouble and useless discussion has been the only actual result, unless I add the annoyance given to sportsmen by having had their expectations unduly raised, and the probable injury to the gun trade through suspension of orders."

—Wm. Fage, who has held the gold medal of the Onondaga Sportsmen's Club for some time, was last week obliged to part with it to Thos. Kimber, Jr., who won it in a match in the town of Onondaga, the following being the score, fifteen birds each:—

Name.	Score.	Total.
Thos. Kimber.	1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1	12
W. Fage.	1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1	10

A match was shot on the 21st ult. at Major J. R. Viley's place near Lexington, Ky., between the Viley Shooting Club of that place, and the Hunter's Club, resulting in a victory for the Viley Club, by the appended score:—

HUNTER'S SHOOTING CLUB.		VILEY SHOOTING CLUB.	
Name.	Total.	Name.	Total.
J. A. Higgins.	4	F. W. Woolley.	7
A. G. Morgan.	5	C. W. Bradley.	5
J. M. Taylor.	5	D. Knoble.	5
J. R. Viley.	6	G. A. DeLong.	7
J. B. Beck.	6	J. Smith.	9
W. R. McComb.	4	M. D. Richardson.	4
F. Waters.	10	W. G. McChesney, Jr.	7

The day was windy and the birds strong. The Viley Club was to have shot a match with the Junior Club of Paris, Ky., on the 29th ult., and another with the Hunter's on the 31st ult. We shall publish scores when received.

A CHALLENGE.—Mr. William Parks, President of the Long Island Gun Club, makes the following proposition to the Chicago Gun Club: He will name four members of the Long Island club to shoot with an equal number of the Chicago club a match at pigeons, on or about January 20th, for \$500 a side; match to be shot on the Long Island club grounds, twenty-five birds each, twenty-eight or thirty yards rise; any gun allowed; English rules; birds furnished by the club free. If Mr. Parks would only take his four members to Chicago with him there would be every prospect of an interesting match, but on the 20th of January the great Bench Show of dogs commences in that city and it is highly improbable that any of the Chicago sportsmen would care to be absent at that time.

THE LONG ISLAND GUN CLUB.—This organization had a gala day at Dexter Park on Wednesday last, to which members of all the shooting clubs in the vicinity had been invited. The match between Ira Paine and Howard Ransom for \$25 a side, 13 birds each, 30 yards rise from 5 traps, Hurlingham rules. The scores were as follows:—
Ira Paine (B)—1 0 1 0 1 1 1 1 0 Howard "Ransom" (B)—0 0 0 0 1
Total 10, killed 7, missed 3. Total 10, killed 4, missed 6.

A number of sweepstakes were shot, in which Messrs. Woodward, Winn, Talbot, Bassford, Thomas and others were successful.

WINDERMEN, Montgomery Co., Pa., Jan. 1st, 1876.

EDITOR FOREST AND STREAM:—

A pigeon match was shot here to-day, between five members of the Undine Barge Club, of Philadelphia. Considering that the participants were not so familiar with the trap as with the oar, I think the score not a bad one. The Chicago Sportsmen's Club rules were adopted, with the following result:—

Name.	Score.	Total.
A. B. Frost.	1 0 1 1 1 0 1 1 1	8
H. Burroughs.	0 0 1 0 1 0 1 1 0 0	4
J. N. DeHaven.	1 0 1 1 1 1 1 1 0 0	8
A. S. Roberts, Jr.	0 1 1 1 1 0 1 1 0 1	7
Edward Walp, Jr.	1 0 0 1 0 1 1 1 1 0	6

There being no birds on hand, the tie between Mr. Frost and Mr. De Haven was postponed till dryer and more favorable weather.

BODINE.

GUIDES' WAGES IN THE MEGANTIC.

BROOKLYN, N. Y., December 24th, 1875.

EDITOR FOREST AND STREAM:—

In your last issue, in an article on "Moose in the Megantic Basin," the writer accuses New York sportsmen of paying Adirondack prices, as though they did so through preference. Allow me to state the facts: When I went to that country I was under the same false idea in regard to its being a cheap country, as he seems to have been, but was soon disabused of it by floundering myself in the hands of men that not only had the cunning of the Yankee, but that of the Canadian thrown in. Being strangers, and consequently new to the regular charges, we were in their power, as they well knew. As to teams being had for \$3 when we paid \$10, I can only say that we did our best to reduce this charge and in the end did not pay it. We even went so far as to write several letters to parties in Scottstown, inquiring the regular charge for teaming on the Megantic road, and were told that we were only charged at the usual rate. Our guides we took with us, employing men that had been with us on previous occasions, as we knew none in the district. Archie McDonald we hired to work on the camp, but not as a regular guide, and he refused to work for less than \$2 per day. Mr. French we found a man of ability in his position, and one that we could count on when ordering provisions, etc., being always prompt; but then he was exorbitant in his charge, more so than men in parts of the Adirondacks.

I write that you may tell Mr. Stanstead that we did not go there to throw away money, but as sportsmen. If we have in any way interfered with his "old sporting grounds" I am very sorry, being sorry also that they were no better. The bills were all worked over carefully and amounts criticized before payment. If we have overpaid, let this be our excuse: "We were strangers and they took us in." PIERREPONT.

[This information may be of service to future visitors to this locality. Better to shun a place than to submit to imposition.—ED.]

SHARPSHOOTING EXTRAORDINARY.

PROVIDENCE, R. I., December 26th, 1875.

EDITOR FOREST AND STREAM:—

A short time ago one of the members of the American Team was on a visit to a friend in Providence, R. I., and some of the amateur riflemen of that vicinity invited him out to shoot. At Valley Falls, about four miles from Providence, there is a very nice range of five hundred yards, which has been used by the amateurs for practice, to which Mr. F. was invited. Near by the range one of the amateurs has quite extensive works for the manufacture of horse shoes, where the party assembled previous to going to the range. When all were ready, Mr. F. took a place on the seat of the wagon beside the driver, Mr. R., who has made quite a reputation as a rifleman, and Mr. M. jumped into the tail end of the wagon, and Mr. P., Mr. K., and Mr. Y. followed on foot. The path pursued skirted a small inlet of the Blackstone River, at the further end of which Mr. F. espied several ducks serenely floating on the water. He ordered the driver to stop, and immediately loaded his rifle. By this time P. and Y. had come up, and they wanted to have a little of the sport. Y.'s sights were pushed in their case, but the party waited for him to adjust them, and the ducks very accommodatingly waited to be shot at. They agreed that Mr. M. should count, and at the word "three," all should fire. There were three ducks and four shooters, so it was arranged that two should take the two left hand birds, and two take the two right hand ones. At the word "three" all blazed away, and there was great joy among the party that neither of the ducks escaped, for there were their black carcasses floating on the water. The riflemen were congratulating themselves upon their marksmanship, when a countryman spoke up and said: "Them ere etumps have been there ever since I kin remember."

In justice to the riflemen, it may perhaps be well to add that the countryman afterwards reported that there were three speckled-back turtles there, which were probably sunning themselves on the stumps, to which a duck-like air was given by the turtles moving about.

There will be no change in our fur quotations until the middle of January.

THE FUR SEAL.—From Mr. Henry Elliott's report on the condition of affairs in the Territory of Alaska, the following new facts in regard to seals are extracted. Mr. Elliott is employed now in the Smithsonian Institution, and is a young man of most superior attainments:—

"The male fur seal at the age of six or seven years is described as an animal that will measure six and one-half to seven and one-quarter feet in length from tip of nose to end of tail, and weighs at least four hundred and sometimes as much perhaps as six hundred pounds. The head, in comparison with the immense thick neck and shoulders, seems to be disproportionately small, but as we come to examine it we find that it is mostly all occupied by the brain; the light frame work of the skull supports an expressive pair of large, bluish-hazel eyes, and a muzzle and jaws of nearly the same size and form observed in any Newfoundland dog, with the difference of having no flabby, hanging lips; the upper lips support a white and yellowish-gray mustache, long and luxuriant, composed of heavy stiff bristles. The fore feet or hands are a pair of dark bluish-black flippers, about ten inches broad. The shape of the flipper is strikingly like a human foot, providing the latter were drawn out to a length of twenty or twenty-two inches, the instep flattened down and the toes run out into the thin, membranous, oval-tipped points, only skin thick, leaving three cylindrical, grayish, horn colored nails, half an inch long, back six inches from these shining toe ends, without any nails to mention on the big and little toe. As we look on this fur-seal's progression, that which seems most odd is the gingerly manner in which he carries those hind flippers. They are held out at right angles from the body, directly opposite the pelvis, the toe ends and flaps slightly waving and curling above the earth. The neck, chest and shoulders of a fur-seal bull comprise more than two-thirds of his whole weight, and in this long, thick neck and fore limbs is embodied the larger portion of his strength; when on land with the fore feet he does all climbing over rocks, the hind flippers being gathered up after every second step forward. These fore feet are the propelling powers in water, the hinder ones being used as rudders chiefly.

The females, or cows, like the males, vary much in weight, but are much lighter, only weighing from eighty to one hundred and twenty pounds. The strong contrast between the males and females in size and shape is heightened by the air of exceeding peace and amiability which the latter class exhibit. They are from four to four and a half feet in length from head to tail, and much more shapely in their proportions than the male, the neck and shoulders being not near so fat and heavy in proportion to the posteriors. The head and eye of the female are really attractive; the expression is exceedingly gentle and intelligent; the large, lustrous eyes, in the small, well-formed head, apparently gleam with benignity and satisfaction when she is perched upon some convenient rock and has an opportunity to quietly fan herself."

—A letter from Meacham Lake, Franklin County, New York, says that the season, thus far, has been very unfavorable for trapping, feed being so plentiful that the fur-bearing animals will scarcely take the "bait."

—The vicinity of Pesh, Ontario, Canada, is a fine trapping region. It lies on the Upper Ottawa River. Last week Messrs. Thompson and Brady brought to Brockville 52 dead and 3 live deer, 4 live mink, 110 mink skins, 450 muskrat, 600 brace partridge, 2 dozen otter, 2 dozen beaver, 1 dozen fisher, 2 dozen fox, 4 dozen coon and a lot of woodchuck skins.

Yachting and Boating.

All communications from Secretaries and friends should be mailed no later than Monday in each week.

THE COLLEGE REGATTA.—As we go to press the delegates to the Convention of the Rowing Association of American Colleges are in session at the Fifth Avenue Hotel. The principal object of the convention is to solve the question as to where the college regatta for this year shall be held. Representatives of the interests of the three points under discussion were, on Tuesday, mingling with the delegates, each singing the praises of his own particular course, and working as strenuously in the interest of his own hotel keeper as ever did lobbyist for a fat bill. It was generally understood that two reports would be presented, one, the majority, favoring Saratoga, and the minority voting for New London. The general impression, however, was that Saratoga would finally be chosen, the drawbacks of that course in its liability to be disturbed by high winds, being overbalanced by the lack of hotel accommodations at the others. Nor, aside from the question of the course itself, can we see any good reason why the regatta should not be held at Saratoga. The gambling proclivities ascribed to that place are absurd when considered in this connection; nor are college men to be considered as boys. If they are, a letter addressed by each President to Mr. Morrissey, would probably ensure them his protection, as well as immunity from temptation. At no other place would the event be attended with so much *clat*, and there are especial reasons why, during the Centennial year when we are supposed to be overrun with visitors, the regatta should not be held at some point which has the advantage of abundant hotel facilities, in addition to its being a representative place of Summer resort.

With regard to the challenges sent to Oxford, Cambridge and Trinity, a reply to but one of them has been received. A letter from Cambridge, states that the challenge has been received, but must remain unanswered until the return of the students now absent on their vacations. The letter to Thomas Hughes, inviting him to act as referee, has not been heard from, and it is feared that it has miscarried.

The withdrawal of Yale from the association continues to be a matter for much acrimonious discussion. It is now a settled fact, however, that her example will not be followed, this season, at least, by Harvard or any other college. Captain Ostrom, of the Cornell crew, in a published letter, intimates that one reason for Yale's withdrawal is, that by adopting the eight-oar, which is in accordance with the English University system of rowing, she may make a race with Oxford or Cambridge, to the exclusion of all other colleges. But he claims that both Columbia and Cornell have both men and money to enable them to sustain the credit of American colleges, and that they have the right to contest with Yale and Harvard for the honor. He gives the following table of averages to substantiate his claim:—

Year of Race.	Time of Harvard. Min. Sec.	Time of Yale. Min. Sec.	Time of Columbia. Min. Sec.	Time of Cornell. Min. Sec.
1871.	18.30.50			
1872.	16.57.00	18 13.00		
1873.	17.11.00	16.59.00	17.58.00	17.28.50
1874.	16.54.00	not taken.	18.42.00	17.31.00
1875.	17.05.75	17.14.75	17.04.25	16.53.25
Total.	86.33.25	52.76.25	52.44.25	51.52.75
Average.	17.19.65	17.28.91	17.14.75	17.17.58

The Boston Journal, however, controverts this statement, and claims that '71 and '72 should have been left out of the calculation, as none of the other colleges contested; but taking the average for 1873-4-5, when the four crews were all contestant, the total should be as follows: "Harvard's total, 51 minutes 10.75 seconds; average, 17 minutes 3.58 seconds. Yale's total, 34 minutes 13.75 seconds; average, 17 minutes 6.87. Cornell's total, 51 minutes 52.75 seconds; average, 17 minutes 17.58 seconds. Columbia's total, 52 minutes 44.25 seconds; average, 17 minutes 34.75 seconds. Cornell and Columbia have nothing to be ashamed of in connection with their recent boating contests, but judging by averages, as Capt. Ostrom suggests, these two colleges are outrowed by Harvard and Yale; the former college, according to Mr. Ostrom's own figures and principles, being the one fittest to represent American colleges in an international race.

The Convention decided upon Saratoga as the course for the next regatta.

ANOTHER CHALLENGE.—Through the columns of the N. Y. Times the Princeton Boating Association sends the following challenge to Yale and Harvard.
To the Editor of the New York Times:

Although Princeton College does not intend to withdraw from the College Rowing Association, yet the following crew does hereby challenge Yale or Harvard to row an eight oared race, with coxswains, four miles straightaway, the race to come off between the 1st and 15th of June, 1876, the course to be agreed upon hereafter. The crew is: Benjamin Nicoll, stroke and Captain; Theodore W. Hunt, Frederick Vinton, J. Stillman Schauck, Henry C. Cameron, Joseph Kargé, Lyman H. Atwater, S. G. Peabody.

SECRETARY, P. B. A.
By order of W. A. BUTTLER, President P. B. A.
New York, Thursday, Dec. 30, 1875.

The following officers have been elected for the coming year by the Nereid Boat Club: Joseph P. Earle, Captain; William Wise, Jr., Lieutenant; Charles R. Flint, President; W. D. Johnson, Vice President; P. B. Rogers, Treasurer; A. B. Brown, Recording Secretary; T. Bull, Corresponding Secretary; Directors, Francis Lawton, Jr., B. A. Jessup and H. C. Brown. The club have contracted for several new boats for the coming year.

FLORIDA HARBORS.—The following directions for entering the various harbors on the Florida coast, together with the depth of water on the bar of each, have been furnished the New York Board of Underwriters by Mr. Thomas S. Eels, of Jacksonville.

Fernandina Bar.—Low water, 10 feet; high water, 17 feet; Spring tide from 18 to 21 feet. If the wind is easterly there is a full tide. If westerly, the tide falls off. Course from sea buoy, inward bound, S.W., W. to No. 4 buoy; thence W. by N. to No. 6 buoy; thence N.W. to No. 1 buoy; thence follow the buoy and range up to the harbor; plenty of water inside the turn buoy.

Nassau Inlet Bar.—At low water, 7½ feet, and from 11½ to 13 feet at high water; Spring tide, 14 to 15 feet, governed by the winds.

St. John's Bar.—A short bar; only about 150 yards over it, subject to changes. A heavy N.E. storm will sometimes close up or shoal the water over the north channel and deepen the south channel. The average depth of water during the last year has been from 6 to 7 feet, low water; high water, from 10 to 13 feet; Spring tide, from 13 to 16 feet, governed by the wind. Vessels do cross the bar drawing 11½ to 12 feet. Plenty of tugs here to tow vessels in and out.

St. Augustine Bar.—Low water, 7 feet; high water, 11½ to 14 feet; Spring tide, from 15 to 16 feet. The bar is changeable, but it is only about 200 feet over it. No tugs, but good pilots.

Mosquito Inlet Bar.—Low water, from 4½ to 5 feet; high water, from 8½ to 10 feet. Good pilots, but no tugs; dangerous bar for vessels drawing over 8 feet.

Indian River Inlet Bar.—Low water, shoals out of water; high water, about 4½ feet. Nothing can cross over 4 feet; No other inlets south of Jupiter.

—The room of the St. Augustine, Fla. Yacht Club is now open daily, its banners flying, and all has an appearance of business and life. A yacht race took place on Christmas day between the Henrietta, Brooklyn Belle, Lucy and Maud.

A CORRECTION.

NEW YORK, December 27th, 1875.

EDITOR FOREST AND STREAM:—

In your issue of December 16th, among the list of winning yachts for 1875, the Octoplexara is mentioned as the winner of the Queens County regatta, when it should have been the Chester A. Arthur, which now holds the cup and pennant. Your correspondent, no doubt, was misled in the matter from the fact that the race was sailed twice, the judges deciding the first contest (won by the Octoplexara) unfair. The second contest was won by the Chester A. Arthur, which was awarded the prize above mentioned.

Geo. W. Logan,
Chester H. Southworth,
Geo. Coffin,
owners Chester A. Arthur.

Rational Pastimes.

—The chess contest between Messrs. Mason and Bird has progressed so far as to indicate a promised victory for the American player, Mason. When the two met in the series of exhibition games played at the Café International, Mr. Bird had the best of it, winning the majority of games without apparent difficulty; but in the money match now in progress, Mason seems to be developing his full strength, and to give promise of being one of the coming American chess players in the Centennial Tourney. Up to the 4th inst twelve games had been played between Messrs. Mason and Bird, and of these Mason had won six and lost but three, three being drawn. They have to play until one or the other wins eleven games. Bird has now to win eight and Mason but five. Of course no such brilliant play has been shown as in the exhibition games, both players being too anxious to win the purse in the money match, to run the risk in dashing moves, which they do in most exhibition contests. The match is a good thing for chess in this city as it has quite revived interest in it, the daily papers now recording the scores of the games played, though generally very incorrectly.

—The National Chess Association from some cause or other seems to have lost the confidence of the chess fraternity of the country, at least to the extent of giving it influence enough to successfully organize a grand Centennial tournament. Action should have been taken last year in organizing this tourney; but nothing of importance was done, and now we find the Philadelphia Chess Club the most influential chess organization of the country—taking the subject up in earnest, as will appear from the appended circular which they have recently issued:—

Whereas, The Philadelphia Chess Club has been frequently importuned by numerous chess organizations throughout the country to hold a tournament under its auspices during the Centennial year; therefore,

Resolved, That the Philadelphia Chess Club offers playing accommodations and the sum of \$250, at least as a nucleus for a fund for a grand international chess tournament, to be held under the auspices of the Philadelphia Chess Club, during the Centennial Exposition of 1876; and

Resolved, That in accordance with the above resolution the Centennial Board of Management of the Philadelphia Chess Club requests each chess organization subscribing to a fund for this tournament to delegate one member as a representative of such organization in the said Board to arrange the rules of play, distribution of prizes, &c.

Resolved, That we cordially invite the co-operation and assistance of the various chess organizations and all chess players throughout the country.

W. H. SAYEN, Secretary,
By order of the Board—L. D. BARBOUR, Corresponding Secretary.

Every chess player in the country should promptly respond to this call of the Philadelphia club. Let each club at once get up a Centennial subscription list in its rooms, to which every chess player can subscribe to the extent of his means. Tournaments in the several clubs to assist the fund too, would be a good thing to do. It is to be hoped that the Brooklyn Chess Club and the Down Town Club, will at once take action in response to the Philadelphia club's circular.

Billiards.

—The Union Square Rooms, which, since the death of Chris. O'Connor have been run in the interest of his widow, were sold Dec. 31. We are gratified to learn that the sale does not necessitate any change in the former name, and that as of yore they will be styled "O'Connor's Union Square billiard rooms." The purchaser is Mr. John D. O'Connor, who in conjunction with Capt. Tom Murphy,

formerly owned the Columbia Room. Mr. O'Connor is well known in billiard circles and Cris' Mantle, could not have fallen on better shoulders.

MAURICE VIGNAUX.—A correspondent writes: "Vignaux lately played an interesting match with a new aspirant for billiard fame, a Mr. Piot. The contest was for a purse of 4,000 francs and the game, French, 5,000 points up, requiring several days to bring it to a terminus. Vignaux proved the conqueror." Vignaux is expected to arrive in this country during the month of February, and in all probability his late antagonist will accompany him. Who will be the next challenger for the Collende cup emblematic of the three-ball championship of the world?

—Ned Bryan at last replies to the challenge of Clarke E. Wilson. He says he will play for not less than \$500 a side, the games to take place in any two New England cities. He also offers to play any man in the United States for \$1,000 a side at his place of business in Providence. What does Cyrille Dion say to that?

ALL SORTS.—The posters announcing the coming match, Jan. 27th, between Slosson and Sexton, have a very suggestive heading: "Native experts to contend at last at three-ball American game." Slosson is working like a beaver practicing continually from morning until night, and expected to beat Daly's unparalleled run of 212. He has several times done it, but not in a match where it must be performed to get a record. Sexton and Garnier were to have left for Baltimore and Washington on the 2nd inst., on an exhibition tour under the management of Dr. Taylor. Upon Sexton's return it is his intention to settle down to uninterrupted practice, under the membership of Garnier, if such a thing is possible. . . . Joseph Dion has been the recipient of a gold medal on which is engraved: "Presented to Joseph Dion, champion of the Billiard tournament held at Tammany Hall, Nov., 1875. . . . The games for the medal offered by the Dion bros. closed Dec. 31st. The prize was for the best record at fifteen-ball pool, and confined to the amateur patrons of the place. Two players tied for it, each pocketing fifteen balls in a single inning. . . . Wm. Grey, of Dublin, who contended with Foulkes in 1857 for the Racket championship of the world, is suffering with the consumption. . . . Over 1,500 ladies and gentlemen inspected the rooms of Major J. A. Walker in New Orleans, Dec. 23d. . . . The prizes for the Canadian Tournament are \$500; first, \$200; second, \$150; third, \$75; fourth, \$50; fifth, \$25. Entrance five per cent. of whole money. Game, 3-ball, 300 points up, for residents only. . . . A handicap tournament is now in progress in Massachusetts. It is proposed to play three games a week alternately in Salem, Lynn and Swampscott, which will prolong it to nearly four months. The prizes are an elegant silver emblem and \$75 for first; \$50 for second; \$30 for third, and \$15 for fourth. The contestants are George F. Batchelder, of Swampscott, James O'Gorman, Frank Baker, Mr. Cheney, and Lyman Hayes, of Lynn, and E. H. Marshall, James Sullivan, David Riley, and Frank Ladd, of Salem. . . . Davenport, Iowa, also boasts of a tournament. The game is four-ball, 300 points up, and the managers are the Messrs. Hawley Brothers, of Hill's block. Nine contestants participated, in the persons of H. Moore, J. Haupt, T. S. Buck, E. Hart, W. Dolan, L. Martin, G. G. Shanks, C. Davis, and W. W. Woods. On December 27th H. Moore had the lead. He had won five games and lost one.

WONDERS OF NEW GUINEA.—A new book has just made its appearance in England, entitled "Wanderings in Guinea," by Capt. J. Lawson, of the ship Nautilus. Among the wonders he describes is a mountain, said to be 30,000 feet high, the highest by few in the world. Capt. Lawson ascended it to the height of 25,000 feet, when his party became almost frozen and insensible, the blood gushing from their eyes, mouths, and ears, and they were compelled to return. They also met with a race of large apes, of which he shot two specimens, the male measuring five feet three inches high and the female five feet high; a cataract 900 feet wide with a fall of 179 feet, throwing Niagara quite in the shade; butterflies with wings a foot long; scorpions ten inches long; a tree 337 feet high; and other things in proportion.

It is this old skipper, we believe, who witnessed the combat between a sea serpent and a whale, the former raising himself sixty feet out of water, and the whale taking his punishment without a sign of weakening or blubber. Capt. Lawson evidently has not gone to see for nothing.

WHAT CORRESPONDENTS ASK.—We have a most indulgent constituency. We print herewith a few extracts from friendly letters received this week:—

"Why don't you print more horse?"
"Give us more dog and gun, and less rifle reports and yachting."
"What do you want to touch base ball for. The game is played out, and your space is too valuable."

"I am glad you have got a new Natural History editor. If you will go a little more into fish culture, your paper will be nearly perfect."

"Why don't you print fuller reports of rifle and pigeon matches?"

"You have a very neat engraved title; but I would suggest that you add the word 'Ocean' to FOREST AND STREAM."

"What have you taken up billiards for? I do not encourage my children to play billiards."

"Give us more miscellaneous sketches; You used to print three or four pages."

"I am glad you have taken to printing poetry again. It is one of the most attractive features of your paper. I give herewith a package of contributions for the 'Poet's Corner.'"

"Would it not be well to revive your Art and Drama Departments? We would like to see these treated from a brighter stand-point than the other papers do."

"Why don't you print more humorous articles? Your paper is sometimes a little dry."

"I like your paper very much, but would prefer more attention given to agriculture and gardening. I think it would benefit your paper."

These are specimens of the friendly attentions we constantly receive. The fact is, our journal is so complete and pleasing to everybody, that each one is eager to add just that feature which he thinks will make it perfect, and then he fancies that all will be satisfied. At this beginning of the year, these hints, come in abundantly with new subscriptions and renewals, and in acknowledging our appreciation thereof, we can only promise to continue our best efforts to please.

New Publications.

IN DOORS AND OUT. By Oliver Optic: Lee & Shepard, Boston.

This book, originally issued twenty-one years ago, is reprinted and republished at the request of many friends of the author. Some of the sketches appeared in different periodicals originally, but all are sprightly and pointed, hitting some social absurdity or vice.

FUNGI; Their Nature, Influences and Uses. By M. C. Cooke, M. A., LL.D. Edited by the Rev. M. J. Berkeley, M. A., F. L. S.: Henry S. King & Co., 65 Cornhill, and 12 Paternoster Row, London.

This is a book that will prove of much value to students of science. The illustrations are very numerous.

THE READING CLUB. By Geo. M. Baker: Lee & Shepard, Boston.

This little book is a "handy speaker," comprising selections in prose and poetry of serious, humorous, pathetic, patriotic and dramatic sketches for readings and recitations. The young elocutionist will find it a convenient pocket companion, and the general reader derive much amusement at odd moments from its perusal.

INFELICE. By Augusta Evans Wilson: New York. G. W. Carleton & Co.

Mrs. Wilson, or as we more familiarly know her, Miss Evans, has a reputation almost world-wide, through her other works, of which, perhaps, "Beulah" has been the most popular. In the present volume we have a plot of great interest, with a denouement carefully worked up, and culminating in a satisfactory manner. The works of this authoress are all pleasantly told stories, and command the attention of the reader from title page to finish.

THE MODERN COOK. A practical guide to the culinary art in all its branches. By Charles Elmo Francatelli. Illustrated: Philadelphia. T. B. Peterson & Brothers, publishers.

This is emphatically a regal cook-book, prepared by the *chef de cuisine* of Her Majesty Queen Victoria. In addition to English cookery, it comprises the most approved systems of French, Italian and German cookery, and teaches those who are able to comprehend its instructions the most ingenious methods and contrivances for disguising and metamorphosing the commonest viands out of all semblance and favor of their original properties. In it all the mysteries of Tourtes, Chartruses, Fricandoux, Pates and Souffles are exemplified and explained by numerous illustrations, without which the ordinary mind would be bewildered and befogged. Only the professional caterer can grasp the situations, and educated palates only can be gratified. This is true of the book in its greater part. In its ministrations to the wants of the inner man, it is so far above the comprehension and pecuniary means of impecunious plebeians, that only the aristocratic and wealthy should venture to look between its covers. For the latter it is eminently adapted. Any aspirant for distinguished reputation as a high liver, can here duplicate the dinners set before the Queen of England, and in the gustatory delight that attends the serving and the swallowing, almost imagine himself a prince of the royal blood, and be happy in the extravagance and temporary illusion. Eating, *a la mode*, as exemplified here, need not be aspired to by the simple sportsman in his backwoods life. Such a massing and distributing of incongruous ingredients, such lavish use of garnishes and wines, such utilizing of improbable and *outré* portions of the animal anatomy, such phenomenal juxtapositions of miscellaneous messes, would not only require tribute from every known resource, but absolutely appal and confuse the man of simple tastes. Venator could not think of serving on primitive dishes of birch bark the wonderful Turbans of Ox Palates *a la Perigueux*, the Souffles of Partridge, Salamis of Woodcocks Tongues, Filets of Larded Rabbits, the boudins (entrails) of Whittings, Calves Ears *a la Tortue*, and the fourteen hundred other dishes here offered for his selection. He could not toast any of these on a stick, or frizzle them over the coals. Indeed, we find very few plain dishes. There is only one recipe for Hash, we regret to say, and to manufacture this, *en regle*, we must have pepper and salt, chopped onions, Hovey source, mushroom catsup, a half pint of broth, and sippets of toasted bread! On the whole, the exposition of Francatelli is wonderful; that his talent is appreciated, is shown by the fact that his book has run through nine editions in Europe. We can therefore freely recommend it to young housewives here, especially those of New England, who desire to astonish their palates, provoke the gossip of the neighbors, or pass their leisure hours in experimenting. It comprises 600 pages, and the price is five dollars.

MAGAZINES.

Horticultural Magazine. The *Horticulturist*, the oldest horticultural magazine in the United States, has recently been purchased by the proprietors of the *Gardeners' Monthly*, published in Philadelphia, and edited by Thomas Meehan, Esq., of Germantown. The two magazines will hereafter be united.

The American Naturalist.—We have been watching with some attention for the appearance of this, the first number under the new regime; and now that it is here, we cannot but express some disappointment. The old *Naturalist* was, at best, always good as a biological magazine. It needed an element of popularity, the lack of which finally resulted in its failure financially. In this respect the present number is no better. Nor does its new dress and type become it any better. The old was extremely good. The list of contents includes "Burs in the Borage Family," by Prof. Asa Gray; "The Florida Chameleon," a capital article, by the Rev. S. Lockwood; "The Availability of Certain Bartramian Names in Ornithology," by J. A. Allen, discussing Dr. Coates' recent paper in the Proceedings of the Philadelphia Academy; "The Harvard Summer School of Geology," by Prof. Shaler, which was printed word for word in the New York Tribune of Nov. 26th, 1875; "Ancient Ruins in Southeastern Colorado," a rehash of the explorations of Wm. H. Jackson and Ernest Ingersoll in the United States Geological Survey of 1874, printed in the Bulletin of the Survey six months ago. Its illustrations are borrowed from that Bulletin. There are two other short and technical papers, and a review, with illustrations of the stag, reindeer and elk, of Caton's "Summer in Norway." The departments are Botany, Zoology, Geology and Paleontology, Anthropology, Geography and Exploration, Microscopy and Scientific News, all of which are full of interesting notes. But, although the improvement in the *Naturalist* is not yet so easy to be seen, it is nevertheless an interesting and useful magazine, and one which ought fully to succeed; and we heartily wish it every bit of the success which it deserves. It stands alone in publishing the result of American naturalist's studies, as FOREST AND STREAM stands alone in recording their field observations.

—We acknowledge the receipt of an invitation of the Cuvier Club of Cincinnati to attend their second annual reception on New Years day. Alas! that so much space should have intervened to prevent our accepting. In spirit we were present, and acknowledged with thanks the kind invitation which "circumstances over which we had no control," prevented being met in a more material manner.

—Daniel Coon, of Chesterfield, New Hampshire, has trapped one hundred and thirty-three foxes within five years, sixteen this fall; all done with steel traps.

—Thomas F. Stone, the veteran billiard player, died of heart disease on Tuesday, Dec. 28th, at his residence in this city. He was fifty-five years of age.

—J. Warner won the first prize of \$100 at the Newark three-ball tournament, just closed.

Whitney Arms Comp.,

Whitneyville, near New Haven, Conn., U. S. A.

JOS. C. GRUBB & CO.,

712 Market street, Philadelphia,

AGENTS FOR THE SALE OF THE

Celebrated Breech Loading Shot Guns—Unequaled in Fine Workmanship and Material.

Made by James Purdey,

314 1-2 Oxford street, London, England.

Have now in store an extensive assortment of Breech Loading Shot Guns, made by JAMES PURDEY, E. M. REILLY & CO., WESTLEY RICHARDS, W. & C. SCOTT & SON, P. WEBLEY & SON, W. W. GREENER, and a large variety of cheaper grades. Also BREECH LOADING, CENTRAL FIRE, DOUBLE RIFLES, AND RIFLE AND SHOT GUNS of superior quality. Implements, ammunition, and all other articles appertaining to Breech or Muzzle Loading Fire-arms generally. Illustrated Circular sent by mail when requested.

Hart's Sportsman's Favorite Metallic Shells for Breech Loading Shot Guns.

These Shells are easily loaded, and the caps easily extracted from inside. Head solid, and much thicker than any shell now made, giving a solid seat for cone or anvil, which prevents it from driving through or springing away, thereby causing misfires. The cone is made of nickel and fastened solid in its place. It neither rusts or corrodes fast like moveable anvil made of steel. The nickel cone also prevents misfire when cap has been left on shell for a few days, which is liable to occur either in steel or iron. These shells are finely finished, and made any length ordered, from 2 1/4 to 3 1/4 inches.

Shells and Loaders, and description Price Lists, can be obtained from all the leading sportsmen's houses throughout the country. GEO. E. HART & CO., 363 and 365 Market st., Newark, N. J.

From Captain Bogardus, Champion Wing Shot of America.

Messrs. GEORGE E. HART & CO.,
Gentlemen—The fifty shells I received from you to-day suit me better than any I have ever used. They are stronger and better in every respect, and I shall use them in all my shooting hereafter. Yours truly,
A. H. BOGARDUS.

Paper and Metallic Shells

FOR

Breech Loading Shot Guns,

Manufactured by the

UNION METALLIC CARTRIDGE CO.,

BRIDGEPORT, CONN.

THE STURTEVANT SHELLS are the easiest reloaded. Do not have to unscrew the head nor use an awl to remove the exploded caps. THE PATENT MOVABLE ANVILS, made of steel wire, will not bend or break.

THE BERDAN PATENT SHELLS, new model, with Hobb's patent waterproof primers, never miss fire, and are highly prized by all that have used them.

PAPER SHELLS.—By repeated experiments and great outlay for improved materials, and machinery made expressly for the purpose, we can now warrant our BROWN PAPER SHELLS equal to any imported. They are sure fire, and will not burst in the gun.

Inquire of any of the dealers in sporting materials for the U. M. C. Co.'s Shells.

Not sold at retail by the manufacturers.

Illustrated Household Magazine.

—Now in its 17th Volume—

The best Periodical ever published for the Family Circle.

Profusely Illustrated—Replete with choice reading and useful information.

An Attractive Monthly for Young and Old.

Examine the brilliant list of Grand Prizes!

(the first is one Elegant Rosewood Piano, retail price, \$500). The publishers now offer these prizes for subscription, in addition to the commission, which is thirty cents for every subscriber. For terms in full, see announcement in the Magazine, headed "Grand Prizes Now Offered to Workers."

It will pay you well to act upon our advice.

Subscription ONLY one dollar a year!

Postage 10 cents extra.

Parents send at once for a copy of this excellent, chaste and sparkling publication—examine it carefully; and, OUR word for it, YOU WILL at once become subscribers for the sake of your little ones, as well as because you will find its columns most attractive for your own reading.

The conductors of this magazine have spared neither pains nor money in order to make it what it is to-day—an instructive and entertaining desideratum for every household. Its pages are devoted to popular literature, science, art, education, and the development and maintenance of the moral influence of home attractions. Its characteristic feature is comprehensiveness. The manuscripts now on hand, from noted pens, and others especially engaged, embrace an unusually attractive list of Sketches of Travel, absorbingly interesting Serials, Tales, Poems, Popular Essays, Literary Criticisms, etc., etc. In the EDITOR'S STUDY, Important and Posing Questions of the Day, will be treated with fearlessness, uncompromising independence, and unserving loyalty and devotion to Truth, Justice and Right.

THE HAZARD POWDER CO.,

MANUFACTURERS OF

GUNPOWDER.

Hazard's "Electric" Powder.

Nos. 1 (fine) to 5 (coarse). Unsurpassed in point of strength and cleanliness. Packed in square canisters of 1 lb. only.

Hazard's "American Sporting."

Nos. 1 (fine) to 5 (coarse). In 1 lb. canisters and 6 1/4 lb. kegs. A fine grain, quick and clean, for upland and prairie shooting. Well adapted to short guns.

Hazard's "Duck Shooting."

Nos. 1 (fine) to 5 (coarse). In 1 and 5 lb. canisters and 6 1/4 and 12 1/2 lb. kegs. Burns slowly and very clean, shooting remarkably close, and with great penetration. For field, forest and water shooting it ranks any other brand, and it is equally serviceable for muzzle or breech loader.

Hazard's "Kentucky Rifle."

FFFG, FFG, and "Sea Shooting" FG, in kegs of 25 12 1/2, and 6 1/4 lbs. and cans of 5 lbs. FFFG is also packed in 1 and 1/2 lb. canisters. Burns strong and moist. The FFFG and FFG are favorite brands for ordinary sporting, and the "Sea Shooting" FG is the standard Rifle powder of the country.

SUPERIOR MINING AND BLASTING POWDER. GOVERNMENT CANNON AND MUSKET POWDER; ALSO SPECIAL GRADES FOR EXPORT, OF ANY REQUIRED GRAIN OR PROOF MANUFACTURED TO ORDER.

The above can be had of dealers, or of the Company's agents in every prominent city, or wholesale at our office.

88 Wall Street, New York.

National Exhibition

OF

POULTRY, PIGEONS AND DOGS.

The Exhibition which is to open in the Exposition Building, Chicago, January 20th, 1876, is an assured success. The large Cash Prizes, aggregating

OVER NINE THOUSAND DOLLARS,

and the reduced rates to exhibitors over all the leading Railroads, and the free return of all stock by the Express Companies, will draw more fanciers to Chicago than ever before met in America.

Premium Lists and Entry Blanks now ready, and may be had on application to

CHARLES P. WILLARD, Secretary,
Chicago, Illinois.

THERE CAN BE NO GREATER PORTABILITY without serious defects. They are the only portable boats that are equal to the very best whole ones for local use.

Hotels and Resorts for Sportsmen.

GRAND NATIONAL HOTEL,
Jacksonville, Fla.,
George McGinley, Prop. \$4 per Day.

TUBBS' HOTEL,
OAKLAND, California.
JOHN M. LAWLOR & CO., PROPRIETORS.
SITUATED AT THE TERMINUS OF
the great Trans-continental Railroad; 40 minutes from San Francisco; 200 rooms, with hot and cold water in every room; delightful drives and splendid scenery; a favorite home for tourists. July 22-26m

Rossin House, Toronto, Canada.
SHEARS & SON, Proprietors.
This house is a favorite resort for gentlemen sportsmen from all parts of the United States and Canada.

DUCK SHOOTING.—THE ATTENTION of sportsmen is called to the fact that the best shooting ground within three hundred miles of New York city is Shinnecock Bay. More ducks of all kinds in the bay now than has been for a number of years, and sportsmen are bringing in bags of birds daily. The most experienced guides and gunners, with boxes, battues, decoys, etc., furnished at the Bay View House. Address
ORVILLE WILCOX, Proprietor,
Good Ground Post Office,
Suffolk county, Long Island.
Nov 25-8t

SPLENDID TROUT FISHERY TO lease. The Trout Fishery of the Connecticut River, Long Island, below the bridge, three miles in length, will be leased for a term of five years or more, to a company. Attached is the snipe shooting of the South Beach, close to the river. Address
EGBERT T. SMITH,
Brookhaven, L. I.

For Florida.
PHILADELPHIA AND SOUTHERN Mail Steamship Company's line to Savannah, Ga., sailing every Saturday, from Pier 23, below Pine street, Delaware River, at 12 o'clock noon, making close connections through to all points South. The line is composed of the steamships JUNIATA and WYOMING. The Wyoming does not carry passengers. The Juniata is a favorite ship with the traveling public, having passenger accommodations of the most superb character. She has recently been refitted and elegantly furnished with everything requisite to the comfort and convenience of passengers.
Families en route for FLORIDA, Georgia, Alabama, and even as far as New Orleans, will find the Savannah route the most desirable for comfort, as well as the most economical. Through trains of the Central Railroad of Georgia, and Atlantic and Gulf Railroad, Florida, leave Savannah every morning and evening. The Florida steamers leave Savannah three days in the week for all points on the coast.
For through passenger tickets and bills of lading to all points in Florida, Georgia, Alabama and Tennessee, apply to WM. L. JAMES, General Agent, 416 South Delaware avenue, Philadelphia.

National Tube Works Co.,
Boston, Mass., and McKeesport, Pa.
COATED INSIDE AND OUT WITH AN
INDESTRUCTIBLE ENAMEL.
WARRANTED.
Joints are connected by our Patent Sleeve Couplings, preventing all leakage.
Specimens can be seen and obtained on application at the Company's Offices, 8 Pemberton Square, Boston and 78 William street New York. Oct 21-12w

Sportsmen's Goods.**Orange Sporting Powder.**

ORANGE LIGHTNING POWDER,
The strongest and cleanest Powder made. Nos. 1 to 7, packed only in sealed 1 lb. canisters. The coarser sizes (higher numbers) especially are recommended to owners of fine breech-loading guns, giving great penetration with very slight recoil.

ORANGE DUCKING POWDER,
For water fowl. Very strong and clean. Nos. 1 to 5. Packed in metal kegs of 6 1/2 lbs. each, and in canisters of 1 and 5 lbs.

ORANGE RIFLE POWDER,
The best for rifles and for all ordinary purposes. Sizes F.g, FF.g, FFF.g, the last being the finest. Packed in wood and metal kegs of 25 lbs., 12 1/2 lbs., and 6 1/2 lbs., and in canisters of 1 lb. and 1/2 lb.

All of the above give high velocities and less residuum than any other brands made.
BLASTING, MINING, AND SHIPPING POWDER OF ALL GRADES AND SIZES PACKED IN WOOD OR METAL KEGS OF 25 LBS.
SAFETY FUSE AND ELECTRICAL BLASTING APPARATUS.

LAFLIN & RAND POWDER CO.,
21 Park Row, N. Y.
Sole proprietors, and manufacturers of the celebrated ORANGE brand of GUNPOWDER. Recommended and used by Capt. A. H. BOGARDUS, the "Champion Wing Shot of the World."

DITTMAR POWDER

MANUFACTURING CO.
MY NEW IMPROVED POWDER
can now be loaded from an ordinary powder flask; grains hard. Use it now like Black Powder. No fear of overloading. Burns slow now. No fouling of the gun. Little or no smoke. Little or no recoil. Not very loud report. Less heating of the barrel in rapid firing. Good penetration and good pattern. Safe to keep, as it does not explode if set on fire, except well confined. Shells furnished loaded with powder only, if desired. None genuine without my signature on the can. **CARL DITTMAR,** NEPONSET, MASS.

HOLIDAY PRESENTS.

Received the Prize at the Paris Exposition, 1867.

Fred. Julius Kaldenberg,
WHOLESALE AND RETAIL DEALER IN, AND MANUFACTURER OF
Amber Goods, Meerschaum Pipes, Cigar Holders, etc.

Monogram and Crests cut on Pipes and Holders. Portraits made from Photographs. Pipes and Holders of any design, or made to order.
N. B.—By a new process I boil Pipes so that the color remains, no matter how much or how hot they are smoked.
Pipes sent by mail to all parts of the world.

Stores: 4 and 6 John st., one door from Broadway; N. W. cor. Nassau and John sts.; 6 Astor House, Broadway, New York. P. O. Box 81. Send for illustrated Catalogues. Nov 25-3m

FOR EVERY SMOKER.

AN INDISPENSABLE ARTICLE FOR THE PIPE. Pick, Spoon, and Press combined. Can be carried in the pocket. Has long been used in Europe, and now manufactured in this country for the first time. Sent post-paid on receipt of 50 cents. Address
WALKER & WELCH, 212 Main street, Buffalo, N. Y.
Nov 1-3m

TRY IT Vanity Fair.

It is shaved from the best Natural Leaf, for Meerschaum and Cigarettes. Does not make the tongue sore. Sample on receipt of 20 cents. Highest award, Vienna, 1873. Send for circular.
WM. S. KIMBALL & CO.,
PEERLESS TOBACCO WORKS, Rochester, N. Y.

From an Officer U. S. A., Fort Yuma, Cal.
I have the honor to acknowledge the receipt of your favor of Sept. 13th, 1875, also of the Vanity Fair sent by you same date of the letter. I can only say that it is delicious and surpasses all my expectations. Please not delay in forwarding my order, as I do not want to smoke any other tobacco again, especially the stuff we get here, for three times the price of Vanity Fair.

For Cigarettes.
There are times and places tolerant only of the Cigarette; tenderly white and sweetly fragrant. Vanity Fair is the correct thing for Cigarettes.

From Assistant Observer U. S. Signal Service.
Having tested thoroughly the Vanity Fair you kindly sent me, I have come to the conclusion that it is the best smoking tobacco I have ever tried. I have been in the habit of smoking Perique and Granulated mixed for the last two years, but greatly prefer your Vanity Fair. I have shown the tobacco to several of my friends, and they are very favorably impressed with it.
I have had more solid comfort out of your tobacco than I have had for some time. Please accept thanks for your promptness in answering my letter.

For Meerschaums.
Smoking is an elevated mental and psychological pleasure, when one uses that splendid article, Vanity Fair. Best dealers have it.
Vanity Fair will be your constant companion by day and night; in merriment and in distress.

CHAMPION GUNS OF ENGLAND**PAPE'S Unrivalled Sporting Guns.**

Stand unequalled in every contest. Their performance at the London Trials of 1875 beats the records of any maker in the world.

1875. 12-Gauge, Choke Boring.
Maker of Gun. Exhibitor.
1st—Greener. Greener.
2d—Pape. Davidson.
3d—Pape. Pape.

Out of a class of 68 guns, 8 out of the 6 best were made by Pape. The Greener gun was protested against on the spot for having its score false counted, the fact proven there, and afterwards confirmed by same gun being shot for two days per week for six weeks in succession, when its average score only took 24th place, its very best score being greatly below the scores of the best six guns.

1875. 12-Gauge, Old Sporting Bore.
Maker of Gun. Exhibitor.
1st—Pape. Davidson.
2d—Pape. Davidson.

1875. Long Range, 60 yards, Choke Bore.
1st—Pape. Davidson
60 yards, Long Range, Sporting Boring.
1st—Pape. Davidson

Those champion Long Range guns, only 7 pound weight, with a charge of 3 1/2 dr. to 1 1/2 oz. shot, beat the best 8 bore Greener gun at 60 yards; weight, 15 lbs.; 6 drachms and 2 1/2 oz. shot.

1875. The Sportsman's Sub. Cup, valued at £45, was also awarded to W. R. Pape, for the original invention of choke boring. Winner of the London Gun Trials of 1858, 1859, 1866. Address
NORTH OF ENGLAND GUN WORKS,
Newcastle on Tyne, England.
NO AGENTS.

H. C. Squires, No. 1, Courtlandt st.
New York.

THE GREAT London Gun Trial,
1875.

W. W. GREENER begs to inform his numerous clients in the United States that he has been very successful in the above trial, having secured the first prize, a silver cup, value 40 guineas—class 2 for 12 bores; also winner in class 1 for 8 and 10 bores, and class 4 for 20 bores. He has won in all the classes for improved boring, which is upon a different plan to any other maker, and is far superior in the three most essential points, viz., PATTERN, PENETRATION, and REGULARITY OF SHOOTING.

Mr. HENRY C. SQUIRES, of No. 1 Cortlandt St., New York, is now importing my DOUBLE-CLOSE-SHOOTING GUNS to order, an invoice of which will be shipped to him on the 1st July, and can be examined about the 15th. All special orders given to Mr. Squires will be carefully filled. A full report of the GREAT TRIAL, showing the marked superiority of my guns over guns made by Dougal, Pape, Tolley, and others, will shortly be published, and can be had on application at No. 1 Cortlandt St.

W. W. GREENER,
Champion Gun Maker,
St. Mary's Works, Birmingham, England.
HENRY C. SQUIRES, of No. 1 Cortlandt street has just received an invoice of these close-shooting guns, and from him any information in reference to the results of the Great Trial can be obtained on application

Ivory and Pearl Stocks put on Pistols. Repairing of all kinds artistically executed.
Cartridges for Breech Loading Shot Guns, ready loaded, put up in boxes of fifty, or loaded to order.
Aug 5-6m

W. W. GREENER'S
DOUBLE-CLOSE-SHOOTING GUNS. Winner of the Silver Cup, value 40 guineas, at the Great London Field Trial 1875, beating 33 competitors with 68 guns, also winning in all the other classes for the Improved System of Boring. These guns will kill from 80 to 100 yards, loaded with large shot, and will shoot well with small shot with a less powder charge than guns bored upon the old system. For report of the Gun Trial apply to Messrs. McLaren, Williams & Co., Agents, St. Louis, U. S. A. Address
W. W. GREENER,
St. Mary's Works, Birmingham, England.

**J. D. DOUGALL'S EXPRESS SHOT GUNS.**

(Title registered.)
Shown by trials at Wimbledon by Editor of the Field to possess the GREATEST PENETRATION and therefore LONGEST RANGE—thus: Circle, 30 inches; 300 pellets; average, 191; penetration, 37. The Editor's trial of Greener guns with 340 pellets of same shot, and same charge of powder, gave 180, and penetration 30, although there were 40 more pellets in each charge. Should any controversy arise as to the durability of these new systems, we herewith warn all beforehand that our system is our own invention (though founded on the American idea) and is DURABLE, a fact remarked on by the Field, that the guns tried had been in use during last season, and references permitted to the owners. Send for Illustrated Circulars to
59 St. James's Street London.

JOHN RIGBY & CO.,

72 ST. JAMES STREET, LONDON.

WILLIAMS & POWELL,

Gun and Rifle Manufacturers,
Call the attention of the Sportsmen of America to the extreme SIMPLICITY, STRENGTH and DURABILITY of their New Patent "SIMPLEX" Breech loader and INDEPENDENT EXTRACTOR.

The parts in this new action are so few (only two,) its mechanical soundness so thorough, and the strength and simplicity of the action so great, that W. & P. feel sure it will supercede all the complicated and manifold grips now in use, its one powerful grip being far stronger than any double, treble or quadruple grip now used. In this new action LEVER and GRIP ARE ONE SOLID PIECE OF STEEL and the ANGLE of the BODY is left in its ENTIRE STRENGTH. Drawings of action and extractor will be sent on application, and orders may be forwarded through any of the best houses in the States for execution in the Spring.

Guns guaranteed to make patterns of from 160 to 230 with No. 6 SHOT AT 40 YARDS, as desired.

NO. 25 SOUTH CASTLE STREET,
LIVERPOOL.

McBride Flies.

HAVING BEEN FOR THE PAST

twelve years associated with my father, John

McBride, in the manufacture of fishing tackle, I feel

competent to continue the business and supply the

custom with the same quality as heretofore. Parties

supplied with casting lines and artificial flies for

Pennsylvania trout streams, Adirondacks, the Maine

Woods, Lake Superior, Thousand Islands, Canadian,

and other waters. Anglers not acquainted with the

nomenclature of these flies, by mentioning the local-

ity where they intend fishing, will have the varieties

best suited to those waters sent to them. Flies copied

from any natural insect or pattern desired. **SARA**

MY VISITOR.

For Forest and Stream.

WHILE lost in thought one sunny morn,
A thing of perfect beauty born,
Into my room was sent—
A humming bird with taper wings
Bedashed with tints of ancient kings,
And to and fro it went.

While bronze-like colors decked its head,
From dark blue-brown to almost red,
With iridescent hue,
Its eyes with flashing radiance shone,
Chatoyant like some sparkling stone,
And thrilled me through and through.

The window closed, it could not pass—
It buzzed and buzzed against the glass
And beat its crested head:
But soon its mellow hum did cease
With anxious look for quick release—
Alas, my bird was dead!

A constant humming was its tune,
It sung May out and sung in June—
A song for every flower:
But now it sings a spirit's song,
A song that's sung the Ages long
And constant as the hour.

T. D. I.

The Dismal Swamp.

For Forest and Stream.

"Away to the Dismal Swamp he speeds,
His path was rugged and sore,
Through tangled juniper beds of weeds,
And many a fen where the serpent breeds,
And man never trod before."

THERE are but few people in this country who have not heard of the great Dismal Swamp of Virginia, and in their mind's eye have not pictured an immense section of land composed of quagmires, quicksands, morasses, and bogs, all commingled together, and forming an impassable swamp, into whose depths the foot of man has never trod. This is the general impression, but it is entirely an erroneous one. There is much to see in the Dismal, much of varied loveliness and picturesque beauty, and nowhere on this continent is there a region that will interest, amuse, and instruct the tourist, and give more satisfaction to the sportsman, than this great swamp.

To those who like every varying scene, and who love to see nature in all her aspects, they will be satisfied in their explorations there. It is so different from the mountains, valleys, and seashore, so unlike any other place they ever saw before, so weird, strangely solemn, so utterly still and silent, that it inspires the traveler with a nameless awe, and an intense fascination. The immense cypress trees, with bare trunks and interlacing boughs, stand like pillars supporting a fretted dome in some vast cathedral, and the dim aisles stretch away off all around you and powerfully excite the imagination. One can stand and imagine himself in Avernus, condemned to wander through a vast unpeopled shade all alone, with no voice to break the horrible solitude; doomed to be seeking some object sentient with life, but never finding it; followed by grim remorse wherever he fled, ever by his side, and never leaving him, except when his crime was expiated. De Quincey, in his confession of an "Opium Eater," draws just such a picture. He believed that he had committed such a great sin that even the crocodiles shuddered when they heard it; and he dreamed that he was hunted by Bramah, the Hindoo god through the forest, the jungles, and swamps of the Indies, but finding no rest. In fancy, I could behold the crouching figure of the cowering wretch hiding behind the tree trunks, and fleeing in dim recesses of the forests.

The Dismal Swamp lies in two States; one section lies in Virginia, and is twenty-five miles in length, running from east to west; the other part lies in North Carolina, and is twenty miles long, and stretches in a southward direction, but its width is much contracted. Its area is some eight hundred square miles. The whole

of the Dismal is one vast morass, with little islands scattered here and there of solid ground. The earth is spongy and soft, and consists of vegetation and matted roots, forming but a treacherous foothold. It would be natural to suppose that the swamp was lower than the surrounding land, but this is not so; and singular as it may seem, the greater portion of this vast morass stands higher than the ground that surrounds it, some seven or eight feet higher than its banks, as was ascertained by careful measurement when the railroad was cut through. Another most singular of singular facts in connection with the fascinating spot is, that the water flows from and not into it, there being five rivers that draw their source of supplies from the Dismal—the South Branch of the Elizabeth, the South Branch of the Nansemond, the North and Northwest Rivers, and the Pergamond. Of these, the two first flow into Virginia, and the three latter into North Carolina. Follow all these rivers to their heads and they will be lost in the great Dismal, there being no signs of them above ground. This vast amount of water is sucked up by the spongy soil that retains it, and furnishes a never failing flow to these rivers. The extreme richness of the soil causes a prodigious amount of luxuriant vegetation and aquatic plants to spring up. There are a thousand different varieties, from the diminutive shrub up to the gigantic cypress. Much to my surprise, I found the temperature of the swamp very cold; it must be, I imagine, due to the constant evaporation of the moist soil, and also to the trees keeping out the sun, and forming by their interwoven branches a never ending shade. Be that as it may, the air feels as if you were at the bottom of an ice-house, except when you get into the weeds where there is no shade, and then, on a sultry summer day, if there is any place hotter this side of Hades, I have never felt it.

To those who imagine they have made their way through thick cover in their hunting excursions, whether through the laurel brakes of the mountains, or the weeds and briers of a salt water bog, I commend to them a short trip in the Dismal, and you can wager your pet breech loader against an old flint-lock musket that they will acknowledge they never saw a road so hard to travel before. In the first place the ground, though it supports for a time your weight, has really no foundation. You may take a pole ten feet long and shove it down into the treacherous soil out of sight without using your strength. And there are many large tracts that have no trees whatever, and in their stead are immense patches of reeds; this is a hard place to get through; the reeds are often ten to fifteen feet high, and as thick as a cornstalk, and grow so close together that you cannot thrust your arm through them. They spring up as thick together as the fingers upon your hand, and the briers entangle your feet and wind around your legs so that you cannot extricate yourself, and can only struggle furiously and tie yourself tighter, until you give up the undertaking in despair. Some of the aquatic plants are of rare beauty and exquisitely colored, and by their vivid tints light up the otherwise dreary region in some places; but, on the whole, it may be called a horrible desert solitude, the very "abomination of desolation"—a spot that his "Infernal Majesty" must covet in his "Plutonic Realm," and he was well pleased, for it gave him a hint for improving the prisons of Hell. In some sections of the great Dismal there is no living thing to be seen, not even a bird; and even the buzzards avoid circling over this Avernus, as the exhalations taint the very air. Yes! I often used to think I saw Satan sauntering among the everglades, and strolling in his favorite earthly resort.

"From his brimstone bed, at break of day,
A walking the devil is gone.
To the Dismal Swamp he wends his way,
To see how subjects gets on."

The great swamp used to be a famous place for bears in the old days when the canal was first built. The trapper who accompanied the workmen kept them amply supplied with bear's meat, without ever going out of the path. An old journal of one of the surveyors, speaking of the game he saw, says: "The like of wild game was never seen before; the numbers of nocturnal animals, such as coons

and opossums almost surpass belief, and bears are seen in abundance every day, and they are so tame that our trapper has stopped shooting, because the whole party has sickened of bear-meat." There are still many bears in the Dismal, but they are very shy and wary, and keep concealed in the fastness and the impenetrable jungles. Dogs are generally afraid of them, and wont attack them. The most common way of hunting them is to listen intently near midnight, and when you hear a scuffling noise and the sound of breaking limbs, you know that the bear is climbing a tree and seeking his favorite meal of acoras. Going to the spot and camping, and keeping guard for the night, Monsieur le Bruin is found comfortably squatting on the forks of a tree. The next morning, and at the break of day a long tube is leveled in his direction, a gleaming eye glances along the barrel, a sharp crack, a heavy thud, and all is over. Wild cats also used to be abundant, but I have met nobody who has shot one lately, though the workmen all say they have seen them. By far the most interesting and beautiful part of the great Dismal is Lake Drummond. It is like an oasis in the desert, a beautiful island in the ocean, a very jewel in the Slough of Despond. As I said before, nobody for a long time ever penetrated the swamp, and it was as late as the Revolutionary war that a hunter named Drummond first discovered this lake. It seems he went hunting one day, and, allured by the wounding of a bear, he followed the trail far in the interior, until he had hopelessly lost his way. He was the first white man whose footsteps ever trod this unknown land, and he must have been terribly frightened, for tradition, rumor, and superstition had made this swamp a veritable enchanted land, within whose realms dwelt warlocks, witches, and goblins, and such uncanny beings. There were tales told, too, of vast wild animals of surpassing strength and fierceness, the like of which mortal eyes never saw before. The whole place was peopled by only an immortal race. One cannot help fancying his feelings during his three day's wandering, his constant action, and incessant struggles, and at last a helpless despair at ever getting out of the labyrinth, and then his ecstasy and delight when he at last discovered the lake, placid in its beauty, and gleaming like gold in the sunlight. Lake Drummond is a splendid sheet of water, and is oval in shape. It is seven miles long and four miles wide. There is no beach whatever, the forest growing clear up to its boundaries. The water looks black, but when examined in a glass it is the color of light wine. It is tinted and tintured by juniper and gum leaves, and other decaying vegetable matter. This water is considered a fine medicinal drink; and invalids afflicted with pulmonary diseases have often been so benefitted by it as to remain several months in the vicinity where they would have daily access to its health-giving waters. Another peculiarity is, that it keeps pure for a great length of time, and is often used by ships going on a long voyage, who have their water casks filled from Lake Drummond. A popular delusion was that this lake had no bottom, but Commodore Barron, of the U. S. Navy, once sounded it, and the greatest depth in the middle was only fifteen feet, the average being ten feet. The bottom is generally composed of mud, but sometimes of pure white sand. The lake had always in my boyhood been a fabled land; to me Moore's beautiful ballad had ever made me long to see it, and as I stood on the brink it looked like an enchanted realm. The setting sun rested lovingly on its surface, tinting its dark waters to a rich golden wine-like hue, casting the reflection of the majestic cypress on its mirror-like breast, while its borders fringed with the brilliant and varied colors of the myrtle, the laurel, and the yellow jasmine, made the whole scene one of surpassing loveliness, and the rich odor of the jasmine made the balmy air redolent with its voluptuous perfume. As the sun sank slowly to rest, and the shadows increased, and the warmth died out of the lake, I could swear that phantom boats came and went, and the tradition of the two Indian lovers returned forcibly to my memory; and along the banks, under shadow of the trees, I could behold the canoe paddled by the two lovers come and go; and in fancy I could see the dark eyes of the tender maiden

gazing upward at the evening star, and hear the soft dip of the paddle as the boat shot noiselessly across the lake.

"But off from the Indian hunter's camp,
The maid and her lover so true,
Are seen at the hour of midnight damp,
To cross the lake by a fire fly lamp,
And paddle their white canoe."

Verily it is worth a trip to stand upon a spot that makes us lose our head, and forget for a time that we live in a matter of fact world, and dwell for a time in an ideal country, where the castle of Spain is but a common coarse edifice. The lake is but twelve miles from Suffolk and twenty-two from Norfolk. In the interior of the swamp it is perfectly healthy and entirely free from miasmatic diseases. Some years before the war, a speculator built a hotel in the center of the swamp, with the intention of making a summer resort, but by the first of August the landlord, the guests, waiters, and all hands had cleared out bag and baggage, for the mosquitoes, gad-flies, gallinippers, and yellow flies attacked the inmates in countless swarms, and soon routed them. I was shown the site of the hotel, it lies on an elevated plateau, but there is no sign left of it now; it was either burned or taken down, probably the latter. The swamp is but little hunted, the dark, forbidding exterior keeping the majority of "kid glove" sportsmen out; none save the resolute tourist, or enthusiastic sportsman ever penetrated to the center; one has to make up his mind to rough it, but to the true huntsman this is all the better; so, to those who want true sport I will say, that they can shoot as many turkeys, partridges, and ducks as to satiate the most inveterate hunter that ever pulled trigger. The Fall is the best time by far; any time, in fact, after the middle of October, when several frosts have fallen, and the mosquitoes and flies have disappeared. This is the favored land of reptiles. Water moccasins grow to an enormous length, and are in immense numbers. The shingle getters are sometimes bitten by them; but liberal potatoes of whisky will always cure the patient. These moccasins will always run if they can, and only when trod upon will they strike their fangs. Terrapins are as numerous as the snakes, and can be caught in any numbers; they make delicious soup. Frogs ("bloodhounds," as the boys call them,) lead a happy life here, and die of old age in the swamp. They are a jovial set, even if they have discordant voices; they keep late hours, and all night they talk, halloo, gossip, whoop, make stump speeches, and sing hymns, to their own very great satisfaction, at least, until the "wee sma' hours ayont the hoal." If some wicked fairy of the swamp, or some witching Circe, who was wont to transform men into strange shapes, like that fascinating and ancient coquette did to Ulysses Argonauts, were to suddenly appear to me, and, waving her magic wand around my head, ask me out of pure politeness what animal or shape I would be metamorphosed into, I would unhesitatingly ask her "ladyship" to turn me into a frog, which, being done, I would have a courtship and an opera every night on my own account—two things in this world that I most delight in. Oh, those frogs! Would that I could understand their language. They evidently don't like to be intruded upon. Many a time when there was nearly a silence in the swamp, and when sentimental frogs were gazing at the moon, silent in their reverie, have I blundered into their privacy, and such a tremendous uproar would be invoked as would make me shake in my boots. Tiny voices would squeak—vixenish voices—shrill voices of waspish wives—the hoarse, expostulatory tones of the old patriarch who resented the intrusion—fierce, abrupt cries of the town's guardian, who, like our own city police, were mad as hornets at being awakened from their sleep by untoward commotion—and the quavering voices of wandering lovers, who had evidently been sitting up long after all good frogs had retired to rest, and who no doubt were afraid that all this turmoil would wake the old folks, and bring the house over their ears. A Frenchman would here be in his element. Such glorious fellows, fully twelve inches long, that could be knocked in the head in every branch. I skinned a pair of l—, (I beg pardon) well, dash it all, of legs, and, frying them, found that they were daintier eating than Spring chicken.

Before the war this place was the great resort for fugitive slaves, and when once in the recesses of the swamp they never were retaken. The shingle getters, mostly blacks, were friendly towards them, and supplied them the luxuries in barter for their game. Indeed, many of them were employed in cutting timber, and no questions asked, as they would work for half price. In many instances these fugitives reared families in the swamp, the abundance of game rendering that an easy matter.

The Dismal Swamp, though a vast spot in the centre of a beautiful country, is not wholly valueless. Its timber trade is lucrative, and the "Land Company" have made enormous profits out of shingles. This is the great source of profit from the swamp, and is a regular business, well-conducted, with a heavy capital employed. The workmen live in comfortable shanties, built on the high ground. They are mostly negroes, with white foremen. The shingles made from the cypress are the most durable, and the very best made. The cypress grows frequently 130 feet high, and is as straight as the mast of a vessel. It splits readily, and the wood, soft when green, hardens when dry. The laborers are a well-fed, happy, careless set, and the sounds of their fiddles and banjos make the gloomy woods re-echo with their jovial strains. In their cabins I found they were well-supplied with bacon, meal, potatoes, game, and whiskey. It is a picturesque sight to see the long lines of carts, each drawn by a mule, piled high with shingles, moving in single file over the rough corduroy road to the landing. It is absolutely necessary to have these roads made, and they are always repairing them, and the soil is always sucking the logs down. In many instances in these clearings the shingle getters have to walk from shanty to shanty on a plank scaffolding, made like a rustic bridge across a small stream.

Many years ago a devastating fire occurred in the swamp, that destroyed all the made shingles and burnt down thousands of magnificent trees. The fire lasted about a month, and those who worked in the swamp had to fly to the neighborhood of Lake Drummond for safety.

In the year 1725 Col. William Byrd made a minute survey of the Dismal Swamp, and in his journal speaks of the almost unparalleled difficulties his party had to encounter. Sometimes his progress would be but two miles a day. The said survey was made in accordance to the wishes of the Governor of Virginia, to investigate the feasibility of draining the swamp. His report was favorable, and a petition was forwarded to His Majesty, King George

the Third, by his loyal subjects of Virginia, praying that a company be allowed to form for that object, they bearing the expenses and taking the reclaimed land as payment, and also asking that in consideration of their great expense they should be excused from paying quit rent and taxes for fifty years, the company binding themselves to finish the work within ten years. What answer the third Georgus gave to this petition the historian does not inform us. Hercules' task of cleaning the Augean stables was child's play compared to it, still it might be done, and can be done. Yes, anything can be done; and if Napoleon ever said a true thing it was when he uttered the immortal sentiment, "Impossible!—c'est le mot d'un feu."

A trip to the great swamp is made by everybody nowadays, and from Richmond, Norfolk, and the surrounding cities, the belles and beaux make up parties to go. Last Summer Commodore Rogers invited the *élite* of the city of Norfolk to visit the swamp, and see it in all its glorious beauty of tangled vines, waving reeds, and radiant jessamines; and the expedition, led by the little steam launch of the Commodore's flagship, and followed by thirteen others, steamed gallantly towards their destination, with flags flying, voices laughing, and bands playing, and when Lake Drummond was reached the martial strains of the flagship's band floated grandly over the water with an unutterably sweet sound, that lingered in the ears long afterwards. The trip, in a pecuniary point of view only, did not pay, for of the fourteen launches that started out thirteen had their propellers broken by striking against snags and logs.

I will end my long letter by giving some good advice, which, if followed by the sportsman, pleasure-seeker, or tourist, will give them unalloyed satisfaction, fine sporting, and yield to me many thanks from unknown lips. If there is any set of young men with money to spend, and who desire to have a good time in shooting, fishing, and sight-seeing generally, let them first go to Norfolk, and make that city their base of supplies, always remembering that the early Fall is the best time to start. At Cobb's Island, four hours' ride from Norfolk, they can have splendid sport in shooting ducks and bay birds; or let them write to McKeon, at Cobb's Island, Va., and make arrangements with him to guide them to Hog's Island, twelve miles from Cobb's, where the wreckers live—a rough set—but hospitable and honest. McKeon is an excellent guide, and also an entertaining companion, who can while many a weary hour away with o'er true tales of the traditions of Cape Charles, its shipwrecks and its dangers. After getting tired of slaughtering the brants, shufflers, and red-heads, go back to Norfolk and take a deer hunt with Capt. Blow at Tower Hill, in Sussex county, and while there ask the Captain to get Gillem's and Thornton's hounds, call the neighbors together, and have such an old Virginia fox hunt as they never saw before. Then go to Suffolk, hire a guide, cook, and lay in provisions, and take a week's sauntering in the Dismal; and then, *Messieurs*, you will have taken a trip that cost but little, but was as full of varied charms to those who love nature and the manly sports, as a costly journey to the cañons of Colorado, or to the Yosemite Valley itself. I know whereof I speak.

And now a few remarks of this great swamp and I am done. To health seekers and invalids, I must add that there is a pleasure resort, known as the Salt Sulphur Springs, situated on the Seaboard and Roanoke Railroad, three miles east of Suffolk, Va., and fourteen miles southwest of Portsmouth and Norfolk, the mean temperature being 60°, thus permitting outdoor daily exercise all the year round. I believe that these springs would be beneficial in a great degree to invalids who could not stand a journey so far South as Florida, and they would have the help of a mild winter, and also the medicated waters of Lake Drummond. I could write further on this subject, but those desiring more light can get direct information from Col. William P. Moore, Suffolk, Va.

In conclusion, I beg leave to say that I have no interested motive whatever in writing this article. I have but one desire, and that is to point out to the gentleman sportsman and amateur hunter a section where they can have the most diversified sport and pleasure. Simply this and nothing more. And if this article will lead others to get as much pleasure as I have received by my narrated wanderings, then I will be content.

ALEXANDER HUNTER.

For Forest and Stream.

NOT BAD FOR INJUN.

OLD JOE COOP, the famous moose hunter, whom Hardy has celebrated in his "Fields and Forests of Acadia," was well known to me when I was a boy, and that acquaintance revealed to me other sides of Joe's character than Capt. Hardy found space to portray in his interesting and instructive pages. He appears there only as the bold and skillful hunter, which he certainly was; but there are a few touches to show the peculiarities which made him a character almost unique. Joe was especially possessed of a certain ironical humor, which albeit not without parallel, is rare among Indians. An instance is afforded in a celebrated dictum of his, which indeed amounts, taken in all its bearings, to a positive stroke of philosophy. He was getting away from a fur trader after the disposition of sundry packs of beaver, mink, and otter, and the imbibition of sundry tumblers of John Company's fire-water, and reeled against and nearly capsized a white frequenter of the locality. "Hillo, Joe," shouted the half angry settler, "guess you got too much rum to-day." Joe swayed to a brief stand-still, as he surveyed the speaker in contempt for the want of experience implied in his remark, and then in his deep, chest tones axiomatically responded, "Hugh! too much lum, jus' 'nough," and wended deviously on, like a man who had no time to waste with such an evident shallow-pate.

A shrewd observer, Joe early learned to appreciate the white estimate of Indian character; and it was upon this that the play of his irony was always directed. And there is one instance extant of his having turned it to practical account which is worth recording. He had been on an unsuccessful moose-hunt for days, and at last found himself near nightfall, at the foot of the Cobequid mountains; out of food, far from the timber, and no human habitation near, Indian or otherwise, save that of a certain notoriously inhospitable hunk, whom I shall call Flint, because that wasn't his name, and because I like to call niggard souls hard names, anyhow. But notwithstanding his reputation, Joe decided on trying the churl. So he walked down and entered, just as Mrs. Flint was lighting the candle, and "settin' the table for supper."

"Mr. Flint," said Joe, "me wantum stop all night. No bush, no wigwam, bimeby snow, hugh."

"Gut-eny munny?" demanded Flint.

"No got."

"Can't stop, then."

"You no talkum too quick—me got um deer dis afternoon; pay um you deer meat."

This put a different face on affairs, and Flint entered into a negotiation by virtue of which Joe became entitled to supper, lodgings, and Flint to the deer's hide and half the meat, for such was his unconscionable greed. The deer, Joe explained, he had been unable to bring in, owing to lateness and fatigue—"berry fat deer; Joe's back mos' broke walk so far"—but he had hung it up on a certain big maple tree, near which was a certain big rock, and Flint could take horse and sled in the morning and "bring um in no time," when the agreed upon division should be made.

Flint was perfectly familiar with the locality described by Joe, and after breakfast he started with his two sons in search of the deer. Joe saw them out of sight over the hill, then picked up his rifle and started also, to resume the chase of the hitherto unsuccessfully followed moose; for the deer was only an evolution from the depths of Joe's inner consciousness.

Months passed ere the twain met again, this time in a different locality.

"Look-a-here, Joe," said Flint, "I couldn't never find that deer o' yours. I rayther spect there warn't any, anyhow, 'n I want you fer t' pay me fer them meals 'n lodgin'."

"Pay um sometime or nebber," said Joe. "You tink you make um mighty big bargain dat time, 'cause Joe half starb and half froze. You find um tree?" he continued.

"Yes, yes," was the eager reply.

"You find um big stone?"

"Yes, found it, too."

"No find um deer?"

"Couldn't see hide ner hair on't, 'n sarched 'n sarched most all day."

"Well, dat two trut; only one lie. Dat not bad for Hin-jun," summed up Joe as he turned and walked away.

N. W. BECKWITH.

Hantsport, Nova Scotia, December 20th, 1875.

For Forest and Stream.

A BUFFALO HUNT IN ARCHER COUNTY, TEXAS.

LET me give you a sketch of a hunt in which I have just participated. On the 4th inst. your correspondent and one other, mounted on mustangs, and two more in a wagon, took our departure for the hunting grounds—object, fun and meat, principally the latter. The first camp was at Montague Village, forty miles; second camp was at Squire Nichols' place, half a mile south of Cambridge, in Clay county. The Squire

"Lives all alone,

In a little brown house he calls his own,"

and has nothing to keep him company, except a half a dozen cats—we thought he had enough to start a first-class sausage factory. Well, as we said, we camped at the Squire's, and through his courtesy we made down a bed on his floor, which was on mother earth's warm (cold) bosom. Blankets being scarce we tried an experiment, (Lord forgive us, we won't try it again), and that was sleeping four in a bed. I say sleep, but we didn't, and that's what we are growling about. We remember while a boy that on Christmas and such occasions we went to sleep three in a bed, but never thought of four large, healthy, full-grown men sleeping together. Morning found three of us the happy possessors of one blanket apiece, and the fourth man had been frozen out, and was sitting by a fire, nodding to the tune of "Hard Times." At Henrietta we got another Nimrod, whom we called "our man Friday." This made five in all. The first was about fifty years old, and was known as Uncle Joe; the next was his son, aged twenty-five; then a fat, lazy-looking genius that played the part of Murphy's boarder—i. e., never missed a meal or paid a cent, and was good for nothing but to watch the wagon and eat his rations; then ye reporter, who of course was all right, and our man Friday, who was a little, Frenchy-looking fellow, but a good man in camp. Our animals corresponded with the men—some good, some indifferent. Borrowing the Squire's horse and gun we proceeded westward. At the Little Wichita River we killed a turkey, and now said, "farewell bacon, we'll live on turkey." But alas! vain hope. We longed for the bacon we left behind before we got any more turkey. The recent prairie fires had devastated the country, and turkeys, deer and all game was run out of that section. On the west side of the river we met a hunting party returning from the buffalo range. Never saw men as hungry for tobacco in our life. They had been out for some time and were out of the weed. We made our next camp at a lake in the midst of the burnt region, making supper on corn dodgers straight, and realizing the serious fact that it was a poor hunter that could not kill his own meat. While sitting around the fire telling tales of blood and thunder, we were aroused by the clattering of hoofs on the opposite side of the gulley, and instantly every man was heard to say "Indians!" In less time than I write it every man was at the wagon, with his gun in his hand. The noise ceased just as suddenly as it commenced, and now we were sorely puzzled. All was quiet for several minutes, and our eyes were intently fixed on the ears of our favorite camp mule, Old Pete, who worked those attachments (ears) backward and forward like a jib sail on a nervous day. Soon we heard splashing in the lake below us, and forthwith we started single file down the glen, like Poe, "this mystery to explore." Just as we thought that we would each perform deeds of valor that would immortalize us in the pages of history, and would be handed down by the red man, in tradition, to ages yet unborn, we heard the lowing of cattle, and by the light of the rising moon saw the reflection of the brutes on the placid surface of the lake. They had been driven there to quench their thirst, and our fright was now turned to jesting. We went back to camp, crawled into our blankets, and dreamed of stampeding cattle, Indians, etc.

Sunrise the next morning (which, by the almanac, was Sunday, but to us was the same as any other day) found us on the road. We took dinner at a pond of red water and then drove to Harold's* Rancho on north fork of Lit-

*Great stock raiser.

the Wichita, where we camped for the night; spent the evening shooting at turkeys on the roost. We scared them a good deal, but took breakfast again without meat, thinking, however, that when we got to civilization again we would let any one try Dr. Franklin's vegetarian rule that chose to, but none of it in our'n. Early next morning, near the deserted Wagefathe city, two of us came upon a large bull buffalo feeding on the flat. After crawling a half mile we found ourselves near enough to shoot. We shot, but our game looked up coolly, then trotted off slowly for about three hundred yards, and stopped and gazed at us. I then gave him a shot in the flank, when he galloped off lively over the hills. My companion then took his horse, that had been left some distance back, and followed after him, giving him a chase. I left him to enjoy his fun as he might, and I took over to a bunch of four or five that I saw feeding by themselves. I got within a hundred yards, rested myself well, took a drink out of my flask of nerve quieter, then rested my gun on a large rock and fired—but with the same success. They left me lying there thinking myself anything but what I had boasted on being, and that was, "a crack shot." Just then my companion came up, and said that he had killed the buffalo. The wagon came near, and we told them to go to the first camping ground they could find, and we would go out for more buffaloes. We found plenty. We walked about ten miles and shot at several, but the monsters would invariably go off with the bullet. It became very monotonous to us, and we went back to camp as hungry as bears and as savage as Kiowas. After another lunch of our vegetable diet we took a horse and a mule, and we two Nimrods again went out for camp meat. My companion (whom I called Red Fox, because he shot at a snag, mistaking it for a red fox) rode the horse and I the mule. This aforesaid mule was as intelligent an animal as Balaam rode when he went out to cuss the Jews; but his intelligence ran the wrong way. He knew a mesquit bush at sight; he knew they had thorns on them, and when Red Fox and I "rounded in" a few buffaloes for a chase, imagine my temper to see this son of a donkey stop and run round a mesquit bush as carefully as though walking on eggs intended for Christmas egg-noggs. Red Fox cut out a fine bull and chased him about two miles, while I and my mule brought up the rear. When we got to him he stood at bay, and showed that he was badly wounded. I gave him a shot from my Burnside and he fell over, dead. I then cut off his scalp, the tip of the tail, and after cutting out a good steak, we started for camp—about four miles. It was dark when we left the carcass, and it was not a very interesting ride; for although we had seen no Indians, yet we knew that we were at their tender mercies should they happen to be in the vicinity. However, we rode to camp, tired with our day's labor. We looked at the stars, said a verse and retired to our blankets. Several times during the night we saw (in our excited dreams) whole herds of large bull buffaloes. At one time we were out on our favorite(?) saddle-mule, and after wounding one of them, he chased us up hill and down, till the mule gave out, and I then went on foot with Mr. Buffalo after me. I then made for a large cliff of rock, and the buffalo, it seemed, was still in hot pursuit, his eyes glaring at me fiercely. Never had I seen so terrible a monster; he was as large as an Asiatic elephant! Just as he seemed to be up to me I awoke to find myself performing several feats of a gymnasium on the wagon wheel, upon which I had clambered, thinking it the cliff of rocks. My companion was growling about the blankets I had just pulled off from him, and said he'd have a buffalo robe to sleep on next night, and would see if I could rob him of his bedding in that manner. Early next morning we took the horses and crossed the creek, over which we could not cross the wagon, and went to the carcass of the dead buffalo and skinned him. Red Fox and Friday went off, and the former returned shortly, saying he had killed two buffaloes, and that the latter had lost his gun and would look it up. We returned to camp with the robe, hitched up the wagon, and drove to the carcass of one of the bulls, cut up the meat, took off the robe, and as it was now nearly night, and a "norther" was coming up, we struck out for tall timber. Darkness finally compelled us to stop, as further traveling was impossible, and we camped for the night in a cave at the side of a bluff. The night was bitter cold, and we experienced considerable inconvenience from it; but we soon had a large fire, and with the addition of the two buffalo robes to our stock of bedding, we put in a very fair night, all things considered. Many were the remarks of anxiety about our lost man—whether he had been thrown and had lain on the prairie all the long night, or whether the Indians had taken him in "out of the wet," were the leading conjectures. But, to our relief, when we arrived at the ford next morning we learned that he had crossed there, and was, at that time, safely quartered at Harold's Rancho. After searching for his gun several hours he looked for us, and not finding us, he directed his attention to the ford, but failing to find it, he camped just below it. He had had nothing to eat since morning, and as he had no gun he was compelled to go without rations until next morning. He built a large fire, lariatied his horse to a large stone, and then sung himself to sleep in his saddle blanket. At the river we salted our buffalo beef, packed away our turkeys, of which we had a good many, and started for the settlements. We got home after being out from Gainesville ten days. With the exception of suffering from scarcity of water for about four days of the time, we had a very good time, and none regretted the trip. At the time we camped in the cave in the mountain we had but one pint of water to drink between the four men, and doubtless would not have had that but for the forethought of one of the men, who, after emptying a pint bottle of "chill tonic," filled the bottle with water. A buffalo hunt is a splendid place to teach a man temperance—even in water.

BUFFALO BILL.

Gainesville, Texas, Nov. 30th, 1875.

THE NORTHWEST PASSAGE.—Pacific whalers have made an interesting scientific discovery this season. A few years ago they reached the whaling grounds in August only to be obliged to leave them in September. This year they remained until October, and might have delayed longer, so far as peril from the ice pack was concerned. They went within eighty miles of the mouth of McKenzie River, where sailing vessels have never been before, and say that a steamer, aided by the currents, might have gone through to Baffin's Bay without difficulty, and thus solved the mystery of the Northwest passage.

Fish Culture.

THE McCLLOUD RIVER RESERVATION.

THE United States fishing grounds on the McCloud River, Shasta County, California, in charge of Mr. Livingston Stone, have been set apart for fish culture by the President of the United States through the intervention of Hon. Spencer F. Baird, United States Commissioner of Fish and Fisheries. The Canadian Government long since saw the necessity of setting aside reservations for the purpose of conducting their fish culture operations, and have five or six stations solely under Government control. The action which our own Government has taken, at the suggestion of Professor Baird, could well be supplemented by extending the movement to other States in which there are public lands suitable for the purpose. By so doing, aid and encouragement would be given to the State Commissioners, private enterprise be stimulated, and the incalculable importance of providing by artificial means for a restoration or recuperation of a depleted fish supply be brought home to the people generally. Another movement which we should like to see imitated is that commenced in Virginia, by which pisciculture is made a part of the curriculum in the colleges. An accurate acquaintance with its details is valuable to the possessor as a trade or a profession.

The recommendation of the Secretary of the Interior, with the President's endorsement, is given below. The description referred to in the President's order was prepared by Mr. Stone from a rough survey of the fishery, and covers a strip of land following the course of the river, 850 yards in length and 200 yards in width:—

DEPARTMENT OF THE INTERIOR,
WASHINGTON, December 7th, 1875.

SIR:—

I have the honor to recommend the reservation for pisciculture, of the smallest legal subdivisions within which the premises on McCloud River, California, represented on the diagram herewith inclosed shall be found to be embraced when the lines of public surveys shall have been extended over the same.

The request is made at the instance of Professor Spencer F. Baird, commissioner under the act of February 9th, 1871, (16 stat. 594) and the Commissioner of the General Land Office, informs me that the records of his office present no objection to the reservation.

(Signed) Z. CHANDLER, Secretary.

On the back of the Secretary's letter was endorsed the following order by the President:—

[COPY.]

EXECUTIVE MANSION, Dec. 9, 1875.

Let the tract of land described within be measured for pisciculture, as recommended by the Secretary of the Interior.

U. S. GRANT.

LIMING PONDS AND STREAMS.

ROCHESTER, N. Y., January 3d, 1876.

EDITOR FOREST AND STREAM:—

I see by your issue of December 30th, that some of your correspondents recommend putting lime in the headwaters of small streams in order to kill the fish that would eat the small fry that you wish to stock the streams with, then to put a screen below, so that the obnoxious fish could not get up, nor the young fish could get below until they grow large enough to take care of themselves. Now, my opinion is, that if you put lime enough in any stream to kill the fish, you will not only kill the fish, but every living thing that is in the creek, and when every living thing is dead in the stream you may as well put your young fish on the land as to put them in water where there is no feed; for in both cases they would surely die.

SETH GREEN.

We have already printed a good deal from Seth Green and other authorities showing the objections to liming waters for the sake of substituting one kind of fish for another, but no one seems to have discovered a practical method for accomplishing the object desired—for instance, the eradicating of pond pickerel and the substitution of speckled trout. We can evoke no satisfactory information from the best informed. Small ponds may be drawn off, and most of the worthless fish picked out, but more or less fish will always escape, and soon multiply four-fold. With large bodies of water, the difficulty is vastly greater. One would have more success in attempting to clear a chamber of mosquitoes at midnight. Every one knows how satisfactory this procedure is. When every mosquito has been hunted down with a candle and threshed out with a wet towel, the operator retires to his bed, and no sooner gets into a drowse than new legions assail him with fierce music and reduplicated attacks.

FISH CULTURE IN MARYLAND.

AT a recent meeting of the Maryland Academy of Science the report of the section of Ichthyology upon the subject of the preservation and increase of the food fishes of Maryland was read; from it we condense the following:

"The wealth of Maryland in food is greater than any other State in proportion to its geographical area, yet we are behind many other States in adopting adequate means of increasing our supply by 'artificial cultivation,' and by protective legislation. The shad and herring are probably the most profitable commercial fishes of the State, yet are rapidly decreasing in numbers, from excessive fishing and other causes. The remedy recommended is not only to prevent excessive fishing or obstructions to their passage up the rivers to their spawning grounds, etc., but to encourage 'artificial production.'

"During the past fifty years the mountain streams feeding the Potomac have diminished in power from the denudation of forest land, and the supply of fresh water being lessened, the salt water has replaced it, and thus the formerly profitable shores of the lower Potomac have been abandoned for those higher up. The probability is that in course of time, as the supply of fresh water diminishes, the water of the ocean will take its place, until the herring will

not seek the river at all to spawn, but the alewives or other fish will. The herring fishery will then of course be destroyed in such localities. This would indicate that it may be useless to attempt to stock a river with fish that have never existed there, for apart from the cause of excessive fishing, fish will leave water that is not adapted to their condition and seek some other locality.

"The report refers also to the new mode of catching herring by the weir. This, if not regulated in length by law, will do more harm to the Potomac fisheries than all other causes combined. If its use is persisted in it will drive the fish away from our waters entirely.

"While so much attention has been paid to the culture of the shad and salmon, etc., within the last twenty years, it seems strange no attention has been given to the artificial breeding of herring. It would not only be the means of adding greatly to our wealth, but the supply of mackerel, cod, blue fish, haddock, trout, etc., that feed on the herring, would return to our waters. These larger fish, also the black bass, pickerel, etc., are seen in large numbers at the mouths of our rivers when the young herring are making their exit. Herring are more prolific than shad, and more hardy in their young state.

"Our efficient Commissioner from the Western Shore has done much for the fisheries of the State thus far, having put over four million of young shad in the Potomac, Susquehanna and other rivers, consequently we must expect an increase of shad in these rivers in the course of three or four years."

Mr. Pearson Chapman, Sr., a resident of the lower Potomac, has watched the habits of fishes for fifty years, and corroborates fully the theory of the members of the Section of Ichthyology in the matter of excessive fishing, and also the use of the gill-net. The latter, he says, catch only shad, while the seine catches great quantities of catfish, eels and mullets, which follow the shad or herring to prey upon the eggs and young fish. He refers also in forcible terms to the destruction of the spawn by the dragging of the sinkers of the gill nets on the bottom of the river.

He dwells at some length upon the importance to the State of an effort to hatch the spawn of herring as well as shad, artificially, for while the "shad is the rich man's luxury, the herring is the poor man's living."

The "glut" shad appears in the river about the 10th of March generally, and commences to spawn about the last of April. During May a species called the "May" shad, a fish of good flavor and fat, generally appears.

This shad is now nearly extinct, chiefly because of the war made upon it by the gillers. In the month of June a very large and stout shad of another species makes its appearance. Its flesh is remarkably white, but soft and comparatively tasteless.

During the month of September, as the young shad are returning to the ocean, immense numbers are caught in gauze seines, to be used for bait. This practice he strongly condemns.

The "branch" herring makes its appearance about the same time as the "glut" shad, and follows the creeks into the small branches to deposit its spawn; hence its name. It goes up the shallow streams as far as it can flutter.

The "branch" herring does not decrease in numbers as rapidly as the "glut" herring, for the reason, probably, that the latter spawns in the river, while the spawn of the former, being in small streams, is not disturbed by the gill-nets.

The "glut" herring is about half as large as the branch herring, of much finer flavor, has a small, round black eye (the eye of the branch herring is peculiar) and never goes up into the branches.

Fifty years ago we had five distinct varieties of the herring: First, the "branch" herring; second, the common "glut" herring, early in April, but in later years later in April, and for the last three years they did not appear at all in April; third, the "poplar back," now extinct; fourth, the "dunbellies," being of a light color underneath, now very scarce; fifth, a fine fat fish, called the "May flipper," called so from jumping higher out of the water than the other kinds; these are occasionally seen now, but not in gluts.

During the last fifty years the season has been growing later. A half century ago the shad and herring fisheries commenced from the 15th to the 25th of March, and ended about the 1st of May. Now they commence about a month later, and end about the 25th of May.

While shad and herring have been gradually decreasing, the perch is as numerous as heretofore. This may arise partly from his pluck and courage in defending himself from his enemies, and partly because they spawn in shallow water and late in the season.

The flounder is nearly extinct in the Potomac, but has no enemy other than the "war" loon, and kindred ducks, such as the "gogler," etc. The Virginia, or winter shad is not seen now. Its flavor is such that it is not in demand if found. The gar is now nearly extinct about the middle waters of the Potomac, but is still caught in great numbers down the river, much to the annoyance of the gillers. The sturgeon is also becoming very scarce. While three a week may now be caught by one man, a boat load could once have been taken in two or three hours. But the greatest decrease of all fish is observed in the number of the shad and herring. From forty to fifty years ago, where the catch at one haul (estimated) was from two to three hundred thousand, now from ten to twenty thousand is considered a great haul.

BROOK TROUT FREE.

ROCHESTER, N. Y.,

Young brook trout will be delivered free of expense at the New York State Hatching House at Caledonia after February 15, 1876, to all persons desiring them to stock public streams or ponds in this State, or they will be sent to any address on the parties paying traveling expenses of a messenger to accompany them. For further particulars address

SETH GREEN, Superintendent.
HORATIO SEYMOUR,
EDWARD M. SMITH,
ROBERT B. ROOSEVELT,
Commissioners of Fisheries.

—The head of a turtle, for several days after its separation from the body, retains and exhibits animal life and sensation. An Irishman had decapitated one, and some days afterward was amusing himself by putting sticks in its mouth, which it bit with violence. A lady who saw the proceeding, exclaimed, "Why, Patrick, I thought the turtle was dead!" "So he is, ma'am; but the crayther's not sensible of it."

Natural History.

[This Department is now under the charge of a competent Naturalist, endorsed by the Smithsonian Institution, and will henceforth be made a special feature of this paper. All communications, notes, queries, remarks, and seasonal observations will receive careful attention.]

THE NESTING OF AMERICAN BIRDS

IV.—HERMIT THRUSH; SWAMP ROBIN.

Turdus Pallasi—Cabanis; Baird; Cones; Bd. Brew. and Ridgw. *T. solitarius*—Wilson; Audubon, (Birds of America); *T. minor*—Nuttall; Audubon, (Ornith. Biog.); Giraud.

THE typical hermit thrush ranges all over eastern North America, wintering in the Southern States, whence it spreads northward in the Spring, reaching New England by May 1st. It breeds in the Alleghenies from Pennsylvania northward, but in New England only north of the hilly parts of Massachusetts; thence to Labrador, the islands in the Gulf of St. Lawrence, and perhaps Greenland. Dr. C. C. Abbott says that this thrush seems to be less common in New Jersey than Audubon described it to be, and that about one in twenty which pass the city of Trenton breed, retiring for that purpose about June 1st.

The nest is always built upon, or close to the ground, usually away from the woods, and under bushes in swampy places. Dr. Brewer mentions that in Parrsboro, Nova Scotia, he found one in the midst of the village, but in a marshy place, nearly inaccessible. At Upton, Me., Mr. Maynard found two nests on top of decayed logs, and Mr. Samuels has several which he took from low scrubby bushes; but these latter were in wet places. The materials used are decayed, deciduous leaves, remnants of dried plants, sedges, plants and grass mixed with twigs and lined with fine matter. In the North much moss is used, and sometimes exclusively among the pine woods. When you have found their hiding place, and approach it, the birds mournfully retire and keep silent; but it is said that if a hawk or a crow, in search of young birds, comes near, they attack it courageously.

The eggs are laid about the first week in June. Mr. Maynard found a nest at Upton, Me., with three fresh eggs on June 5th, and another with young on June 9th. Mr. Samuels found full nests at Lake Umbagog on the 10th. The eggs are of a somewhat elongated, oval form, and in color light blue, with a tendency to green. Wilson described the eggs as pale greenish-blue, "marked with specks and blotches of olive, particularly at the great end." Giraud, in his birds of Long Island; DeKay, in his Ornithology of New York, and Nuttall, in his Manual, all repeat this statement; but, like Wilson, they were probably mistaken in the bird, and were describing another egg; since there is no well-authenticated instance of the eggs of the hermit being spotted. The eggs measure about .90 by .62 inches.

In the West there are two varieties of the hermit thrush—the dwarf thrush (var. *nanus*), and Audubon's thrush (var. *Auduboni*). The former is chiefly confined to the Pacific coast, but is also accredited to Pennsylvania. It breeds from Oregon northwards, and in the Sierra Nevada; and, except in being smaller, its nest and eggs are like those of the eastern bird. Audubon's thrush is more common, and is southern in its habitat, extending from northern Colorado and Utah in Summer to Central Mexico, where it is resident upon the table lands. It breeds abundantly through the southern Rocky Mountains, at high altitudes, and at Salt Lake City, where Mr. Henry Henshaw found its nest. Another nest, taken on June 7th, by him at Fort Garland, Col., he describes as built in the cavity of a broken pine stub, about three feet from the ground. It was composed almost wholly of strips of bark and coarse grasses, covered externally with mosses, and contained a single light blue egg.

NOTES FROM OUR CORRESPONDENTS.—Mr. John Burroughs writes that the pine grosbeaks (*Pinicola enucleator*) appeared at Esopus-on-Hudson as early as Nov. 25th, and are still to be seen. Last Winter they came first about Dec. 10th. They are very tame, and evidently do not know much about man and his ways. "E. S." writes from Portland, Me., that a perfectly white live chipmunk or ground squirrel may be seen there, which was captured in Windham, Me. A robin was seen by him on Dec. 16th, but the pine finches, which were abundant last Winter, have not yet appeared. N. Elmore, (Granby, Ct.), informs us that a ruffed grouse, with a circle of pure white, half an inch wide, surrounding the left eye, was shot in Hartland, Ct., last week. "Teal" describes a peculiarity noticed in the tongue of a golden-winged woodpecker which he dissected. Unlike those of this species, and woodpeckers generally, the tongue, instead of dividing into two parts on the skull as commonly in this family, ended at the base of the skull. There was no appearance of accident about it. Harold Herrick mentions that the red-headed woodpecker was almost never seen in the neighborhood of Newark, N. J., until three years ago last Fall, when it appeared in large numbers. After that very few were seen until last Fall, when the bird was again abundant.

A VERY RARE FISH.—Mr. Blackford, of Fulton Market, in his indefatigable endeavors to aid scientists in procuring specimens of our rare fishes, has fortunately, within the past few days, come across one of the rarest and least familiar ever found on our coasts. Some fishermen, while hauling their net near Yonkers, on the 10th inst., found, in company with a number of small, or school bass, a "spotted, wry-mouth" *Cryptacanthus maculatus*, (Stover). This fish is described by DeKay as being the only one of the genus known. Of its habits nothing is known, one of the only three specimens extant being found in the stomach of a haddock. In appearance it somewhat resembles the wolf fish; or, to the unscientific

observer, a small eel, with black spots on a reddish ground, and a head from which the lower jaw projects like an undershot bull-dog's. It has gone to the Smithsonian Institute.

WINTER HABITS OF THE RUFFED GROUSE.

NEWPORT, December 23d, 1875.

EDITOR FOREST AND STREAM:—

I notice a communication from your Boston correspondent, "M.," concerning the present scarcity of the ruffed grouse, as compared with last year, and some remarks as to the probable cause. While fully indorsing his statements with regard to their scarcity, I am compelled to differ with him in relation to the cause, for the following reasons: In the Autumn and Winter of 1874-5, a crew, of which your correspondent was one, were encamped on a township on "Little Sebois," where the ruffed grouse were exceedingly plenty, not only in the Fall, but throughout the Winter, as "M." himself, who visited the place in March, can testify. Returning to the camp the latter part of May, and remaining through June and July, we found numberless broods, frequently seeing five and six in a single day, although it was noticeable that they contained fewer birds than usual, which latter circumstance was undoubtedly to be ascribed to an unfavorable Spring and late heavy rains. In October I took a tramp of sixteen miles over the same without flushing a single bird! But at night, coming to an "old camping," I found two flocks within ten rods of each other. The cause of this unprecedented scarcity in a region where they usually abound was plainly owing to a lack of food; for never, in the last twenty years, have the forests been so barren in that respect as at the present season, and the checkerberry, plums, and tender cloves around the "old camping" accounted for the presence of the two coveys.

In this vicinity it is a rare thing for Reynard to take a meal off ruffed grouse. The grouse seems incapable of burying itself in the snow, while standing upon it, and invariably does so by hurling itself into it from a height, and striking it at an acute angle, so as to project itself about two feet horizontally and eight or ten inches vertically from the point of entrance. Often and often, when on snow-shoes, and the fleecy snow gave back no sound perceptible to human ears, I have endeavored to creep on to them when seeing their holes in the snow, but never yet succeeded. Some instinctive sense, placed there by the great Creator for their preservation, always gives them warning in time. Another protection is the fact that when the snow is of sufficient softness and depth to admit of their burying themselves in the manner stated, it is very tiresome traveling for the fox, and he confines his operations chiefly to fields, bag, and meadows. A much more formidable enemy is the great-horned owl, which, winging its way noiseless, and observant, on moonlight nights or in the gloaming, snatches many a savory meal from out the trees and under the overhanging branches. PENOBSCOOT.

NICASIO, Marin Co., Cal., Dec. 26th, 1875.

EDITOR FOREST AND STREAM:—

In answer to Mr. G. A. Boardman, whether the male mallard does not change its plumage in Summer, I would say it does. By the first of June the male and female are the same plumage. Old and young are of the same plumage till the middle of October, when the males begin to put on their winter colors. The males showing the brassy color of the bill in old and young, the old females meanwhile showing small black spots at the base of the bill.

THOMAS H. ESTEY.

Woodland, Farm and Garden.

WINTERING FLOWERS.—All the ordinary budding flowers can be wintered successfully in a tight, tolerably dry and light cellar. We have a cellar provided with sash to the windows, and about the 15th of November, before severe frost, we make a bed of light rich soil under one of the windows, and take up all our geraniums, heliotropes, and verbenas, with all their roots, and a small ball of earth, put them in the cellar and pack them as closely as they will stand in an upright position. Sift plenty of loose earth between them, and give them a good soaking of water. They will require no other attention, except a moderate watering once in two weeks. In very fine weather open the sash for an hour or two during the middle of the day. In this way we have kept a large stock of budding plants for the two last years. They will grow but little, but in the Spring make nice plants. Before taking them up in the Fall they should be severally cut down to six or eight inches in height. A large quantity of budding plants are allowed to perish every Fall, and the florists will not thank us for this hint.

AMERICAN BEEF IN ENGLAND.—During the last week of the year just ended, forty-two tons of meat were sold in the Smithfield market, London, which had been shipped from New York to Liverpool, and thence by rail to London. The market was closed on Christmas day and the Sunday and Monday following, and the meat was consequently kept three days longer than would otherwise have been necessary. Yet on Tuesday it was in excellent condition, and sold rapidly at an average of six pence (sterling) per pound. The Germantown Telegraph claims that there is no difficulty in thus transporting fresh meats between this country and Europe; that it was tested forty years ago, and proved a success. If that is the case, there should be no difficulty in shipping over beef in these days of quick passages and refrigerating compartments, only don't make our own meat any dearer.

A NEGLECTED FLOWER.—The marad of Persia, or four o'clock, as it is vulgarly called, is well worthy of attention as an ornament to our flower gardens. It possesses the following good qualities: The colors are rich and gorgeous, and of endless variety; a profuse bloomer; not af-

fected by drought; the flowers expand in the cool of a Summer's evening, the time when we usually walk in our gardens, another good quality, and one that is not generally known by all. A bulbous or tuberous root is formed, which can be taken up, kept in a cellar, as dahlias are, and planted out in the Spring. As a decoration for our public parks and gardens it has no superior.

A RARE CHANCE.—A correspondent now employed in the U. S. Custom House at Pensacola, Fla., writes to us, saying:—

"Should you know of any responsible party who intends starting an orange orchard on the gulf coast, and who will only wish to spend his Winters here to enjoy the hunting and fishing and delightful weather, and who will wish some one to take entire charge of the place, keep things in shape for him, etc., etc., please refer him to me. I know there are such parties who are as desirous of meeting me as I am to meet them."

This correspondent, whom we know personally, is a universal genius. During the war he was a captain of cavalry. Afterwards he planted Sea Island cotton for two years. He owns a yacht, and has cruised all along the coast of Florida, is a first-rate sportsman and taxidermist, and was the first northern settler on Sarasota Bay after the war.

NEW TULIPS.—A new species of tulip has been discovered in Central Asia, said to be much more beautiful than those which marked the celebrated tulip mania in Holland many years ago. The flower is much larger than the common tulip, orange, spotted with black, and the bottom of the cup yellow. It is known to botanists as *Tulipa griegii*.

HOW TO GET EGGS IN WINTER.—With a warm shelter and suitable feed, pullets that begin to lay in the Fall will continue to lay through the Winter. It is mainly a question of feed. The staple feed is Indian corn, especially in the West, because it is the most plentiful and the most convenient. It furnishes plenty of fat, and keeps up the heat of the fowls but is poor in albumen and the phosphates. They want a variety of grains and vegetables, and, to do their best, one feed daily of warm cooked meal and vegetables. Most farmers have milk, and if this can be added, it will be all they need. Butcher's scrap cake is good, and may safely be kept in the poultry yard, where the fowls can help themselves at pleasure. Boiled potatoes or turnips, mashed and mixed with Indian meal, make an excellent feed for laying hens. Fowls are particularly fond of cabbages and turnips at all stages of their growth, and eat them raw greedily every day, if they can get them. We have found so good results from cabbages to laying hens, that we always lay in a large supply for the Winter. Refuse from the butchers, and offal from the fish market also, furnish good material for making eggs. The laying bird should have free access to gravel with sharp grit, broken oyster and clam shells, which assist in reducing the grains and forming egg shells.—*American Agriculturist*.

HOW TO EXTRICATE A Mired ANIMAL.—An animal mired in a swamp gets into a worse predicament the longer it struggles. The effort to extricate it should be made in an effective manner, so that the animal may not be encouraged to exhaust itself in repeated exertions, which are useless, and only sink it deeper in the mire. The usual method is to fasten a rope around the animal's horns or neck, and while this is pulled by some of the assistants, others place rails beneath the body of the animal for the purpose of lifting it out of the hole. This plan is sometimes effective, but it often is not, and at best it is a slow, clumsy, and laborious method. The materials needed for the method here referred to are all that are required for a much better one. This is very simple, and two men can operate it, and at a pinch, even one man may succeed with it. A strong stake or an iron bar is driven into the solid ground at a distance of 25 feet or more from the mired animal. Two short rails, about 9 feet long, are tied together near the ends, so that they can be spread apart in the form of a pair of shears, for hoisting. A long rope is fastened around the horns or neck of the animal, with such a knot that the loop cannot be drawn tight enough to do any injury. The rope is cast over the ends of the rails as they are set up upon the edge of the solid ground, and carried to the stake or crow-bar beyond. The end of the rope is fastened to a stout hand-spike, leaving about a foot of the end of it free. This end is laid against the bar or stake, and the other end is moved around it so that the rope is wound upon it, drawing it up and with it drawing the animal out of the mire. The rope being held up to the tied rails, tends to lift the animal and make its extrication very easy.—*American Agriculturist*.

—Our native walnut wood is, according to the Cabinet Maker, one of the best materials in the world for furniture, when oiled, approaching very near the color of dark old oak, and finishing much finer. The American walnut, however, requires the grain to be well filled with a composition to resist the action of the heat in most dwellings, and, to effect this, mere oiling is not adequate, as it leaves the pores of the wood so open that it absorbs the heat; thus, in a room at a temperature of some seventy-five degrees, the oiled walnut will absorb the heat to within five degrees of the heat of the room, while varnished oak will reflect the heat, and will not reach over forty-five to fifty degrees. On this account the wood should be well seasoned and the grain filled with shellac, or other material, to prevent shrinkage. Linseed oil hardens wood, and well-made walnut work finished with it and shellac, will, in a few years, acquire a polish almost like bronze, and, it may be added, as beautiful in appearance.

TO CLEAN OLD PORK BARRELS.—Old pork barrels, whether tainted or sweet, should be thoroughly cleansed before being used for new pork. A very simple and effectual method is to put in a peck of strong wood ashes and a couple of pails of water, and let it stand a day or two; then scour thoroughly with a stiff corn broom. The lye will take hold of all the greasy particles with which it comes in contact, and the ashes, water, and broom will, if vigorously used, leave them as sweet as new barrels. Rinse in cold water to remove all the ashes, then pour boiling water all around the sides and wash clean, then rinse again in cold water, and the work is done.

—The London *Builder* recommends people who transplant trees to mark the north side of each tree with red chalk before it is taken up, and replace it in its natural position. A larger proportion will then live, as in ignoring this law of nature transplanted trees generally perish.

LOCATION FOR FLORIDA SETTLERS.

PENSACOLA, Fla., December 31st, 1875.

EDITOR FOREST AND STREAM:—

I am much gratified at the course FOREST AND STREAM is taking toward building up my adopted State. I am warmly interested also in seeing it filled up with an enterprising and prosperous class of settlers. I have no lands for sale, so my advice is entirely disinterested. My service of a year and a half in the cavalry on the St. Johns, living for two years at Stark, after the war, during the latter of which I rode horseback four times between that place and Sarasota, each time over a different route, and still later, the constant cruising in which I was employed between Cedar Keys and Charlotte Harbor, have given me unusual opportunities to look the State over, and with this extensive experience I do not hesitate to advise settlers to seek a location on the Gulf Coast, in preference to St. Johns. The lands are better, many excellent sites are still open for homesteading, and it is healthier. The only advantage they have upon the St. Johns is that communication with New York is more frequent, but that is an advantage which the gulf side will soon possess also, as steamers are constantly being added which can run into the hundreds of little inlets and harbors with which the whole coast is thickly studded. Vegetation is a fortnight earlier on the gulf side, at the same latitude as on the Atlantic. Besides we never have those cold damp northeast storms here. Our "northerners" are always dry. Should anyone wish for more explicit information, about any particular locality, I shall be pleased to give it if in my power.

E. B. STAPLES.

The Kennel.

"OLD GROUSE."

WE are frequently asked the question, whether the double nose in the setter is an indication of impure blood; and recently, in looking over the answers to correspondents in the *Chicago Field*, we find it is there stated that the double nose is an evidence of impure breeding, and that such dogs should be looked upon with suspicion. We wonder sometimes that Old Grouse can lie quietly in his grave while such things are said and written. Who was Old Grouse? Let us say that many of the most skillful field sportsmen in New Jersey, and in other sections of the country, will never forget the old fellow; and for the information of the younger breeders and shooters of the day, we will endeavor to give something of his history.

In the year 1838, while shooting with a friend in the vicinity of Lambertville, Hunterdon County, N. J., we were informed that a Mr. Taylor, a cabinet maker and turner of that place (now residing in Trenton) was using dog power upon his turning lathe, and that one of the dogs he had used for a long time was a setter. We called upon Mr. Taylor at his place of business, where we found upon the wheel two large-sized dogs of mongrel breed, and a full-sized, heavy moulded, liver and white double-nosed setter, the liver color in some places shading to something of a tan color; legs, indistinctly ticked; head, rather short; eyes, rather light, but exceedingly bright; ears, well set; tail, straight; back, short; and legs and feet good, and altogether presenting the appearance of a well-bred, serviceable setter. Upon inquiring of Mr. T. where the dog came from, he stated that about four years before that time the dog was picked up astray somewhere on the line of the Camden and Amboy Railroad, near Camden, and given to him, and that he had worked him all that time on his wheel; that during the time he had found that other kinds of dogs he had worked with him would not last over two years, but that the setter (Grouse) showed no sign of wearing out, but that he, having worked so faithfully for so long a term, he was anxious to let him up and give him to any one in exchange for any kind of stout dog to take his place on the tread-mill. This exchange was soon made, and Grouse fortunately fell into the hands of a good sportsman, and very soon gained the reputation of being a wonderfully good, staunch, well-broken dog of great endurance. During the next few years he changed hands repeatedly, and was much used for stock purposes. When Grouse was supposed to be eight or nine years old we had a day's shooting over him near Lawrenceville, N. J., with his then owner, Judge Holmes Stout, and Mr. A. P. Lanning, of Mercer County, N. J. Both gentlemen are still living, and no doubt well remember how splendidly Old Grouse did his work that day. Some time after that Old Grouse became the property of the late John Hutchinson, of Mercer County, N. J., who was a breeder, breaker, and large dealer in setters and pointers, and some of the older sportsmen will remember the advertisements of Mr. Hutchinson in the *Spirit of the Times* during Wm. T. Porter's time, when Mr. H. always advertised his dogs as being of the Old Grouse stock.

The old dog lived to an unusual age, and was supposed to be not less than seventeen years old when he died. We very frequently shot over him, and bred to him while he was in Mr. Hutchinson's hands; and when he was twelve or fourteen years of age it took an extra good dog to beat him, and now it would be hard to convince us that any dog ever produced better dogs than were the descendants of Old Grouse, very many of which passed through our hands. Among those we now remember as being wonderful dogs of their day were—Chief Justice Beasley's Rolla, Maj. Robert Stockton's Hal, Mr. H. Van Schaick's Hal, Mr. R. A. Drake's Arch, Cane, and Cone; J. J. Seitzinger's Sancho, Hal, Dash, and Mack; Mr. Theo. Morford's Glen, besides a host of others which we have forgotten, but just such dogs as any good practical shooter would desire. We doubt if a better strain of dogs ever lived than they, and this opinion, we feel confident, will be sustained by the

sportsmen above mentioned, and by many others who have shot over the descendants of Old Grouse.

Most of the old dog's pups partook of his peculiarity—the double nose—but none of them ever showed any thing of the pointer in their coat or appearance. But even if Old Grouse did get his double nose from pointer cross, (which we very much doubt), was not all the pointer bred out of his descendants years ago? If not, what constitutes a pure setter? And then, again, the question arises, Who knows to any certainty that the double nose originated with the pointer? For many years, not only we, but many of our shooting friends, had great faith in double-nosed setters; but time and close observation convinced us that there was nothing gained by that peculiarity, but that it was when the nose was much divided, rather a fault, as such dogs, while working, were often injured by briars and rough grass passing through the crease. Consequently we crossed the Old Grouse strain with imported bitches and the Gildersleeve strain, in order to get rid of the trouble; and if there are any more intelligent, more stylish-looking, more industrious, and more lasting dogs than those we have bred from such stock, we would go a long way to see them.

WORMS IN THE HEART.—There is a remarkable disease which attacks all sporting dogs taken from England to China, for which neither cause or remedy has, as yet, been assigned. In a recent issue of the *London Field* a correspondent, in describing a shooting trip to the country back of Shanghai, mentions the death of one of his dogs. Upon opening the body he found the cause to be that curse to sporting dogs in China—worms in the heart. The aorta was found to be choked by a mass of thin white worms, and the left ventricle was filled with clotted blood. The Editor of the *Field* remarks in a foot note that about four years ago he received from Japan the heart of a dog, choke full of worms, which in appearance much resembled a tangled mass of "fine twine." He submitted the specimen to Dr. Cobbold, who pronounced the parasites to be *Spiroptera sanguinolenta*, particulars of which he had given in a paper published in the "Proceedings of the Linnean Society" for 1875. It is believed that no remedy is known for the disease, which appears to be very common in dogs in China and Japan, but unknown elsewhere. Whether the areca nut, which is so effectual in removing worms from the intestines, would reach in its action the heart, is questionable; but, if administered in time, it might possibly touch the origin of the disease. The experiment would be at least worth a trial.

HOME FOR LOST DOGS.—According to the *London Times* there is a Home for Lost Dogs, which has been recently enlarged by the addition of accommodations for 150 or 200 more dogs. The average number of inmates is 400, which are well fed and supplied with water. A dog is kept three days, and if not claimed in that time is sold. The cost of the buildings is £4,000, or \$20,000—a most excellent institution. Who has not witnessed the intense suffering caused to a dog by the loss of his master? Darwin, in answer to the argument against his development theory that man differs from the brute in that he has a religious sentiment, answered by saying that a dog's veneration for his master closely resembles a religious sentiment, and that his master is to him a divinity.

TRAP FOR SHEEP-KILLING DOGS.—An Indiana man has furnished the *Agriculturist* with a model of a trap for catching sheep-killing dogs, which consists of a small pen eight feet square, to be made in the field where sheep are pastured, and fenced in tightly. The pen is divided into two parts, so arranged that when the dog rushes in to get at the sheep, confined in one partition, he is made a prisoner in the other, while the other pen is opened and the sheep liberated. This may be a very good plan; but if our farmers, who are also wool growers, will pay some attention to importing collies, they will find no more trouble from mutton-eating curs, and save the wages of one man in addition.

A CORRECTION.—In our last issue we printed an interesting letter from that veteran sportsman, Ethan Allin, of Pomfret Centre, Ct., on food for large kennels. The types, however, made an error in the twentieth line of the article, by substituting "canned meat," for cooked meat, which quite changed the sense and force of the argument.

—Dr. Webb's "Whiskey" will not go to Chicago. Her very promising family require all of her attention.

THE ALEXANDRIA PALACE DOG SHOW.—Closely following the bench show of dogs at Birmingham was one at the above favorite place of exhibition, given under the management of the Kennel Club. Our contemporary, the *Fancier's Gazette*, thus discourses of the setters, which were nearly as well represented as they were at Birmingham:—

"The English Champion Dog Class rested between Bandit and Rock, two remarkably good specimens of the pure Laverack breed; the former is remarkable for his fine symmetry, great depth, and big bone; Rock is quite his equal in all but bone and size, and beats him in color, Bandit being white and liver. In the Open Dog Class, in which first went, very rightly, to Mr. Bowers' Rock II, a youthful son of champion Rock and Lillywhite, by Fred II, out of Lord's Sal, by Withington Frank out of Flak. Rock very much resembles his sire, being much after the same pattern, but possessing in no small measure just those very properties in which old Rock is so deficient; the old dog lacks bone, size, and substance, this is not so with Mr. Bowers' dog, and when we look at the magnifi-

cent texture of his coat, his pleasing Laverack color, his make, shape, and sweetness of expression, we fail to see how he could be improved. We understand he will be forthwith prepared for the Field Trial Derby. Second fell to the lot of Mr. Wardlaw Reid's Rothay, by Pilkington's Dash, out of a sister of the world-renowned Sam; he is a red and white—pure Laverack, of course—and a good, shapely dog. Mr. Hennings was well third with his black and white puppy, Nob, a promising son of his Rock and Blanch. First in the bitches was awarded to a white, black, and ticked Laverack, bred by Mr. Macdona, and showing wonderful quality—if any thing, too much—in other words she shows but too plainly the effects of inbreeding; her coat is not exactly first-class, but her carcass, frame, and loins are very nice—by no means inferior to the Prince's bitch. Mr. Macdona's beautiful blood-like Pera came second; she does her breeder, Mrs. Geo. Lowe, great honor. Mr. Hemming's Liz, placed third, is full of beauty, and blood-like. Mr. Bowers was unsuccessful with a very grand young bitch called Bessie I, own sister (same litter) to Pera, and which it is rumored will prove a star at field trials.

"Black and tans were somewhat better than at Birmingham. Mr. Coath's Lang stood alone in the Champion Dog Class, while the bitches proved a blank altogether. In the Open Dogs, Mr. Coath's Blossom (bred by Rev. J. C. Macdona) had a remarkably easy win; he is a dog that shows himself wonderfully well, his carriage and corky action being quite equal to his extraordinary richness of color and exuberance of feather. Floss, the Birmingham winner, repeated her victory by coming first in the bitches; she is so good that it is impossible for the judges to get away from her; her fine symmetry, depth of color, and length of feather are alone sufficient to make their mark, but beyond these she possesses a deal of that true Gordon character that has been to a considerable extent lost.

"Irish setters did not bring out such an extraordinary lot as were at Birmingham. The champion Palmerston was again to the front, with Mr. Macdona's Shirley, or one of his Shirleys, second; for he exhibited a brace bearing the same name second. In Irish Bitches, the judging was a series of errors from end to end. Mr. Gordon MacHaffie showed his champion Mina, by champion Palmerston, and a very fair bitch called Bella. Mina never looked fitter, and yet—'tell it not in Gath'—the judges spotted Bella to win, and left her kennel companion without even a commendation. May be, not a patch on Mina, was placed second."

BROOKEVILLE, Kansas, Jan. 4th, 1876.

EDITOR FOREST AND STREAM:—

I am greatly interested in E. A.'s mode of feeding dogs so that they shall be free from distemper. Hope he will not forget to tell us soon, as I have two setter pups growing up, and I wish, if possible, that they may come up to doghood without having distemper. I raise every year one or two dogs, but, so far, all of them have had distemper; I have never lost one with it. My setter bitch, Juno, dropped, Nov. 17th, 1875, a litter of twelve pups, all alive and doing finely. Who can beat that? L. C. W.

Furs and Trapping.

There will be no change in our fur quotations until the middle of January.

—The duty paid by the Alaska Commercial Company under their lease of 1870 is \$17,480 for rental of the islands of St. Paul and St. George, and \$1,057,709 as taxes on seal skins; the latter is less by \$16,458 than the tax that should have been paid had 100,000 skins been taken each year since 1870, or in other words 6,269 fewer skins have been shipped than the lease permitted nearly every year. In addition to the seals killed by the company for the skins, 12,000 are killed annually under the direction of the Government agents to supply the natives with food.

For Forest and Stream.

TRAPPING MINK.

NOT long ago my nephew was seized with an attack of the trapping mania, which is almost certain to lay hold of all live country boys, and is outgrown in a few years by most, but from which a few never recover. The disease has progressed with this youngster in the usual way. First, the mouse stage, which ran its course, ending when he had caught a dollar's worth of these small deer, at five cents a dozen, duly paid him by his grandfather in lawful currency of these United States. Then the rat stage declared itself, and for a fortnight the kitchen was littered every night like a carpenter's shop with the shavings he made in building "figgery fours," which, somehow, wouldn't work—going off when they shouldn't, or not going off when they should, and were at last consigned to the kindling basket with the shavings. Then a few antiquated steel traps were borrowed of a neighbor, and set with more satisfactory results, and rat after rat was shown in triumph to the household till rats palled upon his aspiring soul, and he sought a stronger foe, worthier of his steel. He found it in the skunk, and has been so far successful as to patch the end of the woodshed with the skins of several of his captives, and to make himself so odiously odorous that the ruling powers have forbidden his seeking further distinction in this direction. Now he thinks he has seen a mink track down by the Slang, though likely it is only that of a large weasle, and coming to me, asks: "How shall I set a trap for a mink?" I can show you better than I can tell you, my boy, though I fear it will be of little use to you, for mink have become scarce here, almost to extinction. However, let us go and see what can be done. Here are half a dozen single spring steel-traps, muskrat size, of the Oneida Community's make, and there are none better. When I was of your age, traps as good as these cost nine dollars a dozen, as they were all hand-made, and good makers were so rare that one was a noted man in his county. These we will take in a peck-basket, which is a handy thing to have, as we shall see, and a hatchet which we must have, and also a gun, if for nothing else, to keep us from those glorious chances so sure to befall him who goeth forth unarmed through forest or by streams. And here we are on the banks of the sluggish Slang, and sure enough, these tracks in the mud are of a mink, and, judging from their size, of one whose days have already been many in the land. Two and two they go, side by side across this patch of mud, unmistakable mink tracks. He turned out of his course a little to go through that hollow log, as any true mink would, and when he comes this way next time will pretty surely do so again. So we will set a trap in the log here where the hollow is narrowest. Cut a stout "tally stick," with a hook near the but and a fork at the top. Slip the trap-chain on this, and if you cannot thrust it into the ground firmly enough for security, tie the top to this overhanging branch of water-maple. Be careful about this, for the mink is a strong fellow, and will make a lusty pull to regain his liberty. Now cover the trap and chain carefully, but lightly, with the matted moss which grows upon this log, and hang a morsel of bait directly over the pan. The head of the chicken that furnished our breakfast fast is better than nothing, though I would rather have a small fish, or best of all, as I think, a bit of muskrat. A drop of musk on the bait will help to attract him. Some use smoked herring for bait, but they never proved good with me. It is said that a very taking scent can be made by putting an eel, chopped small, into a bottle, and letting it hang in the sun till it turns to oil, but I never have tried it, having always found muskrat good enough. There swims one now, with his mouth full of weeds, building material for his house. A charge of B.B.'s puts an end to his earthly labors, and he will furnish bait enough for all our traps, with plenty left for rebaiting. This railroad culvert used to be a favorite haunt of mink, and we will set a trap here after another fashion. Place it here in this slack-water, an inch or two below the surface, and lay two or three of these sodden leaves over it. Hang the bait over it, just as in the other place. Stick the "tally" in the deep water, as far off as the chain will reach, so that the mink will drown, if caught. Many a mink have I done to death here, and to show you the virtue of muskrat for bait, will tell you of one of them. I knew he was hanging about here, for I had seen him, but he would not go near my trap, for which I had no better bait than a chicken's head. It had no charms for him, and my trap gaped unmolested for many days. So I went over to the camp of Swain Tahmont, a St. Francis Indian, down from Canada, trapping, and got of him the carcass of a muskrat, with the head of which I rebaited my trap, and went my way to others. Returning this way only half an hour later, the chink of the trap-chain greeted my ears as I drew near, telling the tale of something caught, and sure enough, there poor furry was, fast by a hind leg, but struggling bravely for life and liberty. Now we come to a long stretch, somewhere in which we ought to set a trap. There is no hollow log nor stump, nor hole in the bank which we can use, nor any place to set a trap in the water. If there was a standing tree with a hollow but we would hang our bait in it, set our trap, covered with moss, at one of the openings, and close all the others, but there are none of these, and we must make a place. This we will do by making a "cubby-house" about a foot long, half as wide, and eight or ten inches high. Its walls are sticks driven into the ground; it is roofed with bark or any slabs of wood at hand, and the less new looking the whole thing is the better. It has no opening but the doorway, which is about the width of the open trap, and this we set in it, or just inside of it, and cover with some of the moss which we brought in our basket, or with some of these fallen pine needles which are lying all about it, for it is better, when you can, to cover your trap with what will not look strange and out of place. Snow, however, is a poor covering for a mink trap, as it is apt to crust over hard enough to bear so light an animal. Put the bait on a stick, well back in the house, and scatter a shred or two of it about the door. The tally is made fast just as in the other places. These "cubbys" seem to be just as good as natural places, and I caught four mink one fall in one just like this. Some

trappers trail their bait along the ground from trap to trap, holding that the animals will follow it. It can do no harm, but is a little more troublesome than carrying it in your basket.

The remaining traps you will set, each in some such place as we have used or I have told you of. No two will be exactly alike, and you will have a chance to exercise your judgment and ingenuity. You may find where a mink lives and where he goes every day in and out of his burrow. No need of bait there; all you have to do is to set your trap carefully at the door of his home. Or, perhaps, you will find where he has made a deposit of frogs beside a pile of driftwood. If so, set your trap there. Hollow logs near water, piles of driftwood, overhanging banks with a screen of tree-roots, behind which he can travel unseen, the stone or wooden abutments of old bridges are haunts, he loves, and when in any of these places you find his "sign," his dark-colored excrement, fresh and frequent, there set your trap, with or without bait, as the case may be.

Remember that to be a successful trapper you must be a close observer of the habits of the animals you are trapping. The more you can learn of them, the more ready will you be with expedients for every case that presents itself. I never yet saw a good trapper but would say that he was always learning something.

Now I will show you how to make a dead-fall. It is a contrivance with which I never had any luck, but it is in high favor with some trappers. Cut that smooth maple sapling which is about two inches through at the butt, and trim off the lower branches. Cut a piece a foot and a half long off the larger end, and lay this short stick down on a level place. This is the bed-piece; now cut four straight smooth sticks, fourteen or fifteen inches long, for guides; sharpen and drive them into the ground, two on each side of the bed-piece, and the two pairs about eight inches apart. Place the long sapling—the fall—with its larger end on top of the bed-piece, lengthwise, and see that it will rise and fall easily between the guides. The upper limbs are left on the fall to keep it from rolling when raised. Now build a house close up to the two inner guides, like the one we made for the steel-trap. Next, whittle out a standard of hard wood, two and one-half inches long, cut square at its upper end, and like a very blunt wedge at its lower. Then a spindle, eight inches long, flat on the lower side of the large end, beveled to a blunt edge on the upper side of the same, and sharpened at the other end, near which should be a fork to keep the bait from being pulled up on the spindle. When we have weighted the fall with some heavy pieces of wood our trap will be ready to set. This we do by raising the fall and placing the large end of the spindle on the middle of the bed-piece, with the sharpened end baited, inside the house. On the end of the spindle we set the wedge-shaped end of the standard, directly over the bed-piece, and gently lowering the fall on its upper end, our trap is set. You see that if any animal reaches in and tries to draw out the bait, he will pull the inner end of the spindle toward the bed-piece; the standard will be thrown off the spindle, and down will come the fall on his neck or back. It is a very merciful trap, killing its catch outright, and for that reason I wish it was a surer one, but I never could get anything to enter it but skunks and once a raccoon. And now I will leave you to set your remainieg steel-traps, and as many dead-falls as you please.

Fortune smiles most benignly on my young trapper, and two days later he comes home from making the rounds of his traps, exultantly bearing a large male mink, whose thick fur is as dark as mink ever wore, and now the youngster's question is: "How shall I skin it, and how stretch the skin?" So with a keen edged knife we fall to, he holding the legs, I skinning. Rip from the ball of this hind foot down the inside of the leg, across just forward of the vent, to the other; then skin out the hind legs and around the root of the tail. Turn the skin of the tail as far as possible, then replace it, and slip it off the bone without turning. Now strip the skin off to the fore legs, which skin out carefully, then strip again to the head, which must be skinned out, being all the while very careful not to cut the skin. Now we will make our stretcher of a nicely planed piece of pine, two feet and a half long, three inches wide, and three-eighths of an inch thick. Cut five or six inches of the end in a gradual rounding taper to a point. Draw the skin on, wrong side out, the snout holding on this point, stretching it as hard as you can; fasten it with several tacks at the tail end. When it is thoroughly dry take it off the stretcher, turn it, shake it well, and it is ready for market. AWAHOOSE.

THE USES OF CHARCOAL.—By keeping charcoal in a hog pen there will be but little odor or disagreeable smell, such as is usual. The hogs appear to thrive better and faster than in a strong smelling sty. They will consume quite a quantity, which undoubtedly does them good. Some should be powdered, and some left in chunks; the powdered absorbs the wet, and the hogs will eat the lumps as they desire it. The refuse makes a most excellent manure for onions or any vegetables. By putting a small quantity in the horse stable every day under the horse, it will absorb the wet and keep the stable perfectly sweet and wholesome. As it is removed from the stable keep it under shelter, dry it, and sow it on the meadows; the increase in the crop will pay for the trouble. Cow stables will receive the same benefit and produce the same results. It is also invaluable in the poultry house in keeping it whole some for the fowls, and making a most valuable manure. The fowls will consume a part of it, and are not so liable to disease. It is also very desirable in the sheep pens or yards. By putting a bushel or so of the powdered charcoal down the water closet it will remove the disagreeable smell which generally attends such places, and will remove the great objection there is to cleaning them out. When charcoal is powdered and a little dropped into a potato hill when planted, it will double the crop, and will improve the quality beyond expectation. An objection to it is that it is black and will blacken any person that handles it. I have powdered it by pounding it on the barn floor, and also by putting it through an old cider mill, but it is undoubtedly dirty work any way you can fix it. But "he that would catch fish must not mind getting wet."

—Prof. Spencer F. Baird, of the Smithsonian Institute, the United States Fishery Commissioner, obtained a special award at the recent fluvial exhibition in Paris.

Shot Gun and Rifle.

GAME IN SEASON IN JANUARY.

Hares, brown and gray.

Wild duck, geese, brant, &c.

FOR FLORIDA.

Deer, Wild Turkey, Woodcock, Quail, Snipe, Ducks, and Wild Fowl.

GAME IN MARKET.—Ruffed grouse are still being received in fair quantities, principally from Maine, and sell for 90 cents to \$1 per pair; pinnated grouse (prairie chickens) are still scarce, and bring \$1.15 to \$1.25 per pair; last year at this time they were worth 75 cents. Quail are also scarce, those in market purporting to be Western birds, but if they could their little tales unfold, we should probably have exposed a wretched list of violated game laws. Canvas back ducks are worth \$1.50 to \$2.50 per pair; red-heads \$1.25 to \$1.50; mallards, 75 cents to \$1.25; widegeon, 75 cents to \$1; black ducks, 75 cents to \$1; sprig-tails, 60 to 75 cents; broad bills, 75 cents; teal, 75 cents to \$1; brant, \$1.50; geese, \$1 to \$1.50. Southern birds have been coming into market in rather bad condition, which accounts for the variation in price. A few green-winged teal have been received from Norfolk. Hares and rabbits are very abundant at 50 to 60 cents per pair; venison is worth 20 to 25 cents per pound.

PENNSYLVANIA—Pittsburgh, January 3d.—Ruffed grouse is the only bird that has been plenty with us this year, and they so wild as to render choke bores almost useless. Quail have been scarce, and, fortunately for the supply next year, the second brood did not get large enough to kill until the season was more than half gone. AUGUSTINE.

—Greenville, Penn., is situated on the Shenango River, sixty-three miles south of Erie, and eighty-six miles north of Pittsburgh, in Mercer county, and contains about 4,000 inhabitants. The Erie and Pittsburgh Railway runs through the western portion of it, and the Atlantic and Great Western Railway through the eastern portion. On the 24th December last Messrs. J. T. Nelson, Nelson H. Camp, Jack Holmes, and "Pop" Mills, bagged nineteen grouse, four quail, and six rabbits on good shooting ground about eight miles distant from Atlantic Station, on the A. and G. W. R. R. There is a good hotel at Greenville, kept by Fred Grubbe.

SOUTH CAROLINA—Columbia, January 3d.—The weather is warm for this month, and consequently ducks are now scarce; but a week ago, when there was a freeze up, mallard, teal, and Summer ducks were plentiful. One gentleman killed eight out of ten mallards, and another four with one barrel. Partridges can be found in large coveys within a mile of town; there never were more. Rabbits are plentiful and swamp hares are occasionally killed. Deer can be found by going ten or twelve miles in the country; a good many have been killed this year. Doves are here in numberless droves. The Saluda River is filled with geese, but on account of their being out on the rocks in the river not many of them are killed. E. J. S.

FLORIDA—Pensacola, December 30th.—I cannot honestly recommend tourists to visit Pensacola, either for its hunting or fishing, as there are so much better grounds to be found in other parts of the State. It is very good here, however, on the other side of the bay, in what is known as the Live Oak Reservation. An acquaintance of mine killed seven fine deer there last Saturday; besides, numerous turkeys and ducks have been brought in. Still, when compared with Sarasota or Southwest Florida, the hunting is rather poor. Should any of your friends happen this way, please send them to me, and I will see that they have good guides, with dogs, boats, etc., at reasonable rates. S.

KANSAS—Brookville, Saline county, January 4th.—I wish to say a few words in behalf of the country situated beyond where farmers have men arrested for carrying a gun, and then turn in and trap and net the chickens and quail all Winter and ship them East. I think there is no finer chicken shooting in the United States than we have here. Quail have always been very plenty till this year; but the uncommonly severe Winter of '74 and '75 thinned them out so much that we have made an agreement here among the "shootists" not to kill any quail this year, and I believe it has been religiously lived up to so far, although some of us have had several sore temptations. Knowing that we should have no quail shooting, we early turned our attention to hunting jack rabbits with greyhounds, and I must say that we have had any quantity of sport. Everybody here, nearly, has got a Texas pony (and no better saddle horses can be found), and six of us have greyhounds. Rabbits are very plenty, and if by chance we find a herd of antelope, which we frequently do, then the sport is right royal. Jack rabbits are harder to catch than antelopes, but when taken they do not make as good a show hanging to your saddles as the latter. S. C. W.

—A pigeon match for \$1,000 has been arranged between Dr. Talbot, of this city, who won the sweepstakes open to all comers, on New Year's day, at the Long Island Shooting Club, and William Hess, the champion of Pennsylvania. The conditions are for each to shoot at fifty birds, 21 yards rise, 80 yards boundary, with one ounce of shot, with double-barreled guns, but only one barrel to be used during the match. The contest is to take place at Burlington, N. J., next Monday.

—A match is also said to have been made for a similar stake, between the champions, Capt. Bogardus and Ira A. Paine.

A GOOD SNIPE BAG.

NICASIO, Marin Co., Cal., January 1st, 1876.

EDITOR FOREST AND STREAM:—

In the FOREST AND STREAM of November 11th, your correspondent, "Mortimer," gives an account of remarkable snipe shooting, made by Mr. John E. Loveland, in New Jersey; he also wished to hear of large scores made at same birds. A few years ago, while on a hunt for geese and mallard in the lower part of Sacramento county, I found a large number of snipe on ground lately burned over. In six and half hours I bagged 109 snipe; using a No. 10 muzzle loader, and No. 5 shot, as I had no other size with me; the wind blowing a strong norther at the time. I shot under the wind, using but one barrel, as I had no dog and had to go directly for each bird as soon as shot. I think with a breech loader and a good retriever, 300 snipe could have been bagged by one man that day. THOMAS H. ESTEY.

The Rifle.

CREEDMOOR JR. RANGE.—The third match for the Union Metallic Cartridge Badges, open to all-comers came off at Creedmoor Jr. range, 260 Broadway, in the old Underground Railroad Tunnel, on Wednesday the 5th inst. Terms of match: Entrance \$1, ten shots, off-hand; distance, 100 yards; first badge value \$100, to best score; second badge, \$35, to 10th best; third prize, S. & W. \$15 revolver to 20th best score. The winners were as follows:—

Name.	Score.	Total.
F. Buckofen, first badge.....	4 4 5 5 4 5 5 4 5	45
W. B. Farwell, second badge.....	4 4 4 4 3 4 4 4 4	39
J. Woodward, third prize.....	4 4 3 4 4 3 5 4 3	37

The scores at this range are improving every week, showing that practice is essential to perfection. The match days hereafter will be Tuesdays.

The Third Subscription Match at Creedmoor Jr., Tuesday, Jan. 11th. Conditions: Entrance, \$1, ten shots, off-hand; distance, 100 yards: one-half entrance money divided between 1st, 5th, 10th, 15th, and 20th best scores. The following are the winning scores:—

Name.	Score.	Total.
John Tragger, first.....	4 4 4 4 5 4 5 5 4 5	44
John Tragger, second.....	4 4 5 5 4 5 5 3 4 5	44
R. Miley.....	4 5 4 4 4 4 4 5 4 4	42
James Bryan.....	5 3 5 4 4 4 4 5 4 4	42
J. McGlensy.....	4 4 4 4 4 5 5 4 3 4	41

There were 55 entries, and the scores were better than ever before made at this popular range. The 4th competition for the Union Metallic Badges comes off next week, Tuesday; open to all-comers. The badges have been won on scores of 42, 42, and 45.

SECOND DIVISION RIFLE PRACTICE.—The report of Col. Valentine, Inspector of Rifle Practice of the Second Division, N. G. S. N. Y., contains a summary of the practice at Creedmoor during the past year. It is satisfactory to know that the scores in the Division matches exhibit an improvement in the average of each individual of more than seventy per cent in every team in the Division. In the table of team scores below, the scores of this year have been diminished, in order to compensate for change in value of targets, by subtracting twenty per cent to equalize the two styles of targets:—

Teams.	No. of men.	1875.			1874.			No. of men.
		Average scores.	Average per man.	Average scores on old style targets.	Average per man.	Average par man.	Average scores.	
Twenty-third Regt.....	13	414	31.50	332	27.66	17.35	207	12
Forty-seventh Regt.....	12	405	33.75	324	27.00	12.25	153	12
Thirty-second Regt.....	12	338	28.16	271	22.59	13.50	162	12
Fourteenth Regt.....	12	332	27.66	266	22.16	13.66	164	12
Thirteenth Regt.....	12	233	23.53	227	18.19	10.25	123	12
Fifteenth Battalion.....	12	209	17.41	168	14.00	8.56	60	7

Although the improvement in marksmanship is general throughout the Division, the greatest gain has been made in accuracy at the longer range. In 1874, out of a total of 420 shots fired at 500 yards in the Division match, 313, more than seventy per cent., failed to hit the targets. This year, out of the same number of shots, there were only 105 misses, or twenty-five per cent.

—The Scottish-American Rifle Club contested for the Morrison medal at Creedmoor on Wednesday of last week. Captain W. C. Clark was the successful competitor, upon a score of 93 out of a possible 100 points.

HELLWIG'S GALLERY.—The sixth weekly competition, shooting in lying position for a gold medal, a double-barrel shot gun, a rifle, and a revolver took place at this gallery, 271 and 273 Eighth avenue, on January 5th, 1876, with the following result. Charles Morris, Chicago, first prize, 46; F. N. DeWitt, second prize, 46; T. C. Banks, 40, third prize; Louis Cirkor, fourth prize, 21.

MILEY'S RIFLE GALLERY, BROOKLYN.—The tournament in aid of St. Peter's Hospital, which commenced at Miley's Rifle Gallery, on the 3d of Dec., 1875, closed on Friday evening. The following are the winners, with their targets, ten shots each: John F. Burns, 4 5-16, first prize, *Turf, Field and Farm* cup; J. L. S. Kellner, 5 3-16, second prize, medal, presented by Col. B. E. Valentine; Robert Simpson, 5 1/2, third prize, presented by Robert Miley.

CONLIN'S GALLERY.—The sixth competition for the *Turf, Field and Farm* cup was shot January 6th, 1876. L. V. Sone won the first cup—score, 42; Joseph Woodward, second cup, 35; T. C. Banks, third cup, 25. A neat and durable flask was given as a prize to the best score made on the 60 foot range at 500 yards target reduced in proportion for distance; ten shots; any position allowed. Messrs. W. H. H. Sabin, W. B. Farwell, L. C. Bruce, and L. V. Sone tied on 50. These ties were shot off on the 8th inst., Mr. Bruce proving the winner. The following is a programme of the matches at this gallery for the next two weeks: January 14th—FOREST AND STREAM badges; 18th—Lying Down Position; 20th—*Turf, Field and Farm* cups; 22d—Subscription Match. At the next competition for the FOREST AND STREAM badges he will present two yearly subscriptions to that journal to the two gentlemen who make scores nearest to 25 and 35 respectively. All comers will be welcome.

NATIONAL RIFLE ASSOCIATION.—The first Director's meeting for 1876 was held January 5th, Gen. Shaler in the chair. Treasurer's balance, \$4,334.65. Gen. Woodward reported that his committee inspected a piece of ground nine miles from Philadelphia, and Major Fulton was requested to examine the proposed site for a range. The programme adopted, if the Centennial match is shot at or near Philadelphia, is as follows: Commence on second

Tuesday in September, 1876. Match open to teams of eight from each country. Any rifle within N. R. A. rules. Distance, 800, 900, and 1,000 yards; thirty shots at each distance; each competitor firing fifteen shots each day. Match to last two days. The Amateur Rifle Club was requested to appoint a committee of five members to act with a similar committee from N. R. A. in the matter of the International Match of 1876. A contract was entered into with Mr. Poppenhusen, of the Flushing and North Side Railroad, to rent or buy fifteen acres of land, lying north and west of range at Creedmoor. The Winchester Arms Company have offered to erect and present to the range a "running deer target." The Range Committee were ordered to inquire about renting more ground at the southern extremity of the range, to make 1,200 yards shooting.

—The Viley Club, of Lexington, Ky., shot a match with the Paris Jr. Club, Paris, Ky., and the Hunter's Club of Lexington, on the 31st December, and 1st inst., respectively. The weather was extremely fine, with a very strong southeast wind blowing, which probably accounts for the scores:—

AMATEUR RIFLE CLUB.—This club proposes building a club house for the use of its members at Creedmoor, and the following sums have been subscribed for the purpose:—Robert Schermerhorn, \$100; George Crouch, \$100; E. H. Sanford, \$50; George S. Schermerhorn, \$25; A. Alford, \$25. The following are the committee appointed to obtain a contract for building the house, provide plans, etc.:—H. S. Jewell, Joseph Holland, George Crouch, and Jacob McGlincy. In response to an invitation from the National Rifle Association, a committee of five have been chosen to co-operate with a similar committee for the purpose of conducting the grand international match during the Centennial Exhibition. The following gentlemen form the committee:—Robert Johnston, George Crouch, W. G. Coughtry, A. Alford, and G. S. Schermerhorn.

Answers To Correspondents.

No Notice Taken of Anonymous Communications.

G. H. R., Gainesville, Cooke Co., Texas.—Where can I get prices current for bird skins? Ans. Of C. J. Maynard, Newtownville, Mass.

J. W. W., Boston.—Will you please tell me your opinion of Remington's \$45 breech loading shot gun? Ans. It is a good serviceable gun.

F. J. B., Franklin, N. Y.—How much in bulk of areca nut, after grated fine, is a dose for a pup six weeks old, for one seven months old, also one full grown? Ans. Give two grains to every pound of dog.

A. B. C., Boston.—Where can I obtain "Dudley's Pocket Recapper," and what is the price? Can I have it sent by mail? Ans. Address Dudley & Co., Poughkeepsie, N. Y.; price fifty cents; sample sent by mail.

W. W. W., Unionville, Ct.—Will you kindly advise me what book will teach me fly-fishing. Ans. We have no American work on fly-fishing. Norris' American Angler's guide will give you as much information as any single book.

J. S. W., Boston.—Will you please tell me in your Answers to Correspondents, if there is any law in Massachusetts prohibiting the shooting of ducks from sail boats. Ans. No; if not done within the close season or with a battery, swivel, or pivot gun.

CONSTANT READER, Syracuse.—If you will sign your name to communications in future, we shall be very happy to answer your questions. We are always willing to respond to queries, but must call the attention of yourself and many others to the notice at the head of this column.

W. B. W., Boonsboro, Md.—How are barrels bored straight (cylinder) to be made choke-bore; barrels 30 inches long, 12-gauge? Ans. Choke-boring consists in enlarging the bore a few inches below the muzzle. Any gun may be choke-bored if the barrels are heavy near the muzzle.

Q., Uniontown.—Please inform me through your valuable paper of a sure and safe way of removing lice from a dog. Ans. By anointing your dog with any kind of oil or grease, and then some ten or fifteen hours after, washing him thoroughly with carbolic soap, you will rid him of lice.

E. L. F., Central Falls, R. I.—Will you give me a receipt for some mixture of acid, or something else that will clean long range shells nicely for reloading? Ans. Immerse your shells in diluted sulphuric acid for five or ten minutes, then wipe them out and put them on the stove to dry. Vinegar would answer pretty well.

W. M. L., Noblesville, Ind.—1. I should like to have an extra pair of laminated steel barrels for my No. 10 breech loader, made expressly for shooting buckshot at long range. I should like the left hand barrel a choke-bore, and the other one a modified choke-bore, and the length of barrels anywhere from 30 to 35 inches. About what would they cost? 2. If I send my gunstock to you, can I commission you to have it done by some competent workman? Ans. 1. The expense would be just about one-third the cost of the gun. 2. If you will send your stock to us we will have it well done for you.

G., New Haven.—Where can I get from six to twelve pairs of live quails, and what will be their probable cost? I wish to keep them through the Winter and then turn them out in Spring. Ans. Address H. H. Tate, Greensboro, N. C., who can give you the name of a party there from whom live quail can be obtained. Probably Whitely & Morris, of Washington Market, this city, may have live quail.

J. H. C., West Troy.—Please inform me who spays bitches, and whether there is any work on the subject I can buy, as I wish to learn to perform the operation? Ans. Capt. Anderson, of Trenton, N. J., is the only one we know who can spay a bitch properly. There is no book giving directions as to operations that we know of. By seeing the operation performed a few times one could learn the art.

W. N. S., Philadelphia.—1. Are Spencer repeating rifles for sale anywhere in the United States, if so where, and what are they worth? 2. Do you consider the Wesson rifle, 44-100 calibre, accurate at 500 yards? 3. What is your opinion of the Robinson repeating rifle? Ans. 1. The Winchester Arms Co. now own the Spencer patent; the rifles are no longer made. 2. The Wesson is a capital weapon at that range. 3. We know nothing of the Robinson rifle.

BROWN HACKLE, N. Y.—1. Can you inform me in what part of the country the rough-billed pelican is found? I have never met with it in Florida. 2. What is the English whitebait? Is it a distinct species of fish, or is it the small fry of a certain species, or are the small fry of fish generally so termed? Ans. The rough-billed or white pelican is a bird of the Pacific Slope, accidental in the Eastern States. 2. The character of the white-bait is a disputed question.

S. A. A., Rochester.—Can you give any information respecting the merits of the breech loading guns manufactured by Robert Mortimer & Sons, London? Also do you regard the double vertical bolt (for breech loaders) as strong and durable as the Scott, or whether you have any prejudice against that fastening? Ans. 1. There is no such firm of gun-makers in London. 2. The vertical bolt, such as is used in the Greener gun, is as durable as any other kind of fastening.

J. M. K., Philadelphia.—I have a very nice setter-pup four months old that is troubled with worms. I gave him a dose of oil and he passed what I thought was a tape worm, the worm was flat and linked together, and about five inches in length. Please inform me whether it was a tape worm or not, and if young pups are troubled with such worms. Where can I obtain areca nut, and what is a dose? Ans. It was probably a tape worm. Have sent to you some areca nut with directions for its use.

T. C. R., Brooklyn.—I have a rifle R. Johnson, U. S., 1822; barrel 36 inches long, seven grooves with a twist once in full length; throws a half ounce ball and has small back and top sights. Is it long or short range? What calibre is it; would you advise any alteration of sights? About how many grains of powder is needed for a charge? Ans. Your rifle is 34 calibre; use conical balls and 50 grains of powder for 500 yards and more for longer ranges. Can say nothing about altering sights until we know how it shoots with those it now has.

FIELDS, Fort Wayne, Ind.—Will the foreign gun manufacturers be required to pay the duty on guns which they exhibit at the Centennial Exhibition at Philadelphia, this year? Ans. No—unless they are sold, or otherwise disposed of in this country. What does it cost to enter a gun, and what assurance do they give that the gun will be taken care of and returned to the owner? Ans. There is no charge; the FOREST AND STREAM has charge of the special Government Department, which will include guns as an exhibit, and will take charge of such articles, returning them to owner after the Exhibition closes.

THOMPSON, Talladega, Ala.—Please give me some information on fish culture. I have a small pond, one only. Will the fish destroy their own spawn; what is the best fish to raise that will not eat their young? Trout, perch, and red horse are the kinds I thought of. Give me all the information you can. Ans. We would advise you to communicate with the Fish Commissioners of Alabama, who are most familiar with your requirements and the waters of your section. Address C. S. G. Doster, or Robert Tyler, Montgomery, or D. R. Hundley, Courtland. D. R. Metcalf, of Montgomery, is a reputed authority on Southern fish, but we never can evoke a reply from him, although we have addressed him repeatedly on important subjects.

ED. SCHWEYER, New York.—I received of Messrs. Whitely & Morris, of this city, on December 23d, forty-eight live quail, of which seven were dead when I received them, one died next day, ten on December 25th, and five on December 26th, making a total of twenty-three out of forty-eight; the balance hang their wings and heads and will no doubt die. The food I give them is wheat screenings and buckwheat and sand. I have opened several and find their lungs are discolored. Have they possibly been chilled on their transit? This is discouraging to me, as I had made preparations for wintering 200 this year, having wintered 100 last year. Ans. For instruction how to raise and winter quail, see FOREST AND STREAM, Jan. 7th, 1875, illustrated article.

W. F. W., Gloucester, Mass.—I have a muzzle loading gun, 10 bore, 35 inch barrel, marked on rib between the barrels, Smith, London, bar locks, weight 10 pounds; I have the gun on trial. Please tell me what you think of the style of gun, and of the maker, if there is such a maker in London; what charge of powder and shot should I use at 40 and 60 yards. I am using Orange Lightning No. 6. Is there such a rifle as Sharps improved? Ans. The style of your gun is all well enough, but the name "Smith" is indefinite as to the real maker. It is a name we have frequently heard of, but not as a gunmaker of London. Four drachms of powder and 1 1/2 ounce shot would be a good charge. The present Sharps rifle has all the late improvements.

TREMONT, Boston.—Is J. P. Clabrough & Bro. on the list of gun-makers? 2. How do their guns work compared with Scott's Greener's or Tolley's? 3. What is your opinion of the quality and shooting powers of their No. 8 breech loading guns? 4. Will you please give me the names and addresses of the Fish Commissioners of Maine, New Hampshire, and Virginia? Ans. 1. They are not London, but Birmingham gun makers. 2. They do not rank with Scott, Greener, or Tolley, as gun-makers. 3. Their guns of all gauges are good reliable guns, and shoot well. 4. Of Maine, E. M. Silwell, Bangor, and H. O. Stanley, Dixfield; of New Hampshire, Oliver H. Noyes, Henniker, J. S. Wadleigh, Laconia, and A. C. Field, of Enfield; of Virginia, Dr. W. B. Robertson, Lynchburg, A. Mosely, of Richmond, and M. G. Ellzey, M. D., of Blacksburg.

J. E. S., Philadelphia.—1. Will the Oriental Powder Co. inform me through your paper where, in this city, I can procure their best coarse sporting powder. I wish it for experiments. Is there a gun-smith in Boston named Fonks, and if so, can you favor me with his address? 2. I have a 12-gauge 8 pound Scott breech loader, very broad at the breech, (2 1/4 inches) in fact, thicker at this point than my 10 pound 10-gauge duck gun. Can you give me the address of any gunsmith who can fit a pair of 12-gauge barrels to the same stock, without interfering with the working or fitting of the present one? The gun (with new barrels) to weigh 10 to 11 pounds; to be choked so as to pattern at least 240 under regular conditions? Ans. 1. We can ascertain nothing of the gun-maker mentioned; perhaps some of our Boston correspondents will furnish the information. 2. We question if it could be done satisfactorily in this country, and would suggest your sending the gun to the maker.

A SUBSCRIBER, Baltimore.—1. After reading "Camp Life in Florida," I have decided to spend a good part of my time with Mr. Jones, at Homosassa. Will it be necessary to engage accommodation there a long time ahead? I should think, from "Al Fresco's" account of the place, that a great many people would want to go there. Ans. Will probably be crowded; engage at once. 2. Can I get ammunition at Jacksonville, or would you advise me to take a supply of shells, &c., from Baltimore? Ans. Buy in Jacksonville. 3. How many paper shells ought I to take from Jacksonville for a three weeks' stop at Homosassa? Ans. Two hundred 4's, 7's, and 12's. 4. Could I have a fresh supply sent to me in case they gave out? Ans. Not readily. 5. I have a 10 bore Greener gun, weight 8 1/2 pounds; how should I load for wild turkeys? Ans. 4 1/2 drachms powder and 1 1/2 ounce No. 4 shot. 6. Is it safe to shoot buckshot with my gun, and how should I load my shells? Ans. Chamber 1 1/2 ounce of buckshot so as to have them lie evenly. No danger in using buckshot. 7. Do you know whether Mr. Jones has any decoys? Ans. Do not know. 8. Would you advise me to take my rubber boots to Florida? Ans. No; we never advise their use.

A WEEKLY JOURNAL,

DEVOTED TO FIELD AND AQUATIC SPORTS, PRACTICAL NATURAL HISTORY, FISH CULTURE, THE PROTECTION OF GAME, PRESERVATION OF FORESTS, AND THE INSTRUCTION IN MEN AND WOMEN OF A HEALTHY INTEREST IN OUT-DOOR RECREATION AND STUDY.

PUBLISHED BY

Forest and Stream Publishing Company,

—AT—

17 CHATHAM STREET, (CITY HALL SQUARE) NEW YORK,
[Post Office Box 2832.]
123 SOUTH THIRD STREET, PHILADELPHIA.

Terms, Five Dollars a Year, Strictly in Advance.

A discount of twenty-five per cent. allowed for five copies and upwards.

Advertising Rates.

In regular advertising columns, nonpareil type, 12 lines to the inch, 25 cents per line. Advertisements on outside page, 40 cents per line. Reading notices, 50 cents per line. Advertisements in double column 25 per cent. extra. Where advertisements are inserted over 1 month, a discount of 10 per cent. will be made; over three months, 20 per cent; over six months, 30 per cent.

NEW YORK, THURSDAY, JANUARY 13, 1876.

To Correspondents.

All communications whatever, whether relating to business or literary correspondence, must be addressed to THE FOREST AND STREAM PUBLISHING COMPANY. Personal or private letters of course excepted.

All communications intended for publication must be accompanied with real name, as a guaranty of good faith. Names will not be published if objection be made. No anonymous contributions will be regarded.

Articles relating to any topic within the scope of this paper are solicited. We cannot promise to return rejected manuscripts.

Secretaries of Clubs and Associations are urged to favor us with brief notes of their movements and transactions, as it is the aim of this paper to become a medium of useful and reliable information between gentlemen sportsmen from one end of the country to the other; and they will find our columns a desirable medium for advertising announcements.

The Publishers of FOREST AND STREAM aim to merit and secure the patronage and countenance of that portion of the community whose refined intelligence enables them to properly appreciate and enjoy all that is beautiful in Nature. It will pander to no depraved tastes, nor pervert the legitimate sports of land and water to those base uses which always tend to make them unpopular with the virtuous and good. No advertisement or business notice of an immoral character will be received on any terms; and nothing will be admitted to any department of the paper that may not be read with propriety in the home circle.

We cannot be responsible for the dereliction of the mail service, if money remitted to us is lost.

Advertisements should be sent in by Saturday of each week, if possible.

CHARLES HALLOCK, Editor.

WILLIAM C. HARRIS, Business Manager.

ARTIFICIAL INCUBATION.

WE published a fortnight since a letter from Mr. Geo. M. Fairchild, describing a visit to the establishment of Mr. W. C. Baker, at Alpine near Englewood, in New Jersey, where the process of artificially incubating eggs and rearing chickens is being prosecuted on a very extensive scale. Since that letter was written we have visited Mr. Baker's place, and, although we can add nothing to Mr. Fairchild's description, some of the ideas evoked may be novel and of interest.

If we are rightly informed, the majority of the attempts in the matter of artificial incubation, in this country at least, have been in the nature of experiments, and have not been conducted to that point where a profitable result places the project beyond a peradventure, or a risk of failure. Many have hatched eggs by artificial heat, produced in a variety of ways, some with hot air, some with hot water, and others again by using manure as a substitute for the animal heat of the hen; but these efforts appear to have been fitful, and, whether from the exigencies of another occupation, or a want of means, or from whatever cause, have not been pushed with vigor, or brought prominently before the public as a tangible pecuniary success. But Mr. Baker's enterprise comes under quite a different category; being first assured of the correctness of his theories by long and patient experiment, he has invested a large amount of capital, at least seventy-five thousand dollars, in the business, and matured his plans with that thoroughness which can only be accomplished with a sufficient sum of money at command. In fact, here we think is one of the great secrets of his success, for many can invent and plan, who do not possess the means to complete; and thousands of promising schemes are "nipped in the bud" for the want of cash. The other secret of Mr. Baker's success will at once strike every visitor to his place; the extreme, even fastidious attention to detail, and the great mechanical ingenuity of the gentleman himself.

Visiting the hatching room, which, by the way, contains a row of tables like those in a wholesale dry goods store, only the drawers, when pulled out disclose, instead of "goods," the layers of eggs (we don't mean the hens) in their coverings of flannel, we are at once convinced that the old injunction not to count your chickens before they are hatched, is no longer applicable. In a little dark room adjoining, there is a powerful Argand lamp, also inclosed, the light from which can only escape through a little aper-

ture about the size and shape of a hen's egg. By holding an egg in this aperture, the strong light reveals all the secrets of the inside of the shell, and the condition of an egg at any stage can at once be determined. In cracking our hard-boiled egg at lunch when shooting, or fishing, we notice a cavity at one end. In the live egg there is a bubble of air which then appears to be in the yolk. Take an egg which has been exposed but three or four days to the incubating process, and by holding it in this aperture we see this little bubble slowly rise to the upper surface of the egg, and little fine dark lines shooting here and there through the yolk, being, as Mr. Baker described them, the forming blood vessels. In eggs only a few days older, when thus exposed to the Argand light, the signs of animal life, the first movements of the embryo chick are plainly visible. By this means all addled or unimpregnated eggs can at once be discovered and removed. The *Poultry World* thus describes the regular developments:—

"The heart may be seen to beat on the second day; it has at that time somewhat the form of a horseshoe, but no blood yet appears. At the end of two days two vessels of blood are to be distinguished, the pulsations of which are visible; one of these is the left ventricle, and the root of the great artery. At the fiftieth hour one auricle of the heart appears, resembling a noose folded down upon itself. The beating of the heart is first observed in the auricle, and afterwards in the ventricle. At the end of seventy hours the wings are distinguishable; and on the head two bubbles are seen for the brain, one for the bill, and two for the fore and hind part of the head. Towards the end of the fourth day, the auricles already visible draw nearer to the heart than before. The liver appears toward the fifth day. At the end of seven hours more, the lungs and the stomach become visible; and four hours afterward, the intestines, loins, and upperjaw. At the one hundred and twenty-fourth hour, two ventricles are visible, and two drops of blood instead of the single one which was seen before. The seventh day, the brain begins to have some consistency. At the one hundred and nineteenth hour of incubation, the bill opens, and the flesh appears in the breast. In four more, the breast bone is seen: In six hours after this, the ribs appear, forming from the back, and the bill is very visible, as well as the gall bladder. The bill becomes green at the end of two hundred and thirty-six hours; and, if the chicken be taken out of its covering it evidently moves itself. At the two hundredth hour, the eyes appear. At the two hundred and eighty-eighth hour the ribs are perfect. At the three hundred and thirty-first, the spleen draws near the stomach and the lungs to the chest. At the end of three hundred and fifty-five hours, the bill frequently opens and shuts; and at the end of the eighteenth day, the first cry of the chicken is heard. It afterwards gets more strength, and grows continually, till at length it is enabled to set itself free from its confinement."

But what astonished us most, was the impunity with which the eggs, at any stage, were removed and handled. The old idea that the hen must turn her own eggs, or that to touch them with the hand was to spoil them, is exploded. The hatching is done by means of hot water, heated by lamps so connected with an electric battery that upon the water becoming too hot, or too cold, the lamp is acted upon, and the water brought again to the proper temperature. This portion of the operation is very ingeniously arranged, but as most of the contrivance is the invention and secret of the proprietor himself, we did not care to investigate too closely.

Adjoining the hatching house is the house of glass, a home of floral beauties, to which the young chicken is at once introduced when he escapes from the shell. In reality it is a large hot-house, the spaces on each side of the center walk, usually occupied by banks or stands of flowers, being divided by wire screens into little compartments, planted with rose bushes, and communicating directly with the artificial mothers, into which the wee things run for warmth and shelter. Occupying each side of the walk are rows of exotic plants the culture of which, together with that of the roses from which the chicks obtain their insect food, will go largely towards defraying the expenses of this portion of the establishment. At a little distance, and separated by a pond for ducks, is a building now eight hundred feet in length, but which is shortly to be added to. Looking down the long alley which lines one side, and in which is a tramway for a car with feed to travel on, one is reminded of an enormous stable with a continuous row of box stalls, except that the upper half of each compartment is covered with a wire screen. Each of these pens has its yard where the chickens can go for air, light, and exercise. At the time of our visit many of the pens had their quota of fowls, nearly all of whom had been artificially hatched and reared. The white Leghorns appeared to predominate, magnificent sleek looking birds, with feathers as white as snow. Turkeys there were, and also ducks, for the rearing of both is on the programme.

We don't know whether it has occurred to Mr. Baker; but it does to us, that the providing of such quarters for his fowls, particularly those of the little chicks, should have a tendency to make the meat sweeter and more tender, for the principal profits from artificial incubation will probably be in the sale of spring chickens at a date when it would be utterly impossible for breeders on the old plan to compete. There is a great and increasing demand for spring chickens, particularly from the hotels, and a dollar and a half a pair is no uncommon price for little things that would scarcely weigh as much in pounds. But Mr. Baker will probably not confine himself to the breeding of chickens, he will doubtless follow the example of Mr. Montgomery Queen, a wealthy Californian, who has invested one hundred thousand dollars in the enterprise, and commenced raising ostriches for their plumage. Each bird is said to produce two hundred dollars worth of feathers per annum, and, as Mr. Queen is said to have

purchased one hundred of them to begin with, his income should be very handsome. Ostrich farming has been carried on at the Cape of Good Hope, and in Algiers for years, but this is the first attempt in this country. We think that the Californian has the advantage in climate over Mr. Baker, and yet we would wager that the latter, if he undertakes it, will succeed. We shall follow these matters with interest.

STEAM YACHTS.

THE revolution which has caused steam to almost supersede canvas in the mercantile marine of this country and of England, has had due effect upon yachting. Not that the change is likely to be so rapid or complete, however, for about yachting there is, when anything but the important business of racing is considered, an indifference to the matter of expense in time which is a large contributor to the *dolce far niente* of the sport. And yet the change has been so marked, and the increase in the number of steam yachts so great, as to attract attention and be worthy of remark. Any summer visitor to Alexandria Bay will have observed the immense number of steamers, of all sizes, from the little launch of one horse power, with captain, engineer, crew, and passengers represented by one and the same person, to the handsome vessel with gorgeous cabins, large enough for a sea voyage. Everybody who owns or rents an island seems to have his steam yacht, and makes his pleasure trips without regard to wind or currents. In the winter, the sojourner in Florida finds the same condition of affairs, with many of the little vessels for hire at prices that are very moderate. And along our whole coast, every harbor acknowledges the presence of these bustling little craft, many of them dainty and airy in appearance, with light spars and rigging, more for show, apparently, than use; and others, the veriest old ships' boats, fitted with an engine and propeller, all possibly the work, at odd hours, of some factory mechanic.

Commodore Vanderbilt probably has the credit of building the largest, the *North Star*, a steamer of 2,000 tons, with which he visited Europe some years ago. In her case, however, the affix of yacht was merely complimentary, as she was really intended for and was afterwards placed in his California line. Mr. Smith's *America* of the burden of 800 tons, on the other hand, was veritably a yacht built for pleasure purposes alone. She was sold to the government during the Virginian excitement, and has proved a very comfortable vessel for carrying Congressional committees, etc. Among the principal steam yachts hailing from this port, may be named the *Day Dream*, of 78 tons, belonging to Mr. Lloyd Aspinwall; *Ideal*, 200 tons, Mr. Havemeyer; *Lookout*, 76 tons, Mr. Lorillard; *Lurline*, 71 tons, Mr. Phenix; *Mystic*, 50 tons, Mr. Chapin; *Skylark*, 70 tons, Messrs. Leech; *Emily*, 70 tons, Mr. T. W. Myers. But very recently the cost of a steam yacht, both in building and in running expenses, was the great bugbear to their more general use, but now-a-days, what with surface condensers, compound engines (combining both high and low pressure principles), and other economical and fuel-saving devices, the cost of a steam yacht, that is, one to be propelled by steam alone, will not exceed, even if it equals the cost of a sailing yacht of equal tonnage. Iron is also used largely for building these steamers, and for small vessels is probably cheaper than wood. Nor are the expenses of running a steam yacht much greater than those incurred by a sailing vessel; fuel is of course the principal item, but this is nearly offset by the difference in crew, and the wear and tear of sails and rigging, which any yacht owner knows is a never ending demand on his pocket.

But it is in England that steam yachting has taken the firmest hold, and made the greatest strides. And in England both coal, iron, and mechanics' labor are so much cheaper than with us that the expense is greatly reduced. There everybody, from the Queen, who has her sea-going *Alberta*, with which she crosses the Solent at the rate of fifteen miles an hour, and occasionally runs down a sailing yacht for not keeping out of the way—not that the Queen was to blame in the Mistletoe affair, although that there is a lubber who was, nobody doubts—to the aspiring cockney with a "willa on the Tams," has a steam yacht or launch. In fact, the number of the latter vessels on the Thames has become a nuisance, and constant is the outcry of the damage done to the banks, and to silk dresses on less pretentious craft by their wash and swells. We all remember poor Leech's picture in *Punch* of the old gentleman sitting in the punt on his chair, contentedly waiting for a bite, and the two men in a wherry bearing down at full speed upon him. For the wherry substitute a steam launch, and we have the constantly recurring picture of to day. Old gentlemen no longer enjoy a quiet day's spinning or pater-nostering; the puffing, wheezing launch comes by and riles the water and the old gentleman's temper at the same time.

Steam yachts are now built by Messrs. Holmes, Shaw, Brown & Co., of Bordentown, N. J., the New York Safety Steam Power Co., and others, with a guaranteed speed of 18 to 20 miles per hour; and if these gentlemen have not yet felt the full result of their generous advertising they undoubtedly soon will, for in no other country is there likely to be such a demand for these little sputtering, easily handled craft.

Wherever there are islands, either on the coast or in the interior, these little craft are likely to multiply, as the resorts become more visited. In Passamaquoddy, Casco and

Buzzard's Bays; in the Archipelago around Newport; at Thimble Islands, on the Sound; on the sheltered waters of the Great South Bay of Long Island; from the Cape of Delaware to Key West, through all the intricacies of the sounds, islands, and inside passages; on the St. John River in Florida; among the islands of Lake Erie; on the back lakes of Canada; and among the Thousand Islands of the St. Lawrence, in fact, wherever calms, baffling winds, and sudden squalls are frequent, these craft are found in greater or less number, and for such waters are they eminently adapted. They have every possible advantage over sailing craft that have to depend upon capricious weather. Very charming indeed is a voyage in one of these open steam launches with their gay streamers and awnings, and jolly crowds of passengers. There is no doubt that they will become more and more popular year by year, and more and more used as times improve and new resorts become more frequented.

THE INDIANS AT ST. AUGUSTINE, FLORIDA.—The wild Indians now imprisoned at the old Spanish fort at St. Augustine constitute a first-class card of attraction to visitors, and almost daily furnish some new sensation for the sight-seers and pleasure seekers. War dances and scalp dances are given *con amore* for the delectation of spectators; many of the Indians go hunting with the sportsmen; and all employ themselves in the manufacture of trinkets which they sell for a little money. More than this, they sometimes build bonfires and illuminate the old fort; sometimes they are called to take a bath in the briny ocean which they never saw until recently, or to witness a yacht race, or balloon ascension, or to go shark-fishing. Taken all together, the Indians and their visitors harmonize quite comfortably, and contribute to each others' enjoyment. Last week they had a genuine buffalo hunt—not a sham affair like that a year ago at Barnum's Hippodrome, but a real blood and bones prairie slaughter. The following article from the *St. Augustine Press* will show how these amusements are conducted; and, by the bye, those who have friends spending the winter in Florida, can keep constantly posted with respect to what is going on down there by subscribing to the *Press* and having it sent to them:—

"The fort was thrown open, when a general stampede commenced, apparently to see who could gain the best seat from which to view the mounted Indians pursuing the bull, (which, by the way, was not quite as ferocious and wild as was represented to be by the suppliers of the animal.)

"A little before three the bull was chased to the Indians, who skirted the common, north of the fort, and the hunt commenced. Owing to the docility of the beast, the hunt was of short duration, when 'White Horse,' a Kiowa chief, let depart from his bended bow an arrow that pierced far into the side of the bull, causing its death in a few moments. The shot had been well aimed, and a vital spot was hit. The arrow, with the exception of the feathers, was buried into the bull, and also withdrawn by 'White Horse,' before the 'buffalo' succumbed. It was the only arrow shot, therefore the Kiowa chief claimed all honors. Four Indian butchers were on hand, the beef skinned, quartered, and carried within the fort, where fires were being lighted for the cooking of the meat, for a feast for the Indians, who, decked with plumes and adorned with paint, began to assemble in the court yard of the fort. The scene was a novel one, the Indians in full costume dancing, whilst waiting for the beef to cook. The crowd of spectators within the fort now increased, and when the Indians sat down to their frugal meal, the assemblage was estimated at between twelve and fifteen hundred. The dinner ceremonies were for a time interesting, when the crowd began to depart, and sundown found them entirely gone, and the Indians still struggling with 'stewed buffalo.'

"Again, as early as seven o'clock in the evening, the influx to the fort was resumed, and at eight the gathering to witness the war dance was equal to that of the afternoon. Three large bright fires were burning, around which were Indians wildly dancing. The doings of the evening consisted of a series of war dances, and were kept up with good spirit until after ten, at which time the happy Indians retired.

"The day passed off pleasantly, and alike did the entertainments, which were under the supervision of an appointed committee, who did all in their power to afford amusement, and considering the disadvantages under which they labored, the days' sport was a success."

FISH AND FISHING AT THE CENTENNIAL.—In the able hands of the well-known house of Bradford & Anthony, of Boston, the exhibition of fishing tackle of American manufacture at the Centennial appears likely to be one of great interest and excellence. It having been understood in some quarters that *FOREST AND STREAM* were to exercise jurisdiction over this department, we would say that our efforts will be confined to the collection of sportsmen's outfits more particularly, including clothing, guns, pistols, and all the appliances of shooting, boats, etc. We shall be happy, however, to receive and forward to Messrs. Bradford & Anthony anything in the shape of fishing tackle that may be sent to us.

AN ELEGANT PRIZE.—The cup presented by this paper to the National Poultry Association of Chicago, as the leading prize at their great Bench Show of Dogs, to be held this month, is now on exhibition in the window of the Meriden Britannia Co., the manufacturers, No. 550 Broadway. We would advise all those who love the dog, or admire the beautiful in art, to see it. A cut and description will appear next week.

—Although this is said to be the warmest weather at this season ever before known, the record nevertheless shows that last January, 1875, was just as warm at this date, and even warmer.

GAME PROTECTION.

—The January meeting of the New York Association for the Protection of Game was held last Monday night at the residence of Clinton Gilbert, Esq., No. 20 West Tenth street, Royal Phelps, President, in the chair. Among the communications read were one from A. W. Lawrence, game constable at Moose River, New York, recording the successful prosecution of offenders, four-fifths of those arrested having been convicted and fined. Mr. John Page, of St. Paul, Minn., complained of the difficulties of enforcing the game laws in Minnesota, popular opinion there being opposed to it. To this communication Mr. Phelps replied that the New York association had experienced similar opposition some ten or fifteen years ago, but by its persistent labors had convinced the masses that the protection of game was a much greater benefit to them than to the sportsman, and were continually convincing restaurant and hotel keepers of the advantages arising from properly enforced game laws, thereby greatly diminishing the labors of the thirty protective associations in the State. He added, that in order to protect the game of the West the citizens should form associations and name constables, as the New York associations did. "It is not an uncommon thing," he said, "to see on our wharves during the closed season at one time a hundred barrels of prairie chickens and grouse *en route* for England, shipped at some Western city, and fully addressed to their destination."

On motion of Col. Wagstaff, the Committee on Amending the Game Laws was authorized to substitute the word "daylight" for "sunrise" in section 2 of the amended game laws, relating to the shooting of ducks between sunset and sunrise.

The Secretary announced that he had sent copies of the proposed amendments to the State association, and thirty-six other associations for the protection of game and fish, in order that their members might use their influence in having them passed by the Legislature. He also announced that the association had obtained judgment for \$125 from a restaurant keeper named John A. Currier for violating the game laws. The Treasurer's report for the year 1874 showed a cash balance of \$74.34, carried over to the present year, after meeting all expenses, and a fund to their credit of \$4,000, invested in United States securities.

An election of officers for the ensuing year was then held, and the following gentlemen were unanimously re-elected: President, Royal Phelps; Vice-President, Robert B. Roosevelt; Secretary and Treasurer, Thomas N. Cuthbert; Counsel, Charles E. Whitehead; Executive Committee, B. L. Swan, Jr., Clinton Gilbert, and Francis H. Palmer. The meeting then adjourned, and the members were entertained by Mr. Gilbert.

—A correspondent of the *Richmond Whig* writes to that paper, saying that for twenty years he has protected and multiplied the game birds on his farm by regularly catching all the hawks that visited it. His manner of doing this he describes as follows: "I set steel traps of the mink and otter size, baited with red birds, blue birds, larks, or any bird of bright and conspicuous plumage, at points frequented by the hawks. If there be no stock in the field, I prefer to set the traps on the ground, fastened by a chain or line to a small stake. If stock run at large in the field, adjust the trap on the top of a stake out of their reach. The best points for the location of the traps are along and at the intervention of ditches, and near trees upon which the hawks are in the habit of nesting. The first year I commenced using these traps I caught *thirty-three* hawks, many being of the largest size. I began with three traps, and now have eight. I have never caught less than twelve or fifteen hawks a winter, when I keep the traps baited. Last winter I caught twenty-six. Besides hawks, I also catch owls, minks, weasels, 'coons, 'possums, and cats." Although he is an ardent sportsman, and shoots constantly, birds are more numerous on his farm than anywhere else in the vicinity. Unquestionably hawks are terribly destructive to birds and their young, and so also are foxes, probably destroying dozens where the sportsman shoots one, and, if they could be kept down, a rapid increase in the quantity of game would be the result. Why do not some of the sportsmen's associations turn their attention to this matter? A small reward offered for each hawk would be an incentive to the boys to trap them, and the results would undoubtedly soon be apparent.

—Although we have repeatedly called attention to the wholesale slaughter of game in various localities, and its shipment thence to available markets, few persons can realize the extent of the business; and nothing will show it so readily as a few solid facts which we herewith print. They were obtained from the Superintendent of the Eastern Express Company, operating in New England and the Canadian provinces. A transcript of the way bills over two routes only show that over *fourteen tons* of venison and ruffed grouse have been shipped out of the State of Maine during the past season. Of this weight 17,000 pounds were grouse. These figures do not cover the amount shipped by this Company from other routes; game sent by other express companies, or as freight; nor, indeed, all that was sent over these two routes; but only what was *known* to be grouse. Many boxes containing grouse did not have their contents stated. The data, however, would indicate that *forty tons* would be a low figure of the amount shipped out of the State by market shooters this fall.

—By some strange ignorance or oversight, such as too frequently attends legislative tinkering with the game laws, the recent Canadian Order-in-Council left the month of

January open for catching speckled trout in Ontario. A more unfortunate privilege could not be granted for the destruction of trout, as one can cut a hole through the ice of any mill-dam or deep water and clear that pond or stream in a few days of all the trout in it. It is a well-known fact that trout in the winter inhabit the deep water, consequently, where holes are cut they gather there in shoals and are easily fished out.

We hope the Government will at once cancel that order for the Province of Ontario, making the close season from 15th September till 1st of April.

—A meeting of the subscribers of the fund for stocking the Bushkill with trout, and enforcing the laws of the State of Pennsylvania against illegal fishing, was held at the office of Messrs. Reeder & Reeder, Easton, on Wednesday evening, December 30th inst., when it was resolved "that an association be formed to be designated as the Bushkill Angling Association, the membership to be composed of those subscribers to the fund that may sign the Constitution, property owners along the Bushkill, and such other persons as may be admitted under the provisions of the constitution. Mr. Howard J. Reeder was elected President; John F. Hess, Secretary; Samuel Arnold, Treasurer, and Nelson P. Cornel, Robert Arnold, Harlem P. Hess, Charles Bercaw, and Benjamin Fleming as the Executive Committee. Mr. Reeder is well known as one of the Fish Commissioners of Pennsylvania.

The *Turf, Field and Farm* of recent date contains a suggestion which is worth considering by those who are operating for an approved and improved law regulating close seasons for game and fish. It says:—

"The French system for the protection of game, as we understand it; is as follows: France, containing 204,091 square miles, is divided into 87 Departments, just as the State of New York, with its area of 47,000 square miles, is divided into 60 counties. As the laws are administered in the American States by elective governors, so in the French Departments the executive power is confided to the Prefects, with this difference, however: the latter are appointed by the central power at Paris. These Prefects have each an advisory council, called the 'conseil general,' composed of a certain number of the more prominent citizens of their respective Departments. These councils decide upon the opening and closing of the shooting season each year, and this decision is promulgated by a proclamation from the Prefect. The wisdom of this system is apparent, and consists in the fact that the exigencies of climate, the interests of the farmers, and the protection of game, are all made to harmonize. Thus, if the harvests are backward, or the birds immature, as is so often the case in this country, the opening of the shooting may be postponed until all interests are conciliated, or, if it be necessary for the protection of game in any particular district, the close season may be maintained for a year or more, as the Council may deem expedient. In this way the vicissitudes of climate and other contingencies may be provided for as they arise, and the game more thoroughly protected than it possibly can be under any system yet devised for this country.

—The question of the rights of ownership in fish and game found on one's premises is likely to engage discussion to the end of time. The following arguments in favor of the land owner are advanced by the *Vermont Watchman and Journal*:—

"If it was the common law that hens, chickens, turkeys, and geese belonged to nobody; that anybody might kill and eat them at pleasure, it would not be long before the race of domestic fowls would become extinct. Nobody would dare to leave an egg in a nest, lest some one else should get it; or leave a half-ripe chicken on the roost, lest some one else should pick it. Every man would slay all he could lay his hands on. Or if it was the common law that sheep and lambs belonged to nobody, it would be impossible to preserve them from utter destruction. Each man, when he saw a sheep or lamb, would take and sequester it for his own use, lest his neighbor should get the start of him.

"There is no common or statute law protecting fish and game, therefore our fish and game are rapidly disappearing; in fact, have almost entirely been exterminated. What belongs to everybody belongs to nobody, hence our streams and forests, which might produce enough fish and game to pay all our taxes, and leave us a handsome sum besides, are as barren and unproductive as a stagnant pool, or the Desert of Siberia.

"What we need is a law, not simply protecting game and fish—for such a law is as useless as any sumptuary statute—but one making game and fish the property of the owners of the land on which they are found, and the streams through whose territory they run. Then, every man who owned a forest or stream, would protect his property in game and fish as much as he would protect his property in poultry and sheep. A law protecting fish and game can provide no adequate means to secure the protection. A law making the fish and game of the State the property of those upon whose estates they are found, would make each land holder in the State an interested keeper and guardian of his property.

"The result of such laws would be, first, the enrichment of the people of the State. Every farm would become a breeding ground for the most delicate and luxurious articles of food for the table. In every stream and forest would be raised, without cost to the proprietor, food enough to equal all the product of the poultry-yard and sheepfold. The annual increase of fish and game, under favorable circumstances is greater than the annual increase of domestic animals. The woods and streams furnish abundant supplies of costless food to their denizens. The proprietor, if he did not wish to secure his own game, could lease the privilege of shooting or fishing, as is done in other countries, for a sum that would exceed his interest and taxes, and would furnish in many cases a handsome revenue. It would turn what is now of no profit, especially if he should cultivate his forest and streams, into a source of large and increasing profit.

"And the second result of such laws would be to the advantage of the sportsman. Now, sport is a rapidly vanishing thing. A gun is of no use any more, except to shoot at a target. Our fishing-rods are being placed over the chimney-piece as memorials of an ancient civilization."

into the centre of a pool abruptly. Like a wary general, he worked his way to the heart of the citadel by "gradual approaches." A novice would have charged him with undue timidity, just as impatient lookers on sometimes accuse him of irrelevancy when carefully drawing the net of his irresistible logic around his bewildered victim in the witness box, during that famous Brooklyn combat of intellectual giants. He knew what he was about then; he knows what he is about now. He was too wise a lawyer to thwart himself by inordinate haste; and he is too skillful an angler to hazard success by undue precipitancy. Foot by foot his casts were lengthened, and swept gracefully across the current of the pool. Foot by foot he worked his way to the objective point, where rested what he coveted more than the verdict of judge or jury. And now at last the fly drops gently upon the glistening surface of the dark water, just at the point desired, when there followed a rush and strike, and a momentary pause, as if fish and fisher were alike astounded, and then click, whizz, whirr went the reel, as if harnessed to a lightning train with a thunderbolt for a locomotive. Away went the fish with two hundred feet of line, but stopping at that distance as suddenly as if arrested by a peremptory order of the court. Then came the tug of war; first, to hold him—that required muscle; then to bear with him while he sulked—that required patience. The Judge had both, and both were brought into skilful requisition. For ten minutes not a fin stirred; but the taut line, as it resisted the combined pressure of the current and the fish, thrummed like an æolian harp, and made every nerve tingle with delight. As became the watchful angler that he is, the eyes of the Judge were immovably fixed upon his line as it stretched out straight before him. He believed the fish to be near the opposite bank in a direct line with his rod, and he was looking intently for some sign of life from the spot where he supposed his fish was sulking; when click! click! whizz z z z, again went the reel, and a huge fish leaped his whole length out of water a hundred feet above him. "Hello," said the Judge, "there's another fellow!" "No, that's your fish," said the Indian gaffer. "Blazes! you don't say? What's he doing there? He's not within a hundred feet of my line." "It's your fish, sir. The swift current makes your line bend like the new moon." And this was the fact; but the illusion was so perfect that it required several like experiences to convince him that his Indian gaffer was not "fooling him" upon that occasion. "After an hour's struggle, and with a skill and judgment which excited the admiration of all who witnessed the battle, the fish was killed and captured. When he kicked the beam at the twenty-eight pounds notch, the Judge was a proud and a happy man. There are many things he will forget as old Time weaves silver threads amid his auburn locks, but he will never forget his astonishment when that fish showed himself one hundred feet from the point where he was intently watching him."

MORE NEEDLE POINTS—"SHARPS."

BOSTON, January 7th, 1876.

EDITOR FOREST AND STREAM:—
I find in your issue of November 25th, an article from Seth Green, in which he recommends hooks made from needles, for salmon and trout fishing. I am not surprised that the gentleman should prefer hooks without beads for taking such trout as he has been in the habit of angling for; but I will confess to some astonishment that he should presume to instruct old salmon fishers, especially as I believe he has never been so fortunate as to have killed a *salmo salar*. I venture the opinion, that if Mr. Green should ever have the good luck to fasten to a twenty-five or thirty pound salmon in rough water, he would (by the time the fish had made two or three leaps, and perhaps bolted for the rapids) wish he had one of those India-rubber arms, of which he speaks, long enough to reach to some friend and brother of the angle, who had the good sense to leave those needles at home for the benefit of his wife, and beg from him a few flies made on No. 2 or 3 hollow-pointed Limerick hooks.

A NEW PORTABLE BOAT.

ON Saturday last a remarkable boat was brought into the store of Messrs. Bradford & Anthony, 374 Washington street, to await transportation to the Centennial Exhibition with a large collection of implements which they are now making for the Smithsonian Institution and the U. S. Fish Commission. The boat came in a box not so large as some trunks we have seen, which, being opened, revealed what at first sight seemed to be an oblong basket with a lid. When turned out on the floor it was taken hold of by two men and immediately drawn out to the length of twelve feet. It then was seen to be a lattice frame of great lightness and strength, a man standing in the middle of it while it rested upon supports at the ends. Over this frame a waterproof canvas cover was laid, and in ten minutes it was ready for sea. Indeed, it had already made its trial trip on the sound, carrying four men with ease, and drawing only four inches of water. Its entire carrying capacity is half a ton, while its own weight is but seventy-five pounds. This is for the largest and heaviest pattern, it being the intention of the builder to make smaller and lighter patterns down to the "valise" style for one or two persons. The use of canvas for boats is not new. Its strength is greater than the ordinary birch or cedar used in light boats, and when made impervious to water by Mr. Tappan's process, makes the dryest of boats. The principle on which the frame is constructed has its

own peculiar advantages. Of strength first, as seen in many railroad bridges, and of compressibility, where each intersection moves upon a brass rivet. After it has been shoved together there still remains a space in which the canvas is laid, with room for tent, clothing, and victuals. The whole is then closed by folding down the two seats for a lid, and the boat is then a stout trunk, which can be placed in another box or not. As such, and fitted with air-tight compartments under the seats, it will be a very convenient piece of luggage at sea, or in Florida. A yachtsman seeing it, said: "I want one of those, to save towing a boat; something that I can spread out and go ashore with, and stow away when I come aboard." It can also be used as a shelter tent. Jointed paddles are to be used with it. Second, improvements will be made in the next one that is built which have been suggested by the construction of this one. A perfected model will take its place soon after its removal to Philadelphia. It may be seen for a few days at the above store, previous to its departure. The builder is Mr. C. A. Fenner, of Mystic River, Ct., who is thoroughly acquainted with all that belongs to water-craft. At odd hours he has made cradles and cribs for children on this extension plan, and has patents covering such work. The application of it to portable boats, with some of the details, was suggested by a clergyman, who prefers to remain in the background. Any desired information can be obtained by addressing Mr. Fenner as above.

LYNN YACHT CLUB.—At the annual meeting of the Lynn Yacht Club, held Tuesday evening, 4th inst., the following officers were elected for 1876:—

Commodore, George L. Babb; Vice Commodore, W. E. Neal; Fleet Captain, C. H. Clifford; Secretary, F. L. Earle; Treasurer, H. S. Marks; Measurer, J. M. Taylor; Trustees, Q. A. Towns, Alvin Richardson, Wm. McMurphy; Regatta Committee, J. W. Haines, C. H. Clifford, Ed. Poland, S. T. Downs, F. H. Carswell.

The following resolution was adopted:

Resolved, That, in the opinion of the Club, Manning's "Yachting Annual" is beneficial to the yachtsmen of today, and we hereby officially recognize the same, and instruct the Secretary and Measurer to furnish all information asked for the benefit of the book and refuse information to all others in opposition to it.

THE COLLEGE REGATTA.—The Rowing Association of American Colleges held its adjourned convention in this city on Tuesday of last week. The following colleges were represented: Amherst, Bowdoin, Brown, Columbia, Dartmouth, Hamilton, Cornell, Harvard, Princeton, Trinity, Union, Wesleyan, and Williams. Mr. Rees, of Columbia, gave the majority report, in the course of which he read letters from W. Gordon Mitchell, Hon. Sec. of the Cambridge W. B. C., and John R. Leslie, Vice President of the Dublin W. B. C. The former was unable to reply to the challenge until the close of the holidays would permit of a meeting of the captains of the C. U. B. C., and the latter thinks it highly improbable that a crew could be gotten together to cross the Atlantic. The report decided in favor of Saratoga as the location of the course for the next regatta, which was confirmed by a vote of the colleges, Amherst, Brown, Bowdoin, and Dartmouth voting for New London, and the rest for Saratoga. Yale's formal letter of withdrawal was received and read, and her name taken from the roll of the Association. Mr. W. F. Weld, of Harvard, explained the position of his college, and presented a letter addressed to him by the committee appointed to decide the question of withdrawal, concluding as follows:—

"While Harvard may probably repudiate the notion that she must remain permanently attached to the association, which no longer fairly represents her interests, simply because it was her fortune to establish the association, there are grave, and, as it seems to the committee, insurmountable objections to a sudden and unannounced withdrawal now, after the preparations for the next regatta have fairly begun. For these reasons you are hereby authorized to state to the convention that Harvard will contribute her best efforts to the success of the next regatta, but that after that event, whether she wins or loses, her connection with the association will cease."

The selection of judges was next in order, and was accomplished by the method of ballot peculiar to the association. The conditions were that judges be graduates of two years' standing, and that they be under the direction of the referee. Each college nominated a candidate as follows: Amherst, E. M. Hartwell, '73; Bowdoin, F. K. Smythe, '68; Brown, Francis Laughton, '70; Dartmouth, E. R. Nutter, '65; Harvard, Geo. F. Roberts, '71; Hamilton, E. G. Lull, '72; Princeton, Robert K. Cross, '63; Columbia, Robert C. Cornell, '74; Cornell, Rufus Anderson, '73; Trinity, James H. Brocklesby, '69; Wesleyan, S. H. Olin, '66; Williams, P. C. Chandler, '72; Union, Wm. P. Rudd, '73. The nominees of Amherst, Hamilton, Princeton, Columbia, and Cornell were elected judges for the regatta. An attempt was made to amend the constitution so as to exclude as members of crews all students excepting those who are candidates of the degree of Bachelor of Arts and Bachelor of Science, but it was strongly opposed by Columbia and Cornell, and, upon being put to ballot, was lost by a vote of 8 to 5. It was decided that the crews receive no prizes, except those offered by the association, and a suitable memento to be offered to each member of the winning crew. A resolution was passed that the captain of every crew entered in the race submit to the Regatta Committee, at least one week prior to the race, a certificate signed by the Presidents of their respective colleges, that each member of the crew has been a regular member of the college for at least nine months prior to the race, and specifying also his exact status in college at the time of giving the certificate.

On motion of Mr. Rees, of Columbia, it was voted that the race be rowed at 10 o'clock in the morning and that the Freshman and single-scul races be rowed the day before the University race. Mr. Rees also moved that the entire charge of the regatta be given to the Regatta Committee, which should be at liberty to receive assistance from the Saratoga Boating Association. The motion prevailed. On motion of Mr. Luther, of Brown, a new section was added to article 7 of the constitution, providing

that one of the two delegates from each college be a graduate.

The convention voted the thanks of the association to the authorities of New London, for their kind attentions to the Regatta Committee, and adjourned to meet on Dec. 2d, 1876, at the same place.

—The Schuylkill Naval Board, at their meeting on the 3d inst., elected the following officers for the ensuing year: James M. Ferguson, Commodore; John Hockley, Jr., Vice Commodore; J. Gillingham, Secretary; W. R. Tucker, Log Keeper, and Calhoun Megarge was nominated for Treasurer.

—The Seawanhaka Boat Club held its annual meeting at Snedeker's, on South Eighth-street, Williamsburg, on Tuesday evening, and elected the following officers for 1876:—

For President, Charles A. Girdler; for Vice President, Daniel A. Moran; for Secretary, W. H. Goodnow; for Financial Secretary, W. A. Kelly; for Treasurer, J. L. Wheeler; for Captain, R. H. Orr; for Investigating Committee, A. Harris, Jr., Frank Adece, N. Guldenkirch; for Trustees, C. Searle, Frederick A. Fox, J. M. Ranken, A. W. Fiske, Charles D. Jones.

—The National Amateur Regatta Association, which organization is composed of all the principal amateur boat clubs in the United States, is to hold a meeting in this city on the 28th inst., to complete arrangements for the annual regatta, and to decide upon the "amateur question." It is understood that the National Amateur regatta next year will be held at Philadelphia.

THE GRAMERCY BOAT CLUB.—The members of the Gramercy Boat Club met on Saturday to elect officers for the year, and to consider the question of sending a crew to the Centennial Exhibition. It was agreed that the Club should build an eight-oared barge, and send to Philadelphia a picked crew. The following officers were elected:—President, J. A. Baird; Vice President, C. I. Hudson; Recording Secretary, D. McClintock; Corresponding Secretary, C. H. Wilcox; Treasurer, H. Mills; Captain, E. J. Atkinson; Lieutenant, F. Winnie; Trustees, F. Hopper, John Kyle, H. R. Mills, R. Weisner, and C. F. Nathan.

THE ARGONAUTA BOAT CLUB.—The Argonauta Boat Club, of Bergen Point, has already begun preparation for the coming contests. A crew of seven men, with the janitor of the club, and a cook, are encamped about forty miles above Enterprise, on the St. John's River, Fla., where they are said to be in active training. The members of the party are Messrs. Aldred, Smith, Stevenson, Gunster, Dunbar, and Walker, and Eugene Mann.—N. Y. World.

Rational Pastimes.

COLLEGE ATHLETICS.—The Athletic Association of American Colleges met on Wednesday last, at the Fifth Ave. Hotel. Harvard, Yale, Columbia, Cornell, Amherst, Brown, Dartmouth, Union, Hamilton, Trinity, Wesleyan, Williams, and Princeton were represented. The College of the City of New York was elected to membership. It was voted to hold the sports at Saratoga on the day after the regatta. The following programme of sports was adopted: A mile run, three-mile run, half mile run, quarter mile run, hurdle race of 100 yards, dash of 100 yards, mile walk, three-mile walk, running high jump, three-legged race, putting a shot, running low jump, and base ball throwing; for graduates, a mile run and a mile walk. The first prizes are to be of uniform values. A motion to restrict the entries for the running and walking matches to two competitors from each college was lost, as was a motion to invite the English Universities to compete. Daniel M. Stern, of the N. Y. A. C. was elected umpire.

GLEN DRAKE.—Matches were held at this range on Saturday, Jan. 8th, 1876. Geo. H. Thompson was the winner in the Remington Sewing Machine Match, with a score of 32. In the Subscription Match at 200 yards, the following were the winning scores:—

Name.	Score.	Total.
Capt. A. W. Peck.....	4 5 4 4	21
Capt. Jno W. Coburn.....	4 4 3 4 3	18
Alfred B. Fry.....	3 3 4 3 4	17

There was also a Subscription Match at 500 yards; the winners and scores were as follows:—

Name.	Score.	Total
Lieut. Geo. H. Thompson.....	5 5 5 4 5	24
Lieut. Geo. H. Thompson.....	4 5 5 4 4	23
Col. J. T. Underhill.....	4 4 5 2 5	20

Matches will take place on Thursday next, open to members only.

SAN FRANCISCO.—The National Guard Shooting Club held their monthly practice at the San Bruno range on the 2d inst. The day was stormy and cold, but Cunningham's roast goose after the shooting warmed the marksmen up again. The following are the scores made, there being five shots each at 200 and 500 yards—Springfield rifles:—

Name.	Total.	Name.	Total.
Burgans.....	43	Muller.....	36
Sherman.....	41	Hentz.....	35
Foid.....	40	Dibble.....	35

Snook.....	32	McElhinney.....	29
Sime.....	39	Templeton.....	28
Raye.....	37	Klose.....	28
LeBreton.....	36		

Average, 35 73 each.

—At a great outlay of time and money, a wagon road has been completed from the highway passing through the Delaware Water Gap to the summit of Mt. Minsi, the peak forming the Pennsylvania walls of the gap. The mountain is 1,000 feet high. A suspension bridge is to be built from the summit of this mountain to that of Mt. Tammany, on the Jersey side of the river. This will be the highest bridge in the world; it will be over half a mile long. The cost of the structure will be about \$100,000.

—When a patient will not take beef tea in the ordinary form, freeze it, and administer in small portions—way it forms a most palatable article in fever cases.

Third Edition.

Camp Life in Florida.

By CHARLES HALLOCK,

AUTHOR OF THE FISHING TOURIST.

This is a most seasonable book for Sportsmen, Tourists, Invalids, and Settlers, and has been long needed by Winter tourists to Florida and persons seeking settlement there. It gives a full classification of the game and fish of the Southern Peninsula, routes of interior and coastwise travel, the agricultural resources of the country, and sites for settlement, hints for camping out, resorts for game, hotels, and such other information as will be of great benefit to visitors seeking Florida for health, pleasure, exploration, or permanent settlement.

348 pp., 12mo. Price, \$1 50.

CONTENTS:

Introductory Chapter.
Birds-eye Glance at Florida.
Outfit for Sportsmen.
Hints for Southern Hunting.
Coastwise Router of Travel.
Game Animals and Birds of Florida.
Game Fish of Florida.
Three Months in Florida for One Hundred Dollars.
Supplementary Hints for Cheap Recreation.
Up the St. John River.
Indian River.
Florida the Promised Land.
Fort Capron.
Fishing at St. Augustine.
Black Bass Fishing on Spruce Creek.
Hunting the Panther.
The Environs of Tallahassee.
Private Dougherty and the Bass.
Pet Birds of St. Augustine.
Steam Yachting on the St. John.
Among the Seminoles.
In the Cypress Swamps.
Cruising Along Shore.
Shooting at Salt Lake.
The Okeechobee Expedition.

"Its present popularity is the result of pure merit."—Commercial, Pittsburgh, Pa.

"There is not a dull page between its covers."—N. Y. Times.

"In fact, the Galaxy is a 'Star' magazine."—Commercial Bulletin, Boston.

THE GALAXY.

For 1876.

IN THE NEXT NUMBER WILL BEGIN

GEN. GEO. A. CUSTER'S

Reminiscences of the Late War.

These articles, it is believed, will be second to "Gen. Sherman's Memoirs"—as vivid pictures of army life and startling adventure.

The Serial, "Madcap Violet," by WM. BLACK, author of "A Princess of Thule," began in the last number of the GALAXY.

THE GALAXY FOR 1876

Will contain articles by

ALBERT RHODES, JUSTIN MCCARTHY, RICHARD GRANT WHITE, HENRY JAMES, JR.,

And all the leading writers.

IT IS THE

Best American Magazine.

No Family can Afford to do Without it.

H. L. DUNCKLEE'S

PATENT

CAMPING and MINING

PATENTED JUNE 22, 1875.

Outside dimensions, packed, 12x12x20 inches. Weighing only 25 pounds, very durable, will cook for ten persons, and is especially adapted for camping purposes. The ware consists of 8 qt. kettle, 6 qt. tea kettle, 2 qt. coffee pot, fry pan, round tin pan, 8 square pans, dipper, gridiron, tent collar, 8 ft. funnel, and an oven that will roast 15 pounds beef.

The ware is so constructed that it nests and packs in the oven, and the oven and funnel pack inside the stove, as represented in cut 2, leaving room for packing half a dozen plates, knives, forks, spoons, and drinking cups. Price, complete, \$15.

HURST'S

Stereoscopic Studies

—OF—

Natural History

FOR OBJECT TEACHING IN SCHOOLS

—AND—

PARLOR ENTERTAINMENT.

We are prepared to furnish the first sixty numbers of the first series of

Animals and Birds of North America.

To these will be added a second series of foreign specimens, and various Animals and Birds in grotesque attitudes, never, however, violating their natural instincts.

We offer these views not as pictures only, but as studies from nature. One of the great moving elements in our modern system of education is object teaching. The unerring fidelity of the stereoscope transfers the animals and birds from their natural habitat to the rooms of the student and the fireside of our homes, where they cannot fail to have a lasting impression of the form, color, habits, and locality of each specimen.

An experience of more than twenty-five years as Taxidermist of the New York State Cabinet of Natural History, and in gathering his large collection of native and foreign specimens, enables Mr. Hurst to combine in every view the locality of the specimen, with its appropriate rocks, woods or water, and coloring from the originals.

1. Wild Cat, or Bay Lynx.....*Lynx rufus*.
2. Snowy Owl.....*Surnia Nyctea*.
3. American Wolf.....*Lupus occidentalis*.
4. Wild Pigeon.....*Ectopistes migratoria*.

SUBSCRIBE FOR THE

SCIENTIFIC FARMER.

A 16-Page Quarto, issued monthly, and full of original reading matter. It is devoted especially to science, as applied to agriculture, and is the only journal in the world published with this avowed object.

It records all true progress in agriculture, and the latest results of scientific research. Chemistry, botany, veterinary practice, natural history, farm mechanics, rural art and architecture, rural law and entomology, are all prominently considered in its columns.

AMONG ITS CONTRIBUTORS ARE:

President W. S. Clark, of the Massachusetts Agricultural College, who has few equals as a writer on scientific matters.

Prof. C. A. Goessmann, who is acknowledged to be the first agricultural chemist of America.

E. Lewis Sturtevant, author of the "Ayrshire Cow," the "National Ayrshire Herd Book," &c.

A. S. Packard, Jr., editor of the "American Naturalist," and State Entomologist of Massachusetts.

Prof. N. Cressy, who is one of the foremost of our veterinarians, and is State Veterinary Surgeon of Connecticut.

Prof. Levi Stockbridge, whose experiments in crop-raising, by special fertilizers, have created astonishing public interest.

Jos. N. Sturtevant, Esq., South Framingham.

Richard Goodman, Esq., Lenox.

Prof. J. Wilkinson, Baltimore.

Prof. H. W. Parker, Massachusetts Agricultural College.

Prof. S. T. Maynard, Massachusetts Agricultural College.

J. N. Bagg, Member of State Board of Agriculture.

D. P. Penhallow, S. B., Amherst.

AND MANY OTHER WRITERS OF NOTE.

Subscription price, only ONE DOLLAR a year, in advance. Postage free.

AGENTS FOR THE SALE OF THE

Celebrated Breech Loading Shot Guns—Unequaled in Fine Workmanship and Material.

Made by James Purdey,

314 1-2 Oxford street, London, England.

Have now in store an extensive assortment of Breech Loading Shot Guns, made by JAMES PURDEY, E. M. REILLY & CO., WESTLEY RICHARDS, W. & C. SCOTT & SON, P. WEBLEY & SON, W. W. GREENER, and a large variety of cheaper grades. Also BREECH LOADING, CENTRAL FIRE, DOUBLE RIFLES, AND RIFLE AND SHOT GUNS of superior quality. Implements, ammunition, and all other articles appertaining to Breech or Muzzle Loading Fire-arms generally. Illustrated Circular sent by mail when requested.

Hart's Sportsman's Favorite Metallic Shells for Breech Loading Shot Guns.

These Shells are easily loaded, and the caps easily extracted from inside. Head solid, and much thicker than any shell now made, giving a solid seat for cone or anvil, which prevents it from driving through or springing away, thereby causing misfires. The cone is made of nickel and fastened solid in its place. It neither rusts or corrodes fast like moveable anvil made of steel. The nickel cone also prevents misfire when cap has been left on shell for a few days, which is liable to occur either in steel or iron. These shells are finely finished, and made any length ordered, from 2 1/4 to 3 1/4 inches.

Shells and Loaders, and description Price Lists, can be obtained from all the leading sportsmen's houses throughout the country. GEO. E. HART & CO., 363 and 365 Market st., Newark, N. J.

From Captain Bogardus, Champion Wing Shot of America.

Messrs. GEORGE E. HART & Co.,
Gentlemen—The fifty shells I received from you to-day suit me better than any I have ever used. They are stronger and better in every respect, and I shall use them in all my shooting hereafter. Yours truly,
A. H. BOGARDUS.

Paper and Metallic Shells

FOR

Breech Loading Shot Guns,

Manufactured by the

UNION METALLIC CARTRIDGE CO.,

BRIDGEPORT, CONN.

THE STURTEVANT SHELLS are the easiest reloaded. Do not have to unscrew the head nor use an awl to remove the exploded caps. THE PATENT MOVABLE ANVILS, made of steel wire, will not bend or break.

THE BERDAN PATENT SHELLS, new model, with Hobb's patent waterproof primers, never miss fire, and are highly prized by all that have used them.

PAPER SHELLS.—By repeated experiments and great outlay for improved materials, and machinery made expressly for the purpose, we can now warrant our BROWN PAPER SHELLS equal to any imported. They are sure fire, and will not burst in the gun.

Inquire of any of the dealers in sporting materials for the U. M. C. Co.'s Shells.

Not sold at retail by the manufacturers. dec23 tf

THE HAZARD POWDER CO., MANUFACTURERS OF GUNPOWDER.

Hazard's "Electric" Powder.

Nos. 1 (fine) to 5 (coarse). Unsurpassed in point of strength and cleanliness. Packed in square canisters of 1 lb. only.

Hazard's "American Sporting."

Nos. 1 (fine) to 3 (coarse). In 1 lb. canisters and 6 1/2 lb. kegs. A fine grain, quick and clean, for upland and prairie shooting. Well adapted to short guns.

Hazard's "Duck Shooting."

Nos. 1 (fine) to 3 (coarse). In 1 and 5 lb. canisters and 6 1/2 and 12 1/2 lb. kegs. Burns slowly and very clean, shooting remarkably close, and with great penetration. For field, forest and water shooting it ranks any other brand, and it is equally serviceable for muzzle or breech loader.

Hazard's "Kentucky Rifle."

FFFG, FFG, and "Sea Shooting" FG, in kegs of 25 12 1/2 and 6 1/2 lbs. and cans of 5 lbs. FFG is also packed in 1 and 1/2 lb. canisters. Burns strong and moist. The FFG and FFG are favorite brands for ordinary sporting, and the "Sea Shooting" FG is the standard Rifle powder of the country.

SUPERIOR MINING AND BLASTING POWDER. GOVERNMENT CANNON AND MUSKET POWDER; ALSO SPECIAL GRADES FOR EXPORT, OF ANY REQUIRED GRAIN OR PROOF MANUFACTURED TO ORDER.

The above can be had of dealers, or of the Company's agents in every prominent city, or wholesale at our office.

C. STEHR, 347 Broome st., 3 doors from Bowery, under Occidental Hotel, recommends his large assortment of Meerschaum Pipes and Cigar Holders, suitable for CHRISTMAS and NEW YEAR'S PRESENTS. Monograms on Pipes and Cigar Holders artistically executed. Call and examine my stock and get Price List.

The Goss Revolving Cartridge Holder

CARRIES PAPER OR METALLIC SHELLS, either end up, revolves on centre slides, weighs but 1 1/2 pounds, and is only 1 1/4 inches wide. Holders flare at top so as to quickly receive the shells, and, being elastic, securely clasp the same. For ease of action and rapid shooting it excels anything of the kind invented.

PRICE, C. O. D., \$6.50.
In ordering, give the size of shells and a loose measurement outside of vest.
Jy22-1y N. S. GOSS, Neosho Falls, Kan.

Water Pipe
A SPECIALTY.

SEAMLESS

Lap Welded, Wrought Iron
WATER PIPE,

Sportsmen's Goods.**Orange Sporting Powder.**

ORANGE LIGHTNING POWDER,
The strongest and cleanest Powder made. Nos. 1 to 7, packed only in sealed 1 lb. canisters. The coarser sizes (higher numbers) especially are recommended to owners of fine breech-loading guns, giving great penetration with very slight recoil.

ORANGE DUCKING POWDER,
For water fowl. Very strong and clean. Nos. 1 to 5. Packed in metal kegs of 6 1/2 lbs. each, and in canisters of 1 and 5 lbs.

ORANGE RIFLE POWDER,
The best for rifles and for all ordinary purposes. Sizes F.g. FF.g, FFF.g, the last being the finest. Packed in wood and metal kegs of 25 lbs., 12 1/2 lbs., and 6 1/2 lbs., and in canisters of 1 lb. and 1/2 lb.

All of the above give high velocities and less residuum than any other brands made.
BLASTING, MINING, AND SHIPPING POW- DER OF ALL GRADES AND SIZES PACKED IN WOOD OR METAL KEGS OF 25 LBS.
SAFETY FUSE AND ELECTRICAL BLASTING APPARATUS.

LAFLIN & RAND POWDER Co.,

21 Park Row, N. Y.

Sole proprietors and manufacturers of the celebrated ORANGE brand of GUNPOWDER. Recommended and used by Capt. A. H. BOGARDUS, the "Champion Wing Shot of the World."

DITTMAR POWDER
MANUFACTURING CO.

MY NEW IMPROVED POWDER can now be loaded from an ordinary powder flask; grains hard. Use it now like Black Powder. No fear of overloading. Burns slow now. No fouling of the gun. Little or no smoke. Little or no recoil. Not very loud report. Less heating of the barrel in rapid firing. Good penetration and good pattern. Safe to keep, as it does not explode if set on fire, except well confined. Shells furnished loaded with powder only, if desired. None genuine without my signature on the can. **CARL DITTMAR,** NEPONSET, MASS.

HOLIDAY PRESENTS.

Received the Prize at the Paris Exposition, 1867.

Fred. Julius Kaldenberg,

WHOLESALE AND RETAIL DEALER IN, AND MANUFACTURER OF
Amber Goods, Meerschaum Pipes, Cigar Holders, etc.

Monogram and Crests cut on Pipes and Holders. Portraits made from Photographs. Pipes and Holders of any design, or made to order.

N. B.—By a new process I boil Pipes so that the color remains, no matter how much or how hot they are smoked.

Pipes sent by mail to all parts of the world.

Stores: 4 and 6 John st., one door from Broadway; N. W. cor. Nassau and John sts; 6 Astor House, Broadway, New York. P. O. Box 81. Send for Illustrated Catalogues. nov25-3m

FOR EVERY SMOKER.

AN INDISPENSABLE ARTICLE FOR THE PIPE. Pick, Spoon, and Press combined. Can be carried in the pocket. Has long been used in Europe, and now manufactured in this country for the first time. Sent post-paid on receipt of 50 cents. Address
WALKER & WELCH, 212 Main street, Buffalo, N. Y.
Nov11-3m

USE IT **Vanity Fair.**

It is shaved from the best Natural Leaf, for Meerschaum and Cigarettes. Does not make the tongue sore. Sample on receipt of 20 cents. Highest award, Vienna, 1873. Send for circular.
WM. S. KIMBALL & CO.,
PEERLESS TOBACCO WORKS, Rochester, N. Y.

From a Gentleman of St. Paul, Minn.

A fortunate accident threw in my way some Vanity Fair. I can only say that it is the best tobacco that ever I smoked. To quote the words of the great Sir Isaac Newton, a pipe of it "makes one think like a philosopher and act like a Samaritan." I gladly add my testimony of its excellence to that of thousands of other smokers.

Best in the World. Ask Your Dealer.

You will be conscious of a feeling of good humor, and easy familiarity toward Vanity Fair a sentiment will easily ripen into a warm regard or love for it.

Smoke Vanity Fair, if you want the brain soothed to meditation and dreams of the better life.

From J. Seeman, Chattanooga, Tenn.

Please ship me by express double the amount of last invoice Vanity Fair. I had a little pains to take at first in introducing Vanity Fair, but now those who have used it would not smoke any other tobacco.

For Sportsmen.

Vanity Fair calms the brain, caresses the nerves, and as a semi-conscious act furnishes just sufficient nucleus for floating thoughts and fancies to crystallize about. Best dealers have it.

From Forest and Stream, N. Y.

We have received from Messrs. Kimball & Co., of Rochester, some choice specimens of their celebrated Vanity Fair tobacco in neat metal cases holding a pound each; and, after most thorough trial, no not hesitate to concede to it all the good qualities which its manufacturers claim for it. It is a most superior article, and a great comfort to discriminating smokers.

CHAMPION GUNS OF ENGLAND
PAPE'S
Unrivalled Sporting Guns.

Stand unequalled in every contest. Their performance at the London Trials of 1875 beats the records of any maker in the world.

1875. 12-Gauge, Choke Boring. Exhibitor.
Maker of Gun. Greener.
1st—Greener. Davidson.
2d—Pape. Davidson.
3d—Pape. Davidson.

Out of a class of 68 guns, 3 out of the 6 best were made by Pape. The Greener gun was protested against on the spot for having its score false counted, the fact proven there, and afterwards confirmed by same gun being shot for two days per week for six weeks in succession, when its average score only took 24th place, its very best score being greatly below the scores of the best six guns.

1875. 12-Gauge, Old Sporting Bore. Exhibitor.
Maker of Gun. Davidson.
1st—Pape. Davidson.
2d—Pape. Davidson.
1875. Long Range, 60 yards, Choke Bore.
1st—Pape. Davidson.
60 yards, Long Range, Sporting Boring.

Those champion Long Range guns, only 7 pound weight, with a charge of 3 dr. to 1 1/4 oz. shot, beat the best 8 bore Greener gun at 60 yards; weight, 15 lbs.; 6 drachms and 2 1/2 oz. shot.

1875. The Sportsman's Sub. Cup, valued at £45, was also awarded to W. R. Pape, for the original invention of choke boring. Winner of the London Gun Trials of 1858, 1859, 1866. Address

Guns, Rifles, Pistols, Fishing Tackle

Remington Rifles and Shot Guns, Holabird Shooting Suits, Cartridge Vest, Belts and Pouches. Implements for both muzzle and breech loading guns. Sportsmen's Goods and Ammunition of All Kinds.

We take muzzle loaders in exchange for breech loaders, and have always some fine second-hand guns on hand cheap.

Goods sent C. O. D. to all parts of the United States.

Ivory and Pearl Stocks put on Pistols. Repairing of all kinds artistically executed.

Cartridges for Breech Loading Shot Guns, ready loaded, put up in boxes of fifty, or loaded to order. aug5-6m

H. C. Squires, No. 1, Courtlandt st.
New York.

THE GREAT
London Gun Trial,
1875.

W. W. GREENER'S
Far-Killing Prize Guns.

Winner of Silver Cup, value 40 guineas. Winner in Class 1, for 8 and 10 bores. Winner in Class 4, for 20 bores. Winner in the Wear and Tear Trials, July, 1875. 2,500 shots fired without deterioration.

W. W. G. is the only maker who has made an average pattern of 214 shots in a 30-inch circle, at 40 yards, with a 12-bore gun, at any public trial either in England or America.

I have just received a consignment of these guns, and shall offer to individual sportsmen, for a short time, an opportunity to secure one of these celebrated guns at a popular price, viz: \$75, gold; extra for extreme close shooting, \$10. This will probably be the last chance to secure one of these guns at these very low figures. All grades and styles in stock or imported to order.

Attention is also called to my stock of guns, by W. & O. Scott & Sons, which includes all their latest improvements. No old style guns in stock.

Sole New York Agent for Holabird's Hunting and Fishing Suits. Trade supplied.

Send 25 cents for large Illustrated Catalogue of Guns, and including Game Laws for all the States, and summary of Great London Gun Trial. Ready March 1st. jan13-1y

W. W. GREENER'S
DOUBLE CLOSE-SHOOTING GUNS. Winner of the Silver Cup, value 40 guineas, at the Great London Field Trial 1875, beating 33 competitors with 68 guns, also winning in all the other classes for the Improved System of Boring. These guns will kill from 80 to 100 yards, loaded with large shot, and will shoot well with small shot with a less powder charge than guns bored upon the old system. For report of the Gun Trial apply to Messrs. McLaren, Williams & Co., Agents, St. Louis, U. S. A. Address
W. W. GREENER,
St. Mary's Works, Birmingham, England.

J. D. DOUGALL'S
EXPRESS SHOT GUNS.

(Title registered.)

Shown by trials at Wimbledon by Editor of the Field to possess the GREATEST PENETRATION and therefore LONGEST RANGE—thus: Circle, 30 inches; 300 pellets; average, 191; penetration, 37. The Editor's trial of Greener guns with 340 pellets of same shot and same charge of powder, gave 180, and penetration 30, although there were 40 more pellets in each charge. Should any controversy arise as to the durability of these new systems, we herewith warn all beforehand that our system is our own invention (though founded on the American idea) and is DURABLE, a fact remarked on by the Field, that the guns tried had been in use during last season, and references permitted to the owners. Send for Illustrated Circulars to
59 St. James's Street London.

Overland to Homosassa.

For Forest and Stream.

IN a former communication I referred to the overland route from Silver Spring to Homosassa. Becoming tired of the monotony of city life, I resolved upon personally testing the matter, and shall briefly refer to it for the benefit of intending tourists.

In company with six gentlemen I left Jacksonville on Monday, Dec. 20th, on the steamer Gen. Sedgwick, a staunch, fast, and comfortable craft, well known to every New Yorker. We arrived at Palatka at 2 P. M., interviewed Alligator Pratt, examined Moragne's huge citron, and inspected the curiosity shop. At 11 P. M. we took possession of our berths on the steamer Tuscawilla for Silver Spring. The T. is a new boat, built expressly to navigate the Ochlawaha River, and I can unhesitatingly recommend her to tourists. For speed, she is not equalled by any boat on the route, is well officered, and more than

neatly fitted up; and last, though not least, her table cannot be excelled by any boat navigating the rivers of Florida. I shall not dilate on the wild, wierd, and interesting features of the Ochlawaha, or the unequalled attractions of its tributary spring, but earnestly recommend every visitor to the State to ascend this tortuous and remarkable stream, and, as a *finale*, indulge in an examination of that great natural curiosity, Silver Spring. We arrived at the Spring at 2 A. M. on Wednesday. Dr. DeM and the two W.'s, of New York, resolved upon remaining on the boat and examining the Spring by daylight. Four of the party determined to push through, so we entered a hack in waiting, and arrived at Ocala at 4 A. M. Upon arrival we uncereemoniously roused Harris, of the Ocala House, from his feathery couch, and ordered breakfast. 7 A. M. found us *en route* for Homosassa. We crossed the Wishtacoochie and left the last house in the rear at 2 P. M., and at 1 A. M., on Thursday, reached the old negro quarters at Homosassa. Routing some Fifteenth Amendments, I soon had

my companions enjoying the blaze of a light wood fire. In company with "Uncle Henry," an interesting and obliging representative of the colored persuasion, I started in a boat for the residence of Mr. Jones, distant three miles. The dogs announced my approach, and on reaching the landing I was received (as are all) with a true and hearty welcome. In a few minutes Jones and Frank manned the yawl, and with long and steady strokes were on the way for the remainder of the party. 4 A. M. found the hungry quartette discussing the merits of Java coffee, sheepshead, venison steak, and home-made bread and butter, as only wanderers can do after an eighteen hours' ride through the balmy and invigorating atmosphere of Florida. The cost of trip was as follows: Jacksonville to Silver Spring, \$8; Silver Spring to Ocala, \$1; breakfast and lunch at Ocala, 75 cents; fare from Ocala to Homosassa, \$5—a total of \$14.75. But we will stop and tender advice: If persons attempt this route, I would advise them to provide a full lunch basket, including ground coffee and condensed

RED IRISH SETTER DICK—THE PROPERTY OF Wm. JARVIS, Esq.

milk, at Ocala, and to stop overnight at a plantation two miles south of Wishtacoochie River, reaching Jones' at about 2 P. M. of the second day. This was the course adopted by Dr. DeM and the two W.'s.

The country between Ocala and a point within a few miles of Homosassa is elevated, undulating, and interesting. Many of the hills attain an altitude of nearly four hundred feet above the Gulf, and the ever-varying and park-like scenery will well repay the tourist. We may remark that the horses and vehicles were good for Florida, and supplied by Mr. Davis, an obliging and enterprising colored man of Ocala. As usual, we found the sporting attractions all the gunnist or piscator could ask. In addition to my previous remarks regarding this point, I may add that, if the fisherman is disposed to do battle with his rod and reel, let him use a White Hall spinner No. 01, instead of a fly. By trolling with twenty yards of line astern he will soon be rewarded with a strike from a cavalli weighing from five to fifteen pounds, and, from experience, I can unhesitatingly

assert that the piscator's art will be tested by these fighting and gamy fish. I captured eight with a hand-line, and was forced to abandon the sport; for with fair play the hooks of a Buell's No. 01 spinner were 'straightened and useless. Mr. E., of New York, whom I found at Homosassa, had indulged in trolling, and between the capture of channel bass and cavalli, his spinners were useless. To any one who proposes engaging in cavalli fishing, I will say, visit a tinkers, and have him file off the hooks belonging to spinners where the bend unites with shank, and have firmly soldered to the shanks three of Job Johnson's Virginia, or three Chestertown hooks, for these alone are fit to withstand the rushes and tugs of cavalli. Some of my readers will say that I do not treat my hooks fairly; but to such I will simply say, change your hooks, and use better ones than those usually attached to spinners and spoons. We can but remark that the sheepshead fishing was simply superb.

To any one contemplating a visit to Homosassa, we

would suggest the propriety of providing a stout ten-foot bass rod, with a stout and strong reel capable of holding from 500 to 600 feet of line, not forgetting a gaff hook. Provide a bottle of water, lunch basket with crab or mullet bait, the latter preferred. Take advantage of the ebb tide rowing to the mouth of the river, distant from the house four or five miles; the monotony of rowing is relieved by towing a spinner astern and occasionally landing a cavalli or channel bass. Southwest from the mouth of the river, one mile, will be noticed "Ship rock." When the young flood makes, large red-fish, or channel bass, ranging from two to four feet in length feed around the rock, and lively times may be expected. We would advise the fisherman to pound up some mullet and throw it overboard, as this baiting process will cause the fish to keep a weather eye open. By resorting to a large bait, using a float, casting some distance from the rock, and allowing the bait to drift away with the tide, the angler will soon be rewarded with a "bite as is a bite." When tired of

hauling red-fish, the piscator can row homeward, aided by the tide, catch cavalli or red-fish on his return, and at the house indulge in a dinner or supper of the best, and at night retire to sleep in a good bed. At Homosassa I thoroughly tested the jack lamp manufactured by the White Manufacturing Company, Bridgeport, Ct., and can assure the readers of the FOREST AND STREAM that I found it more than satisfactory. The old-fashioned fire pan is not to be compared to it for convenience and efficiency. The first pair of eyes I saw lighted up by the lamp looked like stars of the first magnitude. To any and all who intend engaging in night hunting I would say, provide a jack lamp. For night hunting it is unequalled; for the camp it is convenient and efficient, and for sailing or rowing at night, it is unsurpassed.

Three of the party decided to remain at Homosassa, and the remainder reluctantly left the dock at 7 A. M. on Thursday. After a pleasant ride on the mill-pond like surface of the gulf for fifty miles, we reached Cedar Keys at 11 P. M. We left the Keys at 8 A. M. on Thursday, and arrived at Jacksonville at 10 P. M. But one opinion was expressed by those who returned, and that was, that the dose might be repeated. In addition to the expenses referred to I will add six days' board at Homosassa, \$12; lodging and breakfast at the Keys, \$1; dinner at Baldwin, 75 cents; fare from Cedar Keys to Jacksonville, \$6. Total for a ten days' trip, \$34.50, or \$3.45 per day.

AL FRESCO.

For Forest and Stream.

THREE EXCURSIONS IN 1888.

NOT that I denied myself the pleasure of a fourth the same year, for I took another which was the longest and most enjoyed, and will require a separate letter properly to report it. But the three which preceded are naturally grouped together, as occurring in the same general direction, within six or eight weeks of each other, and as being alike brief, though very differently characterized. The destination in each case was peculiar, as was also the sport. The fourth was directly into the heart of the Northern Wilderness; but the first, second and third were to places along its northwestern frontier.

I. I was walking in Genesee-street one day near the first of June, when a friend, knowing my proclivities, announced that a party was about to visit Redfield in a day or two, and invited me to join it, which I accepted. That is a kind of invitation I never knew how to decline, if within the range of practicability. "Oh the fysshing companie is the best companie." Who ever saw an angling party set out on an excursion with other than hilarious countenances and a merry glee? If they return otherwise it is enough to account for the change that the sport is past and the enjoyment over. I went home sooner than I intended, and could think of nothing but getting my traps in readiness. It turned out that my friend could not go, so that the party consisted of three, instead of four—one whom I shall call George, an excellent fisherman and citizen; another who is entitled to be known by the name of Pickwick, having many qualities in common with that redoubtable character, and myself. I shall have occasion to speak of these also in another letter. All things in readiness we were off for Camden by rail, and thence by stage to Redfield. This place is in a higher latitude than Utica, and as we approached it the weather grew no less colder very fast; in fact, the clouds were flaky rather than otherwise. The hotel was kept then by a Mr. Munger. Having arrived in the shades of evening, as soon as George was identified by him the first inquiry was: "What brought you up here in this snow-storm?" And yet he must have known the true answer; so George left him to his own reflections. It was cold, the water was high, and the fishing none of the best; still, we exercised not without reward.

George and Pickwick brought guns with them, and their attention was turned to shooting. I heard Pickwick deliver himself as follows: "Now, George, the pigeons are alighting in that field. I want you to take this blanket and your gun and go there, and be a stump. You'll get some of them." But George did not wish to be stumped in that fashion, and declined. After a while they sauntered forth with their guns, while I took my rod. In the course of the morning, meeting George, we were surprised to hear in a neighboring woods very frequent reports or discharges. "Mr. P. must be finding game—possibly a roost." "Oh, no," said he, who knew the man better than I; "he came out to shoot, and shoot he will, at nothing or at something." At length the firing ceased and Pickwick appeared, unattended by a single feather. "Where's your game?" we asked. "Oh, I have't shot anything," he answered; "I only fired to hear the gun go off. I like the music so." But I saw him, while there, bring down a pigeon on the wing as well as it could be done. And this reminds me to say that I caught the shooting fever from my companion, to which, in early life, I was very subject. George saw me then and there bring down a pigeon on the wing three times in successive shots. I know that this is a light affair in these days of wonderful shooting and bulls-eye hits at long ranges; but it will do for an amateur—one who has never yet reported himself as used to powder. Yet in the long run I see an host of witnesses rise up more against than for me, in the form of squirrels, gray, red and black, partridges, plover, snipe, ducks, woodcock, crows and pigeons. The last time I fired a gun I killed two out of three ducks, and brought them home before breakfast. I remember when, with a party, having choice of rod or gun, I chose the latter, and six gray squirrels was the result. But in the North Woods, unless one leaves the water courses with some peril of confusion, there is surprisingly little temptation to carry a gun. A deer I decline to shoot; a muskrat I don't want; a loon I couldn't hit. I never saw one shot in my life by any body. I might bring down an owl occasionally, but there is little to reward one's extra efforts in going to the woods loaded down, as well as loaded up. We all shot pigeons and we all caught trout. I remember taking a large trout in a meadow near the house—in full sight of it, and not many rods away; and one day I followed down a tributary stream, taking as many as I cared to take. The weather daily improved while we were there, and we returned with plenty and to spare for friends and neighbors.

II. A few weeks later, George, Ego, and son, entered into partnership for a few days, to engage in the bass catching business. Our destination was the Fox and Grenadier Islands, in Lake Ontario, which we approached by the way of Chaumont. There, engaging the services of a captain, with his revenue cutter, we took to the bay, enjoying a

fine breezy sail across it to the very narrow isthmus or sand-bar, which separates it from the great lake. There, of course, all hands disembarked, and tugged away at the boat to bear her forward to broader waters. She soon walked them like a thing of life, so that in due time both Fox and Grenadier were overtaken. Nor were these the only things we overlooked; for our friends of the bass family were there in vast numbers, in schools and out of schools, eager to show every attention to what appeared to be the wishes of their guests. I fed them on that occasion with spoon victuals, making use of a choice Buel, which did great execution, leaving nothing to be desired in its place, and finding me incessantly as much to do as I could possibly attend to. So also with George and son. Whatever there is of delight in bass fishing—large, strong, numerous and gamey—we experienced on that occasion. They are indeed prizes worthy of the sportsman's steel, or whatever he fishes with. They are not slow, dull, sluggish and inert, like a variety which I shall speak of presently, but active, spirited, brave; and the way they shook their heads at us at the surface of the water, when they discovered that by hook or crook, they are not their own, and "that things are not what they seem," I have seldom, if ever, seen surpassed. We sailed around those islands repeatedly, always followed by live stock, seemingly anxious to come aboard, whom we accommodated as best we could in such laudable desire, till finding our arms sufficiently exercised for the day with their pulling and jerking, we stepped ashore. A house was there, such as it was, where we tarried for the night. As the shades of evening closed around us we were supplied with a change of game. Bats were plenty on the island and appeared to offer battle; so taking up the cudgels we attacked them, and rested standing after the long sessions of the day. The bats are artful dodgers, but we laid low some of them, till darkness interfering, and not knowing what to do with them, we desisted. By the way, that Buel spoon did equal execution the next season, when I was with the Walton Club on the Fulton chain of lakes. More pounds of fish were claimed for it by my guide than were brought to camp by any other tackle; and I have it in my power to demonstrate that this opinion was generally concurred in. It rests now, after a career of usefulness, at the bottom of Hemlock Lake, Livingston County. Even there it brought several white trout ashore, besides pickerel. I lost it by an act of gallantry. I had just before left the one house there, and had commenced to troll. A lady followed to the shore, to whom I beckoned invitingly, to know if I might have the pleasure of her company. Receiving an affirmative, I returned too directly, not allowing for the length of line, so that the spoon sank to rise no more, becoming inextricably fastened down. *Requiescat in pace.*

III. In the morning our business was bass fishing again till satisfied, when we returned to Chaumont. There the partnership which had been dissolved for the present by mutual consent. George and son went home, while Ego pushed researches farther northward, and brought up at Alexandria. I took the steamer at Cape Vincent, and so passed through or among the Thousand Islands, charmed, of course, and delighted with the scenery. Mr. Crossmon met me on the boat pleasantly, as his manner is, and I abode with him. It is due to him to say that he was kind and attentive while I was his guest as he could be, and it is well understood, and long has been, that he is a genial man. He soon named a guide for me—one of the best—named Westcott, with whom I had several very successful adventures. It was good to be there. The views from his Gibraltar were enough amply to repay one for a visit. How admirable, as a river, is the vast St. Lawrence, rolling a volume of water to the ocean sufficient for a thousand noted streams, around a thousand lovely islands; and the water is as fresh as it is copious. Not like the Missouri's turbid tide, but rather drinking water of the rain of heaven. If the course of true love does not run smooth, the Father of Waters should be apprized of it; for it is said his course is much more troubled and worried after marriage—i. e. after Miss Ouri becomes Mrs. Ippi.

I devoted a day to fishing for pickerel, dining on one of the islands, and then resting over, the evening and the morning were the second day. On the latter occasion we passed on five or six miles down the river, tarrying over night with a farmer, whose house was on the right bank of the river. As soon as

"Aurora, now fair daughter of the dawn,
Sprinkled with rosy light the dewy lawn"

we took to our boat again, and commenced thinning out the pickerel. The result of the two fishings was about fifty of these slimy denizens of the water. One of them weighed eleven pounds, and in Utica was called a maskal-onge; but I heard no such name applied to it on the St. Lawrence. With all the natural charms of this region, all the felicities which belong to it, and all the success which attended my piscatorial efforts—such, I suppose, as I could not hope for again—I yet must pronounce this style of fishing very unsatisfactory to me as a sportsman. To sit for hours, having comparatively nothing to do, positively nothing in the way of skill or activity, watching the clumsy tips of two clumsy poles, which the boat holds and not the fisherman; to observe a jerk on one of them; then first to lift the pole aboard and lay it down; next to pull in a clumsy fish, who makes no objection to the operation, but comes forward like a stick or log; to hit him on the head and place him in a basket, long, slimy, and repulsive, is not at all my *beau ideal* of the art of angling. With no fault to find in the matter with any one or anything, I am quite content to relinquish this kind of sport forever. Even while on the ground I sighed for the North Woods, and would gladly have taken a short cut to them away. One who has enjoyed the pleasure of managing a speckled trout weighing two or more pounds, with pliant rod and spinning reel, amid his native haunts, and landing him at length in beauty, covered with attractions, need not yearn much to catch a pickerel.

Utica, Dec. 17th, 1875.

AMATEUR.

For Forest and Stream.

THREE WEEKS IN THE MAINE WOODS.

WE were to go to the north woods of Maine. Imagine us, then, all prepared at the foot of Moosehead Lake, and on board the steamer which was to carry us some thirty miles towards the north pole, and there leave us to shift for ourselves. While gliding over this charming inland sea, we will lose but little time if we introduce our guides in form.

Uncle John steps out from the admiring crowd which has already gathered around him on the forward deck. Long white hair and beard give him a venerable appearance; a somewhat stooping form would seem to indicate that age had already undermined his strength; one eye was all he could "go" on anything, for the other had been placed on the retired list some time since. A greenhorn would decline to believe that when he looked at Uncle John he saw before him the most renowned hunter of the Moosehead country; a man who had, by mere woodcraft, conducted the surveying parties who ran the township lines through what was then literally a pathless wild; who knows every hill, stream, pond, and brook in the State so well that he not only can name them every one, but can tell the direction of all from any stand-point he may choose, and the distance of each from the other; and moreover, we verily believe there is not a good "hole" for trout in the Maine waters unknown to him. As for strength and skill, he acknowledges no superior on shore or in a birch, which he manages like a toy, and in which he will go where any living man, white or red, can float.

Ike, our other companion, is a giant, physically, for to his six feet and odd inches of length he adds breadth and brawn enough for a Hercules; so straight that he bends over backward, with an eye like a hawk and sinews like iron; quick-tempered, but good-natured, a jolly good fellow, and true as steel. Born, reared, and educated in the woods, it is only necessary to state that he is a pupil of Uncle John's to place him in a rank second to none. As for ourselves, we are modest.

The outfit which we found to answer all requirements, combining what was absolutely indispensable with the least possible amount of weight, consisted for each of an entire suit of very heavy flannel underclothing, a heavy blue flannel outside shirt, an entire suit of "moleskin," or corduroy, a rubber coat, woolen socks, (an extra pair convenient), stout shoes, felt hat, rubber blanket, and two woolen ones; a wall tent for ourselves and a shelter for the guides, a small cooking apparatus, a shot gun apiece, one rifle, ammunition, a fly rod and tackle for each, and an opera glass apiece, with a few groceries.

Our route was that known as the "Baker Lake Route" to the few who know anything about it, and is reputed the wildest and hardest one in the State. As we were the first party who had been over it for years, and as our guides, before they reached the end, had repeatedly declared that they would never come over it again, we concluded that the reputation was a just one, the more especially as F., who has seen all the head-waters in Maine, declares that he has taken no trip which can compare with it for hard work, long carries or portages, quick water, and no water at all.

Leaving Greenville, a little village at the foot of Moosehead Lake, at about four o'clock on the afternoon of September 18th, we steamed up the lake against a miniature nor'wester, and landed at the northwest carry at about midnight. Here our woodland life began, and it was with rather a feeling of newly-acquired responsibility that we saw ourselves thrown entirely upon our own resources by the severing of the last connecting link between us and civilization by the departure of the "Governor." No time was lost, however, in speculation as to our future; each went at once to work at his allotted task, and in a short time, by the friendly light of a bright, full moon, a delightful camping ground was found, everything arranged, and we in the arms of Morpheus.

At daylight next morning we were in our canoes, and soon a pair of ducks and a "musquash" gave us our first game, as well as our breakfast. A short paddle up the inlet, and a carry of about a mile and a half, brought us to Penobscot waters, a lakelet in the Seboomook meadow. While passing down the outlet of this pond, leading into the west branch of the Penobscot, we passed over the first beaver dam we had seen. While paddling up the dead water of the west branch we were at liberty to enjoy the varied tints of Autumn foliage. In this latitude Winter sets in early, and already the forest had begun to assume the crimson and gold, which blended with the varieties of the evergreen and the still untouched leaves of the hard wood growth, gave some of those gorgeous color pictures for which the American woods are so justly noted. The perfectly smooth waters of the stream, reflecting with the exactitude of a mirror the forms and tints on the banks, heightened the effect greatly. Having reached Big Island, we went into camp, and while the guides were preparing for the night's rest, we went off for trout, and after about an hour's fishing counted some thirty-six, all told, averaging three-quarters of a pound, the best strike being one whereby two fish, aggregating a pound and a half, were taken and landed at one cast. The favorite fly at this season, and in this water, seems to be the "green fly." The red ibis also took well, while the Long Island favorite, the brown hackle, was scarcely noticed. In short, a gaudy fly is a killing fly in the upper Penobscot waters in September. At this camp Ike set out a trap for beaver, and caught one. From here two days' hard paddling, poling, and pushing brought us to a point where we left the Penobscot, and, carrying some three miles through the woods, reached the St. Johns pond, and the first of the St. Johns waters. This is easily related, but oh! the untold trials of a carry! We remained in camp on the St. Johns pond two days, on the second of which our party started out in quest of caribou. F. and Ike went to the Abercognatic bog, near the head of the west branch. After hunting about for some hours, they paddled down through the bog, when F., by means of his glass, discovered some caribou dead to leeward of him. He landed at once, and by dint of much crawling, creeping, and running, managed to get to leeward of them, and was fortunate enough to find cover just where he needed it. The caribou, advancing slowly, had meanwhile come up to within what our hunter considered shooting distance. This animal possesses a great deal of natural curiosity, and the knowledge of this fact induces the hunter, whenever he can get a shot at one and kill, to lie quiet, and remain hidden after he has fired; for though the rest of the herd will run off, still if there is no sight or sound of the enemy to be had they will soon return to try to discover what the trouble is with their companion. In this manner, as many as half a dozen may sometimes be killed from the same point, simply by the hunter observing the precaution of lying perdu. F. then being in position, waited till the game came within range, and then, ignoring the stalking policy, stepped boldly forth from his concealment and fired at the leader, a splendid old buck, dropping him in his tracks dead. The other two, a cow and calf, at once took up the line of march, and were rushing off at a great rate, when a second shot from F.

struck the former in the shoulder. She was staggered, but not killed, so that another bullet sped on its fatal errand, and rolled her over lifeless. By this time the calf was thoroughly demoralized, and, with his white flag hoisted, was streaking it along at his best pace, only asking to be let alone, and had gone so far that he was hidden from F. by a clump of bushes. F. ran a short distance toward the dead buck, and again caught sight of the calf, which was going straight as an arrow towards the point whither Ike had come. He was waiting to give it a warm reception when, to his astonishment, he saw F. rush out from behind the intervening bushes and throw his rifle to his shoulder, at the same time imitating the call of the old ones. As Ike was directly in range, he thought his time had come.

"Don't shoot me," shrieked he.

"Get out of the way, then," came the answer, and before he had time to dodge, the rifle cracked, and the calf rolled heels over head. Ike, as soon as he had time, discovered that he was unhurt, but badly frightened. The shots were afterwards measured. The one at the buck was 140 paces; the killing one at the cow, which struck her while running, 177 paces, and the one at the calf 198 paces—the paces those of a six footer. When it is remembered that this shooting was made off-hand, and that between each shot the rifle, a breech-loading Sharp, had to be reloaded; that the game was continually moving, and that three out of the four bullets struck so exactly in the vitals as to cause instantaneous death, while the fourth only struck an inch or so too high, we think no one will dispute the assertion that it was admirable marksmanship. The late matches between the American and Irish teams developed some remarkable shooting, but, to our mind, nothing done by any member of either team excelled this; for it is one thing to shoot at a target, with the accessories of position, windage, elevation, etc., allowed for and reckoned upon, and quite another to stand up and, off-hand, deliver four successive shots at moving game, loading before each, after the first. Not often, indeed, does the sportsman get such a chance, and few and far between are those who could improve it so well.

We have stated that our party separated. While two went to the bog, the other two started for a pond said to be some four miles from camp. A struggle which lasted all day landed the adventurers, after dark, in the midst of an alder swamp, where there was as much chance for game as there is on Broadway, and not till noon of the day following did they succeed in reaching the pond. A few hours' hunt was all they could spare time for, and the result was—not a sight of hide, hoof, or hair of anything in the shape of game, and they had to return, tired, hungry, and disgusted, to find their more fortunate companions, and rejoice with them around the camp fire over their wonderful success. The glorious fire of giant logs, backed by the sombre forest, its light playing over and reflecting all surrounding objects.

On the morning of September 28th we left the St. Johns pond, and, taking the outlet, started for Baker Lake. This was the first time we had had the current in our favor, and the sensation of being helped along was as new as it was pleasant. We were, however, all day working about six miles down stream, so it will be readily seen that this sort of traveling is not the one described by the tuneful individual who informs us what he does as he

"floats down the river in a gum-tree canoe."

Night overtook us at a jam formed by drift logs in a bend of the brook, and as we had to carry around it, and had a terrific rain-storm, accompanied by flurries of snow, we were not afloat again till the 30th, and did not reach Baker Lake till late on the afternoon of that day. On the morning after our arrival Uncle John heard caribou passing through the woods a short distance from where he was, and we at once started in pursuit, leaving the guides in camp. Knowing that there was a brook, bordered by open meadow and emptying into the lake, its course being nearly at right angles with the west shore of the latter, we thought it probable we should be able to find the game feeding on the meadow. So, one taking the shore of the lake, and the other a line some three or four hundred yards from it, we started. After working our way through the thickest of thick woods with the utmost caution, from nine o'clock in the morning till three in the afternoon, we reached the brook, but could find no game, and had to drag our weary legs back over the very ground we had been so joyously and hopefully traversing before. At such a time as this one is apt to think a hunter's life not what it is said to be, especially when, as in our case, the probability of a superfluous and comfortable night is strong. Fortunately, however, we soon discovered one of the guides in his canoe looking for us, and soon forgot our fatigue, disappointment, and hunger—satisfying the hunger from our well-stocked larder, assuaging the disappointment with quickly-aroused hopes and new resolutions, while boughs and blankets compensated us for the fatigue.

Leaving Baker Lake October 3d, we passed down into the main St. Johns River, which we found much swollen by the almost continuous rain we had experienced, and it was while coming down the steep descent from the lake to the river that we had some favorable opportunities of seeing what was meant by running rapids. We distinctly recall the feeling which accompanied us through one set of rapids, where Uncle John's talents shone out supreme. We had been coming down a long stretch of dead water, which for ten or fifteen minutes had been gradually changing into a very quick stream, when, coming suddenly around a point, we were startled at the appearance of a long reach of apparently boiling water directly below us, and by the sound of its rushing, then first heard distinctly, as well as by the cry of "lookout" from the other occupant of the canoe. One moment we seemed to pause; the next instant the canoe, feeling the effect of a sharp stroke from the stern paddle, with a spring like that of a frightened deer, started from the comparative repose in which she had been lying, right into the breakers. A short rush, a dip, a shiver of the little boat, the calls, oft and quickly-repeated, of "hold," "paddle hard," "right," "left," the foaming roller as it reared itself seemingly much higher than the gunwale of the canoe, and apparently just about to board us, then opening or subsiding as though the touch of the stern of our craft had magic in it, the ugly, sharp, black rock dead ahead, the turn and twist of the cockle shell, the occasional scrape as she dashes madly past some half hidden boulder, the swift, wild leap as she rushes from a dangerseen into one almost undiscovered, the terrific force of the falling, surging water, all combined to send the blood through one's veins with accelerated speed. With

teeth hard shut, the muscles braced and quivering with excitement, we rush on, paddle in hand, either resting quietly or working like a flail, as occasion may require, and finally, just as we seem to be surrounded by flying foam, a last, long leap over the final fall, and the canoe glides out into the still water, again, the danger all past, leaving but a realization that scarcely anything is more pleasant to contemplate than difficulties and obstacles overcome by strong personal effort. The effect is not unlike that of riding a swift horse at full speed. His strength has become your own, your hand and will his only guidance; all depends upon the rider, yet he is almost powerless, for a mistake would probably launch him into eternity. In both cases coolness and courage are necessary, and he who has not both had better try neither the running rapids or running horses.

On the evening of the 4th we reached a large lumbering station, with farm attached, known as Seven Islands. This was the first taste of civilized life in nearly three weeks, and though perhaps the accommodations would not compare with those of the "Windsor," we were nevertheless hospitably entertained, and passed a pleasant night, starting on our way next morning refreshed. On our way down the river from this point we encountered both fog and snow, but succeeded, on the evening of the 7th, in getting within seven miles of Grand Falls, where we found a Frenchman, who kindly took us in; but as the manner is somewhat peculiar, the incident may not come in amiss.

The story of the Irishman wrecked on the coast of France, and attempting to borrow a gridiron, is familiar. We were reminded of it when Ike volunteered to ask for lodgings in the vernacular, and as a specimen of his knowledge of it remarked that "*Donnez moi un coup*" meant "Won't you have a drink?" However, he started, and after some moments a shout informed us that he had been successful. Of course the Frenchman was surprised at being asked in pantomime for a lodging by one who looked as Ike did, and who used so little ceremony. When, after a minute or so, the second one of the party appeared, armed with an immense ten-bore, he was astonished. When, after a short lapse of time, the third opened the door and walked in, presenting arms with a savage-looking rifle, he was bewildered; but when the fourth one put in an appearance, shouldering a delicate but wicked little twelve, he began to have an idea that he and his family were to be turned out of doors, and much of Ike's French was necessary to assure him that it was all right, and that there were no more of us. So he kindly concluded to allow us to camp on his kitchen floor, and after much intelligible but well-meant jargon on both sides, he determined to retire, and all was soon quiet, the stillness only broken by the heavy breathing of our tired party.

On the 8th we started before daylight, determined to reach Woodstock and the end of our journey before sleeping. Suffice it to add we accomplished the allotted task by nine o'clock P. M., thus doing eighty-two miles in about ten hours' actual paddling. If any one thinks that is not a good day's work, let him try it and be convinced. We caught trout whenever we stopped long enough to cast a fly, killed plenty of ducks, (embracing four different varieties), some partridges, and incidentals, such as the "lordly heron," etc. Bear signs we saw, and, had time permitted, could doubtless have added to our record the capture of a specimen of the tribe of bruin. Otter and mink were seen. One of the former was indeed killed, but as he sank in deep water before we could reach him he was not captured.

Having spent altogether a most satisfactory three weeks, we determined to advise every one who is fond of woodland life, and who will endure its hardships for the sake of its pleasures and adventures, to try the Baker Lake trip.

"MOLLYCHUNKMUNK."

Fish Culture.

ABSTRACT OF THE REPORT OF THE COMMISSIONERS OF FISHERIES OF THE STATE OF WISCONSIN.

FOR the want of a suitable appropriation the commissioners have found it impossible to give complete statistics as to the extent of the fish interests of their State, a fact much to be regretted, as a knowledge by the people of the extent of their fishery resources and the best mode of utilizing them, would result in their endorsing the very action on the part of their Legislature, which would look toward an increased appropriation.

At Milwaukee there are four steam smacks, and two sailing smacks engaged in fishing. These six smacks have a total of sixty-five miles of nets. Each smack takes an average of 400 pounds of fish each trip, during Summer. During the month of October, 1874, each smack took from 18,000 to 20,000 pounds of fish, while in November they increased the take to 32,000 pounds each. The sailing smacks took about the same number each trip, but they made less number of trips. The total of fish taken at Milwaukee during the season of 1874, was not far from 270 tons of dressed fish. Each steam smack cost about \$7,000. The capital invested at that place is not far from \$75,000. In former days the fishermen used nets of a larger mesh and took white-fish that weighed from eight to fourteen pounds each, the latter figures being the largest known to have been caught. Now they have to use smaller meshed nets and take smaller fish, the large ones being almost unknown now.

At Racine there are employed four sailing crafts, using a total of thirty miles of nets; each trip average about 400 pounds, making a trip every day unless interfered by storms. During October and November the trips were tripled. A large per cent. of the fish taken during the last half of October and November were trout, as the spawning grounds of this fish are no great distance from this place. Tons of this magnificent fish were taken when filled with ripe spawn. There were taken about eighty tons at Racine during the fish season.

Kenosha employs four smacks, with about thirty miles of nets, and the catch is about equal to Racine. In these places, Kenosha, Racine, and Milwaukee, there is a total of one hundred and twenty-five miles of gill-nets used. There is a total of nets used in the waters of Lake Michigan sufficient to reach from one end of the lake to the

other. During 1875 there was a falling off of at least one-fourth in the supply of fish so that it is evident that the waters of the lake are being depleted.

Investigations have been made with a view to ascertaining the temperature of the water and nature of the bottom of some of the larger of the inland lakes, so that it could be determined what species of fish it would be best to introduce. In deep cold waters where the small species of whitefish known as sisco's (*Argyrosomus sisco*) abound, there the large lake trout, (*Salmo namaycush*, Penn.) will thrive. It is the intention of the commissioners to stock such lakes with these fish.

It is suggested that fish culture be attached to the Agricultural Department of the State University, as, in a few years it would be found that the harvesting of the waters would be very profitable, besides furnishing skilled labor, which is in great demand.

Since submitting their last report the commissioners have received from the United States Fish Commissioner twenty-five thousand Atlantic salmon spawn, but owing to bad packing, only hatched eighteen thousand, or seventy-two per cent. The young fry were put into Elkhart, Cedar, Rock, and Devil's Lake. They also received thirty-eight hundred and fifty land-locked or Sebec salmon, of which they hatched three thousand five hundred and thirty, or ninety-one and a half per cent. These were divided among the fish breeders of the State, a promise being exacted that should they be successful in breeding them, they would give the State the preference in the sale of their progeny. It was thought that by doing this the State would get a start in them sooner than to trust so few in a lake. In this fish, in common with other fish commissioners, as well as fish culturists, they have a great deal of confidence. As a game and table fish, it is no way inferior to the sea-going salmon, and unlike it, is not an experiment in introducing them into our lakes, as their home is in the fresh water lakes of the State of Maine, that in no material respect differ from their own.

The commissioners also hope to stock their rivers with salmon and shad. Those put in the tributaries of the Mississippi would go to the Gulf of Mexico, as the streams would not likely suit them after the second year, but when nature moved them to propagate, they would return to the fresh, pure water, as they can breed in no other. As to the distance, both fish are known to make longer journeys, and although the experiment is now only in process of elucidation, success is hopefully anticipated.

At present, however, it is the fish native to the waters of the State to which the commissioners desire particularly to turn their attention. Among these are the white-fish, salmon trout, lake herring, black bass, and the brook trout. Considering the importance of stocking the interior lakes, a temporary hatching house was started at Pensaukee, on the railroad twenty-five miles above Green Bay. The attempt to secure Mackinaw trout spawn was a total failure. Most unaccountably there was not a ripe trout caught there this season, and the fishermen were unable to account for it. Neither were so many whitefish spawn taken as had been expected, which was owing partly to inexperience, but mainly to the closing in of Winter so early, which compelled the fishermen to take up their nets in the midst of the spawning season of both white-fish and herring.

In addition to 350,000 white-fish spawn there were taken about 200,000 lake herring spawn. This fish is known in Madison as white-fish, and Fourth Lake is very full of them, a few of them having been put in there by ex-Governor Farwell, who no doubt thought them to be white-fish, as many still do. While in flesh and size they are not quite the equal of the white-fish, they are better for lakes where netting is not allowed, as they will take the hook, (and being very prolific, a large one having about 20,000 eggs,) and being superior to the fish native to our interior lakes, they are thought well worth introducing.

An appropriation of \$15,000 is asked for, which would build hatching houses, ponds, etc., in necessary localities. With this in hand and the experience of other States to be guided by, fish culture in Wisconsin would be an established success. This is but the second year of the commission, but it has demonstrated the availability of the great water area of the State. None is better situated for producing an immense fish supply, and the blessing of cheap and abundant food is sure to be the result of well directed and intelligent efforts in this direction.

--Virginia is making rapid progress in the matter of fish culture and game protection, and has just now followed the example of several other States and established a "State Association for the Protection of Game and Fish," with Alex. Mosely as President, and Peyton Johnson, Secretary and Treasurer. Any person is eligible upon payment of one dollar initiation fee. Both the officers named are enthusiastic in this new branch of economy. Alex. Mosely is an editor of the Richmond *Whig*, and one of the State Fish Commissioners.

NEW FISHWAY.—Mr. A. J. Hinds, of Patchogue, L. I., has invented a fishway, so constructed that fish can pass the highest dams. They can go up, but cannot return the same way. He has used it for trout for over a year, and it has proved a perfect success. We understand that he intends to apply for a patent, but will explain its principles to those wishing to examine it, provided it will not compromise his interest.

SPAWNING OF GOLD FISH.

MAXVILLE, Ky., January 8th, 1876.

EDITOR FOREST AND STREAM:—

I noticed a short time since an article in your paper taken from "Hardwick's Science Gossip" on the breeding of gold fish. As the writer's experience differs somewhat from mine, I thought perhaps it might interest some of your readers to hear how I have succeeded.

I have kept fish for about five years, and have a tank that contains about twenty gallons of water. Last spring I had eleven gold fish, and have never seen more healthy lively fish than mine. I always feed them on raw beef, bread crumbs, and earth worms; they are very tame, and will take food from my hand. A year ago last spring my fish spawned, much to my surprise, as I had read that they could not be propagated in so small a tank. I lifted the eggs from the tank to a globe; the fish were hatched, but died in about three weeks. This year I have been more successful; my fish spawned on the 13th of May, and as soon as possible I had a large washing tub filled with water placed on the porch,

Into this I put my gold fish, also a pot of *Valisneria* and *Hippuris vulgaris*, on which I noticed most of the spawn. I left the fish in the tub until next day, unfortunately too long, as I found they had eaten most of the spawn. After taking them out I partly covered the tub with boards so as to shield it somewhat from the rays of the sun. In six or eight days I noticed the eggs were hatched. I fed them when about four weeks old; but soon after two died, so I concluded to let them alone, as there was so much vegetable growth of *Conferva*, I supposed they would find food from that. They remained in the tub until September, when I placed them in a glass tank. After this I fed them every few days on very small particles of raw beef. I scraped the beef very fine, and only put in just what I thought would be eaten; if any was left, I was careful to take it out for fear the water would become impure.

The fish are little beauties. There is a wonderful difference as to size, some are so much larger and stronger than others. I can't account for it, as all are of the same age, and have received the same treatment. Among my young fish are several that are without the dorsal fin. *

FISH CULTURE ON THE WESTERN PLAINS.

HILLSBORO, Ohio, January 3d, 1876.

EDITOR FOREST AND STREAM:—

Why are there no trout in the waters of the North Platte River? If our friend Spencer F. Baird, who now seems to have become Commissioner-in-Chief of the scaly tribes, as he long has been of the birds and beasts of the country, cannot solve the question, I suppose it may be set down as one of the things "a fellah never can find out."

Here is a great river, the heads and tributaries of which take their rise in the centre of the Rocky Mountains, and interlock with the waters of Wind River, Big Horn, and Powder Rivers on the north, Green River on the west, and the Yampah, or Bear River, and the South Platte on the south, all of which abound in the *Salmo fontinalis*, and yet is itself troutless. Its greatest tributary—the Sweetwater—actually rises on the Pacific slope, and with New River, Green River, and Lewis' Fork of the Columbia, is fed from the perpetual snows of the Wind River range, and flowing through the South Pass, within three or four miles of Pacific Springs, has a total length of 150 miles. The main North Platte rises in the North Park, in Colorado, and its head mingles with those of Bear River running into Green River, and those of the South Platte, and formed from numerous mountain springs and streams, takes its way north to meet the Sweetwater near the great cañon. From the head of the Sweetwater in the Wind River range, or its own sources in the Colorado Mountains to its junction with the South Platte on the plains, it has a total length of about 500 miles.

Many of its tributaries, fed by never-failing springs and melting snow, with clear, cold, swift water, would seem specially fitted for trout. Commencing with Lawrence Fork, which runs at the foot of Court House Rock, and going west, there are Horn Creek, Laramie River, and the many streams running into it; Rawhide, Cottonwood, Horse Shoe, Labonte, Lapelle, Deer Creek, Sweetwater, and its western and northerly sources; the head of the Platte in the North Park, and also Pan Creek, Medicine Bow River, and Rock creek, the three latter being large, never-failing streams heading in the Elk and Colorado Mountains, and running through Laramie Plains. These and many others look promising and abound in fish, but there are no trout.

I have been thus particular in giving detail, that I might make the statement pertinent and full, so that if there is any doubt about the facts, or if any one can give the causes, all may have more light upon the subject. Now that the railroad runs through this section, and the mountain country generally is becoming fully explored and, to some extent, settled by miners, herdsmen, and others, there is no reason why its natural history in all its branches should not be fully understood. These questions in relation to the habits and habitat of food and game fishes are becoming especially interesting and practical, since such skill and attention has been directed to their propagation. And now, lest I may be charged with assuming the facts, I will state my means of knowledge. In the year 1862-63 '64 and '65 I was in the military service in the Rocky Mountains. My headquarters were at South Pass the first Summer and at Fort Laramie afterwards. During the entire period duty called me frequently to all parts of the country drained by the North Platte, and to the headwaters of the other great rivers I have mentioned. The scattered condition of my command, together with military expeditions, scouting parties, and fort posts, and herding camps, etc., from the forks of the Platte to Utah, gave me special facilities for knowing the country. Whenever opportunity offered, the rod as well as the gun were put to use, not only for sport, but from necessity, and to vary the regulation diet of pork and hard tack. When ordered from St. Louis to the mountain country by Gen. Halleck in March, 1862, anticipating the narrow fare and tendency to scurvy in that service, I purchased a seine about twenty-five yards long, and commencing at Fort Leavenworth, where we received our outfit for crossing the plains, until we reached South Pass, a distance of about one thousand miles, each company had its use in turn. A detail of eight or ten men would often bring in several bushels from an hour's fishing. After striking the main Platte at Fort Kearney no game fish are found in it or the North Platte and its tributaries, except the glass-eyed pickerel, as it is there called, but elsewhere generally known as the wall-eyed pike, or pike perch. This is found in nearly all the larger streams, averaging from one to six pounds in weight, and is really a very respectable fish on the hook or the table. Most others, except the catfish, are of the sucker mouth varieties. In addition to our own opportunities to ascertain the inhabitants of these waters, the testimony of the celebrated Maj. Bridger, who was nearly three years with me as guide and interpreter, and of the old trappers and mountaineers generally, could be added and all agree as to the non-existence of trout, as I have stated. It is barely possible some may be found in the extreme headwaters of Pass Creek, or some of the small streams in the North Park, with which I am less familiar, but it is improbable.

As to the causes of this troutless condition of the waters

of the North Platte none seem to be satisfactory. It is true that many of these streams, where they run through sandy or alkali plains, sink or dry up at certain seasons of the year, or become strongly impregnated with mineral soda; but their sources are usually pure and permanent, and the same objection can be made to the tributaries of the South Platte and Green Rivers. There can be little doubt that trout would live and flourish in most of the heads of these streams, if they were properly stocked, and it would be well to suggest to our friend Baird, the Fish Commissioner, that he drop a few trout or troutlings, or cause a few eggs to be laid "where they would do the most good," along the line of the Union Pacific Railroad. It could be done from the California fish car, and, indeed, there are places where a boy with a bucket could make a transfer of living trout from one stream to another in a few hours. While on duty in the Rocky Mountains I had occasional opportunities to give him slight aid in some branches of natural history, of which I gladly availed myself. We feel a national pride in his success in all the branches to which he has specially devoted himself; but there is probably nothing in which his labors will be found more practical and useful than fish culture, where he is exhibiting his usual ability and enthusiasm. It is gratifying to know that he is receiving the aid of the Government, as well as the cordial and earnest coöperation of the highest skill and experience in the country. VETERAN.

CALIFORNIA SHAD.—A shad sixteen inches long and weighing three pounds was taken at Wilmington, California, a fortnight ago; a circumstance that argues well for the success of the Fish Commissioners' efforts to propagate this variety of fish by planting in the Sacramento and other rivers three years ago.

Natural History.

[This Department is now under the charge of a competent Naturalist, endorsed by the Smithsonian Institution, and will henceforth be made a special feature of this paper. All communications, notes, queries, remarks, and seasonal observations will receive careful attention.]

—Nature records the success of an expedition sent to the Pelew Islands, which are situated in the Northern Pacific, at the western extremity of the Caroline Archipelago. One of the most remarkable facts is the occurrence of a jungle fowl (*Gallus bankiva*)—being the species generally recognized as the original of our domestic fowl—in a wild state. It is possible, however, that this may be an introduction. It is singular also to note that the Nicobar pigeon (*Columba nicobarica*) has spread thus far to the west. Noteworthy again is the entire absence, so far as is hitherto known, of parrots and finches in these islands.

—Among the common English sparrows in St. Louis, Dr. James C. Merrill has observed many specimens of the European tree sparrow, (*Pyrgita montana*), which closely resembles the *Pyrgita domestica*, but is distinguished by its chestnut crown, and the similarity of both sexes and the young. It was noticed in New York several years ago, and may be looked for now; but it frequents the outskirts of the town and the country, as is its habit at home.

LINEN-EATING MOTHS.—Edward Newman, the English entomologist, has recently been investigating the loss of William Eccles, a linen manufacturer at Larne, Ireland, through the depredations of the larvæ of the ruby tiger moth, *Arctia rubiginosa*. Mr. Eccles found that his linens, after exposure upon the bleach fields, were filled with holes, generally not much larger than the size of a pin head. He asked the advice of the Editor of *The Field*, through the columns of which Mr. Newman answers. It appears that this caterpillar, which feeds upon the broad-leaved plantain, and has been previously thought inoffensive, would select the linen as suitable material for its cocoon, thus causing the innumerable holes which threatened serious loss to Mr. Eccles. Mr. Newman was unable to offer any remedy, but suggested that possibly, like our own Western grasshoppers, the visit in large numbers might never recur.

SHORT-TAILED TERN IN MASSACHUSETTS.—The handsome short-tailed tern (*Hydrochelidon fissipes*) has been considered somewhat rare north of New York. I was fortunate enough to secure five specimens at two shots, on the 29th of August, 1875, in Ipswich Bay, north of Cape Ann, Mass. I was fishing at the time, nearly a mile from shore, in a small boat, when I observed a flock of about fifteen individuals approaching, engaged in their own fishing. They came within gunshot, and I secured one. The flock were so intent upon scanning the water that they did not appear to notice me until I had fired. They then flew off alarmed, but soon returned to hover over their dead companion, which is a trait of the whole family of terns, as far as my observation extends, and I then succeeded in shooting four more. Only one of the whole number was in full plumage with the black breast. Previous to this I have only known of two individuals being seen in this State; one of which I shot (See C. J. Maynard's Naturalist's Guide, Part II, p. 157) August 11th, several years ago.—J. FRANCIS LEBARON.

THE TROGONS.—Mr. John Gould, F. R. S., has completed a second edition of his magnificent work on the trogons, illustrated by life-sized colored figures of the forty-six species now known. Like the parrots, the trogons are widely diffused through the tropics of both hemispheres. Though not so strongly marked in general characters as the Psittacidae, the Trogonidae are separated from all known birds by the peculiar conformation of their feet, having the first and second toes permanently turned backwards, which is not the case in any other form of the class "Aves." Like the parrots, too, the trogons are most numerous in the New World, thirty-three out of the forty-six species being peculiar to Central and Southern America, whilst eleven are found in the Indian region, and two only in Africa.

As regards habits and mode of life, there appears to be much similarity in the trogons of all three continents. They are universally forest-haunting birds, inactive in habits, short in flight and feeding, whether their prey be insect or fruit, mostly upon the wing. Their brilliant colors offer the most remarkable compounds of yellow, green and various shades of crimson and golden yellow, as will be sufficiently apparent to any one who turns over Mr. Gould's splendidly-colored plates. "We must indeed congratulate the author," says *Nature* for Dec. 23d, "on the energy and success with which, prompted by the pure love of science, he has brought out a second edition of one of the first of his many important ornithological works."

LARGE CARP.—Berlin, Prussia, has produced a monster carp, weighing 27 pounds, and measuring 2 feet 10 inches in length, and 1 foot 11 inches in circumference. It was sent to Lord Odo Russell, British Ambassador at Berlin, by a fishmonger, who advertised carp for sale up to thirty pounds in weight. Frank Buckland, in *Land and Water*, says: "Of course I shall make casts of this splendid fish, and shall then present, in Lord Odo Russell's name, the fish to Prof. Flower, for the Royal College of Surgeons. The carp's bones are very firm and white, and the fellow will make a splendid skeleton. Carp certainly live to a very great age. A correspondent in this paper not long since recorded a carp that was known from positive facts to be ninety years old. I should not be at all surprised if the fish now in my casting-room was not from 100 to 150 years old, and I am in great hopes that we shall be able to get some evidence as to age from the appearance of the bones of the skeleton. Carp, when very old, are said to turn white. The origin of this story is that carp are very much subject to a disease of white fungus growing on the scales."

—A writer in *Land and Water* describes the setting of a swallow's broken leg as follows: The leg was carefully adjusted, flexed, and placed close to the body, and then soaked with gums, the feathers near it being treated in the same manner, and then plastered over with flour. After being kept perfectly still for an hour, it was found that the leg was perfectly set and securely fixed. The bird then flew away with great ease.

HABITS OF PACIFIC SALMON.

SAN FRANCISCO, Cal., January 3d, 1876.

EDITOR FOREST AND STREAM:—

One of your correspondents remarks, in reference to my giving an opinion in regard to the McCloud River salmon returning to the sea after spawning, that I said decidedly at first that they did not return, and afterwards that "I didn't know," your correspondent adding that the matter rested here. The fact is that, in my own mind, I have always been convinced that these salmon died after spawning before they returned to salt water; but when I first announced the fact in 1872, it was received with such skepticism by Californians, and such resolute opposition, that I thought I might possibly have been mistaken, and concluded to reserve my judgment till I had another season's experience. It was then that I answered, when questioned on the subject, that "I didn't know." The next season I built a dam over the river, impassable to salmon, and this settled the question finally, and proved beyond a shadow of a doubt, that of all the thousands of Sacramento salmon that spawned in the McCloud, not one in a hundred returned to the sea alive. Since then I have been very emphatic in the expression of this opinion; so it is not quite correct, as your correspondent puts it, that the matter rests with my saying "I didn't know."

I see a good deal in the papers about what the salmon feed on, as if there was some mystery in it. Now, whatever mystery there may be about other fish, in this particular, there is none whatever as regards the Pacific Coast salmon. While in salt water they eat, and eat ravenously, their food being smelts and other small fish, with some crustaceans. After they enter fresh water they lose their appetite and eat nothing, a good evidence of this being found in the fact furnished by J. W. & Vincent Cook, proprietors of the Oregon Packing Co., on the Columbia River, who stated to me that out of ninety-eight thousand salmon examined by them in 1874, only three had anything in their stomachs, and these three had the appearance of having just left salt water.

LIVINGSTON STONE.

LATE APPEARANCE OF THE MOCKING-BIRD.

GAINESVILLE, Cooke Co., Tex., Jan. 5th, 1876.

EDITOR FOREST AND STREAM:—

During the early part of November, a "norther" visited us and swept our migratory birds to more congenial climes; or, at any rate, out of sight. After the "norther" the weather became warm again, flowers bloomed, and the grass continued green. Frequently of a morning, before sunrise, when the weather was still and damp, I was sure I could detect the familiar musical notes of the mocking-bird, in an undertone, but could never catch sight of him, until about two weeks ago, when early one morning I observed a mocking-bird perched upon the ridge of a house across the street; and again on the morning of December 28th, it sat perched for sometime upon the frame of a grape vine in my yard, and within thirty feet of me. I have been living in this county for nine consecutive years, and I am sure I have never seen the mocking-bird so late in the season at any other time; and it is evidently considered migratory here, for when it appears in the spring it is frequently remarked by the farmers that "winter is broken; the mocking-birds have come." Dr. Cones states, in his "Birds of the Northwest," that it is "resident from the Carolinas southward," which would embrace this place, which is about latitude 33° 30' north, longitude 97° west from London. The most remarkable feature in the case is, that this bird seems to be alone. It is possible, from the fact of this bird being so rarely seen in the locality in which I know it to be concealed, that there are other mocking-birds in this part of the State; but as my business (land surveying) brings me into field and wood, bramble and prairie, more or less every week, it does seem as though I would occasionally start one from its retreat if any more were there. I will state, however, that the winter has been extremely mild.

G. H. RAGSDALE.

CENTRAL PARK MENAGERIE.

DEPARTMENT OF PUBLIC PARKS, }
NEW YORK, Dec. 19th, 1875. }

Animals received at Central Park Menagerie for the week ending January 15th, 1875:—

Two pair Angora rabbits, *Lepus cuniculus*. Presented by Mr. A. M. Halsted.

One eagle, *Haliaetus leucocephalus*. Presented by Mr. H. H. Brockway.

Two pig-tailed macaques, *Macacus nemestrinus*.

Two black-faced spider monkeys, *Ateles ater*.

Two macaque monkeys, *Macacus cynomolgus*.

Three slender-billed cockatoos, *Leucotis tenuirostris*.

W. A. CONKLIN, Director.

Woodland, Farm and Garden.

GARDENING IN CALIFORNIA.—The markets of San Francisco are almost perennial in their supply of many vegetables. Lettuce, radishes, cabbages, and onions are always in season. New potatoes come in January and last until mid-summer; peas and beans from February to December; tomatoes from March and April until the end of the year; cucumbers, ditto; carrots, cauliflowers, parsnips, yams; turnips, beets, parsley, spinach, cabbage, rhubarb, celery, asparagus, and many other vegetables are in season the greater part of the year. There is scarcely a day in the year when strawberries cannot be obtained, while the markets constantly afford a full supply of figs, oranges, lemons, limes, pineapples, grapes, bananas, pomegranates, pears, cherries, peaches, apricots, nectarines, apples, and all kinds of nuts.

PYRACANTHA JAPONICA.—Our Southern readers will hear with pleasure of the introduction of this beautiful new hedge plant. It is too tender to stand Northern winters, but is hardy south of North Carolina. As its name (Fiery Thorn) denotes, its flowers are of a brilliant orange scarlet, succeeded by crimson berries, while its wood is tough and thorny, of dwarf habit, and will bear the shears well, and will turn cattle, and, if kept low, even hogs. With this plant and the Cherokee rose, we hope before long to see Southern plantations with elegant hedges, instead of the slovenly and extravagant worm fences; for we believe these fences occupy thousands of acres that might be cultivated.

A TROPICAL NURSERY WANTED.—Planters of orange, lemon, and banana groves at the South feel the want of a nursery where they can order their young plants. In France, which embraces some tropical territory, all the nurseries in the north keep a good stock of tropical and tender fruits and plants, and so it should be in this country. If some of our nurserymen would keep a large stock of grafted oranges and lemons, bananas and figs, they would find a ready sale for them.

RHODODENDRONS.—This beautiful flowering shrub is called in England and on the Continent an "American" plant; but to see it in perfection, we must visit some of the large nurseries near London. We are pleased to learn that one of them—S. A. Warterer, of Woking, Surrey, Eng.—maintains a large collection of these plants in full bloom. One peculiarity of these plants is, that the time of blooming can be calculated almost to a day, so that a gorgeous display may be expected.

NEW ORNAMENTAL TREES.—Mr. Thomas Meehan, of the Germantown Nurseries, has purchased H. C. Thompson's entire stock of new weeping dogwood. The same nurseryman has introduced a new blood birch and yellow weeping elm, both very ornamental—a most valuable addition to our hardy ornamental trees.

OILING HARNESS.—A good harness is costly, but if properly used and cared for will last a good many years. If neglected it will soon need repairs, and in a short time become utterly worthless. In caring for a harness one great point is to see that it is suitably oiled. A work harness, in use on a farm, should be oiled twice a year, in the Spring and Fall. It should be taken entirely apart; the places where sweat and dirt have collected cleaned with a chip or an old case-knife, then washed clean in warm water, in which a little Castile soap has been dissolved. As they are washed the straps should be hung on a pole to dry.

When the outside is nearly dry, but before the moisture is all out of the leather, the oil should be applied. This may be done with a clean paint brush, which is the best thing for the purpose, a sponge or woolen cloth. A moderate quantity should be used, and if it does not soften the leather enough, another light coating may be applied when the first one is well dried in. This is better than it is to put on a great deal at once.

Care should be taken to obtain a good quality of oil for leather. There are some patent preparations in which a water-proof ingredient is added to oil and also a little coloring substance to make the leather look black and glossy. An honest mixture of this kind is better than the crude oil. Cheap oils are generally poor. When dry, the harness should be rubbed with Castile soap, then with a dry woolen cloth. When this is done, it may be put together and used. This work should not be neglected until the hurry of planting and hoeing time, but should receive attention now.—*Live Stock Journal.*

WINDOW PLANTS.—The *Horticulturist and Gardener's Monthly* gives the following directions for their care:—

"Many of our readers have only a few window plants. These are often kept too warm, too wet, have too little sunlight and have too many insects. In towns, in addition to all these, they have often too much of the fumes of burning gas. Leaks or escapes from the gas-pipe are well known to be an injury to plants, but it is not so well known that plants suffer, though in a less degree, from the common burning of coal gas. The trouble with most room cultivators is, to know when plants get too much attention. Too many insects are easily known, one—a single one—is by far too many. We still think there is nothing like coal oil to destroy all kinds of insects. A very little, just enough to make a colored scum on the surface of a tub of water, is sufficient, and in this the insect-covered plant may be dipped, inverting the pot, and plunging only the plant and not the pot of course. If too much oil is used the plant may be injured. Too wet, is when a plant seldom gets dry—a healthy plant should get dry, and have light, dry-looking surface soil every two or three days. As to heat, a temperature of about 55° or 60° is best for room plants; below that they do not flower freely; above they grow weak, especially if they have not a great deal of sunlight. Indeed, heat should be in proportion to direct sunlight on the plants."

PLANTS.—One of our lady readers, remarkably successful with her house plants in the Winter season, gives us two points in their management. Every gardener and florist knows the value of what is called "bottom heat." A warm atmosphere—especially if a dry one—is often insufficient to bring about healthy growth and is sometimes injurious. What is wanted for many kinds of plants and flowers is moist heat at the roots and fibres, where growth early starts, and from which the stimulus is conveyed to every other part of the plant. A thrifty growth below the ground is sure to be followed by fruits and flowers above. Our lady friend accomplishes this by filling the saucers of her flower-pots with hot water. This is, of course, absorbed and carried up to the roots and fibers, giving the required bottom heat. Unthrifty plants, in addition to this, she places on the mantelpiece over the kitchen-range, keeping them, of course, well watered. It supplies heat where it is most wanted—at the roots—and the benefit is marked. In warm rooms the temperature is warmest at the top, and the coldest near the floor where the pots are. This reverses the proper order, giving the roots of a plant the coldest place. Another important matter in house plants, is to give them the morning sun. Windows where flowers are kept should, therefore face the East. The reasons are not known, perhaps, but the fact is patent to all whose business is to develop healthy growth in plants and flowers, that an hour of morning sun is worth three hours of afternoon sun. Every one observes this, and it may be owing to some electrical action at that time.—*N. E. Farmer.*

THE USE OF FALLEN LEAVES.—In the *Gardener's Monthly*, Mr. Meehan says:—These have to be gathered up. They are excellent to mix with hot bed material, and, where practicable, should be saved for this purpose. They do not heat so rapidly as stable manure, and in this have an advantage as tempering its violence, making it last longer, and maintaining a regular heat. They are excellent material to put round cold frames to protect half hardy plants. A board is put up the height of the frame boards, and about a foot or more from them, and the leaves filled in between. If the plants are somewhat tender, the bottom of the frames may be filled in a few feet with the leaves. Much heat is thrown off during the decomposition of the leaves, which, though not enough to keep out severe frost, yet modifies somewhat the temperature. These leaves, after they have been two or three years decaying, made admirable stuff for potting and flowers in general.

The Kennel.

BUYING AND SELLING SPORTING DOGS.

AS the taste for field sports is increasing in this country, and as many persons who would indulge therein have not the time to spare which is necessary to break dogs for their own use, or are living in cities or places where there is not game enough for the purpose; or have not the necessary skill to break them, they are therefore compelled to purchase dogs already broken. We have frequently heard it argued that no man can have a first-class, satisfactory dog to shoot over unless he breaks him himself. This view of the matter is entirely erroneous. It would be just as absurd to say that no man could ever drive a horse at his best speed unless he raised and broke him; or that a shooter could not shoot a gun well unless he made it. We admit that it is well for those who have the facilities to raise and break their own dogs, if they have the skill to do it. But let the best breaker in the country raise and break a dog, and after he gets him broken let that dog go into the hands of a skillful sportsman, who will continue to work him properly; and nine dogs out of ten will be improved. Remember, we say a skillful handler of dogs; but here the trouble arises. Our long experience has convinced us that not more than one man out of twenty who shoots right well has patience enough, or will exercise skill enough, if he has it, to keep a dog up to his work. And then again, very many shooters spoil every dog they undertake to handle; and from this fact arises the trouble which frequently takes place between buyers and sellers. We are fully convinced that if the best breaker that ever lived should sell twenty of as good dogs as were ever whelped, to the same number of purchasers, who had the privilege of trying the dogs, and of returning them if they did not suit, that at least one-half of those dogs would be returned and the seller slandered. And this difficulty will continue, because almost every man who shoots well feels confident he knows all about the management of dogs. In our long experience we have never known more than four or five shooters admit they could not break or manage a dog. We well remember one gentleman, whom we frequently assisted in getting his dogs, who used to say that it was a wonderfully good one that he did not spoil in one season's shooting.

A skillful handler of dogs has no difficulty in purchasing a good one, because he knows what to expect of a strange dog, and how to work him into his ways. On the other hand, there are many who purchase dogs who never give the dog an opportunity to show his education. This is a matter that should be carefully considered by those who are compelled to purchase their dogs. It is surely a fact, that where you will find twenty men who shoot right well, you will scarcely find one who manages his dog skillfully. To be able to shoot well is certainly a desirable thing, but there is no great difficulty in learning to shoot well. In looking around we see plenty of men, with a very small show of intellect, who are proficient; but to be able to handle a dog skillfully is a very rare and a very desirable accomplishment—one well worthy the close attention of every field sportsman, particularly those who

are compelled to purchase their dogs. Those persons who consider the matter beneath their attention had far better dispose of their guns, and look for other sources of amusement and recreation.

JARVIS' DICK.

THE illustration on our first page is a capital likeness of this celebrated red Irish setter dog. Dick was bred from a pair of pure Irish setters, imported from Ireland into Boston by Mr. Goodwin. From what stock they came Mr. Jarvis has been, as yet, unable to discover. That they were well bred there can be no doubt. Dick is a rich deep red in color, and his hair—of which we have a lock in this office—is soft and silky. He is very stylish and fast, a capital field performer, has a splendid nose, and is a good retriever. His nose itself is large, open, and of a very dark mahogany color; eyes, brown. His tail, which is of fine length, is never carried above the level of the back. Dick's intelligence is something remarkable. He will go back for any thing lost while driving, and find it, no matter how great the distance; will go to market, or for the papers; will lead a horse, and bring his dish at feeding time. Mr. Jarvis relates the following instance of his sagacity: Shortly after coming into his present owner's possession, Mr. Jarvis, Sr., and his son were staking out a young pear orchard, using as stakes some made from the remnants of a picket fence, and which were stored behind the barn at some considerable distance from the orchard. Dick followed them as they each took a few stakes from the pile and went to the orchard. When nearly through, however, the stakes gave out, and it struck Mr. Jarvis that perhaps Dick knew enough to go back to the pile and bring some. So he called him to him, showed him the stakes and started him. Dick soon returned with a stake, dropped it at his master's feet, and looked up into his face, as much as to say: "Do you want another?" On being ordered back he started off, and kept up the supply all the afternoon. Dick is a splendid stud dog, getting good puppies. Mr. Jarvis' address is Claremont, N. H.

DETROIT BENCH SHOW.—The second annual exhibition of sporting and other dogs, in connection with the Michigan State Poultry Association, will be held at Detroit on the 31st inst., continuing until February 7th, bidding fair to be very successful. In connection will be held a cat show, and a baby department has also been arranged for the benefit of bachelors, from amongst which body the judges will be appointed. Premium lists can be obtained by addressing E. C. Skinner, Secretary, Detroit, Mich.

—The name of Phil, Jr., is claimed for a black pointer puppy, by Old Phil, out of Fanny, whelped on the 29th of October, at the kennel of A. C. Waddell, at Newtown, N. J. Fanny was bred by, and late the property of, Jacob Glahn, Esq., of Meriden, Ct.

BLACK AND TAN SETTERS.

Baltimore, January 8th, 1876.

EDITOR FOREST AND STREAM:—

I will be much pleased if you will give me through your paper a full description of a black and tan setter. I have one here that, by popular opinion, has been considered one of the handsomest in this State. I had her at the dog show in this city on January 6th and 7th, but the gentlemen who served as judges did not think her hair was the proper style. The owner of the two Gordons, Mr. Stromburg, of this city, to whom the second prize was awarded, offered me his two dogs and \$50 for my Gyp. These two dogs are full brothers to the one that got the first prize. All of these three dogs have very curly hair. You can see by the offer Mr. Stromburg made me what a wide difference there is between judges and owners. Mr. Stromburg thinks mine the best or he would not have made this offer in the presence of ten gentlemen at the show. I only breed for pleasure and my own hunting.

AMATEUR.

[The true Gordon setter should be, if a dog, not less than twenty-three inches high; if a bitch, not less than twenty inches high; coat, wavy and soft, by no means curly. A curly-coated Gordon setter, although he may be a good dog, yet such a coat would detract materially from his beauty, besides indicating a cross with some other strain. He should have a straight tail; ears should be long, reaching to the end of the hair at the nose. Deep black and rich tan is the most approved color, but we have seen some very beautiful tri-color dogs—black, tan, and white—which we knew were thoroughbred Gordons, and it is a color we very much admire, as such are more easily to be seen while working in cover.—Ed.]

TONKS!!—Last week a correspondent asked through our columns for information regarding one, Fonks, or Tonks, a gunmaker, of Boston. A small boy has been kept actively engaged ever since in opening the letters, which inform us that our correspondent must mean Joseph Tonks, of 45 and 49 Union street, a gunmaker of excellent repute. We find that not to know Tonks argues oneself unknown, and are glad that when we next visit the "Hub" we shall go duly armed with this important information.

—A correspondent of the *Spirit of the Times* says that Col. Caldwell, of the Brock House, Enterprise, Fla., has the largest and most valuable library of sporting literature in the South. It contains all the standard works of this class from the English, French, German, and American press.

—Attention is called to the poetical recommendation of Vanity Fair Tobacco in our advertising columns. It is believed that the eulogium is entirely deserved, and smokers will do well to make its virtues the subject of an immediate experiment.

Shot Gun and Rifle.

GAME IN SEASON IN JANUARY.

Hares, brown and gray.

Wild duck, geese, brant, &c.

FOR FLORIDA.

Deer, Wild Turkey, Woodcock, Quail, Snipe, Ducks, and Wild Fowl.

GAME IN MARKET.—The continued warm weather interferes with the shipment of game from the West, and prices for such as is in market continue high. We quote: Ruffed grouse at \$1.25 per pair; pinnated grouse, (prairie chickens), \$1.50 to \$1.75; quail very scarce, at \$4 to \$5 per doz.; canvas-back ducks, \$3 per pair; red-heads, \$1.25 to \$1.75; mallards, \$1 to \$1.50; black ducks, \$1 to \$1.25; widgeon, 75 cents to \$1; broad-bills, 75 cents; spring-tails, \$1; brant very scarce, \$1.50 to \$1.75; geese, \$1 to \$1.50; rabbits, 50 cents per pair; hares, 50 cents; venison, saddles, 20 cents; steaks, 25 cents.

CANADA—Quebec, January 11, 1875.—Just returned from a nine day's caribou hunt; experienced nothing colder than 20° below zero I think, but sufficiently cold one night to partially congeal Lower Canada whisky. Plenty of caribou, ptarmigan, ruffed grouse, snow buntings, hares, and a few Canada grouse in the market, also red deer from Upper Canada. Can hear of no moose having been killed this Winter as yet.

ROAMER.

MASSACHUSETTS—Salem, January 15.—Gunning and sport generally is very dry now as it is close season, and of late very cold. The law on partridges is a humbug about our country towns, as they are both snared and shot whenever a chance occurs, and parties are very defiant when spoken to about it. I think the weather thus far has been good for wintering over the quail, and there are a goodly number of them in our county. An occasional fox is shot, and I saw two coons lately that were shot at Middleton, Mass.

ARKANSAS—Jacksonport, January 12.—We live in one of the best hunting and fishing countries in the States, probably, with the exception of Texas. Bear, deer, turkey, and every imaginable kind of water fowl in the greatest abundance, quail, snipe, woodcock, plover, etc., also are plentiful. And the fishing can't be beat; only day before yesterday a couple of our townsmen caught seventy-three bass, trout and dominique perch in a little over two hours. From this you can imagine that sportsmen have a fine time, even in mid Winter.

LINN.

—Geo. H. Ragsdale, of Gainesville, Cooke county, Texas, sends the following clipping from the Gainesville Gazette, with the remark that "a notice from this place in FOREST AND STREAM brought Mr. Presow over to this country:—

"Messrs. W. L. Fletcher, Dunbar, Cain, and J. B. Presow, (an English sportsman,) left here on 5th January, for the West, to hunt deer, turkey, and buffalo. They will remain out about a month."

Buffalo are running now, and this is a good time to hunt them.

—Messrs. G. F. Gildersleeve and M. V. Baylis, both members of the Long Island Shooting Club, shot a match at the club grounds, Dexter's, East New York, in presence of a large number of spectators. The conditions of the match were, fifty single birds each, twenty-one yards rise, old club rules, for \$250 a side. The match resulted in favor of Mr. Gildersleeve by the following score:—G. F. Gildersleeve—0 0 1 1, *0 1 1 0 1, 1 0 1 1 1, 0 0 1 0 1, 1 1 0 1 0 1, 1 0 1 1 1, *0 1 1 0 1, *0 1 1 1 1, 0 0 0 1 1, 0 0 1 0 1—Total 50, killed 29, missed 21.

M. V. Baylis—0 1 1 0 1, 1 1 0 0 1, 0 0 1 0 1, 1 1 1 0 1, 0 0 0 1 1, *0 0 1 1 1, *0 1 1 1 1, 0 1 1 *0 1, 1 1 1 0 0, 0 0 0 1 0—Total 50, killed 27, missed 23. Referee, Mr. Parks, of the Long Island Shooting Club. Time—Two hours and five minutes. *Fell dead out of bounds.

—The champion, Capt. A. H. Bogardus, having accepted all challenges of Ira A. Paine, and his friend Mr. Gray, accepting their own terms, a match between these crack shots now appears probable.

A. CURIOUS ACCIDENT.—A correspondent writes us of an unusual accident that happened to a friend. He had tried a Berdan cap on a brass shell to see if it would fit, and in trying to expel it from the shell again the cap exploded and was forced into his eye. A cap should always be exploded in the gun to be removed with safety.

THE MEGANTIC DISTRICT AGAIN.

EDITOR FOREST AND STREAM:—

I am happy to see in your last issue a communication from Mr. Pierrepont in answer to mine of December 23d. There were other parties besides his who camped and hunted in the Megantic District last fall; but my letter referred more particularly to his party, as the prices he paid were brought more directly to my notice. I visited Scotston shortly after he left there, and when I came to pay my own bills, I found them nearly double the amount of those charged on former occasions; and was told that he paid without question the high figures mentioned in my former letter. I protested against those prices, not only on my own account, but also for the many sportsmen who have been in the habit of visiting the Megantic country every season for years, and hitherto for at least one-half the expense that it has cost us when we go to the Adirondacks, or to the lower St. Lawrence districts. I am satisfied by Mr. Pierrepont's explanations that he was badly imposed on by those that he employed there, and was also misinformed by those that he wrote to for information. I have visited the Megantic District several times a year for a long time past, and claim to be "posted" on prices for teams and laborers, and would say to those who intend visiting that country: Make your bargains with those you wish to employ before you engage them and you will have no trouble in getting teams for \$3 a day, and men who are acquainted with the woods for \$1 or \$1.25 a day, or at even a much less price. There are other points to enter the wilderness than Scotston. The most used route is through Stornoway to "John Boston's" at the foot of Megantic Lake. Another good route is up the Ditton road, and strike the Salmon River at the upper still water, or go down the Eaton road to Newport, and then through to the Connecticut lakes, though now that the railroad is in operation between Sherbrook and Robinson the wilderness is the easiest reached through Scotston. In all cases procure your supplies in Sherbrook and take them with you, or have them forwarded to some point where your guides could get them as you want them. I regret that Mr. Pierrepont is "sorry" that our "old sporting grounds" are no better. Experienced sportsmen, however, will have no trouble in killing good bags of game there and in other sections of the Megantic District. "Come again and welcome" is our motto. STANSTEAD.

HUNTING IN GEORGIA.

COLUMBIA Co., Georgia, December 15th, 1875.

EDITOR FOREST AND STREAM:—

Far from the busy hum of city life, and twenty odd miles from the nearest railroad, it is with great pleasure I hail the coming of Thursday, our mail day, and the advent of your welcome paper. I have imposed upon your good nature to ask what will remove the cap from a shell—Sturtevant, I think—the movable anvil breaking off in three per cent. at least of the shell before I can force the cap out. Another objection I find shooting a 10 gauge Powell gun, altered by Clarke & Sneider, of Baltimore, who by the way do most excellent work, is that my metal shells expanded from constant firing, so that out of sixty shells I have only twenty-three that I can force in my gun. I disagree most emphatically with your correspondents, who claim that American shells are as good as English, and for my own use, prefer Eley's brown paper shells to his green, or to any American shell, metal or paper. I have used my breech loader only one season, killing 127 quail, besides other game, but for long range, and when I am doubtful of my opponents marksmanship, I always take my old muzzle loader, disregarding the convenience of the former. Crimpers and creasers I have tried to no satisfaction, mucilage is my preference. I noticed your strictures upon the riding of American gentlemen; should not that have read northern gentlemen? We Southrons, are rather proud of that accomplishment, and I for one, now that I am crippled, refer you to the fact that I once won a hurdle race, during which one horse was killed and two riders thrown. I caught to know how, for I followed Stuart and Hampton through enough of Virginia and Maryland, and a small portion of Pennsylvania, to enlighten the most obtuse mind on the subject of equestrianism. As to fox hunting, I have always kept a pack of hounds numbering from five to fourteen, and catch a red fox occasionally; I have only bagged three this season, though my neighbors report several others. I claim neither fox or bird that I do not bag. I was amused at the Tribune's comments on the subject of fox hunting in this country. I suppose that in my county we average over two hundred foxes caught every season, and at least ten or fifteen planters, like myself, who keep hounds, but none of us ride to dogs like Englishmen; on the contrary, if we can ride hard enough to keep in hearing of our dogs without killing our horses, we consider that we have had a fine hunt. I caught a fox yesterday in one hour and five minutes, and by chance was in at the death. How many I lose this deponent saith not. It would take one mounted on a Pegasus to follow dogs over these gullies, rocky hills, and high rail fences. I am tempted to record the capture of a wild cat—the largest I ever saw—after a two hour's race. I thought she was some "cat" until I read in the columns of FOREST AND STREAM of one being captured measuring five feet; mine only went thirty three and three quarter inches in length, and nineteen in height.

JAREL.

[It is a misfortune inseparable from the use of the Sturtevant shell that an occasional anvil will break, but there is no reason why the metal shells should expand so as to be worthless if they fit the chamber of the gun properly in the first instance. If our correspondent will look again he will see that in the article on Fox Hunting we alluded only to this locality.—Ed.]

Sea and River Fishing.

FISH IN SEASON IN JANUARY.

SOUTHERN WATERS.

Pompano, *Trachinotus carolinus*. Grouper, *Epinephelus nigritus*, Drum (two species.) Family Sciaenidae—(black bass,) *Centropomus undulatus*. Kingfish, *Menticirrhus nebulosus*. Striped Bass or Rockfish, *Roccus lineatus*. Sea Bass, *Sciaenops ocellatus*. Tailorfish, *Pomatomus saltatrix*. Sheephead, *Archosargus probatocephalus*. Black bass, *Micropterus salmoides*; Snapper, *Lutjanus caxus*. *M. nigricans*.

FISH IN MARKET.—The supply of fish during the week has been abundant. Two steam smacks are now engaged in making daily trips to the codfish grounds outside Sandy Hook, but the experiment is, as yet, too young to enable an opinion to be formed as to its ultimate success. Striped bass, from Delaware, are worth 25 cents per pound; smelts, from Maine, 15 to 20 cents; blue-fish, 15 cents; salmon, frozen, 50 cents; mackerel, 20 cents each; shad, 50 cents to \$1.50 each, the former price being for the Savannah fish, and the latter for those caught in North Carolina waters; white perch, 18 cents; Spanish mackerel, 50 cents; frost fish, 8 cents; halibut, 25 cents; haddock, 8 cents; codfish, 8 to 10 cents; black fish, 15 cents; flounders, 12 cents; eels, 16 to 18 cents; sheephead, 35 cents; white fish, 18 cents; pickerel, 18 cents; sunfish, 10 cents; yellow perch, 10 cents; salmon trout, 20 cents; ciscoes, 10 cents; pompano, \$1; green turtle, 25 cents; terrapin, \$12 per dozen; lobsters, 10 to 12 cents per pound; scollops, \$1.25 per gallon; soft clams, 30 to 60 cents per 100; hard-shell crabs, \$4 per 100; soft, do., 75 cents per dozen.

—It is a great saving of expense to our Long Island whalers when they can simply launch out on the adjacent waters and capture forty-barrel whales. On Wednesday of last week a large right whale of this yielding capacity was caught off Southampton.

MASKINONGE.—A superb specimen of this noble fish, the monarch of the pike family, tipping the beam at forty pounds, was received at this office on Monday last, from Mr. Joseph A. Davenport, of Davenport, Iowa. The fish was taken in the Wapsie, a tributary of the Father of Waters, the Mississippi, near its confluence, twenty miles above Davenport. The experts assembled in our office, book in hand, claim it to be a genuine maskinonge.—*Turf, Field and Farm*.

MOVEMENTS OF THE FISHING FLEET.—There has been quite an addition to the La Hayre Bank fleet, and it now numbers forty-five vessels. The first arrival from there this season was schooner David Sherman on Monday, bringing in 60,000 pounds of codfish and 4,000 pounds of halibut. The latter sold for 19½, and 13½ for white and gray. The Tragabigzanda arrived yesterday with 10,000 pounds of codfish and 2,500 pounds of halibut. The latter sold for 16 and 12 cents. There have been five arrivals from Newfoundland with frozen herring, and now that the weather has become colder the prospect of the fleet is much enhanced.—*Cape Ann Advertiser*, January 14th.

THE GODBOUT SALMON SCORES.—The strictures of our correspondent "Littell," in a recent number of this paper, upon the published salmon scores of the Godbout River, in Canada, have evoked some distinguished testimony in

verification thereof, which we print below. If "Littell" be not convinced by this written testimony of two such credible witnesses as Allan Gilmour and the Dominion Fishery Commissioner, then we can only pity his unbelief as past all hope. He is a more obdurate doubter than the disciple Thomas, who, we may presume, was unable to account for the "miraculous draft of fishes," until the catch was made plain to his comprehension. Moreover, in addition to their very lucid exposition of the conditions which make these remarkable scores intelligible as well as practicable, we have a duplicate of the casting line in use, which Mr. Gilmour was considerate enough to forward to us by mail. Never have we seen a single gut of such quality and strength. The fly is dressed upon a double hook, which, once fairly fixed into the jaw of a fish, will be likely to stay there. With a Castle Connell or Forrest rod—far more ponderous implements than the bamboo rods used by our experts on this side of the border; with a gut that will lift ten pounds of dead weight; with a pool favorable for play, and a scientific angler to handle the captive; and with a shelving beach where the fish can readily be run ashore and landed without a gaff—we can easily conceive the possibility of the exploits related. Neither do we gainsay the assertion or the fact that salmon of the weight indicated can be killed in ten minutes, one after the other, as fast as they are struck. In rivers where fish are so abundant that fifty or more can be taken in a single day with a rod, the loss of a fish is trivial. Ill luck can be retrieved immediately. The tactics to be then employed are quick and hard work, and no play. The fish are not to be handled tenderly until they gradually succumb from exhaustion, as would be the policy if fish were scarce, and the loss of a single one to be deplored. The battle must be sharp and decisive, with the whole power of the rod exerted from first to last. No matter if the hook tear out. It were better so than to waste an hour in cautious handling of a fish insecurely hooked, only to lose him in the end. Fish are plenty; we have merely to cast again, and a speedy rise will reward the effort. This is the philosophy and the secret of big scores.

OTTAWA, Canada, January 10th, 1876.

EDITOR FOREST AND STREAM:—

In FOREST AND STREAM of the 6th inst., I observed a communication over the signature of "Littell," with the heading "Prodigious Salmon Fishing," in which the writer expressed his views rather dogmatically on the subject of salmon fishing, while at the same time asserting that the statements of Salmon Fishing on the Godbout, which have appeared at different times in FOREST AND STREAM, could not be correct. It appears that "Littell," in FOREST AND STREAM some time ago, asked for an explanation of my big score of forty-six salmon, (on 10th July, 1865), but I did not happen to see his communication, and so it passed unanswered. What I have now to say is, that I caught that number of salmon of the aggregate weight of 426 pounds on the day above named—all in what is known as the Upper Pool on the Godbout—that I commenced fishing at half past six in the morning and fished steadily till half past twelve—when I stopped half an hour for lunch—and had then thirty salmon ashore. I afterwards fished pretty steadily until about half past seven, during which time I caught and landed sixteen more, making in all the forty-six of that day. And I may add, that as the fish were still taking, though not very freely, I might, had I continued, have made that day's sport up to fifty. But I felt quite satisfied with what I had done, believing, indeed, that I had made the largest day's salmon fishing on record, or off it. I was, besides, somewhat fatigued, and having about two miles to walk back to our cabins, over a hilly and then bad pathway, I concluded that discretion under such circumstances was the better part of valor, and so left off and beat a retreat, though as I then thought, and still do, not from an inglorious field. Now, as to the time required to play out a salmon of say up to eleven or twelve pounds, it can be done frequently in three minutes and need not, nor seldom does it take experienced fishermen with us, over five minutes. Larger salmon will, of course, take longer time, somewhat in proportion to size, though not always so; and with twenty to twenty-six pounds—about the largest found on the Godbout—from fifteen to forty-five minutes is about the range of time required to bring them to gaff. And now, when I have got such skeptics as "Littell" to deal with, and hope to convert, it may be well to give a few more facts. On one occasion in fishing on the Godbout (at the same pool above referred to), having let my experienced gaffman go with a young fisherman and taken his gaffman, rather a novice also, I determined to give him as little to do as possible, and on that day caught and landed twenty-two salmon running from nine to twelve pounds, twenty-one of which I beached with the rod and line, and only one was landed with the gaff. "Littell," and very likely many others, may wish to know what tackle we use in what it seems to him are such impossible feats. We use rods of Forrest & Sons; Kelso on the Tweed, Scotland; length mostly eighteen and a half feet; silk lines, one hundred to one hundred and twenty yards in length, to which is attached a treble gut casting line of about nine feet, and to that a single gut casting line of about five feet in length. The flies we use are also nearly altogether on single gut, which we much prefer, getting, of course, the very best we can, and which will lift a dead weight of eight or ten pounds, and some even more. In regard to "Littell's" remarks respecting the fishing by the river guardian (in 1874), I may state that it was by permission of the lessees, who that season fished only eight full days, and it was after they had left the river that the guardian fished, as may be seen on reference to FOREST AND STREAM of 23d December last. And further that the lessees may safely be trusted to protect their own interests in allowing no fishing that would lessen the supply of salmon so as to impair the magnificent sport with the rod which the Godbout has for years heretofore supplied.

This communication will, I dare say, be found long enough for the present, and so thinking I will close, with the assurance that the guardian's fishing on the Godbout to which "Littell" referred may be accepted as perfectly reliable, and quite as correct as that for which I can and now vouch as of my own experience; while free to admit in both cases very exceptional pieces of good luck—pretty well availed of—as they should have been when so unlikely to present themselves often in the lifetime of any fisherman.

ALLAN GILMOUR.

OTTAWA, January 8th, 1876.

EDITOR FOREST AND STREAM:—

Your quasi endorsement of "Littell's" unbelief calls me out in support of the authenticity of my friend Mr. Gilmour's scores on the river Godbout. Already you know my humble views in favor of genuine sport as contradistinguished from mere slaughter, and can therefore understand that in relating some earlier experiences of my own, I make no boast of them, and do not wish even to excuse them in the light of later knowledge. My sole object is to show, by personal trial, the probability of these questioned scores being feasible; by their accuracy is amply vouched for by the practical ability and honorable character of Mr. Gilmour, who is known to be a most accomplished salmon fisher, and in every respect a high minded sportsman. Several years ago, when fishing at river Moisie, I undertook, for a small bet, to "hook," "play,"

"gaff," and "land" nine salmon, from a birch bark canoe, the whole operation to be performed alone within the time between 9 A. M., and luncheon at 1 P. M. Please remember that to accomplish this undertaking I was obliged to pole my canoe into a swift current, and either hold her there with a setting pole, or anchor her by means of a slung stone at the bow, attached to a line passing through an auger hole in a piece of flattened wood projecting out beyond the bow like a bowsprit, and running under the cross bars down to the stern where it was looped or held in my teeth for the anchor to be let slip, or hauled atrip at will. Then, after hooking each salmon and recovering my anchor, the canoe had to be steered, towed, or drifted about till it reached one of three landing places, distant respectively, two, five, and eight hundred yards from the fishing pools. The rod used was a spliced greenheart 18 feet long, made by Enright, of Castle Connel. My canoe was about the same length. At 12:45 I had secured eight splendid fish, and hurried back to complete my task. Naturally, on anchoring the canoe, I struck the ninth salmon, and whilst regaining my anchor line the canoe swung across the current, and the fish rushing towards me, swiftly as an arrow, leaped clear out of the water and tumbled into the canoe. The tangling and confusion which ensued can be imagined. I cut the casting line as soon as it could be reached, and hastened to rig a fresh cast; but time was cried before another fish could be struck. Two of the canoeemen (Hoffman's), belonging to the party, and Mr. Robinson, their steward, at the Parker House, Boston, and who hung out the luncheon signal when time was up, are, I think, the only living witnesses to this occurrence. These nine fish averaged 16½ pounds each. About four years since, at the same place, fishing from a small birch canoe, I killed a fine, fresh run and vigorous fish, weighing 23 pounds, on a toy rod of split bamboo, three ounces in weight, with a light trout line of 40 yards, single trout gut and miniature fly, the operation lasting about three-fourths of an hour. The tackle belonged to Mr. Reid, of Boston; Mr. Turnel, of Hamilton, Ont., and Mr. John Brown, of Brooklyn were present.

On another occasion, in the river St. John, near Mingan, I killed in one forenoon 20 salmon, the smallest of which weighed 17 pounds, and the largest 27 pounds. In the afternoon of the same day, Mr. Watt, of Montreal, killed fifteen more, all from one cast called "Whitcher's Hole." This work was done from a birch canoe with the aid of one man. Being better acquainted with the cast, and more accustomed to the canoe, I could easily have killed double his number. But having fished all the forenoon with my left hand only, the other arm being disabled and in a sling, gladly surrendered to my companion. We had to run backwards and forwards through a sharp rapid between the fishing pool and the gaffing ground.

Now these instances are convincing as to the feasibility of making "prodigious scores," particularly if we recollect that the localities named, and the circumstances of capture are so much more difficult than at the river Godbout. Here the fish were caught between a fall of several feet and a steep pitch, where the pool is situated in a bend of the river, formed by an extensive beach of gravel and boulders from which it is easy to cast, and where the fish can be quickly guided to the edge and gaffed. Probably not one in twenty would leave the pool, and a skillful gaffman ought often to land the fish almost as soon as hooked.

With reference to your correspondent's remark about a guardian fishing in such extensive style, I am pleased to say that on calling Mr. Gilmore's attention to the matter last season this indulgence was promptly withdrawn.

W. F. WHITCHER.

Yachting and Boating.

All communications from Secretaries and friends should be mailed no later than Monday in each week.

BROOKLYN YACHT CLUB.—This club held their annual meeting on Wednesday evening at their club rooms, the President, P. W. Ostrander in the chair. After the Treasurer's report had been received, the election of new members and officers was proceeded with. The following gentlemen were elected members of the club:—George L. Kingsland, yacht Alarm; Charles J. Osborne, yacht Dreadnaught; J. D. Smith, yacht Estelle; S. M. Mills, yacht Vesta; Edward P. Miller, yacht Cynthia; William Edgar Rodgers, Thomas Palmer, R. Eagan, G. M. Riley, R. Cornell White. The following gentlemen were elected officers:—Commodore, John S. Dickerson, schooner-yacht Madeleine; Vice Commodore, John B. Platt, schooner-yacht Clio; Rear Commodore, John G. Johnson, sloop Lizzie L.; President, P. W. Ostrander; Secretary, William T. Lee; Treasurer, Chauncey M. Felt; Measurer, John M. Sawyer; Assistant Secretary, George G. Dunning; Fleet Surgeon, Samuel Hall, M. D.; Judge Advocate, Hon. John Oakley. Trustees—Ex-Commodore Robt. Dillon, Commodore T. B. Asten, Henry S. Wood, and ex-Commodore M. T. Davidson. Committee on Membership—S. L. Blood, Samuel McElroy, and Wm. M. Ringwood. Regatta Committee—Barry Willard, Alonzo Slote, and William Bishop. Mr. John B. Norris offered a resolution for a special committee to meet a similar committee from the Atlantic Club to take measures for the consolidation of the two clubs. After remarks of ex-Commodore Dickerson, ex-Commodore Dillon, President Ostrander, and others, the question was taken, and by a rising vote the club was declared unanimous in favor of the appointment of this committee. The following gentlemen were appointed such committee: John B. Norris, M. T. Davidson, R. Dillon, B. Willard, Henry Hentz, R. Huntly, and Commodore Dickerson.

SEAWANHAKA YACHT CLUB.—This club held a meeting at Delmonico's on Wednesday of last week. Commodore Swan, in offering his third annual report, recommended that the annual regatta be held on June 26th instead of July 4th, owing to the Centennial celebration at Philadelphia. After the presentation of some of the prizes won last year, the following officers were then elected:—Commodore, Samuel J. Colgate; Vice Commodore, Rutherford Stuyvesant; Rear Commodore, Robert Center; Treasurer, Bayard L. Foulke; Secretary, Frederick De P. Foster; Chaplain, Rev. Wm. Irvine, D. D.; Fleet Surgeon, Dr. Coréy; Measurer, A. Cary Smith. Regatta Committee—M. Roosevelt Schuyler, James H. Elliott, Dr. L. DeForest Woodruff, C. Wyllis Betts, and Thomas S. Young, Jr. The following new members were elected:—G. W. Robins, Jr.; Timothy M. Cheesman, John R. Suydam, Walter L. Suydam, A. Floyd Delafield, Herman Oelrichs, Meyers Bayard Brown, and Robert C. Cornell.

ROYAL HALIFAX YACHT CLUB.—At a meeting of this club, held last week, it being the eighteenth annual one, the following officers were elected for the coming year:—

Commodore, Alex. H. Scott, Esq., (unanimously re-elected); Vice Commodore, John Pugh, Esq.; Rear Commodore, William Hebb, Esq.; Auditors, J. A. Grant, Esq., and A. Forsyth, Esq.; Secretary and Treasurer, C. C. Vaux, Esq.; Assistant Secretary, H. H. Groom, Esq. Sailing Committee—James Kerr, (re-elected); D. M. Story, Esq., Hon. Robert Robertson, J. Townsend, Esq., and Captain H. Langdon. House Committee, Flag Officers and Secretary—W. G. Wiswell, H. J. Marshall, and A. H. Hart, Esq. Measurers—D. McPherson and T. J. Bently, Esq.

—The third annual meeting of the Hudson River Yacht Club was held at their rooms, West Fifty-seventh street and North River, on Tuesday, Jan. 11th, when the following gentlemen were elected to serve as officers during the ensuing year:—John T. Lynch, Commodore; Robert Shaw, Vice Commodore; John J. Finn, Secretary; Joseph Stilger, Treasurer; John Klaus, Measurer; Adolph Joseph, Steward, and Richard V. Freeman, Edward Wilson, and Charles Frick, Trustees. A committee was appointed to prepare a set of engrossed resolutions to be presented to the retiring Commodore, Richard V. Freeman, for his services during the past two years.

ATLANTA BOAT CLUB.—On the evening of the 11th instant the members of this, the oldest club in American waters, held their twenty-ninth annual meeting at their club rooms, Village House, Arlington Square, when the following officers were chosen for 1876:—President, Geo. B. Deane, Jr.; 1st Vice President, Frederick H. Clark; 2d Vice President, Benjamin F. Kobbe; Secretary, J. T. Fryer; Treasurer, Henry S. Sprout; Financial Secretary, Edward S. Mills, Jr.; Captain, John H. Eustis; Lieutenant, George Roahr; Board of Trustees—Messrs. Martin V. B. Smith, Philip C. Benjamin, Charles Devoe, A. Byron Cross, and S. H. Noyes. The declination of R. Parker, Jr., to again be a candidate for the Presidency, was received with regret, but the members experience great satisfaction in the knowledge that their new chief officer, a gentleman who is most favorably known to the entire community, will ably sustain the Atlanta's ancient and honorable record—a record of nearly thirty years of boating history.

—The Pioneer Rowing Club, of Brooklyn, has just completed an elegant boat house on the water front at Third avenue and Thirty-fourth street, which is reached by Fort Hamilton cars. The building is replete with every convenience for the use of members, and the reception of the boats. The room in which the latter are kept is 60x25 feet; the reception room, 42x30 feet handsomely floored and wainscotted. The doorway, which is furnished with glass panels, and the French casement windows lead out on the balcony on the water-front, from which a fine view of the bay can be obtained. On the water-front, leading from the boat house, is a gangway communicating with the float from which the boats are launched. The structure is in fact furnished with every essential of a boating club, and is quite an ornament to the water-front on Gowanus Bay.

—The Meteor Boat Club, of Hoboken, have decided to row to Philadelphia about the 1st of July for the combined purpose of witnessing the celebration and taking part in any of the rowing events which may come off. They will row in a six-oared barge, and are now having a new one built for that purpose. The crew will be composed as follows:—Bow, William Hopkins; 2. R. A. Kammerer; 3. F. A. Gunther; 4. F. Miller; 5. L. Meyer; Stroke, F. W. Wolter. Substitutes, Messrs. Charles Eder and C. Miller. The crew will soon go in training.

—Mr. Thomas Hughes, in a private letter to B. Frank Rees, declines the position of umpire of the Rowing Association of American Colleges for 1876. He nevertheless says he prizes the honor very highly, and regrets his inability to accept the office.

THE INTERNATIONAL COLLEGE BOAT ROW.—*Bell's Life* has an article on the proposed race, in which it says that, owing to the late date at which the Henley regatta will probably be rowed this year, the English universities would find it impossible to get their crews to this country and in condition by the 19th of July. It says that our universities may take part in the international collegiate race, and also the international regatta at Philadelphia, is the wish of the whole country, but it will be necessary for our friends across the Atlantic to fix a later day. The international regatta at Philadelphia is fixed for the end of August. It is highly probable that England will be represented there by two or three crews independently of the Universities. Why not hold the collegiate race at the same regatta or within a few days of it? When the invitations from the New York Regatta Committee reached England all three of the Universities had separated for the Christmas vacation. At the resumption of the term the matter will be discussed, and even if the date of the proposed contest is changed, it is impossible to say what the decision will be; but as at present fixed, it will be impossible for either of the Universities to accept the invitation.

Rational Pastimes.

—At a meeting of journalists and others connected with the metropolitan daily and weekly journals, held in New York on January 14th, a Press Base Ball Club for the Centennial year was organized, and the following gentlemen connected with the *FOREST AND STREAM*, *Clipper*, *Herald*, *Times*, *World*, *Tribune*, *Sun*, *Frank Leslie's*, *Brooklyn Eagle*, were elected as officers and members of the club team for 1876: President, Mr. Henry Chadwick; Vice President, Mr. Samuel McKeever; Secretary and Treasurer, Mr. T. Bayard Brasher. The members of the team are Messrs. Howard Crosby, Charles Blodgett, J. H. Hamilton, B. Loughlin, T. B. Brasher, J. R. Carpenter, Al Martin, J. Rankin, and C. Joy. The club will open play at Prospect Park early in April, their practice days being Tuesdays and Fridays.

BILLIARDS.—M. H. Hewins is home again at Hartford, improved in health and twenty-five pounds heavier. . . . Michael Geary expects shortly to open a room with twenty tables, corner of Sixth and C streets, Washington, D. C. . . . H. W. Collender has a new table, which is pronounced by connoisseurs a marvel of beauty. . . . The formal opening of the Columbia Room, on Monday evening, was a grand affair. Slosson, Sexton, Garnier, and C. Dion gave exhibitions of their skill. . . . Joseph Garsbel, of Newark,

writes that he will play anybody in the State of New Jersey for \$250 a side. . . . Garnier has not yet accepted Cyrille Dion's challenge to play him for \$500 or \$1,000 a side. . . . A. R. Samuells, of Brooklyn, is happy over some Centennial scheme, the field of which is Philadelphia, but he won't divulge. . . . A tournament commenced at Fall River, Mass., Dec. 17th, at the Pocassett Hall. The entries are W. H. Briggs and J. B. Sullivan, of Fall River; A. W. Staples, Taunton; and W. R. Vance, New Bedford. Bristol county is expected to send one or two players. There are two cash prizes—\$30 to first and \$20 to second. . . . A. P. Rudolphe, of New York, and Edward Daniels, of Boston, are matched to play in the latter city on the 20th inst., Daniels receiving the odds of 150 in 600. . . . Joseph Dion has gone to Montreal on his annual visit, and will probably stop at Toronto during the tournament for the championship of the Dominion. . . . A youngster of fourteen is said to have "holed" forty-five balls without missing, lately, at Baltimore. . . . Daniel Strauss has made the celebrated French expert, Mons. M. Digne, an offer to visit this country. It is now probable that the Vignaux brothers, Digne, and Piot will arrive in this country about the same time. . . . Maurice Daly has been exhibiting at the Metropolitan Hall, Jacksonville, Fla. . . . An amateur tournament is in progress at the Union Square Rooms. The first prize will be a handsome gold medal. . . . Jerry McLaughlin receives a gold medal this week, emblematic of the championship of the Nautilus Boat Club. . . . Wm. McKay won the gold medal at the Dion brothers' rooms, given to the best amateur player at fifteen-ball pool. McKay liberally returned it to be contended for again in March. . . . Clarke E. Wilson has deposited \$50 as a preliminary stake, in reply to the challenge of Ned Bryan, of Providence, and selected Hartford and Boston as the cities to play in. . . . A. Verenesneckcockoff is the name of the billiard man at the Grand Hotel, Cincinnati.

CARTER VS. SHAW.—The Adelphia Theatre, at Toledo, Ohio, on the night of January 7th, was the scene of a very exciting match between Louis Shaw, of Indianapolis, and Eugene Carter, of Toledo. The contest was brought about by the result of a former one played in the same city Dec. 17th, where the Ohio champion was beaten by Shaw 89 points in 500. On the night in question the game was the same—three-ball, 500 points up, for a stake of \$500. Shaw, as at the previous game, had it all his own way from the start, winning with a majority of 189. Score—Shaw, 500; Carter, 311. Averages—Shaw, 15.5 33; Carter, 9.14-33. Best runs—Shaw, 108; Carter, 89. Referee, Joseph Caspar, Norwalk, Ohio. Marker, W. B. Burnham. Time, 2 hours, 30 minutes.

Answers To Correspondents.

No Notice Taken of Anonymous Communications.

SPINNER, Trenton.—What kind of hooks shall I use for sea fishing in Florida? Ans. The Chestertown hooks are highly recommended by Dr. Kenworthy, our correspondent. They can be bought of Abbey & Imbrie, 48 Maiden Lane, and presumably of other tackle dealers.

GREEN HORN, N. Y.—I would like to get a berth on some smack to go fishing; having no acquaintances in the business, I don't know to whom to apply for such a berth, so I ask the benefit of your knowledge how to proceed? Ans. Call on Mr. E. G. Blackford, Fulton Market.

W. H. K. Ronseville, Venango Co., Pa.—Please give me the names of breeders of beagle hounds; want one for running rabbits. Ans. S. Bestor, of Hartford, Conn., L. R. Handerson, of Vergennes, Vt., or W. A. Leonard, Ferrisburg, Vt., will tell you all about beagles.

J. E. S., Phila.—Messrs. E. K. Tryon, Jr. & Co., No. 19 North Sixth street, Philadelphia, are agents in that city for the Oriental Powder Co. In his inquiry about a gunsmith in Boston City named Ponks he probably means Mr. Joseph Tonks, No. 45 Union street. His reputation is A No. 1.

G. A. Jackson.—I have a very valuable hound that is constantly shaking his head, and when walking around holds his head over on one side. Please tell me what to do for him, and oblige. Ans. Your hound has canker. Wash his ears with Castile soap, and pour into a weak solution of blue vitrol, four grains to an ounce of water.

H. P. E., Salina, Kansas.—I have a fine pair of setter puppies, say ten months old, affected far inside the ear with innumerable small lice or parasites about the size of grains of ordinary ground pepper, perfectly white, which crawl rapidly about in the ears. The dogs seem to hear well, and apparently are not troubled by the affection. Ears slightly inflamed and offensive. Ans. Rub a little red precipitate ointment or mercurial ointment upon the parts affected.

B. G. D., Galveston, Texas.—1. What American make and size of gunpowder corresponds nearest in size of grain and shooting qualities with Curtis & Harvey's No. 6? 2. What is the cost of Curtis & Harvey's powder in New York compared with similar American powder of the best brand? Ans. 1. Dupont's No. 1, and Orange Lightning No. 6 correspond with Curtis & Harvey's No. 6. 2. The price of Curtis & Harvey's powder in New York is \$1.50 per pound. We consider it about equal to the best American brands.

MERCUTIO, Alleghany City.—I am about to buy a fine high priced English breech-loading shot gun. Should I have it delivered in London, and a friend should shoot it while there and leave it uncleaned, could he bring it over for me free of duty, or would he have to make affidavit that it is for his own private use. In other words, does it make any difference whether it is for his own use or mine so long as it is not for sale? Ans. You could pass a gun in for yourself, but under the existing mode of entering personal effects it would be difficult for a friend to do it for you.

W. E. S., Boston.—1. Can you give me the "regulation rules" for accurate testing of guns as to pattern and penetration? 2. Where can I find a detailed report of the London Gun Trial of 1875? 3. Have any important results followed the introduction of the English "chilled" shot? Ans. 1. There are no "regulation rules," the test used in the Field trial being a certain number of shots at a Pettit pad 30 inches in diameter, distance, 40 yards, 1½ ounces No. 6 shot, no restrictions as to powder. 2. A detailed report of this trial was published in the *Turf, Field and Farm* of Dec. 13, 1875. 3. Not in this country, where its use is still limited. Better penetration is claimed for it in England, and it was used in the winning guns at the Field trial.

ALFRED, Norfolk, V.—Please give me the following information in regard to coot shooting. 1. Is it necessary to conceal the boat with bushes or straw; if so, which is preferable? 2. Do you place the decoys to windward or to leeward, and how many decoys are generally used? 3. Is it necessary to have coot decoys, or will those used for black duck, widgeon, &c., answer? Ans. 1. It is not usual to cover the boat, and the bushes and straw would soon be washed off. 2. The decoys should be anchored so as to head towards the boat, if more than one person is shooting, on her beam. A buoy should be attached to the anchor rope so that the boat could be used readily for picking up the dead and criples. 3. Black duck decoys will answer. For further information regarding coot shooting, see pages 247, 283, 315, 316, 326, 332, and 333 of our vol. III.

A discount of twenty-five per cent. allowed for five copies and upwards.

Advertising Rates.

In regular advertising columns, nonpareil type, 12 lines to the inch, 25 cents per line. Advertisements on outside page, 40 cents per line. Reading notices, 50 cents per line. Advertisements in double column 25 per cent. extra. Where advertisements are inserted over 1 month, a discount of 10 per cent. will be made; over three months, 20 per cent.; over six months, 30 per cent.

NEW YORK, THURSDAY, JANUARY 20, 1876.

To Correspondents.

All communications whatever, whether relating to business or literary correspondence, must be addressed to THE FOREST AND STREAM PUBLISHING COMPANY. Personal or private letters of course excepted.

All communications intended for publication must be accompanied with real name, as a guaranty of good faith. Names will not be published if objection be made. No anonymous contributions will be regarded.

Articles relating to any topic within the scope of this paper are solicited. We cannot promise to return rejected manuscripts.

Secretaries of Clubs and Associations are urged to favor us with brief notes of their movements and transactions, as it is the aim of this paper to become a medium of useful and reliable information between gentlemen sportsmen from one end of the country to the other; and they will find our columns a desirable medium for advertising announcements.

The Publishers of FOREST AND STREAM aim to merit and secure the patronage and countenance of that portion of the community whose refined intelligence enables them to properly appreciate and enjoy all that is beautiful in Nature. It will pander to no depraved tastes, nor pervert the legitimate sports of land and water to those base uses which always tend to make them unpopular with the virtuous and good. No advertisement or business notice of an immoral character will be received on any terms; and nothing will be admitted to any department of the paper that may not be read with propriety in the home circle.

We cannot be responsible for the dereliction of the mail service, if money remitted to us is lost.

Advertisements should be sent in by Saturday of each week, if possible.

CHARLES HALLOCK, Editor.

WILLIAM C. HARRIS, Business Manager.

THE INTER-COLLEGIATE RIFLE MATCH.

THE interest in rifle shooting, which culminated last year with the victories of the American Team abroad, remains unabated. Indeed, it is probable that during this Centennial year many matches will be shot in this country which are likely to awaken an enthusiasm but little, if any, short of that which greeted the news from Dollymount. The avowed intention of Sir Henry Halford to visit us with his picked team of British riflemen, the selection of a range near Philadelphia, and the increase—a notable feature in itself—of galleries for short range shooting, the schools for riflemen, all indicate that during the coming season there will be fifty crack shots where one could be found two years ago.

Among the most important matches of the year will be the Inter-Collegiate match, for which this paper donates a valuable piece of plate, or work of art, as a prize, and we are pleased to note the interest with which our proposition has been received, both by the colleges and the press. The *Syracuse Standard*, a paper which has done much to further the rifle movement, thinks that "a military organization in every college in the country, which should teach its members the rudiments of tactics, would be a good and useful thing, and perhaps such an organization, which some feeble and fitful efforts have been made by Government to provide, can only be maintained under the pressure of emulation, which college rifle matches furnish." Some years since a bill was passed detailing an officer of the army to each college to instruct the students in tactics, but we believe nothing ever came of it. At the South, however, in many of the colleges, such as that at Lexington, Va., William and Mary, and others, there has always been a certain amount of military instruction, the result of which, perhaps, made itself felt in the late war. And, after all, what is West Point but a college in which military drill and discipline are preëminent. On the present occasion, however, we are not arguing for a military course in our colleges generally, but for the formation of rifle clubs, the result of which will be as productive of recreation and permanent benefit as boating, without the risks of training. The journal before alluded to gives the following interesting description of the English college and public school matches:—

"Public school matches are among the most popular of the many team competitions at Wimbledon, England. There are on the programme there, four collegiate matches,

and in all these matches military rifles are called for. The Chancellor's Challenge Plate was instituted in 1862, within two years after the establishment of the English National Rifle Association. The plate was given by the Duke of Devonshire and by the late Earl of Derby for annual competition between the volunteers of the Oxford and Cambridge University Corps. There are eight competitions on each side. The distances fired over are 200, 500, and 600 yards, seven shots each. From 1862 to 1870 inclusive the long Eufield was required, but now the three-groove long Snider, of 577 bore, is called for. The Chancellor's Plate is fought for by teams of eight from each university. The great interest, however, centres about the Ashburton Challenge Shield, competitors restricted to public schools having enrolled or unenrolled volunteer corps. The trophy was given in 1871 by Lord Ashburton, and has been competed for with much spirit ever since. Each school sends eleven representatives, who fire seven shots at 200 and 500 yards. The rifles allowed are those in use at the school, provided they are of military pattern and employ the National Rifle Association ammunition. At 200 yards a standing and at 500 yards any position is permitted. Each "eleven" pays an entrance fee of \$5. The competition for many years lay between Eton, Rugby, and Harrow, but the other schools have come to the front and passed the old favorites. Marlborough, Winchester, Cheltenham, Rossall, Derby, and Charterhouse have all taken part. The competitors are dressed in neat uniforms. The winning schools have been: 1861, Rugby; 1862, Harrow; 1863, Eton; 1864, '67, Harrow; 1868, Eton; 1869 '70, Harrow; 1871-73, Winchester; 1874, Marlborough; 1875, Harrow. The Public Schools Veterans match was started in 1874 for the amusement of the 'old boys.' It is open to former pupils of the public schools, five men from each, firing at 200 yards, ten shots per man. Charterhouse and Westminster clubbed their force in 1875, and took the prize, six other schools competing. In 1867, with seven teams in the match, Rugby lead with 217 points to the possible 250. The rifle used is the Snider, and the prizes are a silver N. R. A. tankard to each member of the successful squad."

There are various ways in which the Inter-Collegiate match can be assisted by those who are more particularly interested in the colleges themselves. One is by the different alumni offering small prizes, such as badges to be shot for by the clubs, either in the competitions for places on the team which is to represent the college in the match, or in general practice. Something of this kind to arouse a spirit of emulation is necessary. Had it not been for the prizes offered by the N. R. A. at Creedmoor, the Amateur Rifle Club never would have produced an American Team. The Faculty of each college should also be interested, and upon their application the Government would undoubtedly issue the requisite number of Springfield rifles; or the various State authorities would provide the State arms. Gen. Townsend, the Adjutant General of this State, than whom no one is more interested in rifle practice, would probably interest himself also in this match, and we have no doubt that an application to him would meet with immediate response. In fact, it is to Gen. Townsend that we are mainly indebted for Creedmoor. It was upon his fiat that the question of the purchase rested, and the result of his far-sightedness is the magnificent record of our riflemen. Maine has already furnished one hundred breech-loading rifles of the regulation pattern, for the use of the students of the State College at Orono, in their military drill. Prof. Chaplin is an accomplished drill master, and the students are very proficient in military tactics.

That some of our colleges have taken hold of the subject of this match energetically there can be no doubt, and we hear of the college rifle clubs looking around among their graduates for suitable men to coach them. Columbia claims Col. Gildersleeve, and Williams will probably call on Mr. Orange Judd, one of our most practical riflemen and expert shots. Other able men will, no doubt, appear in due time. With regard to the prize to be shot for, we are as yet undecided between a solid silver tankard, or a work of art, such as an antique or bronze. We are inclined to the latter, as it will not require to be locked in a safe every night, or be a constant source of anxiety to the owner. We propose that the value of this prize shall be in the neighborhood of Five Hundred Dollars.

We have another proposition to make to collegians in this connection which may be worthy of their attention. To the college rifle club, a member of which will furnish us with the best appropriate design for a vase, or shield, we will present a gold badge, to be shot for among themselves; said design to be engraved and printed in this paper as soon as accepted, due credit being given to the designer.

We shall be glad if the officers of college clubs already formed will put themselves in communication with us, as there are many points in the programme, as yet only outlined, which may require alteration to meet unforeseen contingencies. College authorities generally have been so liberal in boating and other matches that we feel certain of their support in a project which promises all of the *eclat* without some of the drawbacks of other Inter-Collegiate contests. The rivalry in rifle shooting appears to be of a more generous nature than that which accompanies most trials of skill or strength. Proficiency also becomes, as it were, a benefit to the whole community, instead of to the individual alone, and the man who may lack the lungs or muscles to excel as a sculler or an athlete, may yet feel all the joys of victory by cultivating his eye and nerve.

A POCKET PIPE PICK.—Messrs. Walker & Welch, of Buffalo, are manufacturing a little article which will be found of service by all smokers. This combines a pick and spoon for cleansing the pipe, and a stopper or press that is much handier for pressing down the tobacco than the finger. It is pretty to look at, and cheap, too—only costs fifty cents.

THE BRIGHTON AQUARIUM.

TRUTH is stranger than fiction. It would be only another version of this familiar maxim to say that the domain of science and nature is more wonderful than the realms of the imagination. A visit to the Brighton Aquarium shows that all one has ever read in fiction or romance of the mysteries that "the deep unfathomed caves of ocean bear" is a truthful story. There one realizes that the fanciful pictures of Victor Hugo or Jules Verne are only photographs from nature. There one is enabled to visit comfortably, and without putting on a Boyton's patent diving dress, even without an umbrella—perhaps the only place in England that one can go without it—the mysterious chambers of Davy Jones' Locker, and return from that bourne alive and with dry clothes. But it was my intention to give you only some practical information about this magnificent aquarium, which ought to rank as one of the wonders of the world.

As long ago as 1866 the Brighton Aquarium was proposed by Mr. E. Birch its engineer, he having seen a similar, but much smaller one at Boulogne. It is now the largest one in the world. But it was not until the autumn of 1869 that the work was entered upon. At Easter, 1872, it was provisionally opened, and in August of that year it was inaugurated with great ceremony on the occasion of the meeting of the British Association of Science at Brighton. Distinguished personages from the four quarters of the globe were present, including the ex-Emperor and Empress of the French, the King and Queen of the Belgians, the Japanese Embassadors, the Nawab of Bengal, the Patriarch of Antioch, the Bishop of Jerusalem, and many others, showing the great interest that was taken in this novel enterprise. The aquarium is situated close to the chain pier at the end of the Marine Parade, or fashionable drive and promenade of Brighton, and is sunk much below the natural surface of the ground. Entering at the western end, through a beautiful gateway of Oriental architecture, above which is a tower with an illuminated clock, the visitor finds himself at the top of a flight of granite steps twenty feet in width, leading to the entrance court sixty feet by forty feet. The front elevation of the building is eighteen feet high, and consists of five arches with terra cotta columns and enrichments. On the frieze round the sides is this appropriate inscription. "And God said let the waters bring forth abundantly the moving creatures that hath life." From this outer court the entrance hall, which is eighty feet by forty-five feet, is approached through three doors. This hall is furnished with reading tables, and is supplied with the serials, journals, and telegrams of the day.

The first sensation on entering this beautiful and spacious hall is the silence that pervades the place. All the familiar noises of the upper world have ceased. Long vistas stretch before the eye, walled by the pale green water of the sea, ending in rocky grottoes and cascades. To increase the bewilderment, strains of distant music fall on the ear, and at intervals the sharp bark of the sea lion is heard, and were it not for the presence of a few visitors sitting about in this entrance hall, prosaically reading the newspapers, one might imagine he had suddenly plunged into the realms of old Neptune. The architecture of the interior may be said to be a composition of Italian and Oceanic. Strong iron columns support the structure, but there are many other columns of terra cotta, whose capitals are moulded with figures of mermaids, Naiads, dolphins, etc., and friezes and bands of shells and coral run around the sides. The roof is constructed of variegated bricks, is grained, and rests upon columns of Bath stone, serpentine, marble and Scotch granite. On each side of the main corridors the tanks, forty-one in number, are placed. These vary in size from forty to one hundred feet in height. The largest holds 110,000 gallons of sea water. The plate glass of the front is one inch in thickness. The sides and back of the tanks are formed of artificial rockwork, but looking wonderfully real with its overgrowth of mosses, shells, and aquatic plants. The bottom is covered with fine clean gravel. The light to the tanks is admitted from above, and is so disposed that the fish cannot see the spectator, and therefore is not disturbed by his presence. The funny prisoner rests or swims near the glass wholly unconscious of the observation and criticism that he is undergoing, so that one sees the fish as he appears at his own fireside, so to speak. Thus a big cod-fish, or a huge conger eel comes swimming toward you as you stand looking into his tank, working his mouth in a most ominous manner, as if he was hungry and had pre-daceous designs on the end of your nose, when, in fact, he is not aware of its inviting proximity. Owing to the arrangement of the light, and partly to the obscurity of the water, there is a deceptive appearance of vastness to the tanks. They are in reality about ten feet from front to rear, the rockwork drawing to a point at the back, but to the looker on they seem like the vast and mysterious caves of the ocean. The tanks are lighted by gas at night, by jets suspended over the water. At the end of the eastern corridor is a large conservatory, one side of which is composed of artistic rockwork, a fernery, and a picturesque cascade. Here, also, the band plays at times during the day. On one side of this conservatory is a large open tank in the floor, now devoted to seals, and on the other side are six octagonal tables, of elegant design, for the exhibition of some of the smaller and more rare marine animals; and at the eastern extremity apparatus showing the hatching and development of salmon and trout. In another place are a series of microscopes, under which are placed

minute forms of marine life for observation. Just now the eggs of the octopus, or devil fish, may be seen in the various stages of incubation. And I may say here that the octopus is now one of the leading attractions, or "star performers" of the aquarium. The specimens here were taken off the coast of Jersey, and, therefore, may be supposed to be the little brothers of that giant devil fish which figures so largely in Victor Hugo's "Toilers of the Sea." In fact, Victor Hugo made the fortune of the octopus. But for him this marine curiosity might have dwelt in obscurity until now. The keeper kindly fed some of them for my benefit. Small crabs were dropped into the tank, and the little victims came tripping down through the water in their sidelong fashion, dancing to their horrid doom. As soon as the devil fish espied the crab he unfolded and stretched out his horrible arms, drew it under his body, and sucked out its life. It was a sickening sight. The specimens here are not very large, their bodies being about the size of a man's fist, and their arms would stretch perhaps two feet across. One of these devil fish, placed in one of the octagonal vases for better inspection, sometimes escapes at night through the meshes of the wire netting over the top, a space only two inches wide. This would seem to be impossible, but the fact that these fish have only one bone in their bodies—it is in the head—and that one about the size of a nickle, explains how it may happen. The night watchman in his midnight rounds stumbles over something on the floor, stoops and picks up—a devil fish! The sea water is pumped by a steam engine directly from the sea into reservoirs constructed under the floor of the building, and thence conveyed to the tanks through pottery pipes by the same means. These reservoirs are capable of holding 500,000 gallons of water, which quantity can be pumped from the sea in about ten hours. The water in the tanks is constantly aerated and kept in motion by a stream of compressed air, supplied to the bottom of tanks through glass or rubber tubes. The circulation thus afforded is found to be preferable to the more costly system of pumping adopted by other aquaria, as it allows each tank to be heated independently of its neighbors. The whole of the tanks, forty-one in number, are numbered consecutively, and at the side is given the popular names of the fish, plants and zoöphytes which each contains.

I cannot attempt to enumerate here all the various fish and marine plants that this great aquarium contains. Some large tanks are given up to the zoöphytes, anemones, jelly fish, corals, sponges, and the like, of which there are most beautiful specimens. I saw a lovely tree coral from the Red Sea, and some of the beds of anemones look like a rich pasture of flowers.

And here were coral-bowers,
And grots of madrepores,
And banks of sponge, as soft and fair to eye
As e'er was mossy bed
Whereon the wood-nymphs lie
With languid limbs in summer's sultry hours.
Here too were living flowers,
Which, like a bud compacted,
Their purple cups contracted,
And now, in open blossom spread,
Stretched, like green anthers, many a seeking head.
And arborets of jointed stone were there,
And plants of fibres fine as silkworm's thread;
Yea, beautiful as mermaid's golden hair
Upon the waves disspread.
Others that, like the broad banana growing,
Raised their long wrinkled leaves of purple hue,
Like streamers wide outflowing.—*Kehama, vii., 5.*

The most attractive and popular feature to the aquarium just now is the sea lions from California. They are two young ones, and were received about a month ago, two others having died on the journey. They are about half-grown animals, and now seem to be very healthy. Excursion trains run down from London, bringing large crowds to see them. They are quite docile, even affectionate, towards their keeper when he enters their cage, uttering a sort of dog's bark of delight whenever he approaches them. They are fed upon herring several times each day. The department of crustacea, lobsters, prawn, shrimp, barnacles is very well represented, and the gentle ascidian, which, according to the evolutionists, was our early ancestor, is here to be seen struggling up—or down—into a member of Congress. The present curator of the aquarium, Mr. John Parnaby, formerly of the Trentdale fisheries in Cumberland County, is quite well known among our own fish culturists, having visited our country several years ago. I avail myself of this occasion to acknowledge his courtesy to me on my visit to the aquarium. He accompanied me throughout, showing me all its varied mechanism, and allowed some of the fish to be fed for my amusement. Mr. Parnaby is one of the best practical fish culturists in England. One of the most important facts connected with this enterprise is, that, as an investment of capital, it has proved a "good thing." Mark this, ye men of Wall street, it pays splendidly. The Brighton Aquarium was chartered by a special act of Parliament in 1868, and, therefore, does not require the inevitable word "limited" to be tacked to its title—with a capital of half a million dollars. It has paid ten per cent. to its stockholders, and the stock now stands at fifty per cent. premium in the market. The success of this one—the first in this country—has been so great that others are springing up, notably the Westminster Aquarium in London, near the Abbey of that name, which is to be on a very magnificent scale.

When it can be demonstrated that aquariums pay so handsomely as a financial scheme it is probable we shall soon see one in Central Park or Boston Common. The Brighton Company is enlarging and improving its property in many ways. The roof of the aquarium has hitherto been laid

out into a beautiful garden, replete with flowers and plants of every description, admitted to be the most delightful marine promenade on this coast, it being in full view of the sea; it is now undergoing a change. A large portion is to be converted into a skating rink, not of real ice, but of asphalt, to be used with the parlor skates, a kind of amusement that is very fashionable in England just now. A large café is to be fitted up on a portion of the roof for summer use. These extensive improvements involve a large outlay, and new stock has been issued to raise the money. This has been taken by the old stockholders, so that there is no question that such shows pay well in this country. The admission fee is one shilling. Shall we not soon see an aquarium like this in America? DRUID.

THE RUFFED GROUSE ON HER NEST.—The current number of the *Illustrated Sporting and Dramatic News* publishes an excellent cut of a ruffed grouse on her nest, the original of which we had the pleasure of forwarding to our contemporary for its use. We believe that this is the first instance on record of a game bird having been photographed from life during the process of incubation, and it is to the patience of the photographers—Messrs. A. C. McIntyre & Co., of Alexandria Bay, River St. Lawrence—that we are indebted for this interesting study.

While on this subject we should like to say a word commendatory of the enterprise of our contemporary, the *Illustrated Sporting and Dramatic News*. Putting the "dramatic" on one side as being a department upon which we do not feel ourselves qualified to judge, the rest of their paper corresponds exactly with our ideas of what a gentleman's sporting paper should be. We trust that, with the abundant patronage which is to be found in Great Britain, and from her widely-scattered sons, our contemporary is meeting with that meed of success which is due to honest enterprise and well-directed talents.

ART STUDIES FOR SPORTSMEN.—We had the pleasure, a few days ago, of a visit to the studio of Wakeman Holberton, the animal painter. Mr. Holberton, who is a sportsman, as well as an artist, devotes his time principally to painting game, fish, and dogs. His studies of black bass and brook trout are very faithfully rendered, and as life-like as a painter can make them. His last picture of dead game, now at the Union League Club, is remarkable for its round and feathery appearance, as well as being a charming bit of color. He also showed us several bright and sparkling water colors, which are to go to the coming Water Color Exhibition at the Academy of Design. Mr. Holberton complains that he receives very little encouragement from the wealthy sportsmen of the city, a class for whom his pictures are specially adapted. Abroad, animal painting rates very high; but here it seems to be little appreciated, and its difficulties little understood. It is to be hoped that some of our rich sportsmen will remember Mr. Holberton, and at least take the trouble to pay him a visit at his studio, 1193 Broadway, and see his work.

—Initiatory steps have been taken in Boston for the formation of an Alpine Club, whose central field of labor will be the White Mountains. Among the benefits to be derived from organized effort, it was suggested that much might be done in determining the altitudes and positions of various mountains, ascertaining facts relating to the animals and fauna of the high regions, in tracing glacial action, in arriving at some definite results in regard to the nomenclature of mountains where the same eminences were known by different names, or one or more mountains by the same name, in making unfrequented peaks more accessible, in preserving sketches and profiles of the mountains as seen from different points, in collecting maps and other data, and eventually in publishing important results which might be reached.

—Mr. Gardiner G. Hubbard, in his paper on the "Daily Press," read before the Social Science Association at Boston last week, shows how easy it is to start a journal in this country, and how difficult it is to keep it alive. The very few that succeed deserve all the credit that success commands. He says that, in 1840, there were in New York eighteen daily papers; since then, 113 new dailies have been started, but, after struggling for a while, most of them have ceased publication, leaving the same number of dailies in the English language now as in 1840. In London there are seven morning dailies, but only four of these have a substantial hold upon the public.

—Captain Paul Boyton, who has returned to his native waters, after his foreign exploits, has been experimenting in the East River, in presence of large crowds. The other day, when he jumped into the water off the Battery, he struck a current which must have reminded him of Cape Gris-Nez. Before he could reach the Brooklyn shore he was carried down the bay, and finally was picked up and carried to land by a row-boat.

—On January 14th the ice-boats Fly-Away and Snow-Bird, of the Capitoline Club, had a race for the club pennant on the Capitoline Lake, the Fly-Away winning the pennant. It is to be raced for again this week, morning being the time the ice-boats are sailed at the lake, as then the skaters are very few.

—Skating was largely enjoyed at the Capitoline Lake and Union Pond, Brooklyn, on January 15th, the weather being very specially auspicious for the eager sport on that day.

GAME PROTECTION.

INTERNATIONAL ASSOCIATION FOR PROTECTING GAME AND FISH.—The investigating committees of this important Association are making satisfactory and substantial progress. The Committee on Nomenclature is composed of Dr. Elliott Coues, chairman; Alexander Agassiz, Dr. J. L. LeConte, Profs. Theo. Gill and E. D. Cope, G. Brown Goode, and A. B. Lambertson. Their report is nearly complete, and when finished, will constitute one of the most valuable additions to the scientific knowledge of America. It will afford the long-needed formula for designating our species, so that the same shall be known and uniformly recognized in all States alike, and intelligent legislation be thus secured for their protection.

The Committee on the Habits and Distribution of Species is aided by auxiliary committees, among whom the work of examination is divided. These auxiliary committees comprise some one hundred and fifty competent observers resident in all sections of the United States and Canada, and are assigned to an examination of the following classes and species: FISH—Salmoïdes, Percoids, and other Northern fish not of the salmo family; Southern and coast fishes. Large mammals; small game animals. BIRDS—Gallinaceous; ducks and wild fowl; woodcock and migratory birds. In order to facilitate labor, the chairman of the Standing Committee has issued the following circular, which has been distributed. Any information that persons, not members of the Association, may desire to communicate, will be most thankfully received by Dr. Ellzey. The work sought to be accomplished is for the benefit of all, and all should take an active interest in it:—

OFFICE OF CHAIRMAN OF COMMITTEE
ON HABITS OF SPECIES, VA. AGRIC'L COLLEGE,
BLACKSBURG, Montgomery Co., Va., Jan. 1, 1876.

SIR:—The Committee hope to secure your active coöperation in furthering the objects of the Association.

The special duty of the Committee on Habits is to procure full information respecting certain points in the economy of each species, upon which to base intelligent, comprehensive, and effectual legislation for the protection of game quadrupeds, birds, and fishes.

Points upon which information is specially desirable are the following, among others:—

1. Character of the species, whether a resident, a Summer or Winter visitor, or a migrant; with dates of arrival and departure of such as are non-resident.
2. Time of pairing, laying, incubating, and rearing young.
3. Time when in proper condition to afford legitimate sport.
4. Principal or usual food of each species at different seasons.
5. Principal or usual resorts of each species at different seasons.
6. Peculiar or characteristic habits of each species at different seasons.
7. Comparative abundance of different species, now and formerly, with causes which have led to their increase or decrease in numbers.
8. List of the principal or usual game animals in each locality.
9. Any special points affecting the game interests of particular localities.

M. G. ELLZEY, M. D., Chairman.

—Speaking of the use of giant powder in California for killing fish, the *Santa Rosa Democrat* says:—

"Just now the salmon trout is on its travels to a spawning ground, which but few will reach. We are informed by an eye-witness that, after a single discharge of giant powder in Russian River, he counted twenty-seven large salmon with their bellies upward on the surface of the water, and a great number of larger fish of other varieties and innumerable smaller ones, which were left to rot along the bank. Austin Creek was once the finest stream in the State for trout. Giant powder has been exploded in its waters until the fish have been killed. In the Lagoon giant powder has been used, also in Mark West, and in the streams throughout the country. The destruction of fish has reached such an extent that it is absolutely necessary, to save any at all, that prompt and decided action be taken by the law-making power."

—The St. Paul (Minn.) *Pioneer-Press* prints a letter from Mr. R. Warner, President of the St. Paul Sportsman's Club, which corrects its statement that Judge Wilkin had declared the game law of that State unconstitutional, in that it took private property for public use without compensation, when it confiscated birds unlawfully shot and handed them over to charitable institutions. The writer says: "The suit has not been decided, nor has the law been declared unconstitutional, but the case will be tried at the next term of the District Court."

—The West Jersey Game Protective Society is now distributing game throughout the southern part of the State and stocking the streams with black bass and other game fish. To fish with a net in the streams so stocked for three years, renders the violator of the law subject to heavy penalties. The society has its agents, and intends to enforce the law.

TALLAHASSEE, Fla., January 7th, 1876.

EDITOR FOREST AND STREAM:—

I notice in a recent issue of your paper some apprehension expressed in reference to the new game law in this State. It is feared that it will operate to the prejudice and cause annoyance to the true sportsman among the visitors who annually pour into our State, as well as to the taxidermist or aviarist in search of specimens of our native birds for private or public museums.

A reasonable construction and enforcement of the law in question will not bring about the result you fear. Let me give you a summary of its provisions for the information of your readers:—

Section one provides that from and after the 1st of June, 1875, it shall be unlawful for any non-resident to hunt for game of any kind, for the purpose of conveying it, alive or dead, beyond the State's limits, without first obtaining a license from the clerk of the county in which he proposes to hunt. The license costs \$25; but six persons may hunt under one license by paying five dollars additional each.

Section two prescribes a penalty of not less than fifty nor more than five hundred dollars for a violation of the law—one-half to go to the informer.

Section three makes the drying, salting, canning, packing, or caging of the game killed or caught by a non-resident *prima facie* evidence of an intention to convey it beyond the State, and the *onus probandi* is thrown upon the accused.

Section four provides for the payment into the county school treasury of all monies arising under the act.

This is the sum and substance of the game law. It was introduced into the legislature, and its passage urged by members from the western section of the State, who complained that poachers and pretended sportsmen from Georgia and Alabama were in the habit of crossing the line and invading their cattle ranges to the great destruction of their stock, and it was thought that if these so-called hunters were compelled to go to the county sites and take out licenses, the publicity of the act would drive off many and restrain the balance from stock depredations. It looks like a curious way to reach such thieves, but still, in intelligent hands, there need be no trouble in the law to honest men. It is true, the first section is loosely worded, and the statute is deficient in that it does not contain a plain exception, so that the most blundering officer could not err in reference to the true sportsman, who bags his game for the true pleasure it gives him, and the taxidermist in search of those *rara aves* with which Florida abounds. As the law is, there is some fear that ignorant officials in the backwoods may give the stranger some trouble; and there are those here who will endeavor to secure a modification of the law at the next session of the legislature. But that is twelve months off, as Florida has got so poor under carpet-bag rule that she can only afford biennial sessions of this august body.

RESIDENT.

TWIN LAKES, Conn., January, 1876.

EDITOR FOREST AND STREAM:—

Fished to death is the cry constantly going up from all places where fish were once caught in abundance. By way of emphasis, not less than twenty different parties were out on the two lakes near which I write; three on Waushining, and seventeen on Waushinee. On the former the pickerel and perch were of a fair size; but on the other it is known that the average catch is about five to the pound; and the question is, how long will there be any fish left to catch? And another question comes up as to the wholesale destruction of bait fish, "shiners," "scup," &c., in our lakes and small streams. Thousands are scooped out too small for bait, and left on the ice to die, instead of being returned to the water; and it is a serious question, if this wanton waste of the food that feeds the game fish is not the real cause of the rapid decrease of the better sorts of fish. Will our game protective societies think of this matter, and act before it is too late?

GYPSY.

CHOKE-BORED GUNS.

We have received the following letters on the subject of choke-bored guns, which, coming from practical men, we give to our readers for their edification and guidance. We have always admitted that for trap or duck shooting, a choke-bored gun was quite the weapon to use, but we have also claimed, and still remain of the same opinion, that for the general sportsman, a gun which may be called an open shooting piece, in contradistinction to the choke bore, is the one best adapted for his wants. It is admitted by our correspondents that for cover shooting the choke-bore is not the thing, and how much of our best shooting is not in cover? That is, of the shooting that is accessible to the majority of sportsmen, probably three-fourths is cover shooting:—

BIRMINGHAM, England, January, 1876.

EDITOR FOREST AND STREAM:—

I have perused the letter of "Gloan," on choke-bores, in your issue of December 24, 1875, with some considerable interest and gratification, not unmixed with a touch of amusement at his special pleading on behalf of his friend, Mr. Dougall, and I am reminded by his remark, that, "an unusually good gun in England, immediately acquires a reputation all over the Island," of another Yankee, proud of everything stupendous in his own land, as contrasted with our diminutive Island, affirming that the Britisher was afraid to walk out after dark, fearing to tumble into the sea; still we love this little island-home of ours, and there is life and energy in the old land yet. No doubt "Gloan" is mainly correct, for among the fraternity of sportsmen, an unusually good gun does soon obtain a wide reputation.

But, to the point, it is doubtless impossible to trace step by step the cogent arguments of the former portion of "Gloan's" letter without being impressed and convinced by its plain and lucid reasoning; nevertheless, the very identical arguments used against Mr. Pape, with reference to the late *Field* Trial, viz: "He had everything at stake there which a man can possible have at stake, and it will not be believed that he forbore at that time to shoot a choke-bore gun when fame and fortune waited on its use, &c.," are equally applicable to Mr. Dougall, in the same trial. If, as intimated by "Gloan," Mr. Dougall had so early perfected his principle, and if, his first gun built for "Gloan's" own use, would beat the winner of the trial; and if, principle itself were scientific, and therefore correct, and unvarying, then Mr. Dougall could easily make another like it, or a hundred equally good. But the trial itself speaks volumes on this head; for although Mr. Dougall entered the trial only in class 2d, for choke bores, upon which therefore he had the opportunity of concentrating all his energies, yet out of twenty-nine guns shot on the first day of the trial, he was down 24th, and out of the thirty-nine guns completing this round, he was 34th and 35th, thus you see very near the bottom of the whole list. Then again, if, as "Gloan" states, "Mr. Dougall, like a sensible man... has retained all the virtues of the new system and discarded all its vices." Then he must have perfected a weapon, which, if only moderate in pattern, shall be certain, uniform, and thoroughly reliable, and also devoid of wild shots. Refer, however, to his first gun in the trial, and out of twelve shots, the highest was 192, and the lowest only fifty-eight, with penetration ranging from 192 to forty-eight, and his second gun from 209 pattern down to sixty-one, and his third gun from 218 down to fifty-two. Is there anything good or reliable in this? The pattern of my two guns in the same round ranged from 235 to 146, and 211 to 112, with penetration from 228 to 180, and 216 to 156.

I believe my method to be based upon truly scientific principles, and I can, therefore with certainty, give my customers anything they may require, from the performance of the winning gun downwards, with reliable accuracy and regularity. At the same time I am fully aware that many of the methods adopted are utterly unscientific and unreliable.

Again, can Mr. Dougall pretend to lay claim to a speciality as a modified choke bore? And, is not "Gloan" joking when he recommends guns occasionally making a pattern of upwards of 200, as a modified choke? Refer to his third gun, which out of twelve shots, made three bad ones, (under 100 pellet) viz: 52, 72, and 86; and one shot as high as 217—I call this a bad full choke. Imagine such a gun in the field, and at forty to sixty yards distance the bad shots would invariably miss, and at twenty yards the good shots would riddle the birds, which would result in disappointment and disgust to the sportsman. Indeed, it is worse than the old system of boring, in which some of the guns were more regular, and only falling short by a few pellets in average pattern, whilst absolutely exceeding in penetration, Mr. Dougall's choke-bores.

My idea of a modified choke-bore, and what I turn out as such, is a gun of exceptionally equal and regular shooting; never deviating more than from twenty to thirty pellets; and giving a uniform pattern of from

160 to 190; and I think that no living sportsman will dispute that such a gun is a desideratum, and that such regularity of shooting is, of all things, the one most to be desired.

Even "Gloan," I perceive, falls into the same error as Pape and others, in making an assertion of having beaten the winner, at the same time without showing that the charges were identical, or the trial conditions complied with—whereas isolated shots and varied charges make all the difference imaginable. The winning gun has considerably exceeded its winning score by a very slight variation of charge.

The Trial was full, and rigidly carried out in every minutiae, so that the results are thoroughly reliable; but other shooting cannot fairly be compared with it, unless carried out subsequently, and intentionally adopting the same stringent regulations.

Since writing the above, I regret to find I am slightly in error. Mr. Dougall entered the trial in classes 1, 2, and 4; but only shot in class 2, and withdrawing all his other guns—a proceeding most significant.

W. W. GREENER, St. Mary's Works, Birmingham.

OLYMPIA, W. T., November 25, 1875.

EDITOR FOREST AND STREAM:—

I have been much interested over the various opinions expressed in your valuable journal for the last few months concerning the desirability of choke bores over the old system for general shooting in the field, and having had considerable experience myself in different kinds of guns, I do not hesitate to advocate the superiority of any system of boring a gun that will secure the closest and strongest shooting qualities. If we are to judge from the more recent trials of shot guns in England, certainly the choke-bore excels, both in pattern and penetration, anything that has preceded this system.

I have never yet known a sportsman, who claimed to be a good shot, that would select a gun because it scattered more than another, both being equal in other merits, simply because the wide shooting gun increased his chances of killing the game. In fact, the object sought to be attained in selecting a gun, is to secure the one, if possible, which will kill the game at the greatest distance. In all shooting, except in the thickest cover, for woodcock or quail, the longest range gun, in good hands, has a great advantage.

As to the durability of choke-bores, I am fully satisfied, provided the barrels are a little thicker towards the muzzle. The reason that the durability of this system has been questioned, is not that the system is a new one, so much, as that the class of guns most sought in the English trade has been what we would call light guns, viz: from seven to seven and a quarter pounds in weight, thirty inch and twelve bore, which I am informed by some of the best English makers, will not stand choke boring. While they concede, that such a gun weighing from eight and a quarter to eight and a half pounds, the increased weight being distributed from breech to muzzle, would be durable and give more satisfactory results:

I think Capt. Bogardus, with his heavy Scott, has clearly demonstrated the superiority of the heavy gun recently to the English. They attribute his success to his heavy loading. Admitting this to be true, he could not certainly use such charges in a light gun.

For the last year I have been shooting a nine and a quarter pound Scott thirty-two inch, ten bore-choked, and shoot from five to five and a half drachms of course powder, and one and one-eighth to one and a quarter ounces of shot, and have never yet received from it an unpleasant recoil, although shooting one hundred shots in a day without cleaning. And as "Alfred" says, "can stop a mallard or goose at seventy yards," a thing I could scarcely ever do with any gun bored on the old plan, although I have owned several of the very best make.

As to close shooting guns mangling the game at short range, I will state, that I have shot thousands of the plumed grouse on the Western prairies, and as a general rule when with a good common gun, had to allow the birds to reach a distance of thirty or forty yards to prevent mangling them too much, and also to increase the chances of a surer shot.

A better and surer shot can be had at snipe by waiting until they steady from their zig-zag flight, which always attend their first start. Any bird of the size of a grouse rising within ten to fifteen yards of the sportsman, if shot immediately with any good gun, properly charged and held, will receive more shot than is desirable for table use, but let it increase the distance to thirty-five to forty yards, and it will not be injured for eating, even with the closest shooting gun.

I believe the cause of the most misses by sportsmen, is that they are generally in too great haste to shoot as soon as the bird rises, fearing that it will be out of reach if not shot immediately, hence the bird is often missed by the first barrel and killed by the second at twice the distance. In such cases I have often heard the sportsman blame his gun for shooting too close when in fact the fault was his own, and the quality of close shooting is just what would decide his choice in selecting a gun, were he to test it with one which scattered more.

I have recently had an opportunity of testing the qualities of a close shooting gun while on a tour east of the Cascade Mountains, killing sixty-four sharp-tailed grouse one forenoon, with scarcely a single rise under thirty yards. Many of these birds were killed clean at sixty and seventy yards, with one and one-eighth ounce No. 6 shot. They were found in a corn field, and rose wild and could not be killed until they cleared the tops of the corn stalks.

While I would not advise any sportsman to discard a favorite gun which had proved itself a good shooter at ordinary ranges, yet he must, if using it, rest content, when others in the same field, equally skilled, can kill birds clean, that he would not shoot at because they were out of range of his gun. The close shooting gun will eventually come into general use, and the mangling of game which we hear so much about will be found to be more imaginary than real, if the proper sized shot is used and the game allowed to reach a distance that will insure a good aim and sure shot.

I am not an advocate of a particular gun for each kind of game, yet I should consider a desirable gun for woodcock or quail in thick cover, as unsuitable for ducks or grouse after they become wild in the fall of the year, as for hunting grizzlies in the Rocky Mountains. My idea of a perfect gun, is one that will make a pattern with one and one-eighth ounce of No. 6 shot at forty yards, and a thirty inch circle, of say 180 pellets with the right barrel, and 220 with the left, with the best possible penetration. All good guns should be warranted to do this, and the man who cannot kill almost any game bird at forty yards with such a gun, should practice until he can.

PACIFIC

DETROIT, January 6th, 1876.

EDITOR FOREST AND STREAM:—

In looking over the files of your paper I find an article in your issue of November 4th, 1875, from "S. K., Jr.," headed Choke-Bores and Chilled Shot, in which he states that "he would like to see a company of twenty men at a pigeon shoot, twenty-one yards rise, all having something up, and see how many would shoot choke-bores from choice."

I will refer him to the two matches, just shot at Detroit and Chicago, between the two clubs of these cities, as a specimen of choke-bore shooting on the part of the Detroit Gun Club, which now numbers some thirty-five members, who shoot choke bores, and that from choice; and it makes no difference whether there is anything up or not. A. J. K.

PITTSBURGH, Pa., January 7th, 1876.

EDITOR FOREST AND STREAM:—

I have shot more or less all through the season, and, as far as I am concerned, I am decidedly in favor of modified choke-boring. Birds here have been very wild, and one wants a long range gun to reach them. I believe that for every kind of game but woodcock the modified choke will be found far preferable. In the early part of the season you may not need it, but later on you will. And it is easier to wait until the bird gets a little away from you; after he gets up, than to call him back after he is out of reach of anything but a choke-bore.

AUGUSTINE.

The Rifle.

NATIONAL RIFLE ASSOCIATION.—The fourth annual meeting of the National Rifle Association was held on Tuesday, 11th January. General Shaler, the President, called attention to the fact that the association was out of debt, and had some cash balance on hand, with assets still more handsomer, also to the very generous present made to Creedmoor Range by the Winchester Arms Company, in the promise of a "running deer," with track, etc., complete. The President reviewed the military policy of the association, and that policy, he declared, would be continued, making the main object of the association military marksmanship. Judge Gildersleeve followed with the Secretary's report, reviewing the history of the year and referring to the Spring, International, and Fall meetings, and their results. He spoke briefly of the change of the targets, voted April 7, to conform to the Wimbledon system, and of the subsequent change of the third class targets, on the plans of General Shaler, to their present form, mentioning in this connection that the lying down position was permitted at Wimbledon with the third class target. Thirty-seven badges have been sold to life members during the year, and a new medal struck for the association prize. Forty life members have been admitted during the year, sixteen of whom won their privilege in matches. The terms of affiliation offered by the association to other clubs have failed to induce any to join during the past year, and among military organizations Company K, Seventh New York, is the only one that has joined as a body. Twenty matches were shot at the regular meetings—five in Spring, fifteen in Fall, and some ten matches for badges and trophies. Private clubs have made some fifty matches for badges and cups besides. The committee on International Code of Targets, appointed last year, and consisting of General Dakin, Colonel Gildersleeve, and Major Fulton, found their appointment useless, as no meeting on the subject was held at Wimbledon. Letters on the Centennial match have been dispatched to all parts of the world, but with only one official reply so far, from Canada.

The Flushing and North Shore Railroad are building a double track to Creedmoor. General Dakin recommended a more rational system of handicapping sporting and special military rifles by putting them at longer ranges, instead of allowing points, as at present. In electing directors, thirty-one votes were cast and the following seven elected:—Captain William C. Casey, George S. Schermerhorn, Jr., Major D. D. Wylie, Colonel Ira Beebe, Colonel George W. Wingate, Colonel John Ward, (vice Colonel Church, resigned), N. P. Stanton (vice Major-General Shaler).

The directors at a private meeting, elected the following officers for 1876:—President, General Shaler; Vice President, General Woodward; Secretary, George S. Schermerhorn; Treasurer, General McMahon.

CONLIN'S GALLERY.—The eighth competition for the FOREST AND STREAM badges was shot Thursday, Jan. 13th. Many of the best shots of the city participated and a hard fight waged between Blydenburgh, Bruce, Farwell, Yale, and Sone. C. E. Blydenburgh came off victorious. The following were the winners of the different badges:—

FIRST BADGE.

C. E. Blydenburgh.....43 W. B. Farwell.....40
L. C. Bruce.....41

SECOND BADGE.

G. W. Yale.....40 Chas. A. Cheever.....83
L. V. Sone.....39

THIRD BADGE.

Joseph Woodward.....29 H. A. Hynes.....28
T. C. Banks.....25

The Turf, Field and Farm cup competition will be shot this evening. A Subscription Match on Saturday Jan. 22. All-comers are invited.

AN INSURANCE MATCH.—On Saturday a match was contested at the Creedmoor Jr., Range, No. 260 Broadway, between teams composed of the employees of the Continental and Home Insurance Companies. The match was the result of a challenge from the former to the latter company, and was won by the members of the Home team. Following are the scores:—

HOME.

H. J. Ferris.....3 4 4 4 5 5 4 3 3 4—39
J. H. Hitchcock.....5 4 3 5 3 4 3 4 3 3—37
W. H. Hobart.....4 4 3 4 2 4 2 3 4 4—34
W. H. Sampson.....4 4 3 0 3 4 3 3 4 3—31
W. H. Racy.....4 3 3 4 0 3 3 4 4—31
F. B. Southwick.....0 3 4 4 3 2 3 3 4—29—201

CONTINENTAL.

C. E. Truslow.....4 2 3 4 4 4 4 3 4 3—35
W. Townsend.....3 3 4 5 4 3 2 2 4 4—34
W. Ellsworth.....3 2 4 4 0 5 4 3 4—34
Lloyd Roberts.....4 3 2 2 4 4 4 4 3—33
J. W. K. Oakley.....4 3 0 4 4 4 3 4 2 4—32
C. Schermerhorn.....0 3 4 0 4 4 3 3 4—29—197

HELLWIG'S GALLERY.—The seventh weekly competition shooting in lying position for a gold medal, a double-barrel shot gun, a rifle, and revolver, took place at this gallery, 271 and 273, eighth-avenue, January 12, 1876. The winners were:—M. L. Riggs, first prize, 47; D. L. Beckwith, second prize, 46; J. McGlinsey, third prize, 40, and C. D. Nixon, fourth prize, 28.

AMERICAN RIFLE ASSOCIATION.—The second annual meeting of this association was held at Mount Vernon, N. Y., on Tuesday, January 11th. The President, Col. Underhill, made a short address, referring to the success which had attended their efforts, and predicting a greater amount during the coming year. Geo. O. Starr, the Secretary, read his annual report, reviewing the origin and formation of the association and the work done during the past year. The Treasurer, Dr. A. Starr, presented his annual report, showing a surplus of assets over liabilities of \$10.38. The election for officers for the ensuing year was next in order, and resulted as follows:—President, Col. John T. Underhill; Vice President, Capt. F. Whittaker; Treasurer, Lieut. Geo. H. Thompson; Secretary, Major Geo. O. Starr; Directors, Hon. Chas. M. Scheiffelin, Hon. Geo. W. Davids, Hon. S. D. Gifford, Homer Fisher, Esq., Edward Gay, Capt. Chas. J. Chatfield, Capt. John W. Coburn, Thos. S. Drake, Esq., and David F. Davids, Esq. The amendment

to the by-laws to make an initiation fee of \$10, was lost. The Directors will meet quarterly instead of monthly in the future.

MORSEMORE.—Last Tuesday the fourth competition for the Harris trophy took place at this range. There were ten entries, and the shooting generally was good. Mr. Blakemore wins it this time by a score of 74 out of a possible 100, off hand, distance 300 yards. The result thus far for this prize is one each for Messrs. Smyth, Quinn, Frazier and Blakemore. The following is the winners score:—H. W. Blakemore, 74. The other competitors made scores as follows: H. Maynard, 71; G. L. Morse, 68; D. Smyth, 67; G. Underhill, 66; J. S. Clark, 66; H. Quinn, 63; G. Frazier, 62; W. Underhill, 61, and E. Connell, 52.

THE NEXT INTERNATIONAL MATCH.—Sir Henry Halford, who has been appointed by the council of the National Rifle Association of Great Britain to the post of Captain of the British team which is to visit this country during the Centennial, is actively engaged with the preliminary arrangements. The team will be selected by a most exhaustive competition. The following are the regulations adopted with reference to the selection of the British team.—1. It is proposed to take a team of eight, and four waiting men. 2. The twelve to be selected by two competitions, to be held in 1876—one in the course of the Spring, and the other shortly after the Wimbledon Meeting. 3. Each competition to last two days; fifteen shots each day, at 800, 900, and 1,000 yards. In case of bad weather it shall be decided by ballot whether the competition shall continue. 4. Rifles, position, &c., to be as in the "Any Rifle" competition at Wimbledon. 5. No sighting shots will be allowed, nor any previous practice on the range within two clear days of competition. 6. The twelve to be selected as follows:—(a) The three best total scores out of the four made by each competitor will be taken as his aggregate, (b) the sixteen competitors having the highest aggregates will select the two first members of the team, (c) these two will select a third, the three a fourth, and so on. The captain (if not in the sixteen) and the adjutant will be *ex officio* members of each of these committees of selection. 7. The twelve men selected must be prepared to shoot together for two days after the competition, for accurate comparison and register of rifles, &c.

THE INTER-COLLEGIATE MATCH.—The *Volunteer Service Gazette* in referring to our proposed match between teams from American colleges during the Centennial, says:—

"The Americans have taken another hint from the old country, and a good one. The journal from which we have just quoted (*FOREST AND STREAM*) offers a Challenge Plate to be competed for by teams from any regularly chartered university or college in the United States, with any military rifles in actual use in the Army or National Guard. We shall look with great interest to the results of this match, which is to be shot at the "Centennial" meeting of the United States National Rifle Association during the present year."

MASSACHUSETTS.—A number of the member of the Massachusetts Rifle Association assembled at their Arlington range on Saturday week for practice, their shooting showing great improvement. Our correspondent did not mention the range but we suppose it to have been 500 yards. The following are some of the leading scores:—

Creed.	Mass.	Creed.	Mass.
J. B. Osborn.....	47	107 Wm. Pollard.....	43
E. T. Osgood.....	45	106 J. Wemyss, Jr.....	43
C. C. Wemyss.....	44	94 S. Wilder.....	42
C. E. Sanborn.....	41	9 W. H. Jackson.....	40
W. F. Symes.....	42	91 E. M. Messenger.....	39

PROVINCIAL RIFLE ASSOCIATION.—This association, whose headquarters are at Quebec, held their annual meeting last week and elected the following gentlemen to serve as the council for 1876:—Col. Brmer, 66th H. V. B. I.; Capt. Bland, 1st H. G. A.; Col. Pallister, 63rd H. V. B. R.; Col. Mitchell, 1st H. G. A.; Col. Laurie, D. A. C.; Col. Murray, 66th; Capt. Sanford, 1st H. G. A.; Col. McPherson, 2nd H. G. A.; Major Ritchie, 66rd; Col. MacKinlay, Reserve; Capt. Walsh, 63rd; Capt. Graham, H. F. B.; Surgeon Trenaman, 66th; Major Yeomans, Reserve; Surgeon Slayter, 66th. Col. Laurie and Major Ritchie were appointed delegates to attend the Dominion Association's meeting in March. The opinion was generally expressed that some different arrangement should be made for the selection of the Wimbledon team, as the system of holding the competition at Ottawa is unsatisfactory, especially as the \$150 allowed this province to pay expenses, has not been received from the Treasury of the Dominion Rifle Association.

POWDER CHARGES FOR RIFLES.—At the meeting of the Board of Directors of the National Rifle Association on Tuesday of last week, noticed elsewhere, Gen. Shaler, President of the Association, presented a report embodying the results of a long series of experiments at Creedmoor in determining the proper charges of powder to be used in long range shooting. The following is an abstract of the report:—

The practice was with 50 shots each at 500, 800, 900, and 1,000 yards. At 500 yards seven kinds of ammunition were used; 90, 100, and 105 grains, with a lubricant, and 100, 105, 110, and 115 grains, without a lubricant. At 800, 900, and 1,000 yards eight kinds of ammunition were used, viz: 90, 95, 100, and 105 grains, with a lubricant, and 105, 110, 115, and 120 grains, without a lubricant. The shells were all new, of the long kind, none being reloaded. All the bullets, except a few used, were carefully weighed, and those used on the same score, never varied as much as one grain. The powder was also carefully weighed in all cases, and never varied one quarter of a grain to a charge. Generally, the scores were made of 10 shots each, after the correct elevations had been obtained. To ensure accuracy of aim, all the shots were fired over a camp stool.

The following is the result of the practice at 500 yards with the different kinds of ammunition, placed in the order of their merit as determined by the above plan:—

100 grains, without lubricant, average deviation from horizontal,	4.80 in.
105 " " with " " " " " "	4.66 in.
100 " " without " " " " " "	4.92 in.
105 " " without " " " " " "	4.94 in.
110 " " " " " " " " " "	5.19 in.
115 " " " " " " " " " "	6.44 in.
90 " " with " " " " " "	7.36 in.

It will be noticed that the deviations in the four kinds of

ammunition first named vary but little, being but 64-100 of an inch between the highest and the lowest. It would seem, therefore, that for 500 yards shooting, there is not much choice between 100 and 105 grains, with or without lubricant. Indeed, it is reasonable to suppose that a repetition of the test might bring either of them at the head of the list. Although the scores made cannot be used as a test of merit, it may be added that the average value per shot of three of the four kinds of ammunition first named were the highest obtained at 500 yards, according to Creedmoor system of counting. In this practice twenty-one consecutive bulls-eyes were made with 100 grains without lubricant, followed by eleven with 105 grains without lubricant, under a fresh easterly wind. At 800 yards the following results were obtained, viz:—

105 grains, without lubricant, average deviation from horizontal,	7.96 in.
105 " " with " " " " " "	8.18 in.
115 " " without " " " " " "	8.86 in.
160 " " with " " " " " "	9 in.
120 " " without " " (30 shot) " " "	10 in.
95 " " with " " " " " "	12 in.
110 " " without " " " " " "	12.74 in.
90 " " with " " " " " "	16.68 in.

As in the 500 yards practice, this shows but a slight difference between the deviations of the four kinds of ammunition first named, there being but 1.04 inches between the highest and the lowest. It may also be said that the scores made by the four first named were the four highest out of eight. At 900 yards the results were as follows:—

115 grains, without lubricant, average deviation from horizontal,	8.80 in.
120 " " with " " (40 shot) " " "	11.30 in.
105 " " with " " " " " "	11.64 in.
105 " " without " " " " " "	11.68 in.
90 " " with " " " " " "	13 in.
100 " " " " " " " " " "	13.54 in.
110 " " without " " " " " "	14.38 in.
95 " " with " " " " " "	16.04 in.

This table shows a difference of 2 50-100 inches in the deviation of the two kinds of ammunition first named, but a remarkable uniformity in the deviation of the second, third, and fourth named, and between the first and the fourth a difference of only 2 88-100 inches. As at 800 yards the scores made by the four first named were the four highest out of eight. At 1,000 yards the results were:—

115 grains, without lubricant, average deviation from horizontal,	12.24 in.
105 " " with " " " " " "	14.62 in.
110 " " without " " " " " "	14.66 in.
120 " " with " " " " " "	14.87 in.
100 " " with " " " " " "	15.64 in.
95 " " without " " " " " "	16.60 in.
105 " " without " " " " " "	18.02 in.
95 " " with " " " " " "	18 in.

In this record there is a striking similarity to that of 900 yards in the difference between the deviations of the two kinds of ammunition first named, and the uniformity in the deviations of the second, third and fourth. In fact the entire tables closely resemble each other, the principal difference being found in the leap made by the 110 grains from seventh position in the 800 and 900 yards' table to that of third in the 1,000 yards' table, and an equal retrograde movement on the part of the 105 grains, without lubricant. It will be noticed that throughout these tests up to 1,000 yards the 105 grains ammunition, both with and without lubricant, has shown great merit. In the four ranges the 105 lubricated stand second three times and third once. The 105 without lubricant stand first once and fourth twice, only at the longest range dropping back to seventh position. It will also be noticed that while the lighter ammunition produced the best results at 500 yards, it gradually gave way, in falling back to longer distances, to the heavier. Thus the three first positions in the 500 yards' table are filled by 100 and 105 grains; in the 800 yards' table by 105 and 115 grains; in the 900 yards' table by 115, 120, and 105 grains; and in the 1,000 yards' table by 115, 105, and 110 grains. Also, that the 115 grains ammunition stand six on the 500 yards' table, third on the 800 yards' table, and first on both the 900 and 1,000 yards' tables; and that in both the longer distances its average deviation from a horizontal is considerably less than the ammunition holding second place. From this it may be reasoned that the longer the range the more powder should be used, and so far as these experiments show such reasoning would be sound, but the general opinion is that the increase to the powder charge which may be made to an advantage is very limited. Indeed, until recently it was thought that the limit was reached at 100 grains.

CREEDMOOR JR. 100 YARD RANGE.—The fourth competition for the Union Metallic Cartridge Co.'s gold badges came off Tuesday, January 19th. The following are the winning scores: W. H. H. Sabin, 5 5 5 4 4 5 5 4 4—45, first badge; T. Daniels, 4 3 3 4 4 4 4 5 4—39, second badge; Geo. O. Starr, 4 3 3 3 4 2 2 4 4 3—32, third prize. Subscription match next Tuesday.

—Fine Achromatic Field Telescope, very powerful and portable, admirably suited for rifle marking and sporting, for sale. "Telescope," care Editor.

CHICAGO RIFLE CLUB.—ELECTION OF OFFICERS.

CHICAGO, January 11th, 1876.

EDITOR FOREST AND STREAM:—

The regular meeting of the Chicago Rifle Club for the election of officers and the transaction of the regular routine of business, was held in the club rooms of the Sherman House on the 10th inst.

The President submitted the following report, which was received and placed on file:—

"The Chicago Rifle Club has during the six months of its existence produced eight or ten men who, in shooting at 500 yards in a lying position, will make a better score than a like number of men in any other rifle club in America, Creedmoor not excepted. I am proud to say that the record of their scores at this distance excels that of any other club. I regret that our practice has been almost exclusively at 500 yards and in a lying position. Marksmen, in my judgment, should practice at various distances—be educated to estimate the distance with their eye and adjust their sights accordingly.

I would recommend the introduction of movable targets for occasional practice; that the club adopt the policy of refusing to take part in contests where off-hand shooting is entirely ignored; and that in practice off-hand shooting should not be neglected. It is a fact known to all riflemen, that continued and exclusive practice in lying position soon destroys the accuracy of the expert off-hand shot.

I am of the opinion that the rules of our club should be so changed as to allow all who desire to do so, to practice off-hand shooting up to and including 500 yards, although it may be against the rules of the National Rifle Association. In my opinion, the constitution and by-laws of the club should be revised and amended, and the rules relating to matches and practice on the range be rigidly enforced.

I would call your attention to the resolution passed at a joint meeting of the rifle teams of Indiana, Michigan, and of this club, held at the

Palmer House after the recent inter-State match, requesting the Chicago Rifle Club to take such steps as it should think best with a view to the formation of a northwestern rifle association."

Mr. O. C. Blackmer, Treasurer, then made his report showing a small balance on hand in the treasury, and that the club now had a membership of 74 "paid up" members, and that everything was in a flourishing condition. The President stated that Major Fulton had presented the club a handsome Remington pistol, to be shot for at a distance of 800 yards, and to be held by the gentleman winning it twice. On motion the thanks of the club were extended to Maj. Fulton, and the executive committee were instructed to make the donor an honorary member. Mr. Fuller then moved that the election of officers be proceeded with, which was adopted.

Colonel R. S. Thompson was nominated as President, and unanimously elected. He was introduced by the retiring officer as one who had a "true squint" and a steady nerve, and accepted the position in a few appropriate remarks. Gen. W. E. Strong was put in nomination for Vice-President, and unanimously elected. Mr. S. W. Burnham was elected Secretary, Mr. O. C. Blackmer, Treasurer, and the following gentlemen the Executive Committee: Messrs. H. H. Handy, Dr. Arthur Edwards, D. B. Fisk, J. M. Loomis, and H. G. House. On motion of Mr. Burnham, the Executive Committee were introduced to appoint a first, second, and third officers of the day to take charge of the grounds on the days of the shooting in case of absence of such officers, the member having the lowest number to officiate. This was adopted, and the meeting adjourned.

A. G. ALFORD.

CHICAGO, January 14th, 1876.

EDITOR FOREST AND STREAM:—

In a practice shoot at the South Park range of the Chicago Rifle Club, on the 8th inst., the following scores were made at 500 yards. Weather cloudy; wind fresh:—Col. J. A. Shaffer, 73 out of a possible 75; Gen. W. E. Strono, 96 out of a possible 100; C. B. Prouty, 96 out of a possible 100; Walter Burnham, 96 out of a possible 100; C. Fuller, 96 out of a possible 100. Fuller closed his score with eight consecutive bull's eyes, which he ran up to twenty-two, making a total of 166 out of a possible 170, and quit, having run out of cartridges.

HENRY G. JOHNSON.

WASHINGTON, D. C., January 15th, 1876.

EDITOR FOREST AND STREAM:—

A match was shot to day, on the following conditions:—21 yards rice, 14 ounce shot, the use of one barrel, Rhode Island rules, the winner to have returned to him his entrance fee. Mr. Arthur Marr, Referee; Mr. Haywood, scorer.

The principal feature of the shooting was the clean killing power of both guns used by the two winners, Mr. S. and Dr. Van. Mr. Simons used a No. 12 gauge breech-loader, made by Clark & Snyder, No. 12 West Pratt street, Baltimore. Dr. Van Arnum a No. 12 gauge breech-loader, made by J. P. Clabrough & Bro., Birmingham, England.

THE DITTMAR POWDER FOR RIFLES.

NEPONSET, Mass., January 1st., 1876.

Will you kindly inform your readers, that the powder Mr. Douglas Smyth has used in his trials at Morsemore, was my F powder, which I use for sporting purposes only. For long range, I recommend my F F and F F F, of which I use 50 grains, and 53 grains respectively in Sharps Creedmoor shell, and which are equal by my trials to 110 grains of Hazard's F G in penetration and velocity. For short range I use in Sharps Creedmoor 42 grains of my powder, and a 380 grain bullet; on top of powder I use a wad, as the lighter bullets, which the Sharps Co. furnish, have a smaller diameter than the Creedmoor bullets, and do not confine my powder enough. With a wad they work well, giving a very flat trajectory and high velocity. This charge and bullet work well up to 500 yards. I recommend not to use any lubricant and not to clean while shooting.

Although the F powder is not as strong as the two finer grades, I prefer it for all ordinary shooting as it gives the least recoil. For sporting purpose, I think it is strong enough, as I can shoot with my sporting Remington, with 32 grains and a 470 grain bullet through twenty inches of hard wood, the bullet having force enough to be flattened on the rock behind the target. For this charge I use the same elevation at 300 yards as for 70 grains Hazard's F G, but I insert the bullet only 5-16 of an inch. For the Remington Creedmoor, I am trying to make a heavier powder, as I cannot get powder enough into the small shell they are using now, therefore my powder in its general state can only be used in those Remington Creedmoor's bored for the largest shell like those in Sharps. I can crowd powder enough in to get the same force as the black, but the shooting is more even when the powder is not pressed, besides it would strain the gun. The reason that the F powder shows better in the Remington sporting, to compare with Mr. D. Smyth's trials in the Sharps Creedmoor, is, that the bullet for the Remington sporting is a little larger in diameter than the Creedmoor Sharps bullet, and being inserted deeper into the shell it confines the powder more. My powder works best with the lightest fitting bullet. This want of confinement is the reason that some cannot make it work well in shot guns using but small wads, while others are perfectly satisfied.

As so many of your readers are using my powder, I should like that some give their experience, it may be good or bad, that we all may learn by it; I to make it better when necessary, and others how to use it right.

CARL DITTMAR.

AUGUSTA, Ga., January 7th 1876.

EDITOR FOREST AND STREAM:—

The Richmond Rifle Club, of our city, held their first annual Rifle Match on New Year's day. The military of the city also took part in the proceedings, there having been special prizes offered for competition among them. There were seven teams of five men each, who participated in the military contest. The Church Rifles were the successful team for first prize. The Irish Volunteers took second. The winning teams made a score of 117 and 113 out of a possible 240. Off-hand 200 yards. There was considerable amusement afforded the participants in an Individual Match; open to all. The best shooting that was ever witnessed here was done in this match, several having made 15 out of a possible 16, the winner making the possible 16. A gentleman from Virginia, Mr. Rose, of Norfolk, won the prize. In the Individual contest for the R. R. C. the shooting was exceedingly good. Mr. Dunbar came out a winner, having made 25 out of a possible 28. The grounds were full of spectators. Among them was visible the well-known Western Statesman, Mr. Pendleton, of Ohio, who seemed highly pleased with the results of the matches. Mr. Editor, we have a flourishing club, and are about purchasing sporting rifles. We want your advice as regards the merits of the Winchester, Remington, and Sharp rifles, suitable for ranges of 200, 300, 500, 800, 900, and 1,000 yards. Times are hard, and we want the very best and cheapest we can get. With best wishes for the *FOREST AND STREAM*. M.

[Our correspondent will recognize the impossibility of our advising him on the choice of a rifle, when all the manufacturers advertise in our columns. Get the advice of some experienced rifleman, like Col. Wingate for instance.—ED.]

HOLIDAY GIFTS.

We offer to subscribers, in addition with THE EVENING POST, the following useful articles:
A DETACHED LEVER CLOCK, retail price, \$2.50 with the Weekly Evening Post, \$2.75, or Semi-Weekly, \$4.25.
"A good time-piece, of simple, yet careful construction."

THE ST. GERMAIN or STUDENT LAMP, (C. A. Kleeman's patent,) large size (retail price \$7) with Weekly, \$5.75, or with Semi-Weekly, \$7.25.

"The best now in use. The light is steady and bright, and therefore the eyes are not disagreeably affected, as is the case in reading by gaslight or the light of other lamps."—*Engineering and Mining Journal*.

THE UTILITY ADJUSTABLE TABLE (retail \$8) with Semi-Weekly, \$8.

"This table may be raised or lowered in height to suit any person or purpose, and can be folded in a moment for packing away. Valuable to ladies in cutting and basting; a boon to the invalid; a treasure to children; excellent for games, and useful for writing, study, lunch, or picnic purposes."

WEBSTER'S UNABRIDGED DICTIONARY, 1,840 pages quarto; 3,000 illustrations, latest edition, sheep binding, (retail, \$12) with Semi-Weekly, \$10; with Weekly and table, \$12.50, or with Weekly and the Student Lamp, \$12.75.

WEBSTER'S NATIONAL PICTORIAL DICTIONARY, 1,040 pages, octavo, 600 illustrations; (retail price, \$5), with Semi-Weekly, \$6; with Weekly and the Student Lamp, \$8.75; or with Weekly and table, \$8.60.

WORCESTER'S UNABRIDGED DICTIONARY, illustrated; (retail, \$10), with Semi-Weekly, \$10; with Weekly and the Student Lamp, \$12.75; or with Weekly and Table, \$12.50.

WORCESTER'S COMPREHENSIVE DICTIONARY New illustrated edition (retail, \$1.80) with Semi-Weekly, \$4; with Weekly and Table, \$6.50, or with Weekly and Student Lamp, \$6.75.

ESOP'S FABLES. A new and carefully revised edition. By J. B. Rundell, profusely illustrated with original designs, by Ernest Griset, 422 pages, quarto; (retail price, \$3.50), with Weekly, \$3.25; or with Semi-Weekly, \$3.75.

ESOP'S FABLES. Gift edges, beveled covers, (retail price, \$5); with Weekly, \$3.75; with Semi-Weekly, \$5.25.

TO CLUB AGENTS.

In order to still more largely increase the circulation of THE EVENING POST, we offer to give to those who will procure subscribers to the WEEKLY AND SEMI-WEEKLY EVENING POST any of the premiums mentioned above.

Specimen copies containing further particulars, and giving the number of subscribers which should be obtained, sent free to those who apply for them.

Agents who prefer a commission in cash will be liberally dealt with. Please send for our circular to Club Agents.

We continue to send the EVENING POST free of postage, without premiums, at the former low club terms, as follows: Semi-Weekly, five copies, one year, \$12; ten copies, one year, \$22. Weekly, five copies, one year, \$7; ten copies, one year, \$12.50; twenty copies, one year, \$22. These terms include the postage, which will be paid by the publishers.

The above rates are as low as those of any first-class newspaper published.

ODE TO VANITY FAIR.

[From the Boston Traveler.]

Come sing us a song of the Pipe—
Of its struggles and triumphs and fears,
And confusion confounded to those
Who say that it shortens our years.
They may prate of dear woman's smiles;
But that with our theme won't compare;
To drive off a fit of the blues
Try a pipe full of Vanity Fair.

In war times, when rations were scant,
And whisky with quinine was salted,
When many a soldier errant
By the roadside his weary frame halted,
When the thought of his mother and home,
His heart full of grief and despair,
He solaced himself with his pipe
And his ne'er failing Vanity Fair.

Dread foe of the Hypos and blues—
Great poets thy praises have sung,
And e'en from the lips of Carlyle
Has incense unceasingly swung.
Firm friend of the peasant and peer,
The charms are both varied and rare;
Here's a God-speed to any old pipe
When loaded with Vanity Fair.

NEW YORK.

BUY IT Vanity Fair.

It is shaved from the best Natural Leaf, for Meerschaum and Cigarettes. Does not make the tongue sore. Sample on receipt of 20 cents. Highest award, Vienna, 1873. Send for circular. **WM. S. KIMBALL & CO.,**
PEERLESS TOBACCO WORKS, Rochester, N. Y.

From Seth Green, Supt. N. Y. State Fisheries.

I find Vanity Fair to be the best article of tobacco adapted to the wants of the sportsman. Have used your tobaccos for many years, and know them all to be first class.

For Sportsmen.

A trusty friend, in weariness or trouble; a solid resource in Winter and rough weather, is a sweet pipe with Vanity Fair. Best dealers have it.

From A. B. Lamberton, Rochester.

Having smoked your tobacco, Vanity Fair, by the camp fire and by the hearth, I believe it in point of fragrance and taste superior to all brands known to me. Being in search of a tobacco that would not fire the tongue and mouth, I was made acquainted with your Vanity Fair, and found it to be the ne plus ultra of natural leaf.

Does not make the tongue Sore.

SMOKE VANITY FAIR.—It is a wonderful solace, and the best proof that it works no injury is the refreshed feeling you awake with next morning, conscious that there is no reasonable task you could not perform.

For Meerschaums.

It has a permanent existence; again and again does it serve your turn, and still is ready for a fresh bout. That pipe is always ready for its fill of Vanity Fair.

For Cigarettes.

A cigarette is an interlude to the serious habit; a graceful make-believe for spare hours. For cigarettes Vanity Fair has no equal. Best dealers have it.

HURST'S

Stereoscopic Studies

—OF—

Natural History

FOR OBJECT TEACHING IN SCHOOLS

—AND—

PARLOR ENTERTAINMENT.

We are prepared to furnish the first sixty numbers of the first series of

Animals and Birds of North America.

To these will be added a second series of foreign specimens, and various Animals and Birds in grotesque attitudes, never, however, violating their natural instincts.

We offer these views not as pictures only, but as studies from nature. One of the great moving elements in our modern system of education is object teaching. The unerring fidelity of the stereoscope transfers the animals and birds from their natural habitat to the rooms of the student and the fireside of our homes, where they cannot fail to have a lasting impression of the form, color, habits, and locality of each specimen.

An experience of more than twenty-five years as Taxidermist of the New York State Cabinet of Natural History, and in gathering his large collection of native and foreign specimens, enables Mr. Hurst to combine in every view the locality of the specimen, with its appropriate rocks, woods or water, and coloring from the originals.

Boston, Mass., and McKeesport, Pa.

COATED INSIDE AND OUT WITH AN INDESTRUCTIBLE ENAMEL.

WARRANTED.

Joints are connected by our Patent Sleeve Couplings, preventing all leakage.
Specimens can be seen and obtained on application at the Company's Offices, 8 Pemberton Square, Boston and 78 William street New York. Oct1-12w

DUCK SHOOTING.—THE ATTENTION of sportsmen is called to the fact that the best shooting ground within three hundred miles of New York city is Shinnecock Bay. More ducks of all kinds in the bay now than has been for a number of years, and sportsmen are bringing in bags of birds daily. The most experienced guides and gunners, with boxes, battens, decoys, etc., furnished at the Bay View House. Address

Whitney Arms Comp.,

Whitneyville, near New Haven, Conn., U. S. A.

Hart's Sportsman's Favorite Metallic Shells for
Breech Loading Shot Guns.

These Shells are easily loaded, and the caps easily extracted from inside. Head solid, and much thicker than any shell now made, giving a solid seat for cone or anvil, which prevents it from driving through or springing away, thereby causing misfires. The cone is made of nickel and fastened solid in its place. It neither rusts or corrodes fast like moveable anvil made of steel. The nickel cone also prevents misfire when cap has been left on shell for a few days, which is liable to occur either in steel or iron. These shells are finely finished, and made any length ordered, from 2 1/2 to 3 1/2 inches.

Shells and Loaders, and description Price Lists, can be obtained from all the leading sportsmen's houses throughout the country. GEO. E. HART & CO., 363 and 365 Market st., Newark, N. J.

From Captain Bogardus, Champion Wing Shot of America.

Messrs. GEORGE E. HART & CO.,
Gentlemen—The fifty shells I received from you to-day suit me better than any I have ever used. They are stronger and better in every respect, and I shall use them in all my shooting hereafter. Yours truly,
A. H. BOGARDUS.

Paper and Metallic Shells

Breech Loading Shot Guns,

Manufactured by the
UNION METALLIC CARTRIDGE CO.,
BRIDGEPORT, CONN.

THE STURTEVANT SHELLS are the easiest reloaded. Do not have to unscrew the head nor use an awl to remove the exploded caps. THE PATENT MOVABLE ANVILS, made of steel wire, will not bend or break.

THE BERDAN PATENT SHELLS, new model, with Hobb's patent waterproof primers, never miss fire, and are highly prized by all that have used them.

PAPER SHELLS.—By repeated experiments and great outlay for improved materials, and machinery made expressly for the purpose, we can now warrant our BROWN PAPER SHELLS equal to any imported. They are sure fire, and will not burst in the gun.

Inquire of any of the dealers in sporting materials for the U. M. C. Co.'s Shells.
Not sold at retail by the manufacturers. dec 23 tf

National Rifle Depot.

I have now in stock a complete assortment of Rifles of all well known and reliable makers, and having made special arrangements with the manufacturers, am able to sell at their prices. Have just received a stock of SHARPS NEW LINE OF LONG RANGE AND OFF HAND RIFLES. Riflemen are invited to call and examine. They will be cheerfully shown to all who take an interest in Rifle Shooting. REMINGTON, BALLARD, WESSON, AND STEVENS RIFLES, all lengths and calibre. Every Rifle purchased can be tested in the 100 yard range on the premises. Liberal arrangements made with clubs and associations. Send for illustrated circular. HOMER FISHER, 260 Broadway, cor. Warren St., N. Y. dec 23 3m

Our Readers

are heartily advised to send ten cents for a specimen copy of the
Illustrated Household Magazine,
—Now in its 17th Volume—
The best Periodical ever published for the
Family Circle.

Profusely illustrated—Replete with choice
reading and useful information.

An Attractive Monthly for
Young and Old.

Examine the brilliant list of Grand Prizes!
(the first is one Elegant Rosewood Piano,
retail price, \$500). The publishers now offer
these prizes for subscription, in addition to
the commission, which is thirty cents for
every subscriber. For terms in full, see an-
nouncement in the Magazine, headed
"Grand Prizes Now Offered to Workers."
It will pay you well to act upon our advice.

Subscription ONLY one dollar a year!!
Postage 10 cents extra.

Parents send at once for a copy of
this excellent, chaste and
sparkling publication—examine it carefully;
and, OUR word for it, YOU WILL at once
become subscribers for the sake of your little
ones, as well as because you will find its col-
umns most attractive for your own reading.

The conductors of this magazine have
sifted neither pains nor money in order to
make it what it is to-day—an instructive and
entertaining desideratum for every house-
hold. Its pages are devoted to popular lit-
erature, science, art, education, and the de-
velopment and maintenance of the moral in-
fluence of home attractions. Its character-
istic feature is comprehensiveness. The
manuscripts now on hand, from noted pens,
and others especially engaged, embrace an
unusually attractive list of Sketches of
Travel, absorbingly interesting Serials,
Tales, Poems, Popular Essays, Literary
Criticism, etc., etc. In the EDITOR'S
STUDY, Important and Posing Ques-
tions of the Day, will be treated with fear-
less, uncompromising independence, and
unswerving loyalty and devotion to Truth,
Justice and Right.

THE
HAZARD POWDER CO.,
MANUFACTURERS OF
GUNPOWDER.

Hazard's "Electric" Powder.

Nos. 1 (fine) to 5 (coarse). Unsurpassed in point of
strength and cleanliness. Packed in square canis-
ters of 1 lb. only.

Hazard's "American Sporting."

Nos. 1 (fine) to 3 (coarse). In 1 lb. canisters and 6 1/2 lb.
kegs. A fine grain, quick and clean, for upland and
prairie shooting. Well adapted to short guns.

Hazard's "Duck Shooting."

Nos. 1 (fine) to 5 (coarse). In 1 and 5 lb. canisters
and 6 1/2 and 12 1/2 lb. kegs. Burns slowly and very
clean, shooting remarkably close, and with great
penetration. For field, forest and water shooting
it ranks any other brand, and it is equally service-
able for muzzle or breech loader.

Hazard's "Kentucky Rifle."

FFFG, FFG, and "Sea Shooting" FG, in kegs of 25
12 1/2 and 6 1/2 lbs. and cans of 5 lbs. FFG is also
packed in 1 and 1/2 lb. canisters. Burns strong and
moist. The FFG and FFG are favorite brands
for ordinary sporting, and the "Sea Shooting" FG
is the standard Rifle powder of the country.

SUPERIOR MINING AND BLASTING POWDER.
GOVERNMENT CANNON AND MUSKET POW-
DER; ALSO SPECIAL GRADES FOR EXPORT,
OF ANY REQUIRED GRAIN OR PROOF MAN-
UFACTURED TO ORDER.

The above can be had of dealers, or of the Compa-
ny's agents in every prominent city, or wholesale at
our office.

88 Wall Street, New York.

SUBSCRIBE FOR THE
SCIENTIFIC FARMER.

A 16-Page Quarto, issued monthly, and full of origi-
nal reading matter. It is devoted especially to sci-
ence, as applied to agriculture, and is the only journal
in the world published with this avowed object.

It records all true progress in agriculture, and the
latest results of scientific research. Chemistry, bot-
any, veterinary practice, natural history, farm me-
chanics, rural art and architecture, rural law and ento-
mology, are all prominently considered in its columns.

AMONG ITS CONTRIBUTORS ARE:

President W. S. Clark, of the Massachusetts Agri-
cultural College, who has few equals as a writer on
scientific matters.

Prof. C. A. Goessmann, who is acknowledged to be
the first agricultural chemist of America.

E. Lewis Sturtevant, author of the "Ayrshire Cow,"
the "National Ayrshire Herd Book," &c.

A. S. Packard, Jr., editor of the "American Natu-
ralist," and State Entomologist of Massachusetts.

Prof. N. Cressy, who is one of the foremost of our
veterinarians, and is State Veterinary Surgeon of Con-
necticut.

Prof. Levi Stockbridge, whose experiments in crop-
raising, by special fertilizers, have created astonishing
public interest.

Jos. N. Sturtevant, Esq., South Framingham.

Richard Goodman, Esq., Lenox.

Prof. J. Wilkinson, Baltimore.

Prof. H. W. Parker, Massachusetts Agricultural
College.

Prof. S. T. Maynard, Massachusetts Agricultural
College.

Hotels and Resorts for Sportsmen.

GRAND NATIONAL HOTEL,
Jacksonville, Fla.,

George McGinley, Prop. \$4 per Day.
THIS ELEGANT and COMMODIOUS
brick house of modern structure, and furnished
with elegant furniture, is situated within two hundred
yards of the railroad depot, and is unsurpassed by
any hotel in the South. Dec30-tf

Rossin House, Toronto, Canada.
SHEARS & SON, Proprietors.

This house is a favorite resort for gentlemen sports-
men from all parts of the United States and Canada.

For Florida.

PHILADELPHIA AND SOUTHERN
Mail Steamship Company's line to Savannah,
Ga., sailing every Saturday, from Pier 22, below Pine
street, Delaware River, at 12 o'clock noon, making
close connections through to all points South. The
line is composed of the steamships JUNIATA and WY-
OMING. The Wyoming does not carry passengers.
The Juniata is a favorite ship with the traveling pub-
lic, having passenger accommodations of the most
superb character. She has recently been refitted and
elegantly furnished with everything requisite to the
comfort and convenience of passengers.

Families en route for FLORIDA, Georgia, Alabama,
and even as far as New Orleans, will find the Savan-
nah route the most desirable for comfort, as well as
the most economical. Through-trains of the Central
Railroad of Georgia, and Atlantic and Gulf Railroad,
Florida, leave Savannah every morning and evening.
The Florida steamers leave Savannah three days in the
week for all points on the coast.

For through passenger tickets and bills of lading to
all points in Florida, Georgia, Alabama and Tennes-
see, apply to WM. L. JAMES, General Agent, 416
South Delaware avenue, Philadelphia.

THE**PAPER STEM PIPE.**

Just the Thing for Home

and Camp Use.

Supplies a want which smokers have long felt—a
pipe which shall give simply the taste and odor of to-
bacco smoke. This pipe never accumulates rank
smelling liquid in stem or bowl, but is always clean
and sweet. The bowl and mouthpiece are permanent,
but the stem is of porous paper, to be laid aside after
a few days' use and a new one fitted. Extra stems
accompany each pipe. The price of extra stems,
when not furnished with the pipe, is as follows: Four
and a half and seven inches, 5c.; twelve inches, 15c.
Sold by pipe and cigar dealers generally, or a complete
sample sent by mail for \$1 by

McBride Flies.

HAVING BEEN FOR THE PAST
twelve years associated with my father, John
McBride, in the manufacture of fishing tackle, I feel
competent to continue the business and supply the
custom with the same quality as heretofore. Parties
supplied with casting lines and artificial flies for
Pennsylvania trout streams, Adirondacks, the Maine
Woods, Lake Superior, Thousand Islands, Canadian,
and other waters. Anglers not acquainted with the
nomenclature of these flies, by mentioning the local-
ity where they intend fishing, will have the varieties
best suited to those waters sent to them. Flies copied
from any natural insect or pattern desired. SARA

Sportsmen's Goods.**Orange Sporting Powder.**

ORANGE LIGHTNING POWDER,
The strongest and cleanest Powder made. Nos. 1
to 7, packed only in sealed 1 lb. canisters. The coarser
sizes (higher numbers) especially are recommended to
owners of fine breech-loading guns, giving great
penetration with very slight recoil.

ORANGE DUCKING POWDER,
For water fowl. Very strong and clean. Nos. 1 to
5. Packed in metal kegs of 6½ lbs. each, and in canis-
ters of 1 and 5 lbs.

ORANGE RIFLE POWDER,
The best for rifles and for all ordinary purposes.
Sizes F.g. FF.g. FFF.g, the last being the finest.
Packed in wood and metal kegs of 25 lbs., 12½ lbs.,
and 6½ lbs., and in canisters of 1 lb. and ½ lb.

All of the above give high velocities and less resig-
num than any other brands made.
**BLASTING, MINING, AND SHIPPING POW-
DER OF ALL GRADES AND SIZES PACKED IN
WOOD OR METAL KEGS OF 25 LBS.
SAFETY FUSE AND ELECTRICAL BLASTING
APPARATUS.**

CHAMPION GUNS OF ENGLAND**PAPE'S****Unrivalled Sporting Guns.**

Stand unequalled in every contest. Their perform-
ance at the London Trials of 1875 beats the records of
any maker in the world.

1875. 12 Gauge, Choke Boring.

Maker of Gun. Exhibitor.

1st—Greener. Greener.

2d—Pape. Davidson.

3d—Pape. Pape.

Out of a class of 68 guns, 3 out of the 6 best were
made by Pape. The Greener gun was protested
against on the spot for having its score false counted,
the fact proven there, and afterwards confirmed by
same gun being shot for two days per week for six
weeks in succession, when its average score only took
24th place, its very best score being greatly below the
scores of the best six guns.

1875. 12-Gauge, Old Sporting Bore.

Maker of Gun. Exhibitor.

1st—Pape. Davidson.

2d—Pape. Davidson.

1875. Long Range, 60 yards, Choke Bore.

1st—Pape. Davidson

60 yards, Long Range, Sporting Boring.

Those champion Long Range guns, only 7 pound
weight, with a charge of ¾ dr. to 1½ oz. shot, beat the
best 8 bore Greener gun at 60 yards; weight, 15 lbs.;
6 drachms and 2½ oz. shot.

1875. The Sportsman's Sub. Cup, valued at £45,
was also awarded to W. R. Pape, for the original in-
vention of choke boring. Winner of the London Gun
Trials of 1858, 1859, 1866. Address

New York.

THE GREAT

London Gun Trial,

1875.

W. W. GREENER'S

Far-Killing Prize Guns.

Winner of Silver Cup, value 40 guineas. Winner

in Class 1, for 8 and 10 bores. Winner in Class 4, for

20 bores. Winner in the Wear and Tear Trials, July,

1875. 2,500 shots fired without deterioration.

W. W. G. is the only maker who has made an aver-

age pattern of 214 shots in a 30-inch circle, at 40 yards,

with a 12-bore gun, at any public trial either in Eng-

land or America.

I have just received a consignment of these guns,

and shall offer to individual sportsmen, for a short

time, an opportunity to secure one of these celebrated

guns at a popular price, viz: \$75, gold; extra for ex-

treme close shooting, \$10. This will probably be the

last chance to secure one of these guns at these very

low figures. All grades and styles in stock or im-

ported to order.

Attention is also called to my stock of guns, by W.

& C. Scott & Sons, which includes all their latest im-

provements. No old style guns in stock.

Sole New York Agent for Holabird's Hunting and

Fishing Suits. Trade supplied.

Send 25 cents for large illustrated Catalogue of

Guns, and including Game Laws for all the States,

and summary of Great London Gun Trial. Ready

March 1st. Jan13 1y

**W. W. GREENER'S**

DOUBLE CLOSE-SHOOTING
GUNS. Winner of the Silver Cup,
value 40 guineas, at the Great Lon-
don Field Trial 1875, beating 33 com-
petitors with 68 guns, also winning
in all the other classes for the Im-
proved System of Boring. These
guns will kill from 80 to 100 yards,
loaded with large shot, and will
shoot well with small shot with a
less powder charge than guns bored
upon the old system. For report of
the Gun Trial apply to Messrs. Mc-
Laran, Williams & Co., Agents, St.
Louis, U. S. A. Address

W. W. GREENER,

St. Mary's Works, Birmingham, England.

**J. D. DOUGALL'S****EXPRESS SHOT GUNS.**

(Title registered.)

SHOWN by trials at Wimbledon by Editor
of the Field to possess the GREATEST PENE-
TRATION and therefore LONGEST RANGE—thus:
Circle, 30 inches; 300 pellets; average, 191; penetra-
tion, 37. The Editor's trial of Greener guns with 340
pellets of same shot and same charge of powder, gave
180, and penetration 30, although there were 40 more pel-
lets in each charge. Should any controversy arise as
to the durability of these new systems, we herewith
warn all beforehand that our system is our own inven-
tion (though founded on the American idea) and is DU-
RABLE, a fact remarked on by the Field, that the
guns tried had been in use during last season, and re-
ferences permitted to the owners. Send for illustrated
Circulars to

59 St. James's Street London.

Third Edition.

Camp Life in Florida.

By CHARLES HALLOCK,

AUTHOR OF THE FISHING TOURIST.

This is a most seasonable book for Sportsmen, Tourists, Invalids, and Settlers, and has been long needed by Winter tourists to Florida and persons seeking settlement there. It gives a full classification of the game and fish of the Southern Peninsula, routes of interior and coastwise travel, the agricultural resources of the country, and sites for settlement, hints for camping out, resorts for game, hotels, and such other information as will be of great benefit to visitors seeking Florida for health, pleasure, exploration, or permanent settlement.

348 pp., 12mo. Price, \$1 50.

CONTENTS:

Introductory Chapter.
Birds-eye Glance at Florida.
Outfit for Sportsmen.
Hints for Southern Hunting.
Coastwise Routes of Travel.
Game Animals and Birds of Florida.
Game Fish of Florida.
Three Months in Florida for One Hundred Dollars.
Supplementary Hints for Cheap Recreation.
Up the St. John River.
Indian River.
Florida the Promised Land.
Fort Capron.
Fishing at St. Augustine.
Black Bass Fishing on Spruce Creek.
Hunting the Panther.
The Environs of Tallahassee.
Private Dougherty and the Bass.
Pet Birds of St. Augustine.
Steam Yachting on the St. John.
Among the Seminoles.
In the Cypress Swamps.
Cruising Along Shore.
Shooting at Salt Lake.
The Okeechobee Expedition.

THE FLIGHT OF THE BUFFALO.

BY ISAAC M'CLELLAN.

WHERE vast and far the rustling grass burns with its russet stain,
O'er prairies lone, beyond the throne, of Rocky Mountain chain,
The lowing herds, the league-long herds, of bisons roam the wild,
By streams serene, by meadows green, and where great cliffs are pil'd;

By willowy nook of crystal brook, along each ice-cold brink,
The wallowing crowd, with bellowings loud, the gelid nectar drink;
The juicy seeds, the tufted meads, delight their browsing ranks,
Where scarlet flowers and tangled bowers, drape all the bloomy banks.

In sluggish ease, beneath the trees, they pass the idle days,
While gleams the flood and glows the wood in early Autumn's haze;
But when the breath of wintry death from pallid Northland blows,
And drift from out celestial domes, the flaky, fluttering snows,

Then wide across those prairie-worlds, by hillock, crag, and lake,
Their armies vast, defiling past, their long migrations take;
In lengthen'd line, those savage kine, impetuously pour,
As torrent swift, with wrack and drift, sweeps by a sullen shore.

The hoar-frost white, spreads wasteful blight, o'er smiling nature's face,
And thin and dry the grasses sigh, wide o'er the pasture's space;
So, over hill, through pool and rill, the crowding squadrons flow,
With heavy tramp, like routed camp, when storm'd by raging foe.

On either flank with clang and clank, each patriarchal sire
With lashing tail and coat of mail, and eyeball's flaming fire;
With forehead large, like iron targe, and horn like steely lance;
With flowing manes, like hurricanes, lead on the grand advance.

But hark! a yell! those fiends of hell, the Indian tribes are out,
The desert steed of matchless breed, is galloping on their route;
With brandish'd spear, in fierce career, the impish riders wheel,
The bow is strung, the lance is flung, the cruel, crashing steel.

The pistol rings, the bullet sings, demoniac whoopings swell,
Those Arabs of the prairies exult with shriek and yell,
Vain all the flight, vain all the fight, the vengeful charges vain,
The bulls are down and corpses brown incarnadine the plain.

Greenport, Jan. 9th, 1876.

For Forest and Stream.

The Sportsman and the Whale.

IN the ancient city of Quebec lives a sportsman who suddenly found himself the possessor of a whale some seventy feet long and proportionately large around the body. Well, the only advantage the owner of the whale possessed over the man who won the live elephant, was that the whale being dead could do without eating, nevertheless its great weight and want of power of motion, eventually caused so much trouble that it would be difficult to say who was the better off, the owner of the elephant or the owner of the whale. I shall endeavor to relate to you the experience of the owner of the whale in his own words (as far as possible,) as they were given to me not long since, during a pleasant evening spent in his smoking-room, while enjoying a segar. This cosy little retreat is decorated with guns, rods, several cases of stuffed birds and fishes, antlers of moose, cariboo, wapite, and red deer, and hanging against the walls, hunting scenes on the marshes and highlands, and Walter M. Bracket's four life-like and beautiful photos of "The Rise," "The Leap," "Last Struggle," and "Landed Salmon."

"On the morning of the 14th of August, 1872, I despatched one of the steamers under my control on a surveying trip to the Northern Channel, a duty annually performed by that vessel. I expected her to be absent for several days and had looked forward to this with great expectations as I would then be free to take a run out to some of the lakes, trout fishing. I had made all my preparations, looked over my flies, lines, and rods, and arranged with a congenial companion to leave early next day. Little did I then imagine the fish I was so soon to struggle with. The height of my fishing ambition was salmon and trout. I never aspired to such monsters as whales. After the departure of the steamer, I left my office in the evening for home and at the usual hour retired to bed. At about midnight I was awakened by a loud ringing of my door bell, and hurried down to see who was there. I opened the door when a young nephew, who had taken passage in the

steamer, rushed into the house in a great state of excitement. As soon as he could catch sufficient breath, he informed me that the steamer had returned. This being so unexpected I greatly feared some dreadful accident had happened—some one drowned or killed—and I begged him to tell me the worst at once. In a gasping tone he began hurriedly to say that "the steamer—the Captain—the whale, &c., &c., &c." I really did not know what to understand, but it was evidently something about a whale.

"What do you mean? are you mad?" said I.

"No, no," he cried. "The Captain wants to see you immediately about it. Oh! it is such a monster—about two hundred feet long and big as a ship."

I caught the young man by the shoulder and shook him into a seat. After a few minutes rest he was able to give me to understand that twenty-four miles below the ancient city, and one hundred miles from salt water, they had found a large whale stranded on a sand bar, and had turned back with it in tow, and the Captain wanted to see me about it. I dressed and went down to the wharf, and saw the Captain, who was full of importance and anxiety over the matter. I requested him to sit down and tell me what it all meant.

"Well sir," he said, at once appealing to my good feelings. "Of course you are master, and can do as you wish, but I hope you will see fair play in this matter, and that I am allowed my share of the prize; it is a fortune, and such a chance may never happen to me again. You and I can make heaps of money out of it, and afford to be generous to the crew in the bargain. Will you go half the profits and charge me with half the expenses? I am willing to pay my share. Oh! yes sir, I'll do the right thing, and I hope you will see to my interest. We are sure to make a big spec out of that whale; there must be one hundred barrels of oil in that whale, and the oil is in great demand, notwithstanding the opposition made to it by coal oil."

The Captain certainly thought he had struck oil at last.

"Captain, it is a bargain," I answered. I'll do my best for all parties concerned, (of course with a sharp eye to No. 1, as I was to have all the trouble and furnish the money); but do tell me where in the world did you get that whale?"

"Well sir," said he, "After leaving the wharf, everything went on quietly until when about half way through the North Channel. The look-out man cried out: 'A schooner or barge, aground or upset on the sand bar, sir, ahead to the right of us.' Several persons being on deck at the time, all glasses were leveled in the direction of the object, but none were able to make out what it was. I stopped the steamer and sent my mate with six men in a boat to ascertain. Seeing no one near, we were in great anxiety to know what could have happened. We followed the men's movements with straining eyes, and saw them cautiously approach the sand bar; and step out of the boat, the tide being at half ebb, left a large portion bare for a considerable distance from the object in view. The men appeared very undecided what to do next, and huddled together with evident fear, but they kept on slowly, approaching nearer and nearer, then halted, and consulted together; finally they set to shouting with all their might in their native tongue. We carefully listened, and I thought I caught the words, 'Une baleine! une baleine! a whale, a whale!' I could hardly believe this possible, so far up the river. However, I ordered another boat and proceeded to the scene, which I soon reached. The men on the bar came to meet me, all very excited and speaking at the same time, saying it was a monstrous whale; two of them declaring it was alive for they had seen it wink its eyes, another that he saw its body quiver, but none had dared to go near, as they feared it might turn on them and with a stroke of its enormous tail, launch them into eternity. My presence appeared to inspire confidence and all looked to me to lead the party on, but I can assure you, I did not fancy the idea at all, so after the men had called each other cowards, and inferred as much of me, by their looks, one Baptiste who had plucked up more courage than the others, volunteered to go forward if all would follow

and keep quite near. This was acceded to, and in single-file we started, Baptiste leading with a boat-hook, and pole in hand, but when some distance off our leader came to a dead halt and would proceed no farther, until he was thoroughly roused to the task, by the bantering tones of his followers, when with a sudden desperation he ran forward, gave the monster a poke, and dashed back into our midst out of breath. The poor whale never stirred a muscle. This appeared to embolden Baptiste, who tried it again, with the same results. We then mustered sufficient resolution to storm the dead monster in a body, and everyone in turn poked at him with an oar or something of the kind. The whale was really dead. I stared at the great monster in astonishment. Visions of barrels of whale oil and heaps of money appeared before me. I felt I had struck oil and that prospects were decidedly bright, and the old saying, that there is a tide in every man's affairs when taken at the ebb, would lead to a fortune, was at last to be verified in me. A long consultation was held to decide what course to pursue next to secure the prize and safely get it to the ancient city. After a great deal of talking it was determined that a hole should be cut in the monster's jaw, a chain passed in and then fastened to the tail, then attached to a hawser and made fast to the steamer, and in the ebb-tide, to take it in tow and return to the city. The chain was sent for and soon made fast.

How anxiously we counted the hours and minutes which passed waiting for the ebb—that ebb tide which was to lead to such glorious results. In due course it came, and we started with our prize in tow; the whale swaging first to one side, then the other—at times its high mouth would open and almost stop the boat. I can assure you, I was not trolling a minnow, and it was quite the reverse of baiting with a sprat to catch a whale, and I never fancied he was running any risk of being pounced on by any cannibal fish. By dint of perseverance and a favorable tide, we at last reached the wharf near mid-night, and I dispatched your nephew for you. Now I know you expect me to proceed again on my trip at daylight, and as I shall be absent several days, I must leave all to you and hope you will do the best you can for me. As I said before, charge me with half of all the expenses and give me half the profits. We have got a big thing, and I would feel very anxious about it during my absence, did I not know that you will do the right thing.

"Very well Captain," I answered, "I'll do my very best; so make it secure."

The whale was made fast to the pier and I bade the Captain good bye again, and proceeded home quite delighted with our prospects. I sat up nearly the whole night hunting over my books for some treatise upon the subject of whales. The only one I could find was an old copy of "Chamber's Information for the People." In this it is stated that for every foot in length, a Right whale is calculated to give a barrel of oil. Now as the Captain told me it was seventy feet long and a Simon pure whale, I put down the probable produce at seventy barrels—figured this up at fifty to sixty cents per gallon—smoked a pipe of peace, smiled at our good luck, and laid down to take a short rest, dreaming of whales from the one which swallowed Jonah to the one I now possessed. At an early hour I was at the wharf and found crowds of people already assembled to see it, and a large number were engaged in working it up on the rising tide in an ascent near the wharf, where at low water it could be seen nearly its entire length. The fabulous prices stated by would-be-knowing-ones as to its value, soon induced several speculators to make me offers for its purchase, but finding I would not sell, some proposed to form a joint stock company and take shares. I was deaf to all such offers, and determined that the Captain and I should be the only members of the firm. A knowing old fellow proposed to exhibit at so much per head, this struck me as an excellent idea, and I let him carry out his plan, receiving with a happy countenance the money he frequently laid on my table. During the day I was besieged with people who wanted me to relate the history of the capture. An excited individual also presented himself as a claimant of the whale, declaring

that he had harpooned it some two hundred miles down the river several days before it was found, and threatened me with all the rigors of the law if I did not deliver it up to him at once. He said he was sure there were marks on the body to substantiate his claim, but upon close examination none could be found, and consequently I would not give it up to him. I had promised to look after the Captain's interest and intended doing so. In the meantime the exhibition was going on with the best of results, and money pouring in. I came to the conclusion that if this could continue for two or three days the result would be splendid, especially as there was to be opened the next day an industrial exhibition in the ancient city, and thousands of visitors would rush to see such a great curiosity as a real whale. I can assure you, I began to think that we had really struck oil, and something else too, and every half hour added large sums to my first calculations of the profits likely to be divided between the Captain and myself. Whale stock kept rising, rising, and rising again, but all these great expectations were soon to be dashed to the ground and trouble cast their shadows before.

The weather was very warm, the sun shone fiercely, and I don't think that old whale had been accustomed to a warm climate. The cold North would appear to agree better with him, for the old fellow soon began to manifest decided symptoms of suffering from the heat. The Port physician had evidently scented that whale, for he came to me in an excited manner and asked me whether I intended creating some fearful disease by poisoning the atmosphere with that whale. We will have the typhoid fever or cholera, sir, raging in the city before twenty-four hours, said he, if you don't get rid of that whale, sir, he must be removed at once, sir. I tried all manner of arguments to induce him to take a more favorable view of the matter, but it was no use. He said, he was bound to see that whale away from the precincts of the city, and go it must. You may imagine this was a damper to all my prospects. I got vexed, then cooled down a little to become more so, and finally told the Doctor to take the whale and do what he pleased with it.

"No sir," cried he in anger, I will not have anything to do with it. You must see to its being removed sir; you are the responsible party sir."

At last we both decided to go out and have a look at him, to see if it were not possible without danger to the health of the inhabitants to keep it a couple of days longer. My hopes began to rise again, but one look at the poor old creature, lowered them like a shot. We found him high and dry on the slip, and such a sight, he was perforated in every part of his body. He had been stabbed and stuck with knives and other sharp instruments, by numerous inquisitive visitors trying the thickness of his skin, and looked as if seriously affected with the small pox, and I had to admit that it did smell rather strong in that neighborhood. This made the Doctor more determined than ever, and about an hour after he left me, down marched a sub-officer of police with three constables, who served me with a peremptory order from the Mayor to remove that whale at once. Now, first fancy the fix I was in. How to remove him? Where to put him? The man who owned the elephant was far better off than I was, for it was alive and could be marched off; but my monster was immovable and could neither be coaxed nor driven away. Not even the claimant was at hand to relieve me. Obey I must, and one trial should be made to save those seventy barrels of oil and the whale bone, which I was sure would net handsome profits. At last I decided to charter a tug steamer and tow it off somewhere down the river. I was told that it would not float. Not knowing better, I also chartered two barges, and on the rising tide the whale was got between them, securely fastened with ropes, and off we started with the whale and barges in tow. One of the barges contained one hundred empty oil barrels, several large iron kettles, axes, shovels, and everything necessary to carry on the operations of collecting the oil. We had no idea where we could stop; we did not dare to land near any habitation. At last we espied a quiet bay, some distance from the city, and decided the steamer should give the barges good head-way and run them as high on the beach as possible. The condition of the tide favoring this plan, it was carried out, and the whale was left snugly moored to some large trees and on the receding tide it was high and dry in P's Bay. About fifteen or twenty men were engaged to cut it up, boil it down, and barrel the oil. I then returned home, completely used up, bewailing the hour that made me partner in a whale.

I paid daily visits to my whaling establishment until I could do so no longer. The scent penetrated my clothing, and prevented my eating for several days. The news of the great whale being at P's Bay, spread in every direction, and people came from miles around to see it. It was hacked and cut in pieces by curiosity hunters; some carrying away pieces of the skin to make razor straps, or to cover old trunks. I forbid the men to say that I had any thing to do with it, but it was no use, every one appeared to know that I was the proprietor. The newspapers published the most ridiculous accounts of me in connection with that whale, and for many days I got telegrams and letters from friends all over the country, inquiring about my whale, and some of them were very amusing. Several of my artistic friends caricatured me; in one I was represented in bed surrounded by baby whales, beseeching me to return them their mamma. Really I don't think that the celebrated Barnum, as exhibitor of the Woolly Horse, the What Is It, Mermaid, or any other great wonder, occupied a more prominent position than I did at that time. Presidents of Historical Societies and other learned institutions called upon me for the history of that whale, and my name was to be immortalized if I would donate the skeleton to their museums, but I waived aside all such honors until I could consult my partner, the Captain, who I was sure would prefer turning everything into money—and I always answered that he was absent and I could do nothing without his consent.

Upon one of my visits to the whale, I observed a large barge about a quarter of a mile below us; it was filled with country people, from the opposite side of the river, who had got up a picnic to visit the whale. There were about sixty or seventy, old and young women among the rest. As there was no wharf near, a number of strong young men carried the women ashore on their backs. When all were landed they formed into procession to march up to the bay, but every step onward filled their nostrils with such a scent as to nearly take their breath away. At last they came to a halt, evidently unable to stand it any longer. Several of the young men, not so fastidious as the others, ventured up close to the monster and told such fabulous

tales of it that the women loudly expressed their regret at not being able to see the sight too. One stout old dame with broad brimmed straw hat, umbrella and spectacles, and apparently the chaperone, told them that she knew how to get over the difficulty. "Just follow me," she cried. They all turned back and went into a field, and were soon intently engaged in gathering some herbs, after which the procession was reformed with the old dame at the head. When on they came, shouting and laughing with a determined air to conquer all obstacles. When they got up near enough, every one was found to have a bunch of wild mint under their noses, and they chuckled greatly over the success of the old woman's plan of seeing the whale, while smelling the mint.

After several day's work I was rather astonished to find that all the men had secured, was nine barrels of what they assured me was whale oil, and there was no more. This small result upset the Captain's and my own calculations with a vengeance. The man who wrote the article on whales in "Chamber's Information for the People," could not have meant such a whale as ours. I can assure you, I would have sold out my share very cheap, but whale stock had lost its hold upon public confidence, and was far below par. I found that the Captain, after inquiry, had lost all interest in the speculation and did not claim any dividend. However, I was determined to bring the matter to a speedy close. I sent up the nine barrels of oil, and all the materials used in the operation of securing them. Being fond of collecting specimens of Natural History, I had the skeleton also taken up and laid out to bleach on the wharf.

The oil did not please me; there was a smell about it quite different from that of any whale oil I ever noticed before, and one would have supposed that the old whale had come back in its flesh again. So I accepted the first offer I got, before the Port physician came around, and sold the nine barrels for thirty dollars on condition that it was removed at once. This was done and it became the property of a dealer in junk and old stores. I was told he went off boasting of his bargain. Some day's after he found a customer for it. As soon as he started the bung of the barrels to get samples, the contents rushed out and drove him and customer away by its fearful smell. Those nine barrels contained nothing more than boiled whale in a high state of fermentation. There was not an ounce of oil in the old creature's body. It had evidently been afflicted with some disease, worked himself up from the sea into fresh water, died, and finally floated into the sand-bar where found, (to my cost). I put the best face I could in the matter; had the skeleton laid out, and it soon became white, and was really a great curiosity to many. The jaw-bones being each sixteen feet long.

I now found myself proprietor of only a whale's skeleton. There is an old saying, that every man has a skeleton in his cupboard. I can assure you mine was not in a cupboard, for it was rather larger than I presume the generality of mankind are supposed to be haunted with.

I was one day quietly examining the debit and credit side of the whale account, when I found myself the loser by a considerable amount. Just as I closed the book, with much dissatisfaction, I heard a rap at my office door, and desired the person to walk in. A respectable man came in and asked me whether I was Mr. McG? I answered—"No sir, that is not my name," the gentleman he named was President of a large company, a few blocks further off, but our names sound a little alike.

"Well sir," said he, "You will probably say whether you are the person who owned a whale."

"Oh yes, I answered, I am that unfortunate one. What can I do for you sir?"

He said, "I am one of the members of the municipal council of St. J., and also a church warden. You had a whale cut up at St. P Bay a few miles above us; a quantity of the offal has floated down with the tide; settled on the beach right opposite our church, and near our homes. The atmosphere is poisoned; we cannot remain in church, nor live in our homes, from the dreadful stench created by that horrid whale, and I am deputed by the council to call upon you and request you to have it removed before we all die of cholera or some other pestilential disease."

You may well imagine that this did not make me feel any better over my whale speculation. I managed, however, to work upon the counsellor's good nature, and for a sum of money he promised to get some persons to clear the offal off the beach, and rid me of this new trouble.

In the latter part of September a friend, who is President of a university in one of the United States, visited our city and I had many pleasant hours with him. Calling at my office, I showed him the skeleton of the whale, he was very much pleased to see it, as it was the first, and certainly a great curiosity. He gave me several gentle hints that it would add greatly to the attractiveness of his university's museum, if it was there. I told him that it cost me much trouble and considerable money. He then said that if I would have it cased and forwarded to him, he thought the trustees of the institution would allow me a fair value for it. As he offered to pay for the packing, I consented, and had it forwarded via. one of the western steamboat lines. Several months passed before I heard from him, when one day, I received a letter, in which he wished to know whether I was not of opinion that that whale had been born to cause trouble to every one who ever had anything to do with it. In due course it had arrived at Chicago. Of this fact he was notified by the agent of the steamboat line, but perfectly dumfounded by the bill of cost; the university being called upon to pay \$225 for freight and charges, and he feared under these circumstances my prospects of any further allowance were very doubtful, indeed. So ended my adventures with that provoking old whale.

Should you ever chance to visit the museum of a certain university in the State of Illinois, I presume you will find the skeleton of the old monster, one of its greatest curiosities. Whether my name in connection with it is to be immortalized or not, I cannot say, and must leave to future generations. However, every thing pertaining to that old whale has disappeared from my view, and I am content again to struggle with salmon, trout, and smaller fry, as you found me when I first had the pleasure of making your acquaintance, rod in hand, on a pleasant July day, on the banks of the River Charlo, New Brunswick, where, in company with Jack H., we each killed a basket of fine sea-trout.

STADACONA.

—Plaster from old walls and ceilings is now rendered fit for use by a method of treating with carbonate of soda, which gives it all the properties of fresh plaster.

DUCK SHOOTING IN MISSISSIPPI.

ON the 18th of December last the sloughs, ponds, and bayous were frozen over, and the ducks were driven into the "river"-creek, as I call it. Early in the morning I hitched up and drove by for D., but he could not get off, so I had to go alone. Arriving at the river, I blanketed old "Cantharides," bolted a sandwich, and went for the mallards. It was cold and frosty, the leaves very dry, and the stream nearly level with the banks—a condition of things not very favorable for approaching the ducks. After walking a short distance I saw seven mallards feeding near the shore. There was no underbrush or cane to hide me, and no tree that I could "take on them." I tried to crawl alligator fashion, prone on my face, but found that would not do, so I buttoned my canvas from top to bottom, and, lying flat on my back, advanced on them like a capsized mud turtle—took the "back position" modified, keeping my feet before, and by dint of rising, elbows and heels, managed to get along slowly through the leaves, gun on top. The ducks could not make out what manner of beast I was, so I got up within fair gun-shot, and, rising suddenly into a sitting position, with both hammers at a cock, glanced down the barrels. Alas, right in the line of fire hung a vine nearly as large as my wrist. I moved the gun to the right and then to the left of the vine, but it threw me too far off either side. The ducks were in a row, and I felt that I was so stiffened by my crawl that I could not spring to my feet, and the low branches of the trees would prevent me from shooting the instant the ducks took wing. There was only a second left, so I cut away right at the vine. Such a cloud of smoke you never saw; it hid everything, and I could hardly rise to my feet. When I did I saw three ducks flapping in the water, one of which got up, but got down again at the crack of the second barrel. Those drifting near the bank were hauled ashore with an old cane fishing rod that lay handy. An examination of the vine showed that it had stopped the greater part of the charge of shot. It was cut nearly in two.

A little further on a lady mallard—probably a widow—rose with a quarek, quarek from a drift. A sharp crack, and she fell like a stone. Coming to a fresh water slough, fed by springs and not frozen, I followed it a short distance, when I saw a perfect swarm of blue-wings. They were the busiest little fellows—wading and paddling, and coming right towards me. I sat down at the foot of a tree and watched them. Suddenly they all took wing—a man riding to mill had frightened them. If he had delayed his trip ten minutes I think I could have bagged ten or a dozen of them. I followed the slough, until it emptied into the river, without seeing another duck; then I tried the river again. Soon I saw three mallards swimming down stream. I slipped around a bend and headed them off, taking position behind a tree. They all came by, two drakes in front, side by side. I upset them with my right, and, as the duck got up, winged her with the other barrel. She hid under a drift, and it was some time before I could find her. When I did I slipped in a shell loaded with No. 10 and took the top of her head off. Farther up I saw four feeding, and crawling up behind a small log got within gun-shot. There was some thick brush growing in the edge of the water, but the ducks found me out, and I had to take a single one in the water, and one as they got up. The one killed on the wing fell in the centre of the stream, and I had to follow him half a mile to a drift before I could recover him. While standing on the drift I saw an old drake flying down stream; he came along within thirty-five or forty yards, a few yards above the water. I let him pass a little beyond me, and drawing just ahead of him cut away. He did not alter his flight in the least, and I did not see a feather fall. "Hanged if I didn't miss him," thought I; but at that instant he changed ends, and fell as if just fired at. He had flown at least a hundred yards around the bend of the river. I got another shot just above at a passing duck, winged it, and lost it. This in some localities would be considered no duck shooting at all, but here, where they are scarce and exceedingly wild, and where the nature of the stream and surroundings makes it almost impossible to approach them, it is to be called good sport.

Turkeys are very scarce here. The *Meleagris gallopavo* will soon be classed with the *Dinornis*, Dodo, and other extinct birds, and the horned buck be a thing of the past, like the fossil elk of Ireland.

And now, as the end of the year draws near, I send my best wishes to all my brother sportsmen, whosoever dispersed. To "Old Pious," to "Guido," to "Dion," *et omne genus*. May you all live and flourish through the next, and through many, many years to come, and may you derive health, strength, and happiness unalloyed from a rational indulgence in all field sports. To you, Mr. Editor, long life and happiness, and success to FOREST AND STREAM.

GUYON.

Corinth, Mississippi, January, 1876.

For Forest and Stream.

A STAGE RIDE THROUGH ARIZONA.

ON Friday, July 30th, I entered the stage at San Diego, California, for a 500 mile ride to Tucson, crossing, en route, the great American desert of the Colorado. Our route for the first day was through a gently rolling country, abounding in live oak and mesquite trees, until about two o'clock, when we pulled up at a station for dinner and a change of horses. We remained here about an hour, when we commenced the ascent of the mountains. It was very hot, and until twelve o'clock at night we continued our slow and tedious ascent, when we arrived at Hill's station. Here we got an excellent supper and splendid water; for as we were obliged to carry water in our canteens it was a great consideration to get some good, and here we filled up our one and a half gallon canteen and an ordinary soldier's canteen. No one thinks of traveling here without one or more canteens of water.

At Hill's station we took on four horses, and continued this dragging, up hill work until about daylight, when we were awakened by the driver, who requested us to roll up the curtains, as the wind sometimes blew very hard, and might overturn us. Here we were on the very pinnacle of the mountain, some 4,500 feet high, and day just breaking. Directly in front of us was the rising sun, looking very hot and angry in his redness, while down, down, as it were, at our very feet, lay the great basin of the desert, thousands of feet below us.

Fish Culture.

—Our abstracts of Fish Commissioners' reports are made from personal and careful examination of the text as we receive it in the pamphlets sent to us. Much labor and attentive study is bestowed upon these, and we are, therefore, fain to renew our request to the Fish Commissioners of the several States to forward to us their reports as soon as printed. We have already received and reviewed those for Maine, Wisconsin, Minnesota, Pennsylvania, and California.

NEW ENGLAND FISH COMMISSION.—The New England Fish Commissioners met on the 19th inst., at the State House, Boston. It was voted to continue the Penobscot salmon at Bucksport, Me., and land-locked salmon at Grand Lake stream.

—Mr. W. H. Crowell & Co., of Ludlow, McKeon County, Pa., have about 10,000 fine trout to send to market this season, which indicates that fish culture is not altogether a failure, by any means.

TROUT AS VEGETARIANS.—Dr. W. A. Pratt, State Fish Commissioner, of Illinois, and one of the most intelligent fish culturists in the country, doesn't believe that trout prefer buckwheat cakes to beef and liver hash. In a letter to the *Germantown Telegraph* he says:—

"I saw only a few weeks ago, copied from *FOREST AND STREAM*, that trout would eat bread and vegetable food, and grow and fatten faster than on animal matter. This is very contrary to my belief, and I would like to know if my old friend Collins takes any stock in that idea, or if there is any practical fish culturist in the East believes that trout will grow faster and fatten better on buckwheat cakes than on animal matter, as this correspondent claims. I know that you can throw into a pond anything you wish and the trout will take it into their mouths, but will throw it out again. They will jump after a clover-blossom, will take bread, or a stone into their mouths, but only to throw it out immediately. I would like to hear from more on this subject."

As analogies are traced through all species in nature, those who favor the vegetarian side of the question may argue that the Trout Tribe is divided into bread eaters and meat eaters, just as the proclivities of men lead them to the diet of Dio Lewis, on the one hand, or of Sir Jack Falstaff, on the other. Personally we incline to the belief that meat (which, of course, includes worms, grubs, flies, and the like) is the natural diet of trout. We know that they are *cannibals*, which is a strong point in the argument; and, besides, cooked food is a luxury that was not attainable by primitive trout in the early periods. No doubt trout can be taught to eat bread and buckwheat cakes just as dogs can be taught to eat Indian meal, or as Gen John C. Fremont learned to eat grasshoppers and mule meat. It is quite likely that they will grow fat on it and improve in condition. Yet we don't imagine that they "hanker" after it any more than an Alderman does after "hard-tack." We don't agree with Dr. Pratt that the trout merely mumbles the bread crumbs, and spit them out. Not a bit of it. They swallow them, Doctor, and no mistake. Just starve your trout for a fortnight, and try it.

✓ **PROTECTION OF SPAWNING TROUT.**—It is well known that trout in the fall go up as far as they can possibly go to spawn. They always choose gravelly spots, if to be found. We frequently see them spawning with their backs out of the water. It is a very easy thing to catch them at this time. In order to protect them at this period I use the following improved self-protecting spawning race. I believe it is original with me, but any one is authorized to use it:—

1st. To clear a stream from all enemies to young trout, such as pike, eels, etc., the only sure way is to dig a canal from the source of the stream-dam as near the old channel as possible and turn in the water through screens. I dig my canals twelve feet wide, nearly level, so as to have the trout jump up at the lower end, a feat they can well perform if six feet high. It is necessary to dig to a gravel or sandy bottom, or else draw gravel or sand and put it in. Now, lay green oak or pine, or almost any boards will do if green, say four feet apart, imbedded below the surface of the water. If you want a board-race flatten two feet of the center of each on top, bore large holes two feet apart on a line; nail on your bottom boards, also one board on each side; cut holes, say four feet apart, on each side for the trout to go through to hide. Now, lay a long log, say six inches in diameter, on each side of the boards; also one of the same size against each bank; put on poles all over; then put on sods, turf, or something to prevent the dirt going through; then cover with earth.

I forgot to say you must cut holes through the top of the logs. This is a sure protection. You can dispense with boards altogether by having a board-race. After the trout get through spawning you can nail up the holes and keep the trout out. If you use a board race put in four to six inches of fine and coarse gravel, but no sand, as it will pack so that the young fry cannot get out, as the sac is fast to the abdomen a week or so after hatching. Trout will spawn in sand, and they will come out, but only where it is a springy bottom so as to keep the sand loose.

It will do no harm to cover the race with boards tight; the fish need no light.

In planting eggs, cover two inches of gravel on board-race; and if you have no old trout you can dispense with the logs, or cover the eggs in sand or gravel as in natural streams. Put in above as mentioned.—A. J. Hinds, in *Germantown Telegraph*.

ICHTHYOCIDE.—At the last meeting of the American Fish Culturists' Association, we read a paper before them on the murder of the fishes, by poisoning the waters, which attracted some little attention at the time and was widely

copied. This subject is one of vital importance to fish culture; and the past summer, while at Holyoke, Mass., we learned that there are sixteen papermills there, and two across the river at South Hadley Falls. These mills have from one to three machines in each—probably thirty machines in all—which use on an average 600 pounds of lime and 300 pounds of chloride of lime per day—making 18,000 pounds of the former and 9,000 pounds of the latter—in addition to 10,000 pounds of lime and chemicals from the cotton factories and the three wrapping mills, which will foot up nearly 40,000 pounds, or twenty tons of fish poison thrown into the Connecticut at one point, six days in the week! A letter from a gentleman who visited Holyoke this fall, says:—

"Our angling for striped bass this season has been the poorest I have experienced. I do not think that there has been over a dozen taken. The largest weighed thirteen pounds and the rest averaged about three. Sport has been better with the black bass; but they, too, have become scarce—seem to be driven away. Very few young shad of this year's catch are to be seen. I visited the south side of the river on the 17th of September, and such a sight! The water-line was one string of dead fish of all kinds indigenous to the river—mostly fry from half an inch to two inches long. It must be from the poisons thrown in by the mills. I had a collection of them, intending to send to you, but lost them."

The writer of the above is a gentleman such as Isaac Walton describes with his maximum term, "an honest man, and a good angler."

There is but one way for those interested in this matter, that is to agitate it. "The more you stir it," the sooner its odor will arouse the apathetic to ask for an abatement of this great evil. Cannot chemistry precipitate these poisons, and make fertilizers or something else out of them?—*Live Stock Journal*.

TROUT CULTURE IN ILLINOIS.—Many of our trout brooks, made by springs, are just the home for trout, and we have several fisheries and more being established along the valleys of the Fox river. We have fine lakes and rivers, and some very fine trout brooks in Illinois, and the day is not distant when they will be stocked up with the best varieties of game and food-fish. Our Legislature has been very backward in making laws for the protection of fish and fisheries in this State, and making appropriations; but I think there will be less reformers in our next Legislature, and men who are alive to the interests of the State.

The fish and spawn which were received by me from the General Government have been disposed of, the spawn having been hatched and the fish all distributed in our lakes and rivers. We also expect soon to receive some of the spawn of the land-lock salmon, which, when hatched, will be turned out in our small lakes supplied by our spring brooks.

The spawning season of the trout closes in this State about the first of January, and the spawn first taken has already commenced to hatch.—*Fish Commissioner Pratt, in Germantown Telegraph*.

✓ **FISH CULTURE IN VIRGINIA.**—Col. Marshall McDonald, who has had sole charge of the hatching house connected with the Virginia Military Institute at Lexington, has made a report of the result of his work to the State Fish Commissioners. From it we note that after it was definitely determined to establish a hatching house at that place, a site was selected easy of access from the Virginia Military Institute and Washington and Lee University, where is a spring having a temperature of 53° Far., and water enough for 200,000 eggs of the California salmon, and double that number of brook trout. The house, having been constructed in accordance with specifications furnished by the commissioners, was completed, and the first eggs placed in the troughs, six in number, on the 24th of October; on the evening of the 26th all were in. Three of the boxes were opened, and the eggs transferred by Mr. Mather, who had been ordered there from Blacksburg for the purpose.

The contents of the fourth box were transferred by Mr. McDonald in person, Mr. Mather having been ordered back to Blacksburg. The eggs in this had begun to hatch in the box, and the hatching went on rapidly, all of this box hatching before some of the trays first placed in the troughs showed a single fish. By the 8th of November all had hatched, and the accumulation of dead matter was so rapid that Mr. McDonald found he could not maintain healthy conditions in the troughs with the inexperienced labor at his command, and he was compelled to call Mr. Mather back from Blacksburg to assist. He reports that the troughs are now clean, the fish apparently very healthy and vigorous, and growing rapidly. They were ready for removal to the springs before Christmas. Unless some unexpected casualty occurs, they will have fully 120,000 salmon fry as the result of the first experiment.

The total number of eggs received was 160,000. Of these 3,500 were dead when the boxes were opened, 4,000 failed to hatch, 1,500 were malformations, 5,000 were killed by rock-thrown through roof by blast, 6,000 have died since hatching, and about 140,000 are now in the troughs.

In conclusion, Mr. McDonald says:—

"I have not lost sight of the fact that a prime object in establishing a hatching-house in connection with the Institute was to furnish facilities for training experts in the important art of pisciculture, but the press of construction and handling has not allowed time for instruction as yet. If the commission proposes to send eggs of the brook trout to be hatched this Winter, I will be able to begin formally the work of instruction and experiment."

FISH CULTURE IN PENNSYLVANIA.—In his annual message, Gov. Hartranft, of Pennsylvania, touches upon the question of fish culture, and urges upon the Legislature the necessity of strengthening the hands of the commissioners by giving them a larger control over the streams. His remarks, although brief, are sensible and pointed, and will unquestionably carry great weight with those to whom they are addressed. He says:—"It is to be regretted that the labors of the fish commissioners have been, in some respects, almost fruitless, because the Legislature has left them to their unaided exertions to procure protection to the fish, while the various processes for supplying our rivers are on trial. If authority is not given to the

"Now," says the driver—who, by-the-way, is as fine a driver as I ever saw, and one that equals the famous Hank Monk, of Greeley notoriety—"every one hold on;" and drawing his long whip from the socket he stirs up the leaders as a gentle reminder that Jean Bowers has them in hand, and that a fault or misstep will be met with sure punishment. This road on the mountain cannot be walked down, but with a terrific rush off jumps the team along a narrow, thread-like road, with high walls of stone on one side, and on the other, within a distance of three feet, a declivity, almost perpendicular, to the depth of a thousand feet. Down, down rushes the team, while with bated breath I hold on, and scarcely seem to breathe. Then, too, the scenery is so awfully grand and sublime that you do not wish any one else to speak—to break the spell, as it were, for spell-bound you seem to be. On the seat above us, rigid as a marble pillar, with eyes fixed and teeth set, towered the man who held our destinies in his hand. Thus down, down we rushed until, just round a sudden bend, we brought up in the corral of the Mountain Spring House, having accomplished, in a very short space of time, a descent of about 4,500 feet.

The wild yell of Jean Bowers broke the spell; then the clenched hands unloosed their hold, the blood began to move, and again we drew a natural breath. And now fear begins to creep, or rather rush upon me. Suppose one of the leaders, by a misstep, had fallen, nothing could have saved us from rushing down that awful precipice to certain destruction. We here again replenish our water and horses, for not another drop will we find for sixteen or eighteen miles. To get out of this basin, we wind along over broken rocks through a narrow defile, walled up to an immense distance on either side by rocks and boulders, burnt black by the sun's rays, with not a spear of vegetation to be seen save a few bunches of cactus, and after some eight miles we open upon the white and burning sands of the great desert, so deep that we cannot get off a slow walk, and oh, how hot! The reflected rays of the burning sun upon this white sand is perfectly terrific. After wading some nine miles we approach a station, called Coyote Wells, named from the fact that a coyote, or prairie wolf, had found water by digging, and this stage company have improved upon Mr. Lupus, and sunk a splendid well, so that plenty of water can be had for the stock. And here we leave our four-in-hand and the visage of the joyous Frenchman, Jean Bowers.

All day long and the following night was spent in toiling over this great desert; but the dawn of morning brought us to the stream which has rushed through the mighty Colorado cañon, now as gentle as a lamb. We cross by a ferry some six miles below Yuma, and are soon at the place noted as being the hottest place on the American continent. It is certainly the most barren, forsaken place that the sun has ever shone upon. I don't wonder now why Charley Fisher, after a residence here of a few years, can settle down in Washington and be contented, for I think a man must have a residence of this kind somewhere to be contented to reside in Washington, D. C. At Yuma we changed not only horses, but for our comparatively comfortable stage took a hack, which had only room inside for two persons, and what with mails, blankets, etc., the position was anything but pleasant, yet I got through with less fatigue than I imagined.

After leaving Yuma, we followed up the valley of the Gila, and this location would be a perfect paradise for Squire S. or Theodore, for on every hand can be seen hundreds of quail, jack rabbits and cotton tails, while in the mountains several kinds of deer, bear, and wild turkeys abound in the greatest profusion. About 100 miles from Yuma, on the left of the road, and within a stone's throw of it, rises a mass of boulders to the height of some 200 feet, all engraved in hieroglyphics, done by some race of beings of which we have no knowledge. They are called the Scriptural, or Painted Rocks. At midnight we arrived at Gila Bend, where we again took on water for ourselves, and brought four pailsful in a keg for our horses, as we start to cross a desert where for forty-five miles not a drop can be had. About night we reached Maracopa Springs, and had an excellent dinner served, which was presided over by our host, and what did me the most good, in fact, it was really refreshing, for there immediately opposite me sat his wife, dressed in white, which I can assure you was a real luxury, for this was the first female, civilized, that I had cast my eyes upon since leaving the sea coast. God bless her, may she always be there to cheer by her presence the dust-begrimed and way-worn traveler. On the afternoon of the fifth day we reined up in Tucson, not half as tired as I thought.

Tucson, August 8th, 1875.

—Among the articles of interest to our readers in the *Popular Science Monthly* for February, will be a long account of the natural history of the kangaroo by Lieut. Geo. Mivart. It is copiously illustrated, and discusses the characteristics of the whole of this interesting and little known family, of which we have a distant relative in the opossum. "Life in Greenland," "Plasticity of Instinct," and the Miscellany will also be read with peculiar interest by zoologists.

—The "Florida Pathfinder," published by Mr. J. P. Whitney, editor of the *St. Augustine Press*, is a most valuable little hand-book for the Florida traveler. In addition to an itinerary of points of interest to be visited, it contains a list of hotels, the latest schedule of routes, and a variety of other information useful to the tourist. The pamphlet is distributed free at No. 66 John street, and comprises some seventy pages.

—At the last meeting of the French Academy of Sciences, M. Lortel read a paper on a fish of the Lake of Tiberias, the *Chromis pateramilias*, which incubates its eggs in the cheek cavity. The male fish sucks in the eggs from a sandy hollow (where the female has deposited them) and passes them in among the folds of his gills where they go through the usual stages.

—London *Garden* says that geraniums and calceolarias set in the windows will keep flies out of a room.

—Mushrooms weighing from six ounces to two pounds each are a staple article in the Bakersfield (Cal.) market.

commissioners to control the streams while their experiments are in progress, it is manifestly unwise to continue the work, however important or promising of great results it might be. It is too late to discuss the practicability of restocking rivers with fish, for that question has been abolished from doubt and its feasibility demonstrated in other States, and is it not proper that we should make some efficient and systematic effort in this direction, or else forego all spasmodic endeavors that are practically useless and afford us no enlightenment upon this important subject? I trust, however, that the past legislation in this behalf will be supplemented with whatever is necessary to make a sufficient test of fish culture in Pennsylvania.

"I transmit herewith a communication, received through the State Department at Washington, from the British Minister, wherein he states 'that regulations have been adopted in Canada to protect and promote the increase of fish frequenting in common the frontier waters of this country and the Dominion, and suggests the importance of kindred legislation on the subject on the part of the State of Pennsylvania,' to which I ask your attention."

—The hatching house of N. W. Clark & Son, at Northville, Mich., has turned out 4,000,000 whitefish for the State and 750,000 California salmon for the United States. It is said to be one of the best houses in the country.

—A Philadelphia correspondent writes:—

"We have heard two gentlemen complain that, after catching good messes of fish in the Schuylkill, they had to throw them away, as they were so impregnated with the taste and smell of petroleum and gas-tar as to be unfit for the table. The large quantities of gas-tar and the refuse of petroleum distilleries thrown into the Schuylkill are ruining the fishing."

Natural History.

[This Department is now under the charge of a competent Naturalist, endorsed by the Smithsonian Institution, and will henceforth be made a special feature of this paper. All communications, notes, queries, remarks, and seasonal observations will receive careful attention.]

MUSICAL MICE.

AN English gentleman, who had been confined to his room for several weeks by sickness, has written to *Land and Water* (London) of a mouse that came into his room, after a while became very tame, and afforded him great amusement. At last the gentleman relates that he heard occasionally a quiet subdued chirping, more resembling the singing of a teapot than anything else. "At first," the writer says, "we thought it must be a cricket; but one day we found it came from the little mouse, and I have since then watched him repeatedly while he gives forth his little song. His voice seems to have grown stronger and louder every day since we first heard him; and now he can be heard quite distinctly when in an adjoining room if the door is kept open. His voice is of great compass, and he has a variety of airs. Sometimes one can almost fancy it is a canary that is singing—there are so many little runs and trills. Suddenly he changes his tune into a monotonous chirrup, sometimes fast, sometimes slow. He generally keeps on singing for about an hour at a time, and as the noise in the middle of the night is so great as to put sleeping out of the question, we have tried all expedients to stop him, but generally without success."

There was a tuneless mouse exhibited by a showman in London, several years ago, which gave occasion to the wits for no end of fun-poking. Nevertheless, there have been mice which sang, and they are not so uncommon as most persons suppose. One morning, a physician of Minneapolis, Minn., was sitting not far from a half-open closet door, when he was startled by a sound issuing from the closet "of such marvelous beauty" that he thought Bobbie Burns, his canary, had found his way into the closet, and wondered what had started him singing such a queer sweet song in the dark. He procured a light, and found, not the bird, but a mouse, which had filled an overshoe with plundered pop-corn. The next evening his solo was renewed, and the doctor crept close to him and watched him sing. "His song was not a chirp, but a continuous song of musical tone, a kind of *to-wit-to-wee-woo-woo-wee woo*, quite varied in pitch." This one proved to be a prairie mouse, and the doctor determined to domesticate it, if he could, but his success has not yet been announced.

The sick man whom we first quoted thought that the musical power of his mouse might be due to an accident which had injured its nose or throat. Others have considered that it was due to disease in the animal. But both these ideas seem to be wrong, for nothing could be more healthy and active than the few little minstrels whose history we know, and the young bred from them are among the strongest and largest of young mice. One person who kept a great many mice tells us that, after breeding nearly 300 white mice, with the hope of meeting one of these vocalists, he at last succeeded in getting one and no more; yet, strange to say, this one never displayed his accomplishment more than three or four times in seven or eight months. His master induced him to sing by the somewhat cruel method of depriving him of all society and exercise for several weeks. At the end the poor little mouse would be so glad to get out of prison that he would sing for very joy as he bounded in his revolving wheel. This same gentleman also possessed a hiccupping mouse.

Several other domestic musical mice have been known; but the best account of one of these gifted little creatures is given by the Rev. Samuel Lockwood, in the *American Naturalist* for December, 1871. He had as a pet one of the white-footed, or deer, field-mice, called by naturalists *Hesperomys*. She came from Florida, and was named Hespie. Hespie had innumerable pretty traits, but there is not space for the whole story. It was at night that her genius as a

singer shone. This little musician had several snatches of melody, which were often repeated. But in her repertory were two notable ones, each of which deserved to be dignified as a professional role. The most frequent one was the *wheel song*, which she gave when running in her revolving cage. More complicated in notation than this mellow little strain was her *granā role*, which was strictly in the major key of B (two flats); this is remarkable, because it has generally been supposed that the untaught cries of all animals and birds was in the minor key. Dr. Lockwood records one of Hespie's performances as follows:—

"She was gamboling in the large compartment of her cage, in a mood indicating intense animal enjoyment, having woken from a long sleep, and partaken of some favorite food. She burst into a fulness of song very rich in its variety. While running and jumping, she rolled off what I have called the grand role, then sitting, she went over it again, ringing out the strongest diversity of changes, by an almost whimsical transposition of the bars; then, without for an instant stopping the music, she leaped into the wheel, started it revolving at its highest speed, and went through the wheel song in exquisite style, giving several repetitions of it. After this she returned to the large compartment, took up again the grand role, and put into it some variations of execution that astonished me. One measure, I remember, was so silvery and soft that a canary able to execute it would be worth a hundred dollars. * * * So the music went on as I listened, watch in hand, until actually nine minutes had elapsed. Now, the wonderful fact is, that the rest between the roles was much more than for a second of time; and during all this singing the muscles could be seen in vigorous action through the entire length of the abdomen. This feat would be impossible to a professional singer; and the nearest to it that I have seen was the singing of a wild mocking-bird in a grove."

Dr. Lockwood describes still further the scope and variety of Hespie's vocal power, comparing the expression and melody of portions of her different songs to the notes of well-known birds; and calls attention to the fact that most of the music was given when the animal was at play, and very active, and that often she ate and sang at the same time. Her notes of anger, distress and terror, were very different in timbre or quality from the song, which evidently expressed her satisfaction. Dr. Lockwood's reasoning upon this musical ability is highly interesting, and he recalls the fact that several other rodents, rats, rabbits, tree and ground squirrels, and woodcocks are capable of musical sounds, although not to be called singers.

NOTES FROM OUR CORRESPONDENTS.—Several years ago Mr. M'Gloughlin, one of our crack shots, killed a white meadow-lark near this city. The same gentleman, at another time, killed a partridge, the plumage of which was as white as milk. AUDUBON, Harrisburg, Penn. . . A correspondent writes from Niagara Falls, under date of January 11th, that robins have been seen there during the winter thus far. . . A Terre Haute, Indiana, correspondent sends the following item, which is of interest to Ichthyologists:—"A few days since my next door neighbor was presented with a string of nice bass, fresh from our own Wabash. In the stomach of one of the larger fish was found an almost perfect (undigested) minnow of full four inches in length. This would seem to disprove the theory that the bass do not feed, but lie dormant during the colder months."

AMERICAN HARES AND RABBITS.—Mr. J. A. Allen, who has long had charge of the departments of Mammals and Birds in the museum at Cambridge, Mass., is preparing a monograph of the American Leporidae, or the hares and rabbits. A synopsis of the classification, based on a very large series of specimens that have come under his examination has already been published. Mr. Allen finds three groups based upon anatomical characteristics. These three groups comprise the following American species:—*Lepus timidus* var. *arcticus*, the polar hare; *L. campestris*, the prairie hare; *L. americanus*, the Northern hare, or white rabbit; *L. sylvaticus*, the gray rabbit; *L. townsendi*, Townsend's rabbit; *L. brazilensis* of South America; *L. californicus*, the California hare; *L. palustris*, the marsh rabbit; and *L. aquaticus*, the Southern water rabbit. Of *L. americanus* and *L. sylvaticus* several varieties are enumerated which have heretofore ranked as species, but which owe their peculiarities to geographical causes. Mr. Allen's work in this direction is greatly needed, and will have a lasting value.

WILD RED DEER IN ENGLAND.—In 1866 Mr. J. Clarke wrote:—In England, at the present day, the red deer exists in a state of nature only on Exmoor, a wild tract of country on the borders of Devon and Somerset. The red deer still occurs in Ireland, and abundantly in the Highlands of Scotland. It formerly extended all over the British Islands, and was exterminated on Dartmoor, Devon, only three generations since by the stag hounds of the Duke of Bedford.

TENACITY OF LIFE IN A PERCH.

EDITOR FOREST AND STREAM:— I was one of a party of five camped on the shore of Ashland Bay last month, for the purpose of looking up live timber to establish a logging camp for the winter. After returning from the woods to camp for the day, we started out and caught several yellow perch, which we strung upon a stick. Arrived at camp, the string of fish was laid upon the floor of the shanty, and remained there until after supper. After cleaning as many as was needed for breakfast, four or five fish were left upon the stick and lay upon the door block all night. Next morning one of our party noticed that one of the fish showed signs of life, and spoke of it. We took the fish off the stick, put him in a small pool of water near the shanty, and left him lying upon his side in the water, apparently gasping his last. We then started for the woods to run out some section lines, and did not return until about five, when, to our astonishment and delight, the little fellow was seen swimming around as lively as ever. He had enlisted the sympathy of all, and it was unanimously voted that, after so severe a trial for life, he deserved all the aid we could render; so we put the little fellow in the creek, and he started down stream at

lightning speed, making for the waters of the lake from whence he came. This story looks a little "fishy," but nevertheless is true in every particular. K.

HYBRID DUCKS.

Nicasio, Marin Co., Cal., Jan. 6th, 1876.

EDITOR FOREST AND STREAM:—

In answer to Prof. Le Conte's question concerning hybrids in ducks, I would say that, in twelve years' active pursuit of wild fowl in California, ending in 1861, I did not meet with a single hybrid duck; but in the Summer of 1855 I saw a female widgeon with seven young ones. The old bird had been crippled in the wing, and rendered unable to pass north with other ducks of that class, and the young birds were about half grown. From what I could observe of them, I formed the opinion that they were crossed with the gadwall. Since 1861 I have seen three wild hybrids; two appeared to be crosses between the mallard and pintail, and the other one between a pintail and a gadwall. All the examples that have come to my knowledge lead me to think that hybrids in California always come from ducks that breed in the north, which are crippled and unable to go to their proper breeding places, being found by the male of some of the ducks that remain here to breed, such as the mallard, gadwall, red-head, wood duck, and blue-winged teal. That new ducks do appear, I am positive. After an absence of six years I made a visit to a lake where I had used to shoot, and found ducks that were strange to me, looking somewhat like a female red head, with long, light legs. My friend there told me they first came about four years before. He knew no name for them, but said the late Mr. Hepburn called them Southern Summer ducks. Since then I have seen one specimen mounted in San Francisco. THOS. S. ESTEY.

January, 1876.

EDITOR FOREST AND STREAM:—

I notice on page 339 of FOREST AND STREAM that certain hybrid ducks are prolific, and "transmit their peculiarities with great fidelity." Is this really so? If so, it is contrary to my teachings and experience, which has by no means been limited. In the Southern States, where I have resided for many years, muscovies were reared largely, and often in connection with the common paddle duck. Crosses often took place which were always sterile. I cannot say whether the cross was from the male muscovy with the female common duck, or *vice versa*. This difference may account for this productiveness, if such is the case. Please call the attention of the Editor on Natural History to this subject. I once wrote articles on this subject of hybrids, which will be found in the *Fancier's Journal*, Vol. I, in which I stated that they were sterile. If I am wrong, I would like to know the fact.

JAS. S. BAILEY, M. D.

[The ducks referred to by Dr. Bailey, are those existing in Mount Auburn Cemetery at Cambridge, Mass. The facts questioned were given by Dr. T. M. Brewer, in the hearing of the Natural History Editor, before the Boston Society of Natural History. Dr. Brewer vouched for their truth; and that a certain race of hybrid ducks does maintain itself from year to year at Mount Auburn, is undeniable.]

The following are recent arrivals at the Philadelphia Zoological Garden:—

GARDEN OF THE ZOOLOGICAL SOCIETY, FAIRMOUNT PARK, PHILADELPHIA, Jan. 21st, 1876. }
One Weeper Capuchin, *Cebus capucinus*. One Green Monkey, *Cercopithecus callitrichus*. Presented by Dr. O'Connor, Philadelphia.
Two Snowy Owls, *Nyctea nivea*. Purchased.
One Great Kangaroo, *Macropus giganteus*. Born in Gardens.
One Kit Fox, *Vulpes velox*. Presented by James A. Storm, Missouri.
Three Muskrats, *Fiber zibethicus*. Presented by C. B. Russell, New Jersey.
One Banded Rattlesnake, *Crotalus durissus*. Presented by Dr. A. Beecher, Philadelphia.
One Weasel, *Putorius fuscus*. Presented by J. Horan, Philadelphia.
One Snowy Owl, *Nyctea nivea*. Presented by G. DeHaven.
Three White Deer, *Capreolus caprea* var.; one Yak, *Bison grunniens*; one Axis Deer, *Axis masculata*; one Zebu, *Bos indicus*. Purchased.

Woodland, Farm and Garden.

AN EASY WAY TO MAKE A HOT-BED.—This is the season for making hot-beds, and frames for planting seeds, etc. Take three short red cedar or chestnut posts about four inches square and four feet long, plant them about eighteen inches in the ground, then nail on them a one-inch board sixteen feet long and fifteen to eighteen inches wide. This forms the back of the bed. Then plant three more post, only two feet six inches long, eighteen inches in the ground, and nail on them a board twelve inches wide and sixteen feet long for the front of the bed; this will make the pitch of the roof six inches, enough to shed the water. Both of these boards should be set edgewise. To form the back part of the roof nail a twelve-inch wide board flat, but a little slanting to carry off the water, and secure it by nailing it to the top of the back posts; then procure a bundle of good strong four feet plastering laths and nail them with lath nails, so as to be ten inches from center to center. These will form the sash bars to receive the glass. Then procure a sufficient number of 8x10 panes of glass and lay them on the laths without putty or nails. Each pane would have a bearing of one-half inch on each side. To water the bed, or to give air, take off a few panes, and when no longer needed put the glass away in a box for the next year. These frames are excellent for tobacco seed beds, tomatoes, egg plants, pepper, etc.

TO MAKE COVERED WALKS.—An easy way to lay out the covered walks and drives of a country seat is to use a rope about half an inch in diameter, see that there are no kinks in it; then fasten it to a stake at the point where the walk is to begin, allow it to lie loosely on the ground for about twenty feet, and then let the operator raise it and move it about by his eye, until he has a true and graceful curve. Mark it out as it lies for that distance, drive a peg, and proceed with another twenty feet, and so on.

A HORSE WITH A SILVER THROAT.—The Cincinnati Commercial has this account of a horse with a silver throat:—"He was a kindly, hard-working beast, belonging to the Cincinnati Omnibus Company, but was 'wind-broken,' and on that account had become almost useless. It was a pity, and a loss as well, to turn him out to die—he wouldn't sell

—so it was determined by Myers, the veterinary surgeon, to try an experiment, an expedient—in short a 'kill or cure' remedy. So, two months ago, he made an incision in the animal's throat, and inserted a silver tube in the windpipe to facilitate breathing, leaving a sort of artificial nostril at the point of insertion. The device works like a charm, the terrible wheezing has ceased, the incision has healed up beautifully, and the horse is doing his full days' work, and eats his full allowance. The silver throat can be removed and replaced at will for cleansing, but it is so arranged as not to get out of place or cause any inconvenience to the horse.

QUEEN BEES.—Means for raising queens are to be found in hives throughout the greater part of the year, and this is a wise and most beneficent provision against accident or sudden death to the important personage on whose life the welfare of the bee community depends, for as soon as the absence of the common mother is discovered, proceedings are at once instituted for supplying her place. By common consent, certain larvæ are fixed upon for royal honors, and around them are built large cradles with thick walls of wax. But these cradles do not take a horizontal position, like common bee cells—they project from the combs, and hang perpendicularly, with their mouths downward. When made on the face of the combs, all other cells around them are destroyed; but where natural swarming is allowed, they are generally suspended like stalactites from the edges. Now this mode of rearing royalty—so different from the method employed in raising workers—has caused considerable speculation, and the question has been asked—why are queens placed in suspended cells, and made, as it were, to stand on their heads? and for what purpose are their cells loaded with far more jelly than they can consume?

We think a reason can be given. In the first place, there is not room for large horizontal cells between the combs: and in the second place, if a cell for the purpose of isolation requires to be lengthened and bent into a new position, the bees find it more easy, because more natural for them, to build it downward. The position of the cell, though turned upside down, does not affect in the least the embryo. We believe the late Dr. Leitch, of Monomail, was the first to intimate to the public the fact of heat playing an important, if not the prime part in the evolution of queens. It is really the case that princesses require a much higher temperature for their development than common bees.

And what is rather curious, bees can command this higher temperature whenever they please! They can elevate the degree of heat in any part of the hive, and localize or confine the heat to that particular place. Thus, if a piece of comb requires mending, the temperature must be raised before they can manipulate it, but they can raise a circle of heat around the breakage, and keep the heat there within a limited sphere.

They can do the same thing to a queen cell. Having isolated it from other cells, they inclose it in a halo of caloric, two or three inches in diameter, and the heat in the halo is much greater than in any other part of the hive. In a uni comb hive, a distinct warm spot on the glass opposite the queen's cell can be felt by the hand.

The thick waxen walls of the cradle are designed to aid the bees in maintaining an equable temperature around its inmate, and prevent danger from rapid or easy chilling.

The superfluous jelly filling the bottom of the cell is put in for the purpose of bringing the larva forward to a position where it can be properly attended to, and its softness serves to keep the tender nursling from injury. All these things have the most perfect fitness.—*English Agricultural Gazette*.

SHEEP FEEDING.—Sheep require during the long winter some soft, pulvaceous food to take the place of succulent grasses. More diseases and losses are occasioned by an entire change from soft, succulent food to dry hay than from too close herding, though the latter is often very injurious. The best English feeders do not suffer a tithe of the losses of the average of ours. They feed roots, which may be considered grass laid up for winter use; they also feed much oil-cake, which has a very similar affect on the system of most herbivorous animals as grass. American farmers have not yet generally adopted root-culture, and, therefore, are not prepared to adopt the English practice in this respect; but they may use a small quantity of oil-cake, at a less rate of cost than the English farmer, for we export many thousand tons which ought to be used at home. When large feeds of Indian corn are added to dry hay, it only increases the difficulty, for corn is a very fattening and heating food, and thus excites a feverish state of the system. We would not discard corn as a sheep-food, but would always feed with it some laxative elements, as roots, bran and oil-meal. One pound to ten sheep, per day, is sufficient to modify the effects of dry food. This would only require one ton for 100 sheep 200 days, and it will lay on more value of wool and mutton than it costs, besides improving the health of the sheep.—*Live Stock Journal*.

To TELL THE AGE OF SHEEP.—A lamb has eight small teeth on the lower jaw, called the sucking teeth. When it comes one year old past the two center ones come out, and two wide ones fill their places. Thus they change, two coming out yearly until they are four years old past, at which time they have a full set of these wide, short teeth, setting closely together. After this they grow long and narrow, and in time will loosen and fall out. Sheep will do well as long as these teeth remain firm, so they can feed in summer. We have known the native or coarse sheep to live and do well until fifteen years of age.—*N. Y. Tribune.*

ANNOUNCEMENT.

GEN. GEO. A. CUSTER, The brilliant cavalry officer, has for a long time been thinking of preparing an account of his most exciting and interesting adventures in army life. He has been strongly advised to do so by Gen. Sherman and others.

Gen. Custer was engaged in every battle fought by the Army of the Potomac, except Fredericksburg, and has perhaps seen as much of the exciting and adventurous in the late war as any general living. These articles will begin in the February or March number of "The Galaxy."

The Kennel.

ADAPTING SPORTING DOGS.

IN our last issue the subject of the purchase and sale of sporting dogs was discussed. This is a matter of very great importance to those who are compelled to purchase broken dogs, and in the hope of being able to impress upon the minds of such persons the necessity of applying their best efforts in order to make the dog useful, and a comfort to shoot over, we make the following suggestions. In the first place, it should be understood that there is no such thing as breaking a dog so perfectly that when he goes into the hands of a stranger, he will at once go to work and obey him as he did his breaker or former master. Before a purchaser takes his dog to the field, he should first surely get the dog to know his person and voice. This can be done in the course of two or three days, if reasonable skill and a little patience is exercised.

The purchaser upon receiving his dog, instead of at once turning him over to another to feed and take care of, should by all means take charge of and feed him himself, and then, as soon as it is safe to let him loose from the chain, walk out with him and by gentle coercion and kindness let the dog know he has got a new master and must obey. If he is taken to the field before he knows his master there are ten chances to one that he will behave badly, and by bunglers be condemned.

When a dog changes hands he will attach himself to the first person who treats him kindly, consequently it is very important that when a purchaser gets his dog, he should see to it, that he does not attach himself to any other person: and then too, when the dog is first taken to the field to be shot over, he should by all means be taken out alone, as no skillful shooter would expect a dog in a strange place and among strange dogs to do well. Generally working a dog alone carefully a single day, or even half a day, will get him started all right and save a "heap" of trouble and vexation. It is wonderful to see what stupidity is frequently manifested in the management of strange dogs. Two or three cases have recently come un-

our notice. One gentleman had a brace of broken setters turned over to him, which were turned over to to the care of a servant. After a few days he took them off for a shoot, taking both to the field at the same time, although they had never been worked together, and besides, he went out with three other gentlemen, each having a dog, making four shooters and five dogs, and the result was, the brace of dogs alluded to were condemned by the whole party. The three other dogs were in the hands of their owners, who had shot over them for a long time, and they may have done well. Now any one who would expect a brace of dogs to do well under such circumstances, knows just as much about such things as a dog knows about the Greek alphabet. Another instance we would mention of unskillful management. An acquaintance of ours purchased an exceedingly fine young setter, just from the hands of one of the best breakers in the country, the dog, well broken and staunch, and under perfect control with his breaker, but his new master took him out for a day's shooting, and afterwards said he found him unsteady and not disposed to obey, and being asked if he punished the dog for his disobedience, his reply was, "he had no whip." Now, in our opinion, to undertake to work a strange young dog of that kind, and under such circumstances without a whip, is about as reasonable as it would be to take a horse on the track for a trotting race to drive him without lines. As we have before said, if those gentlemen who purchase broken dogs to shoot over, could be impressed with the necessity of exercising good judgment in the management of them there would be no difficulty in purchasing good, staunch, well broken dogs.

In consequence of the mismanagement, of so many persons, who purchase dogs, one of the best dealers of our acquaintance will not sell a dog to any one unless he knows to a certainty that the purchaser has skill and will exercise it. One of the best breakers of our acquaintance will not break a dog for a stranger for fear the dog will go into the hands of a bungler and the dog be condemned.

—Exhibitors at the Chicago Show this week will have an opportunity to visit Detroit also, where a Bench Show is to be held on the 31st inst., in connection with the fifth annual fair of the Michigan State Poultry Association. At this fair there will be an exhibition of cats, and also one of fish, under the direction of the State Fish Commissioners, valuable prizes being offered for the best displays, and also for essays on pisciculture.

COCKERS.—We are in receipt of a letter from Mr. M. P. McKoon, of Franklin, Delaware county, New York, inclosing photographs of a pair of stylish English cocker spaniels, from which he expects to breed some stock—weight of dog, twenty-nine and three-quarter pounds; bitch, twenty-nine pounds.

THE FIELD TRIAL DERBY.—There are one hundred and one entries of setters and pointers for the Field Trial Derby for puppies born in 1875, to be tried on partridges at Horseheath, Luiton, Cambridgeshire, (England,) about the end of April. Laveracks are well represented, Mr. T. B. Bowers having seven, the get of Blue Prince, Bandit, and Banda. Rock II, the Birmingham winner is in, and a number of pointers of Mr. Whitehouse's strain. Mr. R. Lloyd Price has eighteen representatives of his kennel engaged.

—A paper has been published by Dr. Birch of the British Museum, on different breeds of dogs known to the Egyptians, as depicted in the drawings on the walls of tombs. He finds that the variations of the animal were as well marked then as now. Here's a chance for a pedigree.

—Dr. J. B. Alexander, of Henderson, Ky., has purchased the puppy Kaiser, out of the imported Irish setter bitch Kitty, by her own sire Plunket.

KENNEL PRODUCE.—At Cambridge, Mass., on the 16th, John Nesbitt's lemon and white Belle dropped six whelps, all lemon and white, to Luther Adams' imported Rock. We have "great expectations" of this stock, as Belle is first class, and Rock is making his mark as a stock dog.—UNDER GRIP.

Sea and River Fishing.

FISH IN SEASON IN JANUARY.

SOUTHERN WATERS.

Pompano, <i>Trachynotus carolinus</i> .	Grouper, <i>Epinephelus nigritus</i> .
Drum (two species.) - Family <i>Sciaenidae</i> .	Trout (black bass), <i>Centropomus atrarius</i> .
Kingfish, <i>Menticorpus nebulosus</i> .	Striped Bass or Rockfish, <i>Roccus uncinatus</i> .
Sea Bass, <i>Sciaenops ocellatus</i> .	Tailorfish, <i>Pomatomus saltatrix</i> .
Sheepshead, <i>Archosargus probatocephalus</i> .	Black bass, <i>Micropterus salmoides</i> ; <i>M. nigricans</i> .
Snapper, <i>Lutjanus caxus</i> .	

FISH IN MARKET.—The supply of fish continues abundant, owing to the open season, and with some of the finer descriptions at only half the price of beef, poor people ought to be thankful for having such an article of diet brought within their means. We quote: striped bass, from the Mirimichi, 25 cents per pound; smelts, from Maine, 15 to 20 cents; blue-fish have gone so far South as to be beyond the reach of our fishermen, refrigerated fish are worth 15 cents; salmon, frozen, 50 cents; mackerel, 20 cents each; shad are worth from 60 cents each for Savannah fish, to \$1.25 for those taken on the North Carolina coast; white-perch, 18 cents per pound; Spanish mackerel, 45 cents; frost-fish, 8 cents; halibut, 20 cents; haddock, 8 cents; cod-fish, 8 cents; black-fish, 18 cents; flounders, 10 cents; eels, 15 to 20 cents; sheephead, 25 cents; white-fish, 18 cents; pickerel, 15 cents; sun-fish, 10 cents; yellow-perch, 10 cents; salmon-trout, 20 cents; black bass, 20 cents; ciscoes, 10 cents; green turtle, 20 cents; terrapins, \$12 per dozen; scollops, \$1 per gallon; lobsters, 10 cents per pound; soft clams, 30 to 60 cents per 100; hard crabs, \$5 per 100; soft crabs, 75 cents per dozen; pompano, \$1 per pound.

—One of the neatest and most successful fly-dressers we have is the young widow of John McBride, late of Mumford, Monroe county, New York. Ladies are proverbially nimble with their fingers, and we presume few men can manipulate the delicate feathers and tinsel with the same delicacy and artistic effect as Sara McBride. Those wishing flies have only to indicate what particular waters they are required for—Adirondacks, Maine, Lake Superior, Thousand Islands, Canada, &c.,—and their order will be intelligently and satisfactorily filled. We print this notice without solicitation or hint, and hope that some patronage will be bestowed upon an energetic little woman who has taken up the implements of her husband's craft where they fell in an untimely hour.

—An anonymous correspondent writes to recommend that split bamboo fly rods made by John Keider, of Philadelphia. They are made of eight and nine strips glued together, whereas the same kind of rod is usually made of four or six strips, the greater number of these adding to the strength, quality, and finish of the rod. We have never seen the rods of this maker, but will give them a trial. We should judge from the excellent reputation of the maker that they would be well worthy the commendation bestowed upon them.

—The old fishing club now located at Grays Ferry on the Schuylkill, probably the oldest society of the kind in this country, if not in the world, has made application to the Park Commission for a piece of ground at the mouth of the Wissahiccon, whereon to build a new hall.

—We have in print some racy correspondence on Needle Point Fish Hooks, in which prominent experts figure, but want of space compels us to defer it untill our next issue.

MOVEMENTS OF THE FISHING FLEET.—There have been ten arrivals from the Banks the past week, and one cargo of frozen herring. The receipts of fish are 296,000 pounds codfish, and 51,000 pounds halibut. The latter have been sold for 11 and 12 cents for white, and 7 cents for gray. The latest news from the herring fleet is not very encouraging. Colder weather is needed, in order that they may secure fares.—*Cape Ann Advertiser, January 21st.*

FISHING IN THE GREAT LAKES.

FIFTH PAPER—SEINES, GILL NETS, POUNDS, BAG NETS, SET
LINES, TROLLING, SNATCHING AND SPEARING.

EDITOR FOREST AND STREAM:—

THE modes of catching fish in the Great Lakes are various. Seining has largely given way to pound and gill nets, but is still in use upon the beds during the spawning season of whitefish, and is then the most profitable of all fishing. Twenty barrels at such a time, with a seine one hundred rods long, is not uncommon at a single haul, and one hundred and forty have been taken; still, there are few localities adapted to this fishing, as a smooth, sandy, or shingly beach, and a bottom devoid of rocks is demanded. Seines of all sizes are used. The seining season begins on the disappearance of the ice, and is fol-

lowed with profit only for a short time—from one to five weeks, during the favorable nights, when various fish are taken, suckers and wall-eyed pike predominating, though whitefish are also captured in paying quantities. Large hauls of these latter fish are made only during the three weeks of the spawning season, as before mentioned, or when they appear in shoals in the Spring, as they often do. For what purpose whitefish thus congregate in the Spring is unknown; but as they have been caught in July with ripe ova, it has led many to believe that they spawn oftener than once a season; this is probably only an exceptional freak of nature. Seines are worked by three or more men, according to size, and a boat; one end is held or fastened to the shore at the point of departure, and the seine folded upon the stern sheets of the boat, is payed out as the rowers make a circular sweep, ending at the starting point. The leading line is now fastened to a rude windlass or capstan, and the net drawn into shallow water. The fish within the expanse of water encircled are gradually drawn by the surrounding wall of net work, and finally captured from the "purse," which the middle portion of the net assumes when it impinges upon the shore. These seines are weighted upon the lower and buoyed upon the upper edge, so that they assume the perpendicular while in the water.

Gill nets are largely used. The season for gilling is from April, or from the time the ice disappears until it again interferes. By some, gill nets are used throughout the Winter by cutting holes and drawing the nets through them underneath the ice. These nets are buoyed and weighted in the same manner as seines, and are five or six feet in width, and about twenty rods in length and used in "gangs." A "gang" is made by bridling together several nets—from six to twelve. If the nets are designed for trout, four to four and one half inch meshes are used; if for whitefish, three and one-half, and three inches for herring. Gill nets are placed in boats in the same manner as seines, and taken to some favorite resort of the fish—often ten or twelve miles from land. When the ground is reached a stone anchor is dropped, to which is fastened a buoy and flagstaff. To this is attached a line from the nets of sufficient length to allow the weighted edge of the gang to reach the bottom. The boat is now rowed in the desired direction, until the further end of the gang is reached, when it is also anchored and buoyed in the same manner as the first. The nets are now left in the water about three days, when they are lifted, the fish removed, and the nets dried and repaired for a second setting. Twenty fish to a net is a fair catch, but often four times this number are taken. The first gilling for whitefish is usually in from two to five fathoms, but as the season advances and the fish retire to deeper water, so are the nets carried farther and farther out, until they are often set in fifty to one hundred and fifty fathoms; indeed, off the Fox Islands, gill nets have been set with excellent results in water fourteen feet in depth. The largest fish come from deep water. Gill nets destroy great numbers of fish during heavy storms, when the fishermen are unable to visit them for days at a time, two days being sufficient time during the Summer months for fish to die and become tainted. Again, when the nets are lost, as not unfrequently happens, they continue to destroy fish by entangling them, until the floats become water-logged and sink. Nets have been grappled and raised two years after losing, and found full of decayed fish. As a great number of gangs are lost each year through storms, or by leaving until the ice prevents recovery, it may be readily believed that the useless destruction of fish by them is considerable.

Pound, or stake nets and bag nets. The principle is the same in both. Each has a lengthened arm or leader stretching some distance out into the lake, with a trap at the end. The bag net is anchored and buoyed, while, as the name indicates, the stake net is fastened to stakes or spiles. With the latter the leader is often three or more miles in length, and furnished with pounds or traps at intervals. These are set in water varying from five to one hundred feet in depth, and the spiles to which the nets are fastened are often ten inches in diameter and placed by a driver. As the fish cannot pass the barrier formed by the leader, and readily avail themselves of the apparent modes of escape, it is evident that fishing with pound nets is far more profitable than any other; but the expense entailed for a complete outfit deters many from using this mode of capture. The pounds, or bags, are of the same material as the leader, and the walls kept apart by anchor ropes, guys, and light staves stop. Where the leader joins the bag there are openings upon the mouse-trap principle, narrowing as they recede, admitting the fish into the chamber, within which they may reside indefinitely almost, without finding the narrow and now projecting slit by which it entered, and to which it constantly presents its broad side as it swims within its prison wall. Night lines, or set lines, are also used, but to no great extent, and a description would be superfluous.

"Snatching" trout is also practiced, especially in Winter. The apparatus for "snatching" can scarcely be described as a "stick and a string, with a worm at one end, and a fool at the other." A trout hook is made from strong steel wire, of from one-fourth to three-eighths of an inch in diameter, and weighted with lead—about two pounds—in the shape of two cones with their bases joined, through which the shank passes lengthwise. The line is a cotton one of nearly, if not quite, the strength of a bed cord, and from three to six hundred feet long. In fishing through the ice, the moment a bite is felt the fisherman throws the line over his shoulder and runs with all his might until the fish is landed upon the ice, giving his captive no time for resistance. If in a boat he allows him to run, occasionally feeling the line, until the fish is exhausted, when he is quickly secured. As high as eighteen barrels of trout have been snatched by two persons, but four barrels would be considered good fishing. Of trolling, it is unnecessary to say more than that the apparatus must correspond in size and strength to that for snatching.

On Saginaw and Green bays, more particularly, fishing is carried on extensively during the Winter months, and the number of cabins, or shanties, upon the ice, occupied

by fishermen, is often so numerous as to form quite a city. Saginaw Bay boasts of such a settlement each season. Last Winter the fishing city was nearly thirty miles in length, by twelve in breadth, and possessed a population of upwards of 2,500 souls. Two years since the city was regularly organized under the name of "Pickersville," with a Mayor and Common Council. The shanties, or huts, are of different sizes, the largest last Winter being ten by sixteen, and used as a hotel. The ordinary shanty is scarcely more than large enough for the inmate to turn around in, and is cheaply but warmly made, being of culled pine lumber, covered with building paper. A bunk at one end answers for sleeping purposes, while a shelf at the other comprises the pantry and china (?) closet. At door at one side provides entrance and exit, and light is obtained by a small window at the opposite side, so arranged as to be readily darkened. A small sheet-iron stove, about a foot and a half in length, and of corresponding height, answers for warmth and culinary purposes. In the floor is a trap-door, some twenty inches square, which, upon being raised, reveals an opening through the ice. When fishing, the window is darkened, and the fisherman, seating himself at one side of the opening, lowers into the water, by a string dependent from the roof, a wooden lure fish, or a herring prepared for the purpose. Herring are speared only as wanted, and prepared by cramming into its gullet a strip of lead some four inches in length, weighing a quarter of a pound, as a sinker, a slip noose over the head, and all is ready. The operator now lowers his decoy, and manipulates it with more or less skill so as to simulate the movements of a live fish. If the fisherman is fortunate enough to secure a live herring, all the better, which is fed with lead, and fastened in the same manner. Attached to a second cord is the spear; a nail fixed in the handle allows it to be hung on the trap, so as to be always at hand, and when the fish approaches the decoy there is a quick dart, and the victim is quickly secured and drawn out, the handle passing through a small opening in the roof made for its accommodation.

The spearing of fish, which seems simple and easy to the novice, will be found to demand no little skill. The spears used have from three to seven tines, and many possess more than one barb to the tine. The darkening of the apartment operates favorably by allowing the water to furnish its own light, and enables the operator to see to a great depth. In almost every case the bottom may be readily discerned.

The fish run best in the early morning, and after four o'clock in the evening. Some use lamps, with reflectors, that they may pursue their occupation at night. As the fish run in schools, the openings are often black from numbers, and as many as five are sometimes taken with a single cast. The catch is principally wall-eyed pike—known as pickerel to the "Kanucks" and "Wolverines"—although a few whitefish and trout are obtained as well. Near the Charity Islands many make a specialty of trout spearing. These use a small "coop," straw tick and blanket, the shanty being used for living purposes only. The "coop" is made of hoops, something the shape of a skeleton carriage-top, and is placed upon one side of the opening through the ice, while the fisherman reclines at full length upon the mattress opposite, with his head projecting over the hole and under the coop. Now, by drawing his blanket over, all light is excluded, except as is reflected through the medium of the water below.

The yearly catch of all kinds of marketable fish at this fishing city is upwards of two millions of pounds, which is sold at an average of five cents per pound; never less than three, and often as high as six cents is paid. Each year the ice cracks from shore to shore, and large fields float out into Lake Huron; so it may be readily surmised that this occupation is not without its attendant dangers. Indians ignore shanties, coops, and mattresses, using merely a couch of hemlock boughs, or cedar brush, either of which seem to possess antidotal properties to frost, upon which they recline, and cover the head and opening with the blanket alone. They are very expert at catching sturgeon by this method, and possess seemingly the faculty of ferreting out the haunts of this fish, which, in some localities, is their entire sustenance, or nearly so, during the Winter. The spear used by them for this purpose is of great strength, and usually of one tine only; but with four or five barbs, all of which are on the one side, the handle is thirty or forty feet in length, and of some heavy wood, that it may penetrate the water with ease. The spear proper is fastened to it but slightly, being pressed into a mitre at the end, so that the first movement of the fish, when struck, will disengage it, and allow the handle to return to the thrower; but a stout cord, several fathoms in length, connects the head of the spear to the shaft. The reason for this is, that the struggles of a fish as large as the sturgeon would snap the strongest handle, while the attached cord allows sufficient play, and is the final means of securing the captive. I have been unable to obtain anything like the average weight of lake sturgeon, or their size. The largest ever seen by the writer measured a little over seven feet in length.

The boats used by fishermen are generally square-sterned dories, or Mackinacs. These latter are probably the best small boats made for heavy weather. This Summer the writer, with two others, rode out one of the heaviest storms of the season on Lake Michigan, in a Mackinac only twenty-two feet in length, and suffered no great inconvenience. These boats have a good deal of shear, with greatest beam forward of amidships, and sharp at the stern, which prevents the shipping of water aft while running with the sea. I believe them to be unequalled for speed, and the best surf boat known, for with proper handling they may be beached at any time without serious danger. I understand a few parties use small steam craft and schooners in their fishing operations. It is said that one firm alone in Milwaukee employs 1,000 men. This is undoubtedly a gross exaggeration.

ARCHER.

ANGLING FOR EASTERN SALMON (*Salmo salar*) IN CALIFORNIA WATERS.

SAN FRANCISCO, January 1st, 1876.

EDITOR FOREST AND STREAM:—

Angling for young salmon on the Oakland long wharf, opposite this city, commenced about six weeks since. These grilse have begun biting about a month earlier than they did last year. They have not yet, however, come so plentifully into our bay (ultimately bound for their spawning ground up the Sacramento and San Joaquin rivers) the present season. Consequently, few as yet, in comparison with last winter, have been taken. The average size of those which have been captured

is greater by about two pounds than last year. This was to be expected, as they are, of course, a year older. Most of the fish creelers are from two to three and a half pounds in weight. The more I and some others have examined these fish, and looked into the subject, the more are we of the opinion that these beautiful and delicious fish are those, or the proceeds of those Eastern young salmon from the Penobscot or Kennebec rivers, the eggs of which were brought here by Seth Green and hatched at the Company's breeding ponds on the McCloud River, and the infant fry placed in the Sacramento River. Nearly all intelligent judges agree that these young salmon, with which we are now having such good sport, are not of the same species as our common Sacramento salmon, but are longer and slimmer in body, of a rather blue tint on their backs, and their flesh is much lighter in color and more delicate in its tissues and flavor. Some ignorant parties here, still persist in calling them salmon-trout, meaning, probably, identical with, or a kind of what is called here by fish dealers a salmon trout, a few of which are now to be seen in our markets and which first appear on our southern coast about Monterey, and gradually make their way northward—a fish having a square tail, a long body, and a very small head. This salmon-trout, as it is termed, is esteemed by our fishermen yet as superior to common Sacramento salmon, and sells higher in the ratio of one fourth at least, but is not quite so good as our young bay salmon alluded to above, and which we are now taking. Our young salmon have, like all the salmon family, a forked tail, unless our salmon-trout just spoken of, and which, as I have observed have square tails, are to be classed as true salmon, which I, for one, cannot suppose, as I have told you in some of my former letters, these young salmon now in our bay take for bait our mussel-worm, or small fish, or a piece of a smelt, either alive or dead, or both put on the hook at the same time, by threading on the worm first over the shank and putting the small fish, or slice of a smelt, just on the very point of the hook.

BAYFIELD, Wis., January 10th, 1876.

EDITOR FOREST AND STREAM:—

Your correspondent "Archer," in FOREST AND STREAM of Dec. 23d, 1875, speaking of the fishes of the great lakes, states that, "siskowit stands at the head of the list of fishes inhabiting these waters." I would state for the information of "Archer," and all others interested in the matter, that the inhabitants on the shores of Lake Superior pronounce the whitefish far superior to either the siskowit or lake trout, and we also consider the lake trout a better fish for the table, while fresh, than the siskowit. The siskowit is a very fat, oily fish, and is considered much better salted and smoked than when fresh. Our citizens never eat siskowit or lake trout when whitefish can be had in the market. We also have in the waters of Lake Superior a hybrid of the siskowit and lake trout, and one not accustomed to seeing these fish together would not mark the difference in the fish.

K.

Shot Gun and Rifle.

GAME IN SEASON IN JANUARY.

Hares, brown and gray.

Wild duck, geese, brant, &c.

FOR FLORIDA.

Deer, Wild Turkey, Woodcock, Quail, Snipe, Ducks, and Wild Fowl.

GAME IN MARKET.—The continued mild weather and absence of snow, renders Western game very scarce in the market, and we still quote pinnated grouse (prairie chickens) at the unprecedented price for this season of the year, of \$1.25 to \$1.50 per pair; ruffed grouse are worth \$1 to \$1.20; quails, very scarce at \$5.50 per dozen; canvas-back ducks, \$3 to \$3.50 per pair; red-heads, \$1.50; mallard, \$1 to \$1.25; brant, scarce, \$1.25 to \$1.50; widgeon, 75 cents to \$1; black ducks the same price; also sprig-tails; broad-bills, 75 cents; teal, 75 cents to \$1; wild geese, \$1 to \$1.50; rabbits, 40 to 50 cents per pair; hares, 30 to 40 cents; venison, 20 to 25 cents per pound. The wild ducks and geese are being received principally from the South, there being but few Long Island birds in market.

—The Hazard Powder Company have an Agency in Jacksonville, Florida, whereat sportsmen can replenish their supplies without having to send North.

—It is said that ten years ago a gentleman imported a number of the eastern "Bob White" quail, and placed them on an island near Walla Walla, W. T., and now they swarm by the thousands, affording excellent hunting. The attempts to acclimatize California quail on this side of the Rocky Mountains have not been so successful.

WILD TURKEYS WANTED.—The West Jersey Game Protective Society want about two dozen wild turkeys for breeders. Can any of our Western readers supply them?

LONG ISLAND SHOOTING CLUB.—At the annual meeting of the Long Island Shooting Club, held in Brooklyn on the 19th inst., the following officers were elected for the ensuing year:—For President, W. M. Parks; Vice-President, Dr. H. F. Aten; Secretary, W. V. Baylis; Treasurer, R. Robinson, and for Board of Directors, J. J. Walton, Chas. A. Eddy, W. W. Wynn. The report of the Board of Directors for the past year, through its chairman, Capt. A. Elmendorf, was very encouraging to the club, showing a prosperous condition; also showing the shooting grounds to be the most complete in all its details for the comfort and pleasure of its members of any association in the State; and the following resolution was proposed by the Board and unanimously carried, to wit:—"That the mutilation of birds shall not be allowed under any circumstances on the grounds of the Long Island Shooting Club by any person whatsoever, and that this resolution shall be conspicuously placed on the club grounds."

SPRINGFIELD, MASS.—The Beaver River Sportsmen's Club has been formed. The officers are:—President, A. L. Bassett, of Pittsfield; Vice-President, H. K. Cooley; Secretary and Treasurer, Frank Bolles, Jr.; Executive Committee, Walter Clark, E. P. Doolittle, J. A. Bryan, F. E. Cooley, C. J. Lyman, E. W. Ely, of Chester, A. L. Goodrich, of Hartford, and N. P. Wills, of New Haven.

MASSACHUSETTS—*Salem, January 24th.*—Gunning still very quiet. Ducks are scarce in our harbor just now, owing to the open weather, keeping out in the bay. Pine grosbeaks are very numerous this winter, but shore larks and snow buntings scarce. Herring and saddle-back gulls numerous. Smelting through the ice at Rowley has begun. The Grant Rifle Club take advantage of the weather, and have some good shots. I have asked for some of their scores, and hope to get them for you.

TRAIL.

—A match was shot at Philadelphia on the 18th inst., between Capt. A. H. Bogardus, Miles Johnson, and W. Carson on one side, and Chas. Levatt, John Levatt, and J. F. Kleintz on the other side. The conditions were, to shoot at fifteen birds each, trap and handle for each other, thirty yards rise, R. I. rules. The Levatt's are Pittsburgh men, Kleintz and Carson from Philadelphia, and Bogardus and Johnson have been heard from before. The latter both used Scott 10 bores, the Levatt's a 10-bore Greener, and Kleintz and Carson their short, six-bore, single-barrel muzzle-loaders. As the match resulted in a tie, it was to have been shot off on Friday. C. B. Levatt won the \$50 sweepstakes. The following are the scores:—

Name.	Score.	Total.
W. Carson.....	1 0 1 0 1 1 1 0 1 1 1 1 1	11
Charles B. Levatt.....	1 1 1 0 1 1 1 1 1 1 1 1 1	14
A. H. Bogardus.....	1 0 1 1 1 1 1 0 1 1 1 1 1	13
J. F. Kleintz.....	1 0 1 1 1 1 1 0 1 1 1 0 0 1 1	11
Miles Johnson.....	1 1 0 1 0 1 1 1 1 1 1 1 1 1	13
John Levatt.....	1 1 1 1 1 1 1 0 1 1 0 1 2	12

*Dead out of bounds. Bogardus' side killed 37; missed, 8. Levatt's side killed 37; missed 8.

—Mr. M. J. Close, of Pontiac, Mich., is desirous of shooting any man in Michigan a match at 100 single birds from H. T. traps 26 yards rise, 80 yards boundary for \$100 to \$500 a side; each man to furnish one-half the birds, common house pigeons. A deposit in the hands of any responsible person in Jackson will be covered.

CHOKE-BORES.

JACKSONVILLE, Ill.,

EDITOR FOREST AND STREAM:—

I have read with interest, what has been said in your paper relative to the above subject. My opinion is, that it depends on the locality where they are used, whether extra close shooting guns are preferable or not. In this part of the country where it is mostly open shooting where two shots are fired at over fifty yards to one under that distance, at grouse and duck in the months of October, November and December, when most of the shooting is done, a close and strong shooting gun is decidedly preferable. I have been using close and strong shooting guns for the past six years, made by E. C. Green, of Cheltenham, England, a practical maker, worthy of praise. I have been using one of his 12 gauge guns, the closest and strongest shooting gun I have ever used or seen, with the best of success in open shooting. Last Spring I was informed that there was English snipe and some ducks on the "botoms," "but they are so wild you can't get within shot of them." Thinking I would try them, I loaded my cartridges with 3½ and 4 drachms Orange powder and one ounce of No. 8 shot for snipe and one ounce of No. 4 for ducks. In a few hours shooting I bagged sixty snipe and nine ducks, mallards and sprig-tail; making some of the longest shots I have ever seen made. I am confident, had I used an open shooting gun, I should not have killed half the number. This gun will not do for cover shooting, the bird is cut to pieces at close range. There is nothing in the outward appearance of this gun to indicate that it is a close shooting gun, it is not thick at the muzzle like the choke-bore I have seen. I can use more powder without recoil than in any gun I ever used. It does not foul easily, and I use it all day without cleaning. This make of guns speaks for themselves wherever they have been tried. When some of the great gunmakers saw at the New York Gun Trial in 1873, E. C. Green's commonest guns, that had been in use from one to four years, (without being re-bored) lead their best guns in shooting qualities, they thought it high time they were doing something to improve their shooting or they would lose their prestige, hence the choke-bore is brought out, and a great blow made about them. I think the plan adopted by Mr. Green, is the best for all shooting—namely, to make the right barrel shoot open, and the left close. These guns are made on this plan unless otherwise ordered. "Give honor to whom honor is due," is the motto of

GEORGE HAYDEN.

NEW YORK, January, 1876.

EDITOR FOREST AND STREAM:—

There is a vast difference between "Gloan's" former assertion in reference to the shooting of Mr. Pape's guns, and as he now qualifies and explains it. No one would suppose he intended to convey any such meaning; nor could I construe his letter different from what I did as it was then written. Neither shall I acknowledge that "Gloan" goes before me in anything that pertains to sport in its highest and best sense, or in whatever courtesy is due between sportsmen.

As to the cup, if I am not misinformed, three or four English gunmakers publicly claimed in their advertisements to have discovered this system of boring, and to settle the question, a party of gentlemen subscribed towards a cup, to be given to the maker that made his claim good. Now, if these men did not send in their claims to the Field office, it clearly proves that they were claiming something they knew they were not entitled to. As for Mr. Pape persistently refusing to produce his patent, that I deny, as it was this very thing that gave him the cup. He was prepared to show his guns, bored on this system years before, if it was necessary, but there was no need of it. What he did was simply to show his patent to the Field committee, that they could not get behind. If Mr. Pape sees fit to send a copy of it on to satisfy the curiosity of one man, which I doubt, I will make it known. E. L.

DITTMAR POWDER.

A correspondent writes as follows regarding his experience, last spring, with the Dittmar powder in snipe shooting, his anticipations at starting out not being very enthusiastic:—

The first bird rose from the edge of a small meadow as wild as a hare. A slight crack, an almost imperceptible puff of smoke, and lo! *Scotopax* was as dead as snipe could, would, or should be; and so for the balance of the day, making some long shots, thus exciting the surprise of my friend. I have found it of much value and comfort on soggy days where smoke hangs heavily and drifts slowly, being enabled where two birds rose to fire through what little smoke was evolved, and keeping sight of the bird the whole time. My experience of the powder has now extended over a period of over eight months, part of the time being out five mornings a week, and the results always the same. Snipe, woodcock, grouse, and quail have succumbed to it, and so far not the slightest unpleasant consequences have ensued; but when such men as Arnold Burgess meet with mishaps with it, I must confess it shakes my faith—men of known ability and care in the use of their weapons, and who make no idle assertions, it certainly makes a little cold water run down one's back when he thinks of risking a favorite and only gun. Well, in short, my experience has been of a pleasant kind with Dittmar's powder; little recoil, less smoke, little dirt, and little lumps of sawdust, rhubarb, or whatever it is in the barrels, which are easily cleaned. My friend having seen the effects, has borrowed some to try; and if his experience coincides with mine, will let you know. CHAS. H. HINKLE.

SEDALIA, Mo., January 10th, 1876.

EDITOR FOREST AND STREAM:—

I hailed with delight the advent of Col. Dittmar's invention, and hoped that the objectionable features of black powder had been overcome, and when in Boston last summer procured a sample of it for a trial; and I must say that my experience with it was most satisfactory. I tried it at a target first, at thirty and forty yards, and afterwards used it in the field with the most gratifying results. At targets I loaded a No. 12 breech-loader with 3½ drachms powder and 1½ ounces of shot, both measured by Dixon measure; in the field 2 drachms powder 1½ shot. I

used the same loads in every particular of Orange Ducking Powder, made by Lafflin & Rand. The trial showed that the white powder produced less noise, less dirt, and scarcely any smoke, with equally as good pattern, and penetration about one-fourth greater than the Orange powder. At quail in the field it did equally as well. The birds were killed clean, and as often as with black powder. Had nothing appeared in print in regard to it I should probably laid in a supply, and used it in all my shooting, but the unsatisfactory experience and accidents reported to your paper by others led me to wait until more satisfactory trials had been made. If all of it is made of the same strength and possesses the same qualities as the sample given to me, it is good enough for anybody, and just as safe as black powder. But the question arises, has Col. Dittmar arrived at such perfection in its manufacture that he can make it all alike? Have not the unsatisfactory results and bursting of guns reported been caused by mistake or carelessness in its manufacture? Since I read the article of "W. R. C." in your paper last week, I am led to believe that the fault lies in its manufacture, and not in its use? By that article, it appears that it is made in a similar manner to gun cotton, if so, it will be almost impossible to make two lots exactly alike. I suggest that some means be taken to give it a fair trial, by the parties interested, and let the result be published. If it is as good and safe as it appeared to be in my hands, every sportsman will encourage its manufacture; if unsafe, it ought not to be put into the market.

O. A. C.

GAME IN CENTRAL PENNSYLVANIA.

HARRISBURG, Pa.,

EDITOR FOREST AND STREAM:—

For several years past quail, ruffed grouse, wild turkey, woodcock, snipe, plover, quail, and rabbits were scarce, owing to the indiscriminate slaughter by pot-hunters. Thanks to our game laws this business has been stopped and now game is beginning to multiply. We have no deer hunting grounds nearer than Lykens Valley, about thirty miles distant. In the vicinity of Lykens, Williamstown, and Grotz, Peters, Berry, and Short Mountains, some fine specimens are killed. Occasionally a frightened buck or timid doe is run down to the Southern Slope of the Kittatinny into the farming districts, four or five miles north of Harrisburg, and Cox's Island in the Susquehanna, four miles from Harrisburg, is a famous resort for duck-slayers during the Fall and Winter, and for shad-seining in the Spring. Wild turkeys are found in the valley skirting the Kittatinny, Roberts, and Peters mountains—in Fishing Creek, Stony Creek, Clark's and Powell's valley. Last Winter the country Nimrods asked \$5 per pair for wild turkeys, and from \$2 to \$4 for an extra bronzed breed cock. The majority of our deer hunters go up the Juniata River in quest of deer annually, to the Black Log, Tuscarora, and Bald Eagle mountains, and even beyond Altoona, along the Eastern Slope of the Allegheny's.

Quail and woodcock are found within a few miles of the city. The farmers are pretty strict, however, and forbid their killing except for a money equivalent. The severe Winters of the few past years decimated the quail family considerably, but hundreds of dollars were spent for birds from Virginia and milder climates than Pennsylvania, and now they are becoming plentiful.

York Hills, eight miles below the city, is a fair locality for rabbits, grey squirrels and woodcock. Up the river, on the flats opposite McCormick's Island, plover of the yellow-legged variety are found in great numbers along the marshy grounds on the Eastern Shore of Maryland and Northern Virginia. They fly northward often when storms prevail in the localities where they abound farther South than Harrisburg. They differ materially, in color, size, and plumage, from the plover we used to hunt stones at in cow-pastures and fallow-lands.

Jack-snipe may occasionally be shot along the river. Their feeding grounds being principally along the marshy creeks and rivulets emptying into the river and on the edges of the grassy flats when the river is low. Swans, wild geese, and wild ducks are shot above the city. Can vas-back, red-necks, black mallards, etc. The canvas-back bring \$1.50 to \$2 per pair, the others varieties 75 cents to \$1.50, according to quality. A stray brant, the first specimen seen here for years, was observed feeding off Foster's Island last Fall. It was captured by Mr. Robert Mc-Glanchlin. The bird was about the size of a young goose, of pure white plumage, having only three or four dark quills in each wing.

The Susquehanna and its tributaries are filling up rapidly with black-bass transplanted from the Potomac, within the last five years. There are also a number of private trout and bass ponds in Central Pennsylvania. Recently a lot of twelve or fifteen fish averaging about two and three-quarter pounds each were caught at Duncannon, fifteen miles up stream, and at 5:30 P. M. last Spring, while a party were fishing for shad off Foster's Island along the city front, two strange looking fish of the salmon species were caught amongst others termed "Susquehanna salmon." These were some sixteen or eighteen inches in length, handsomely spotted, or blotched, having broad sides and compact bodies and peculiarly shaped heads. These were pronounced to be of Sacramento River salmon variety, the spawn of which was hatched at Seth Green's establishment. Since then a Harrisburg fisherman, while hunting crabs for bait at the mouth of the Conemaugh Gwinnett Creek, (which empties into the Susquehanna River opposite Harrisburg) surprised a fish of the same description in deep clear water. He described it as being of the very same shape and color as those caught while assisting in shad-seining, and describes its movements to have been "quick as a flash."

Many persons appear to think that this fish, accustomed to the icy mountain streams of California, has sought the head-waters of the river where there are many springs.

SWATARA.

THOMPSON & SON, 338 Broadway, use no sugar of lead in waterproofing their suits. Sugar of lead will not stand washing, and amongst old sportsmen is considered detrimental to health, making them liable to rheumatic attacks. Thompson's suits are guaranteed to be thoroughly waterproof, even after being washed, and are as good and cheaper than any other suits in the market.—Advertisement. jan27-76

Answers To Correspondents.

No Notice Taken of Anonymous Communications.

H. C. RIPPEY.—Please send your address to this office.

GRANITE, Bradford, N. H.—Will you please give me information in regard to obtaining land-locked salmon for stocking public waters? Ans. Address Hon. E. M. Stillwell, Bangor, Me.

H. L. FARRAND, Griggsville, Ill.—Hooker's Natural History, which we study, says grizzly bears climb trees. Is this true? Ans. No; grizzly bears never climb a tree, but only reach up as high as they can with their ore paws.

J. H. C., Jersey City.—I have a very fine W. & C. Scott & Son breech-loader, No. 10 bore, weighing 9½ pounds. Can I have a pair of 12-bore barrels fitted to same stock, which will make the gun weigh 7½ pounds? Ans. Yes, by sending the gun to Messrs. W. & C. Scott & Sons, Birmingham, England.

J. C. H., Oconomowoc, Wis.—I have a very fine Gordon setter pup, nine months old, who is troubled with goiter. It does not seem to injure him; neither does it disfigure him at present, but fear it may, if it continues to grow. Can you tell me of any remedy? Ans. Try bathing the part affected with kerosene.

C. S. R., Niagara Falls.—Can you tell me if there is a gunmaker by the name of Thompson & Co. I have a fine English muzzle-loader with that name on the lock, and don't know whether that was the makers' name or not, as there is no other on the gun? Ans. There are several gunmakers in England named Thompson.

C. W. A., Jr., New York.—Can you inform me of any place within fifty or one hundred miles of New York where shooting of any kind can

be had during this or next month? Ans. Nothing but duck shooting now open. Address Capt. Ed. Dunes, Sayville, L. I., as to the Great South Bay; or Wm. Lane, Good Ground, L. I.

SCOTT, Phila.—Can I get a good muzzle-loader, made by Scott, Wesley Richards, or Greener for \$50? How would a 32-inch barrel, 10 gauge, 9 pounds do for any game likely to be met in Pennsylvania? Ans. We can select a good Scott or Greener muzzle-loader for you at about \$50. A gun the size you mention would be a serviceable one if you have the strength to carry it.

W. D. M., Buffalo.—Can you give me any information regarding the workmanship and shooting qualities of the guns made by Chas. Green, of Rochester? Ans. We have never used one of Mr. Green's guns, but have heard them very highly spoken of; some of our best pigeon shots have used them, and in workmanship they are equal to any in this country of corresponding prices.

J. W. P., New Haven.—I have read "Dinks on the Dog," and would ask who is Dinks? Can you give his address; and can he sell me a dog that will fill his description of what a setter dog should be? I have never yet seen one. Ans. "Dinks" has been dead many years. He was a well educated English gentleman, who settled at Amherstburgh, Canada West, where he kept a kennel of dogs and wrote his book.

A. F. D. Philadelphia, Pa.—With regard to the pointer pup I wrote to you about, that swallowed the silver half dollar, and which you said in answer to correspondent, he would digest in six days, I beg to state that he swallowed it on the 21st November, and passed it on the 10th December, making 23 days to pass it. Ans. We can only say that it was in consequence of the purity of the silver that it required so long a time to digest.

G. B., Brooklyn.—Can the English chilled shot, such as was used at the London gun trial, be obtained in the United States? 2. How does the English No. 6 compare with Tatham's? 3. Will the chilled shot prevent leading in a choke bore gun? Ans. 1. It can. Mr. H. C. Squires, No. 1 Courtlandt street, has just imported several tons. Schaffer, of Boston, also has it. 2. The English No. 6 contains 270 pellets to the ounce; Tatham's No. 7 contains 291 pellets. 3. It will.

J. W. W., Bluff City, Ill.—I am one of those unfortunates who never saw a fly rod or reel or artificial fly, and scarcely ever went fishing. Now what fish will I find in the Illinois River that can be taken with rod and line and fly, and how shall I proceed to catch them, and what kind of rod and fixings do I want? Ans. The black bass (*Myxocetor salmoides*) is the only fish that you would be likely to coax with a fly. Send to any reliable dealer in tackle and he will fit you out with a rod line, reel, and flies, at a cost of about \$20.

G. F.—Yearling brook trout usually sell for \$10 to \$15 per hundred (alive). Two year-olds about \$20. Larger fish according to size. We do not like air-pumps for transporting fish, they are very hard work, and kind of nuisance generally; but prefer a can of fresh water, a dipper and a pail. Water can be well aerated with the two latter, by pouring. To draw off water from cans, the best thing is a rubber syphon (one-inch tube) with a strainer-tube to go outside of it; this is what is used by the men who have done the greater part of the transporting in this country.—FRED. MATHER.

C. L. I., Phila.—Will you be kind enough to give me a little information in regard to a couple of muzzle-loading guns that I possess—one is inscribed "Joseph Bourne, maker, No. 5 Whittall street, St. Mary's square, J. W. Baden." On the other is "Renkin Brothers, Liege." The last named is a Laminated steel gun—the other is a twist. I want to know why the name J. W. Baden is inscribed after the makers' name, and also are these celebrated makers, &c.? Ans. There are such gunmakers, but their guns are not well known in this country. It is probable the gun was made for J. W. Baden.

J. C. G., Allegheny City.—I notice your advertisement in FOREST AND STREAM of thorough broken setter. Please give me information as to price, etc. I have a thoroughbred English bitch, which I had lined by a blood red Irish setter, which was imported at a cost of sixty pounds. He threw seven dogs and one gyp, all liver color with red legs, black muzzles, and marked above the eyes like the Gordons. Is this not odd? The bitch is white and seal brown? Ans. Have written you describing the setter advertised. The colors of the pups from your English bitch are just such as would be likely to follow from such a cross.

J. K. S. & Co., Phila.—1. For target shooting what is the longest range that you would consider a Wesson rifle, 44-100 calibre, 28-inch barrel accurate? 2. Is there any rifle club in Philadelphia, and if so, where is their range; who is the President, and what is the cost to become a member? 3. How far do you think a Colt navy revolver would carry accurately if it was screwed in a vice and pointed straight for an object? 4. Which is the best for common shooting Colt's navy revolver or Colt's army revolver? Ans. 1. With long cartridge 400 or 500 yards. 2. Enquire of Edward Anschutz, gunmaker, No. 210 South Thirtieth street, Philadelphia. 3. Seventy-five yards. 4. Not much difference.

M. P., Bridgeport, Conn.—Can you give any information regarding smelt fishing with hook and line in winter season? What would be the proper size hooks, how arranged, what bait, etc., and whether they can be caught in the Housatonic River, or in any of the harbors in the vicinity of Bridgeport, Conn., as I am informed there are in Boston and the other harbors east of here? Ans. Smelts are fished for with the lightest of tackle, say with Nos. 10, 9, 8, or 7 Limerick, or 20, 19, or 18 Kinsey hooks, of which three or four should be used at short distances apart on the leader. Such tackle as would be used for perch fishing, only with more hooks. Clam makes good bait, or a piece of liver. Smelts have become very abundant in Massachusetts Bay since they have been protected. We doubt if they are often caught south of Cape Cod, although we have been assured by trout fishermen that they have caught them on the south side of Long Island.

H. Y. Z., Lima, Ohio.—Being a reader of your valuable paper, I take the liberty of asking your opinion of a pointer dog I have seen as to its being a good breed. It is good size and large bone, being only about six months old; black head, and black on shoulders, with a few black spots, the rest being white. Never having seen a pointer marked with such clear black and white marks, did not know whether it was a poor or mongrel breed. Please give your opinion. Ans. It is not possible to tell if a dog is thoroughbred by a written description of him. The most skillful expert cannot tell that a dog is certainly thoroughbred, even by viewing him. Some half-bred dogs show all the points of thoroughbreds. One of the best dogs we ever shot over was half pointer and half hound; he looked like a pure bred pointer.

S., Fort Scott, Kansas.—I have a dog which, until recently, never made a "skip." Several times lately he has made false points; i.e., pointing where there was no game. I claim it is over caution superinduced by excessive house breaking. A sporting friend of mine thinks it is "dunghill in him." He out hunts all our dogs here, and even with his false points finds as much game as any of our dogs in same length of time. My dog is a pointer, well bred, on his mother's side, but his father is not known to a certainty. He has recently been sick, and his nose may have been affected; but I hope not. Do you advise a rest for him? Ans. Many good dogs will make false points occasionally, but when it becomes habitual it is a great annoyance, and no fault is more difficult to cure. To punish a dog severely for it would do no good. It would probably make him worse. Sometimes, by working them with other dogs, and giving no attention to their points, except a little scolding when the points are false, they will give up the habit.

A large number of answers are unavoidably left over until next week; also, owing to the absence of our Kennel Editor, several kennel queries.

—A planter living about fifteen miles from Tallahassee, Florida, has succeeded in raising a sweet potato weighing twelve and a quarter pounds.

A WEEKLY JOURNAL,

DEVOTED TO FIELD AND AQUATIC SPORTS, PRACTICAL NATURAL HISTORY, FISH-CULTURE, THE PROTECTION OF GAME, PRESERVATION OF FORESTS, AND THE INDOCTRINATION IN MEN AND WOMEN OF A HEALTHY INTEREST IN OUT-DOOR RECREATION AND STUDY.

PUBLISHED BY

Forest and Stream Publishing Company,

17 CHATHAM STREET, (CITY HALL SQUARE) NEW YORK,
[POST OFFICE BOX 2832.]
123 SOUTH THIRD STREET, PHILADELPHIA.

Terms, Five Dollars a Year, Strictly in Advance.

A discount of twenty-five percent. allowed for five copies and upwards.

Advertising Rates.

In regular advertising columns, nonpareil type, 12 lines to the inch, 25 cents per line. Advertisements on outside page, 40 cents per line. Reading notices, 50 cents per line. Advertisements in double column 25 per cent. extra. Where advertisements are inserted over 1 month, a discount of 10 per cent. will be made; over three months, 20 per cent; over six months, 30 per cent.

NEW YORK, THURSDAY, JANUARY 27, 1876.

To Correspondents.

All communications whatever, whether relating to business or literary correspondence, must be addressed to THE FOREST AND STREAM PUBLISHING COMPANY. Personal or private letters of course excepted.

All communications intended for publication must be accompanied with real name, as a guaranty of good faith. Names will not be published if objection be made. No anonymous contributions will be regarded.

Articles relating to any topic within the scope of this paper are solicited. We cannot promise to return rejected manuscripts.

Secretaries of Clubs and Associations are urged to favor us with brief notes of their movements and transactions, as it is the aim of this paper to become a medium of useful and reliable information between gentlemen sportsmen from one end of the country to the other; and they will find our columns a desirable medium for advertising announcements.

The Publishers of FOREST AND STREAM aim to merit and secure the patronage and countenance of that portion of the community whose refined intelligence enables them to properly appreciate and enjoy all that is beautiful in Nature. It will pander to no depraved tastes, nor pervert the legitimate sports of land and water to those base uses which always tend to make them unpopular with the virtuous and good. No advertisement or business notice of an immoral character will be received on any terms; and nothing will be admitted to any department of the paper that may not be read with propriety in the home circle.

We cannot be responsible for the dereliction of the mail service, if money remitted to us is lost.

Advertisements should be sent in by Saturday of each week, if possible.
CHARLES HALLOCK, Editor.

WILLIAM C. HARRIS, Business Manager.

MR. HALLOCK AGAIN IN THE FIELD.

THE Editor-in-chief of this paper, accompanied by Mr. W. L. Brooks, of Stamford, Connecticut, sailed for Florida on Saturday last in the elegant steamer, *Champion*, of the Quintard Line, for a six weeks' cruise. They stop first at Port Royal, where they will remain for a few days as the guest of Mr. C. G. Kendall, who is well fitted with boats, decoys, etc., and who can show them the best of both upland and bay shooting. From there they go to Charleston and then to Jacksonville, from whence they will proceed to "do" the State very thoroughly, going down the St. Johns and visiting Indian River and the Ocklawaha, finally crossing over to Cedar Keys and taking the Steamer for Havana. Mr. Hallock's canoe has gone forward by the Florida Line, of which Mr. Herman Gelpeke is agent, they kindly offering to take charge of it and transport it to Fernandina from whence it will be transhipped to Jacksonville. Our unusually open season has retarded the tide of travel to Florida very materially, but we have yet February to contend with, and the steamers of both these favorite lines will undoubtedly be carrying full complements of passengers before the season is over. We hope to have some of Mr. Hallock's letters to lay before our readers ere long.

The "Squire" is also absent, being in Chicago, attending as one of the judges of the great Bench Show, now being held in that city. By the bye, we had hoped in this issue to have presented an engraving of the Michigan cup, manufactured for us by the Meriden Britannia Co., and which forms the leading prize at the Chicago Show, but the engravers have disappointed us.

A CHANGE.—Mr. S. A. Atkinson, an associate on the staff of this paper since its commencement, has purchased from Mr. Wm. C. Harris, an interest in the Philadelphia *Trade Journal*, and assumed entire editorial control of that paper. Mr. Atkinson is widely known as an editor and practical printer and business man, and our loss can but be a gain to the *Trade Journal*. The latter is now in its ninth year and is the representative paper of the manufacturing interests of Philadelphia. Under Mr. Atkinson its already excellent reputation will be ably sustained.

—To indicate how widely FOREST AND STREAM circulates, we may state that in four days we received applications for sample copies from twenty-six different States, two Canadian Provinces, England, France, and Ireland.

HEREDITARY INFLUENCES.

THERE are probably few persons now living who have paid the subject any attention, who are not inclined to contribute to the influences of inheritance many more characteristics than were formerly assigned to that source. Less is heard of the term "instinct" and more of the term "hereditary." It has been seen that much of that which we call intuitive in animals and men, is only the same knowledge, perhaps a little exaggerated, as their parents possessed; and when, as in the case of the eave swallow, we know the origin of certain habits which are now just as much innate in the young as others, the origin of which is lost, we are inclined to consider all instinct, so called, but the sum of inherited experience. The parent transmits to the young, not only its general form and external appearance, and not only its specific mental likeness, but also those peculiarities which distinguish it as an individual, and, to a less extent, those traits which it has acquired during its life. Instincts are habits fixed by heredity and are unconsciously obeyed, and this rule admits of few exceptions. Pointer pups taken into the field, unaccompanied by older dogs, will stand with muscles strained and eyes fixed at the first partridge they see. The young shepherd dog shows a disposition to guard stock. All spiders construct webs, yet each variety constructs its web peculiar to itself. The dog not only inherits scent, but also that which enables him to know a definite kind of game. Certain races of Indians also inherit scent, and so do negroes. Dr. James S. Bailey mentions a family of negroes who inherited this faculty in a remarkable degree. No matter how stealthily a white person approached their cabin at night, their conversation would immediately be hushed, and they would discover his approach by their scent.

But besides this, changes in the manner of life, habits made necessary or caused by new conditions and environment are transmissible; and here enters that wedge of variation which seems to have been so instrumental in producing the present diversity of form among animals and plants. Before the settlement of this country all the swallows nested in hollow trees, in caves, and under ledges of rock, as they yet do in the far West and in the remote forests of the British provinces. But when farmers began to till the land, and to keep cattle, and erect houses, the swallows, probably at first attracted by the greater number of insects, seized upon the out-houses and chimneys as more suitable places for building their nests, and have gradually abandoned the woods in the settled parts of the country altogether. Their young have not gone back to the woods and caves—although some of the first generation may have done so—and have little by little modified the shape of the nest to suit the new situation, until there is a very great difference between the nests built in our barns and those built by the wild birds of the same species in the Rocky Mountains.

It was long ago found out that certain advantageous traits in horses and cattle could be perpetuated and augmented, the power to make these peculiarities more lasting and more prominent increasing with each generation. Examples of this are numerous and known to every breeder, and it is upon this faculty of inheritance, under advantageous conditions, that Mr. Darwin hinges his doctrine of evolution by natural selection. But, not only do good features perpetuate themselves, but evils and deformity also come under the influence of inheritance, and are the surest of all to descend from generation to generation. Even those deformities that arise from artifice or accident are transmissible. Many Indian tribes of Peru, and some of the Oregon coast, had peculiar modes of distorting the heads of their children, and now many children are born with their heads out of shape in this peculiar way. Esquimaux sledge dogs and Manx cats usually have to suffer the loss of their tails, and their puppies and kittens are often born tailless, and in rare cases the loss of a limb in men has resulted in their children having but one arm or leg. Blindness, deafness, insanity, idiocy, and morbid appetites are all inherited, and statistics abound to show the extent to which this influence has tainted the human race.

In view of these facts, which recent investigations have brought to light, the study of the heredity of disease, in their relation to mankind, becomes one of the deepest interest and importance. To a thoughtful man, it is fearful to consider how unwittingly men are daily sowing seeds of disease and infirmity in their frames, which, once rooted, can never be eradicated, but which will reappear again and again in one form or another. No man may contract asthma, rheumatism, gout, consumption, or any disease which affects his blood, through carelessness or whisky, or any other form of dissipation, and plead that it hurts himself alone. If he have children he surely curses them with an infirm constitution, and opens an ever-broadening, ever deepening channel for a new stream of misery to flow through the world. Our insane and idiot and inebriate asylums, our hospitals for consumptives and scrofulous patients, even our prisons, are witnesses of the certainty of this result. It has been said that there never now occurs—no such a thing is recorded in recent times—an original case of syphilitic disease. This may be too strong a statement, for some physicians doubt its truth; but it is certain that hundreds of innocent families bear in their systems and faces to-day the living, loathsome marks of their remote forefathers' vices, who are not aware of the fact and cause of their suffering. Not alone does the good man do live after them. The iniquities of the fathers are visited upon the children even unto the third and fourth generation. For any one who cares for his race or his children, could there be a stronger argument for leading a pure, wholesome, careful life, than these facts contain?

GAME PROTECTION.

MASSACHUSETTS ANGLERS' ASSOCIATION—A large and enthusiastic meeting of this association was held at their rooms on Wednesday evening, January 12th. Dr. John P. Ordway, the President, in the chair. J. V. Meigs, of the Massachusetts Central Commission, made a statement to the members of the intentions of the committee, and suggested action of some sort by the association. On motion of ex-Gov. Talbot, a committee of three was appointed to confer with the Commissioners, consisting of Gov. Thomas Talbot, Weston Lewis, and Dr. E. D. Miller. The President was added to the number. The subject of lobsters and trout was discussed, and a close time was arranged for the latter. The President stated that there was no question but the present Legislature would pass a law in conformity with the laws of other States. Dr. Ordway read a letter from Hon. R. B. Roosevelt, one of the New York Fish Commissioners, requesting in justice to that State, that a close time should be made. After the regular business was transacted, the members did ample justice to an elegant collation gotten up by J. B. Smith, caterer. The interest in this organization is constantly on the increase.

—The *Ravenna (Ohio) Republican Democrat* deplores the destruction of all small birds and game by bag-hunters with their dogs and ferrets, and recommends a law subjecting all such trespassers to a fine of \$50, with confiscation of their dogs and ferrets. One reason why the game law so often proves a dead letter, it says, "is because they have almost always been drawn up by those who live in large cities, and passed through their influence, and are consequently looked upon with distrust and suspicion by most people, who think and believe that the sportsmen (so called) desire to prevent the birds and other animals from being killed, even by the owners of the soil, in order, at certain seasons of the year, that the country may be invaded by them and their friends, sallying from the cities to gratify their own pleasure in the destruction of the game, to the exclusion of everybody else, they having the advantage of trained dogs always at hand." There is no doubt that this feeling of jealousy is prevalent in rural districts. Time only can eradicate it, improved by a judicious use of enlightening influences, and a contact and mutual understanding between the denizens of town and country.

—The West Jersey Game Protective Society held its quarterly meeting in Camden on Wednesday, January 19th. The attendance was very large; the action of the committee on stocking forests and streams with game and fish was highly approved. Their agent, Capt. Pierce, the South Jersey fish culturist, was congratulated upon his success in connection with the matter.

—A powerful society for the prevention of cruelty to animals has been established in Brooklyn. Mr. George W. Johnson is Superintendent and Secretary. The officers are as follows:—President, John De Grauw; Vice Presidents, John W. Hunter, Samuel McLean, James Stuart Gillen, Charles W. Russel, John Greenwood, Henry E. Nesmith, Augustus E. Masters; Secretary and Superintendent, Geo. Will Johnson; Chairman Executive Committee, Horace B. Claflin, Agents, Frank O. Clark, Charles Crissey and William De Nyse, assisted by a large force of special officers.

SAN FRANCISCO, Cal., Jan. 1st, 1876.

EDITOR FOREST AND STREAM:—

There is considerable controversy just now going on in our papers, whether our numerous seals or sea lions should be destroyed or not. Some contend that they are terrific devourers of our fish, and are destroying our fisheries; others, while they admit that they feed much on fish, insist that their destruction of them is vastly overrated, and that they eat more of the crustacea and other kinds of ocean production. For my own part, I consider that these animals do certainly live upon a large amount of fish food, and thereby considerably diminish our fish supplies; but I am decidedly of opinion that the many Chinese fishermen, by the use of nets permanently fastened to their many stakes driven into the bottom of our bay in all directions, and these nets with meshes almost as fine as a mosquito bar, effect an infinitely greater amount of mischief, and it is a great wonder that they should have been permitted to ply their business in the extirpation of small fish, and even their very spawn, so long as they have. They send hundreds of tons of these small fry made into a kind of paste, to China. However, I trust their time of reckoning is nearly at hand. This nefarious proceeding of wholesale slaughter is about to be put a stop to. The public is being now aroused, and a public meeting of our Italian and other fishermen, and some of our best citizens, has been held, and resolutions have been passed with instructions to our legislators at Sacramento to make an enactment to forbid the use of any nets whatever with meshes small enough to hold and destroy the young fish of our waters, and to disallow the use of stakes, which actually impede, in many parts of the bay, the navigation of boats and vessels.

Whether our Legislature will repeal the existing laws, which preserves the sea lions at the mouth of our harbor, I do not know; but I am one of the advocates for a large portion of them, at least, being put *hors du combat*. I am informed that the repeal of that law has passed the Senate, but what will be the fate of the law to repeal in the other department of the legislative body I cannot yet tell. I only trust that so great an evil as the injury to our fisheries and angling sport as is now going on, will, in all justice, be remedied as speedily as possible. Let us have your sympathies, and we should be very glad to have the benefit of your opinion, and that of some of your numerous readers and correspondents, as to the capacity and rapacity of seals for fish food.

E. J. HOOPER.

We were once engaged for three months in fishing on the Labrador coast, from the Strait of Belle Isle to latitude 55°, during which time we found the seals to be very destructive to salmon fisheries, but not to that degree as prevent the fishing being remunerative. They mutilated more than they ate.

CAMBRIDGE, Mass., Jan. 15th, 1876.

EDITOR FOREST AND STREAM:—

Every year we are told that the Fish Commissioners of California have placed in the Sacramento and other streams so many thousand, as the case may be, of salmon or other fry, with a view to the replenishing

of the rivers and bay with salmon, and also the acclimation of eastern fish, such as the shad, black bass, lobsters, etc. Now, the supplies of fish in the Bay of San Francisco have been steadily increasing for a number of years, and at last people in general have begun to take notice of it. There is a law prohibiting the killing of the sea lions which live at the entrance to the bay, because they, inhabiting exclusively two or three large rocks immediately below the Cliff House, are a sort of natural curiosity, and almost the only one we have to show visitors. The Legislature is now recommended to repeal this law, on the ground that the lions are eating all the fish. They undoubtedly must eat a considerable quantity; but the real source of the diminution will be seen from the following extract from the Antioch (Cal.) *Ledger*:—

"Only a few days since," says the *Ledger*, "we watched the *modus operandi* of catching fish on the San Joaquin. Two Chinese junks or schooners appeared in the river, each holding the end of a remarkably fine net. The schooners then separated and swept the waters with the net to the shore. Fish of all sizes are thus caught, and none, not even the smallest salmon trout, are ever returned to the water. Those too small for market are thrown on shore or fed to poultry. It is said by those familiar with the Chinaman's mode of fishing, that one of these leaves no young salmon behind, and they are far greater enemies to their propagation than the seals."

This will probably account for the non-appearance of the shad, etc., that the Commissioners took so much pains to put into our rivers. I have often watched the Chinamen fishing, and the operation is substantially the same as the above, not even the very smallest sardine escaping. The fact that the Chinese export annually to China nearly \$400,000 worth of shrimps and small fish-ery, speaks for itself. Besides these seines, the Chinese have pole nets, which resemble mosquito netting in texture, and which remain set all the year, swinging with the tide on the flats around the bay. Some of the nets extend out almost half a mile from the shore, and are murderous to the smallest fish, which, as the *Ledger* says, are never returned to the water, but are dried and exported to China. The society of Italian fishermen are taking steps to memorialize the Legislature on this question, and unless something is speedily done about it, the Commissioners may as well give up. HOWARD.

Our correspondent will ascertain, by reference to our columns, that we have already had much to say upon the subject of his letter. Additional communications will also be found under this head, and in the Sea and River Department, of our current issue.

FERRISBURGH, Vt., Jan. 15th, 1876.

EDITOR FOREST AND STREAM:—

The Ferrisburgh Sportsman's Club held its annual meeting on the 14th inst., when its officers for the ensuing year were elected as follows:—

President, Wm. A. Leonard; Vice President, John A. Cadwell; Secretary, R. E. Robinson; Treasurer, Byron W. Field; Executive Committee, Walker Field, M. E. Hall, H. C. Martin, and R. Parker, Jr.; Doorkeeper, Joseph Birkett.

When the Legislature of 1874 enacted the first really effective, if not the only, code of laws for the protection of game and fish which Vermont has ever possessed, a few persons here who felt a vital interest in such protection, united in this organization for the enforcement of these laws, and the promotion of all objects advantageous to sportsmen. Its members being few, and not all of them taking a very lively interest in the objects of the club, our achievements have not been great; but nevertheless there is much to encourage us to continue our organization, and to encourage the sportsmen in the towns throughout the State to unite as we have done. There has been but one prosecution for violation of the game and fish laws (for taking black bass out of season). The simple fact of the existence of a body, standing ready to enforce these laws, has been so effective that there has been very few violations of them in this neighborhood. Doubtless there have been some, but so few and so slight as to work little harm. One of the earliest acts of the club was to request the Fish Commissioners to restock Lewis Creek with salmon. This request was complied with, and on the 23d of May, 1875 Fish Commissioner Dr. M. C. Edmunds brought on from the Charlestown hatching establishment 50,000 salmon fry, which were turned out in Lewis Creek. If the experiment proves successful, a considerable share of the credit will be due to this club for having called the attention of Dr. Edmunds to it; for he was unaware of the true character of the stream as he was of its having been a favorite breeding place for salmon in early times. Upon seeing it, he pronounced it as fine-looking a salmon stream as he had seen in Maine or the British Provinces.

The club has been strengthened by the acquisition of new members of the right sort, and of late an increased interest has been manifested, owing, in a great measure, to the introduction of discussions of the habits of game and fish, and other subjects interesting to sportsmen.

R. E. ROBINSON, Secretary.

No doubt the formation and existence of a protective club in any locality, exerts a moral influence and effect of the most salutary kind. People will not break laws with the police officers in sight.

SOUTH FARNWORTH, N. H. January 6th, 1876.

EDITOR FOREST AND STREAM:—

New Hampshire is still a State, where the earnest sportsman can find a field for his efforts, and where the hunter, that hunts for profit, can still make the business "pay." The Game and Fish League of New Hampshire, of which Col. John B. Clarke, an earnest and adroit sportsman is President, has done, and is doing a world of good, in aiding the lovers of sport to secure their just rights. The slaughter of ruffed grouse at all times of the year is no longer allowed, and the increase in their numbers even in so short a time, has been remarkable, and the sport at the right season, has become splendid. The trout, that had become almost exterminated, have already begun to fill the streams, and Col. Clarke and his associates can well congratulate themselves on having done a great and good work.

But New Hampshire is a State that affords sports of another kind. Bears abound among the mountains, and at least one man has more than a local reputation as a Nimrod, and that is Joshua H. Piper, of Albany, a back town, that is chiefly mountainous, having within its limits all of the stately Cuckoo Range and where Mr. Piper remains, hunts and fishes, monarch of the mountains. Years ago, before the present "Albany hunter" was born, a man lived and hunted there who bore that title, and was known all over the State, a man whose life was a romance filled with wild adventure. Stephen Allard was his name, and his memory is still cherished among his native wilds. He was a man who could tell stories of wild adventures, that those who did not know the man, were inclined to disbelieve, and, with many, Mr. Allard passed as a modern Baron Munchausen, while in fact he was a New Hampshire Davy Crockett, honest, simple, true hearted, and most respected by his townsmen, who several times sent him to the General Court, where the "Albany bear hunter" made a sensation, something like that created by Col. Crockett's appearance in Washington, to take his seat in Congress. He bore the mark of at least one battle with bruin, in the stump of his left arm, which had been bitten off years before. The old hunter, dressed in "homespun" with his erect form, rough speech, and quick wit, formed one of the sights of Concord, when Isaac Hill was governor. In the last years of his life, when questioned about the number of bears he had killed, he replied that he had "kept count of between five and six hundred," a record that few readers of FOREST AND STREAM can equal.

They had a remarkable trial by jury, in Carroll county in October last, turning on the ownership of a bear (dead) and a cub (live). The parties were the "Albany hunter," Piper, and the Hon. De Wit C. Carter, of Ossipee county, lawyer and earnest sportsman. The party were hunting in Albany, and found an old bear and a cub. The bear, Piper

shot, the cub took to a tree, and on the securing of the cub, was where the law point came in. Said cub being valued at \$40, and on this point the evidence ran, "thusly," to quote A. Ward, and the jury rendered a verdict "in accordance with the evidence." It seemed that Piper brought the cub down, the lawyer put his coat around him, and thus enabled the hunter to secure him. The jury gave the cub to the man that held the coat.

Hunting in New Hampshire is good if the hunter only goes to the right place. In my next letter I will endeavor to indicate where said spot is to be found. F. D. J.

FEATS AND TRAITS OF SIR GEORGE GORE.

HIS WESTERN HUNT OF 1855-6-7.

MEN of deeds are not usually men of words, and thus it happens that Sir George Gore, after two years of hunting exploits and adventures in the wilds of the Far West, accumulating a fund of experiences, whose narration could not be other than fascinating to every lover of the wild and perilous, went quietly home, and, however, he may have enacted his deeds over again by his own fire-side, never told the world anything about them in a book. It is, therefore, a reasonable presumption, that many a well informed reader of FOREST AND STREAM never heard of Sir George until his recent return to America in his old character of sportsman and tourist. The writer himself is none too well acquainted with the Irish nobleman's earlier hunting experiences in our western wilds, but having picked up here and there a few items of information in reference thereto, proposes to share them with his fellow readers of the FOREST AND STREAM, believing they will possess some interest.

Having procured from the Superintendent of Indian Affairs at St. Louis, a passport through the Indian country, Sir George set out, in 1855, with probably the most extensive and well equipped purely pleasure outfit that ever penetrated our western wilderness. The party consisted of forty-three men, comprising, as Marcy tells us, "secretaries, steward, cooks, fly-makers, dog-tenders, hunters, servants, etc," and was provided with thirty wagons, loaded with equipage and supplies, many dogs and saddle horses. He had secured the services of the celebrated Jim Bridger as guide and interpreter, a position for which the latter's extended experience upon the frontier, eminently qualified him. It is not to be supposed that Sir George was unsupplied with an assortment of the best guns for his purposes that were obtainable, and accordingly we find him in possession of a small arsenal of weapons of various patterns and calibre, suited to the different varieties of game, all by the best makers of that day, as Joe Manton, Purdy, Westley Richards, and others.

Ascending the Missouri River from St. Louis, and following up the valley of the main Platte and its northern fork, hunting as he went, through a region not then, as now, partially secured to civilization, he finally crossed the Yellowstone, where, at the mouth of Tongue River, he built a fort. Here, in a perfect hunter's paradise, a region for which the Sioux have since contended hotly and strewn with the corpses of murdered whites, he remained nine months, pursuing his hunting projects, and—must it be written? trading with the Indians. At least he is accused of this breach of American law, and upon excellent authority, Indian Agent Vaughan, a fine Virginia gentleman of the olden time, having made official complaint thereof to his superiors.

Bridger related to Marcy that it was Sir George's custom to sleep till ten or eleven o'clock in the morning, when he arose, took his bath and breakfast, and then set out for the day's hunt, usually alone. Frequently he remained out as late as ten o'clock at night, generally returning successful. He then ate dinner, concluding with several glasses of wine, often inviting Bridger to partake with him. The company of the old hero with his odd speeches seeming to afford him much amusement, and closed the day by reading until bed-time. Sometimes his reading was aloud, with Bridger for an auditor; and Marcy relates, in "Army Life on the Border," two or three amusing specimens of the criticisms upon the the authors read, which Sir George drew out from the rough old frontiersman, but the reader who goes to that entertaining volume to enjoy them, is respectfully warned by one who knew Bridger well, that his speech was not quite so provincial as that which Marcy puts into his mouth.

The destruction of game by Sir George's party was so great as to excite the indignation of the Indians and bring forth a remonstrance upon their part, to which Agent Vaughan gave official expression to the Government. The Indians were willing that the party should kill all the game they needed as food, but objected to the wholesale slaughter for mere sport, the carcasses being left to rot upon the prairie. That the remonstrance was well-grounded, and that Sir George met with abundant success in the sports he had come so far to enjoy, will appear when we state that the party destroyed one hundred and five bears, forty of which were grizzlies; two thousand five hundred buffalo, besides uncounted hundreds of elk, deer, antelope, and other game. At last the Indians, in retaliation, drove off a considerable part of his horses in one swoop, and subsequently, in the Winter of 1856-7, while he was quartered upon the Missouri between Forts Union and Berthold, made a clean sweep of the remainder.

In the Summer of 1856, Sir George broke up his encampment at the mouth of Tongue River, and dispatched his wagons to Fort Union, at the mouth of the Yellowstone, by land, himself with a portion of his party descended the Yellowstone in boats prepared of some of the hides he had

secured, going into camp at the mouth of that stream, where he remained two or three weeks. While there he endeavored to sell his wagons and other means of transportation to the Agent of the American Fur Company at Fort Union, but not getting the price he demanded, he made a bonfire of all that was combustible and threw the rest into the river. Having prepared a large Mackinaw boat, he embarked his party and sailed down the Missouri, wintering upon that stream, above Fort Berthold, and the following Spring continued his voyage to the East.

Bridger's estimate of Sir George was, in the language of Marcy, that he is "a bold, dashing, and successful sportsman, a social companion, and an agreeable gentleman." Lest the sympathetic reader should be in dread that Sir George rendered himself bankrupt by maintaining for two years so extensive a party on so extended a tour, we hasten to say that he is reputed to be the possessor of an annual income of \$200,000. And it is presumable that he received from the outlay, great as it must have been, what to his apprehension was a sufficient equivalent, or we should not see him again catering to his hunting proclivities upon our shores. If it is true, as stated, that he returned home with renewed health, and probably ten years added to his life, few will deny that with his ample revenues it was well worth his while to pass two years among savage men, and amid savage wilds in a manner so agreeable to one of his adventurous mind. CAVALIER.

Fort Shaw, Montana, January 1st, 1876.

—The Central New York Poultry Association holds its third annual exhibition in the City Hall, Utica, on the 9th February, continuing until the 16th. Entries for competition close February 4th. The premium list, in addition to the gold and silver medals for the best and second best display of fowls and chickens, comprises money prizes for every variety of fowl dreamed of. There are also premiums for song birds, pets generally, and for salmon, bass, and trout.

A WORTHY MEMBER.—Mr. Wm. Ward, one of the members of the Toronto Gun Club, has recently been presented by the members of the club with an address and a gold watch for his bravery in rescuing the crew of the Olive Branch. This was the eighth vessel's crew that Mr. Ward had been instrumental in saving.

The Rifle.

CONLIN'S RIFLE GALLERY.—The seventh competition for the Turf, Field and Farm cups took place on Thursday evening last. Mr. Chas. A. Cheever was the winner for the second time, scoring 43. The second cup was won by Mr. Frank Houghton; score, 35; and the third by Mr. Handford Smith; score, 26. Thursday the 27th inst., the FOREST AND STREAM badges will be contested for. Messrs. Cheever and Hays will have a match for the championship on Friday evening.

—Mr. J. S. Conlin first patented his Safety Shooting Gallery, June 16th, 1868; patent re-issued January 21st, 1876. Mr. Conlin is the first man, as far as we can learn, who received a patent on shooting galleries in the United States. Mr. Conlin who from his ample experience is well qualified, is now prepared to superintend the erection of, or to furnish plans for shooting galleries on his system.

CREEDMOOR, JR., RANGE.—The fourth Subscription match; entrance, \$1; ten shots off-hand; one-half the money received to be divided between those making the 1st, 5th, 10th, 15th, and 20th scores. The winners were—W. B. Farwell, 45; W. H. H. Sabin, 44; J. Tragger, 42; W. B. Farwell, 41; R. Rathbone, 41. On Feb. 1st the competition for the U. M. Car. Co.'s badges will take place at this range; also, next Saturday, the employees of the Centennial and Home Insurance Company will have their return match.

HELLWIG'S GALLERY.—The eighth weekly competition shooting in lying position for a gold medal, double-barrel shot gun, a rifle, and a revolver, took place at Hellwig's new gallery, No. 271 and 273 Eighth avenue, January 19th, 1876. The winners were:—First prize, T. C. Banks, 45; second prize, Donald Cameron, 45; third prize, D. E. Vannett, 40; fourth prize, M. L. Riggs, 30.

MORSEMER.—The fifth competition for the Harris trophy took place on Thursday, the 20th inst. Messrs. Smyth and Garrison's scores resulted in a tie. They each had one shot to decide who should occupy first place. Mr. Smyth made 4 and Mr. Garrison 3. This makes two victories out of the necessary three for Mr. Smyth. We append best scores:—

Name.	Score.	Name.	Score.
D. Smyth.....	71	H. J. Quinn.....	67
H. L. Garrison.....	71	H. Maynard.....	67
G. Frazier.....	70	G. Underhill.....	65
Frederick Shonnard.....	68		

GLEN DRAKE.—On Thursday the 20th inst., Mr. Geo. H. Thompson was the winner of the Remington sewing machine; score, 39. A meeting of the directors was held on Friday afternoon. A design for a badge for life members was adopted, and a committee was appointed to procure the same.

THE PRESS AND THE RIFLE.—The journalists connected with a number of the weekly papers of this city met at Creedmoor Jr. on Saturday last for the purpose of sending a challenge to their brethren of the daily press, with a view to the ultimate formation of a Press Rifle Club. Representatives of the *Army and Navy Journal*, the *Turf, Field and Farm*, the *Rod and Gun*, and the *FOREST AND STREAM* were present, and a challenge was sent to Gen. Millen, of the *Herald*, who had consented to receive the same on behalf of the dailies. Yesterday, the 26th inst., at 3 o'clock, those of the daily press who desire

to represent these journals were to meet at the rooms of the New York Press Club for the purpose of making arrangements for places on the team. It has been suggested that a team of eight men a side shall contest at Creedmoor Jr. as soon as practicable.

WHO NEXT?—The tailors have become infected with the rifle fever, and two matches at Creedmoor Jr. have increased the temperature and pulse of these Knights of the Shears. The employees of Messrs. J. A. Post & Co. held a contest on Monday the 17th inst., at which some good scores were made. On the evening of the 20th, Devlin & Co.'s hands tried to win glory for themselves at the butt of the rifle. It was the first floor against the second floor. As the shooting progressed the excitement grew, and odds were freely offered that the target would not be hit. At the close of the match each shooter became the happy possessor of a medal bearing an appropriate motto. The "Duffer" receiving one which bore the emblem "C. O. D.," and showed his knowledge of its meaning by asking all to "come over and drink."

MASSACHUSETTS.—The members of the Massachusetts Rifle Association practice every Saturday at their range at Spy Point. We give the best scores made at the last competition, when those using Mr. Dittmar's powder were successful. Range, 200 yards.

Name.	Score.	Totals.
D. Kirkwood	10 10 11 10 10 11 11 12 8 11	101-45
C. E. Sanborn	8 8 11 12 11 7 10 9 10 11	97-44
F. R. Sha'tuck	10 8 10 12 11 5 13 10 9 8	95-42
A. P. Clarke	8 9 11 9 9 11 7 10 10 10	94-42
G. B. Cory	8 8 7 10 9 9 10 11 11 10	93-42

Best possible score—Creedmoor, 50; Massachusetts, 120. Grand average—Creedmoor, 38.7; Massachusetts, 81.8.

THE HARVARD COLLEGE CLUB.—Our rifle club is now in good working order, and the members intend shortly to challenge Amherst and Wesleyan University. Their best scores have crept up to 42, 43, and 45 out of a possible 50 at 200 yards, off-hand, and 23 out of 25 at the same distance.

CONNECTICUT.—An association for the promotion of long range rifle shooting has been organized at Hartford, Conn., to be known as the Connecticut Rifle Association. At the meeting on December 29, 1875, officers were chosen as follows:—President, General Joseph R. Hawley; Vice President, Nathan Washburn; Secretary and Treasurer, Major B. F. Blakeslee; Executive Committee, O. E. Pollard, of the Independent Rifle Club, New Britain; G. W. Yale (American team); John C. Kinney, of Franklin Rifle Club, Hartford; Major L. A. Barbour, First Infantry, and T. F. Plunket, of the Manchester Rifle Club. The organization starts with a good membership and excellent prospects. At a recent practice one of the members, although an amateur, made a score of 48 in a possible 50, at 500 yards. With such expert riflemen as General Hawley and Mr. Yale to coach them, the club should turn out a very strong team for the Centennial matches.

RHODE ISLAND AMATEUR RIFLE CLUB.—On January the 15th inst., the members of this association proceeded to Mr. Perkins' range at Valley Falls, for the purpose of contesting for the champion badge. Distance, 500 yards; highest possible score, 50. The best scores were:—Keyes, 44; Rabbeth, 44; Perkins, 40; Thomas, 40; and Howe, 30.

SARATOGA RIFLE CLUB.—On the 13th the regular match for the club badge of the Saratoga Rifle Club took place at the Tompkins range. Ezra Davis won with a score of 45 out of a possible 50, F. W. Miller, 40, W. Benson, 37, G. W. Ainsworth, 36, O. Gates and E. Allen, 30, A. F. Mitchell, 29, J. Pinney and W. H. Hodgman, 27.

SYRACUSE.—We have received some targets made at the Yates Dragoon Rifle Range, a gallery in the above city. The targets, all being at 120 feet, are not equal those made at Conlin's or Creedmoor Jr. We shall be indebted to our correspondent for a report of the matches now in progress at this range.

MILWAUKEE.—Although mid-Winter, the weather on Jan. 14th was so mild and pleasant, a few of the Milwaukee Rifle Club could not resist the temptation of enjoying their regular practice on the Wanwato Range. They only took one sighting shot, and the distance was 500 yards with the following result:—

Name.	Score.	Total.
Fielding	5 4 4 5 5 5 5 5	47
Sketch	4 5 5 5 4 5 5 5	45
Welles	4 5 5 5 4 4 5 5	45
Bangs	0 5 5 5 5 5 5 5	45
Williams	4 4 5 4 3 5 4 5	43
Meunier	3 3 5 5 5 4 5 4	43
Turner	3 4 5 5 4 3 5 4	36
Hinks	0 4 5 4 3 0 2 5	30
Ormsby	3 3 5 5 4 2 0 5	30

THE TEAM OF GREAT BRITAIN.—It has been generally thought that the team which is to be selected in England for the international match would exclude residents of Ireland and Scotland. The latter were expected to be represented by teams of their own. Recent correspondence between the representatives of the National Rifle Association in England and this country has decided that there shall be no restrictions to places in the selection of the team. At a meeting of the National Association, of England, held January 22d, Sir Henry Halford was further authorized to represent the Association, and to make all necessary arrangements.

Sir Henry Halford has written a letter to the *Volunteer Service Gazette*, wherein he says that "the team which will shoot in America this year will be selected from the best shots in Great Britain and Ireland, and will not be restricted to Great Britain alone." As the use of the word "British" was somewhat ambiguous it is satisfactory to know that that point is definitely settled. Our contemporary copies from us the remarkable scores made by the Chicago Rifle Club on November 27th, and calls attention to them editorially.

—In our excellent contemporary, the *Volunteer Service Gazette*, from whose columns all of us have acquired so much about systematic rifle shooting, we find an admirable resumé of the history of Wimbledon. Two extracts we

take, one showing the improvement made, the other interesting as indicating the commencement of team shooting:—

1860.
"At these early meetings there were, except for the Duke of Cambridge's and the Duke of Wellington's prize, and the Second Stage of the Queen's only two classes of rifles—Enfield and other Government weapons, and 'any rifles.' The latter were restricted in weight to ten pounds, and neither hair triggers nor magnifying sights were allowed. We have always believed that in imposing these restrictions the Council of the National Rifle Association intended to exclude any weapons other than those adapted to either military or sporting purposes, and that they did not anticipate that the ingenuity of gunmakers would enable them to produce the beautiful instruments called Match rifles, which, while they come within the conditions, are of no use except for target shooting. The meeting was evidently an extremely successful one, though the number of competitors, of course, appears to us now very small—only 299 Volunteers being on the ground. We need not here go into any analysis of the shooting, which was, indeed, not very remarkable. The Gold Medal and the Queen's Prize were won, as everybody knows, by Mr. Edward Ross, then a mere lad. His score was 24 out of a possible 60, and was made up of three centres (6 points) and eighteen outers (18 points). There was no bulls-eye in those days at the long ranges. Among the competitors we find many well known names besides that of Edward Ross."

[Mr. Ross has since then carried rifle shooting to its extreme range of excellence, and is President of the Scotch Rifle Association].

1861.
"Perhaps, however, the most important novelty in the competitions was the introduction of matches between 'teams,' all the shooting having been hitherto 'individual.' And these matches were begun by two of the most interesting that have ever been organized—viz., those between the Public Schools, and between the Universities of Oxford and Cambridge. For the first, however, only three schools—Eton, Harrow, and Rugby—entered, and in the second, each University was only represented by two champions."

National Pastimes.

—The skating season bids fair to be of the short and sweet order, or like the good coffee at one's boarding house, "very good indeed what there was of it." Here it is the 26th of January, and not an hour's skating has been had, either at Prospect or Central Park. The Union Pond, in Brooklyn, was open a few days after New Years, and the Capotoline Lake was crowded for about a week during the present month, but that is all the skating we have thus far had in the metropolis, and now it is too late in the season to expect any more skating except after a cold spell or two for a few days should cover the lakes with strong ice.

—The game of rackets has again become popular in the metropolis, and matches are played nearly every day at McQuade's Court, 404 Madison street. Nothing of any special importance in match playing has occurred, however, since the McQuade and Manning contest of December. The new club courts on Twenty-sixth street are progressing towards completion, and it is expected that the Centennial year will see some fine displays of the beauties of the game there. Several fine racket players will visit the metropolis from England, and of course they will be entertained by the club, as they are chiefly military officers.

—Skating has become the fashionable winter pastime with the English nobility this Winter. The severe weather in England has coated the lakes and ponds with excellent ice and the facilities for a full engagement of skating have therefore been unusually great. American club skates are all the fashion, and the American parlor skates—Plympton's patent—are all the go at the London skating rinks.

—The curlers of the metropolis, in December last, when the first cold wave rushed over the city and gave promise of keen ice for the sport, laid out a fine programme for the season's games, but old Preb. has "smashed their slate" with his intervals of mild spells of weather, and the Scotchmen have been rendered inconsolable by their inability to "glide the stanes" over the glittering ice, and enjoy the excitement of their winter contests. The grand match, North vs. South, has been twice postponed on account of thaws, and it is now doubtful if it can be played here this season. The Inter-State match, too, New Jersey vs. New York, named to take place at Paterson, has been twice deferred from the same cause.

—The professional base ball clubs are getting ready for the opening of the Centennial year campaign. The Louisville club, the Southern champions, will call their roll on February 1st. The Chicago and St. Louis clubs on February 15th, and the Cincinnati on February 10th. The Bostonians are ordered to report by the last week in February. The Mutuals are practicing racket daily at the Racket Court in Madison street, and the Philadelphia clubs have been in similar training all the winter.

—A futile effort has been made by a few discontented spirits calling themselves the National Chess Association, to upset the arrangements now being made by the Philadelphia Chess Club to organize a grand international tournament. The club in question is one of the most influential organizations in the country, and it is right and proper that they should have control at the Centennial chess meeting in Philadelphia. The so-called National Association is practically a defunct institution, and it is to be hoped that no chess club will take any notice of their appeal for funds.

—The reorganization of the Gotham Club is the first step in amendment looking to a revival of old amateur ball playing during the Centennial year. The Knickerbocker and Excelsior will take the field in May, as also the Star Club, of Brooklyn, and no doubt the Empires and Eagles will follow the lead of the Gothams.

—Safety lamps are used by the night policemen and watchmen of Paris, which remain good for six months without renewal. A small glass vial holds a piece of phosphorus the size of a pea, upon which is poured boiling olive oil, sufficient to fill up about a third of the vial, which is then closely corked. In use, the cork is taken out for a moment, admitting air to the phosphorous, the vacant inner space lights up giving a clear light, which may be revived by a fresh uncorking.

New Publications.

FLORIDA: Its Scenery, Climate, and History. By Sidney Lanier. J. B. Lippincott & Co., Philadelphia.

In turning over the pages of Mr. Lanier's book we meet with many an old friend in the illustrations of familiar places. The author has carefully gathered together much data of value to those interested in the progress of the State, and compiled it in an interesting and readable form. The body of the work, in fact, is made up of pleasing descriptions of the beaten paths of tourists, which, while they amuse, give us but little insight into those deeper and more rarely visited spots of which we would fain be informed. An historical account of the State commences with the advent of Ponce de Leon and carries us down to the last Indian war. There is a chapter for consumptives, with much valuable advice to those afflicted, and another on the climate, with abundant statistics. In fact, although Mr. Lanier's work is admirably adapted for the pages of a magazine, in which shape it originally appeared, we look in vain for something that is new—for some information or statement which has not met our eye before. The appendix contains papers originally read before the Florida Fruit Grower's Association, descriptive of the culture of those fruits for which the State is becoming famed, and which are destined to be a source of great wealth. To the tourist, this book will be a pleasant companion for his journey, and he will be enlightened as to other places of note on his trip—Charleston, Savannah, Aiken, etc.—all of which share with favored spots in Florida the charms of a genial climate; but it will not give him those points and details of information which we look for in a guide-book, and which are indispensable to the tourist. The information is general and superficial, rather than introspective, and belongs to Florida past, rather than to Florida present, with its infusion of latter day enterprise and activity.

WHITE'S NATURAL HISTORY OF SELBORNE.

Gilbert White has been called the Father of English Natural History. He was a clergyman of the Established Church, who made his home in a vine-clad cottage at Selborne, on the southern coast of England, where he lived quietly until his death, at the age of seventy-three, in 1793. At Selborne, White was surrounded with a charming and varied landscape, and he devoted nearly the whole of his time to the observation of nature and the study of the antiquities of the locality. These observations he recorded from time to time in a series of letters to Thos. Pennant, the celebrated naturalist, and to the Hon. Daines Barrington, a patron of science and a friend of White. These letters were continued through more than twenty years, and in 1788 they were collected and published in book form. Since that time a great many editions—simple reproductions, and with notes by different editors—have been published in England, and with each succeeding year the veneration in which Gilbert White is held has increased, until his book has become an English classic. The latest edition is before us. It is an elegant octavo volume from the presses of Macmillan. Numerous excellent illustrations enliven the pages, and the print is clear, open, and inviting. Between the "Natural History" and the "Antiquities" is inserted 150 pages of notes, observations, and additions by Frank Buckland, the well-known Editor of *Land and Water*. Every other page of White's text induces a half-page note from Mr. Buckland, most of which are taken from his own wide experience, or from the accounts of trustworthy correspondents of his newspaper. They form a wonderfully valuable commentary upon the pages of the older writer, and show that Frank Buckland is a disciple of which the "quiet country parson" might well feel proud. It is an appetizing book, and we wish every person in the country might read it, and be stimulated by it to use his eyes and ears in finding out, and his pen in making known the natural history of his own Selborne, wherever it may be.

MAGAZINES.

Scribner's Magazine. In one respect *Scribner's* for February is like *Scribner's* for every other month in the year, and it is full of useful and interesting reading, contributed by some of the most thoughtful and intelligent minds. We will not anticipate the pleasure which those who buy it will enjoy in its perusal, by a review or synopsis of its contents, but cordially recommend it to all who wish to while away a leisure hour, or seek instruction in its most attractive form.

Appleton's Journal. This popular weekly journal is a capital example of literary conservatism. Its selections are invariably good. The issue of last week, among other interesting papers, contained an illustrated article on "American Historic Houses," valuable as a record of the scenes of some of the earlier events in our history. Mr. Christian Reid is contributing an interesting serial entitled "The Land of the Sky; or, Adventures in Mountain By-Ways," descriptive of the beautiful mountain scenery of Virginia, with a *souper* of romance for spice. As a record of science, invention, and discovery alone, the *Journal* is well worth the trifle it costs.

The Eclectic, which is now in its twenty-third volume, contains in the February number an unusually good selection of the choicest articles from the foreign magazines and reviews. Perhaps "Modern Sorcery," from the *British Quarterly Review*, is equal to any in importance, being an elaborate analysis of the recent works of Prof. Wm. Crookes, Dr. Dollinger, Wallace, Mahan, and others, bearing upon modern spiritualism. For lighter reading, we have the continuation of two serials, "Jonathan," by C. C. Fraser-Tyler, and "Her Dearest Foe," by Mrs. Alexander. A fine portrait of Wm. M. Evarts adorns the frontispiece, and is accompanied by a slight sketch of the distinguished lawyer, contributed by the editor.

The Galaxy for February is ponderous, and if we have a fault to find with this most excellent magazine, it is that there is not a fair distribution of light literature and heavy; that the latter is allowed to preponderate. Mr. Wm. Black's serial, "Madcap Violet," opens the present number, and if his story is as good as his "Princess of Thule," it will be a good thing for the readers of the *Galaxy*. Mr. Justin McCarthy follows with a heavy article on "Home Rulers in the English Parliament," and Mr. Albert Rhodes one on "Suicide," which is appropriately followed by a poem entitled "Transformation," by Nora Perry. An anonymous writer, who is supposed to be Prof. John A. Church, has an able paper on "Army Reduction," as applied to our own estimates as now being considered by Congress, which is elaborately prepared and soundly argued. The valuable scientific miscellany, the regular reviews of current literature, and "Nebula," by the editor, conclude the number.

St. Nicholas comes to us this month fresh and cheery as usual, and with lots of entertaining matter for the girls and boys. The story of the "Black Douglas" opens the number and furnishes the frontispiece. Then we have Mr. Noah Brooks' interesting serial of the "Boy Emigrants," who are struggling across the plains en route for California, and now kill their first buffalo. Our friend Fred Mather contributes one of his useful sketches, this time teaching the boys how to make and use a "toboggan," the sled used in Canada, where the snow is deep and the light crust would be cut through by runners. The table of contents is long and varied, nearly every article illustrated, and that, too, in the nicest style. Buy it for the little ones.

—Dr. Charles J. Kenworthy, ("Al Fresco"), whose Florida expeditions are well known, says of the Boudren Lamp, manufactured by the White Manufacturing Company, in Bridgeport, Ct.:

"I am so thoroughly satisfied with the lamp, from a practical test, that I wish to notice it. To the sportsman I consider it an acquisition; and all the manufacturers claim for it."

Yachting and Boating.

ICE YACHTING.

WE give herewith, for the benefit of our numerous subscribers who have questioned us upon the subject, a cut of an ice boat, for which we are indebted to our valuable contemporary the *Scientific American*. Notwithstanding the fact that the present very remarkable and unusual season has interfered sadly with the ice yachtsmen of the Hudson River, the interest in the sport continues unabated, and each year sees the launching of new crafts, with later improvements and still more expensive fittings, until now the fleet vessels are built as expensively and daintily as their floating sisters. The boat represented in the engraving is the Haze, belonging to Aaron Innis, Esq., of Poughkeepsie, who claims to have made with her the remarkable time of nine miles in seven minutes, or at the rate of seventy-seven miles per hour. The greatest speed is made with the wind on the beam. No great speed

aft, (called the rudder), are made of 2 inch plank, and have steel shoes bolted to them by means of bolts tapped into the shoe and running through the wood, having their heads countersunk therein so as to be flush. The shoes are fastened by 5½ inch bolts tapped into them; they are ground on the running edge to an angle of 90°, and are 1½ inches deep.

The after-runner, or rudder, is smaller than the forward ones, and is fastened to a rudder-post, which passes through the keel and terminates in a tiller, 2 feet 8 inches long, by which the boat is steered.

The body is planked on the under side with inch boards for a distance of about 7 feet from the after-end.

The mast is 20 feet high, 5 inches in diameter at the foot and 3½ inches at the top, and has a top mast fixed into the top 3 feet long, 2 inches in diameter at the large and 1 inch at the small end.

The bowsprit is 16 feet long, 6 inches deep at the widest part and 3½ at the ends, and is 3 inches wide on the bottom, bevelling to 2 inches on the top. It is fastened to the keel by means of an iron band three-quarters of an inch wide, and also by a bolt running through both.

The boom is 29 feet long, 4½ inches in diameter in the centre, and 2½ inches at the ends. It is fastened aft of the mast by means of an eye and a staple.

The jib-boom is 15 feet 3 inches long, 2½ inches in diameter at the centre, and 2 inches at the ends, and is fastened to the forward end of the bowsprit.

The gaff is 8 feet nine inches long, 2 inches in diameter, and has the jaws made to an angle, so that they set square across the mast.

The sails are two in number, the mainsail and the jib. The mainsail has the following dimensions: hoist, 14 feet 6 inches; foot, 28 feet; head, 8 feet; leach, 28 feet; the lift of the mainsail at the end of the boom is 1 foot 6 inches.

The dimensions of the jib are as follows: hoist, 15 feet; foot, 14½ feet; leach, 22 feet; and it has a lift of one foot. The rigging is of half inch round iron and wire rope.

The above definition does not prevent boat builders from rowing unless in the case of an individual whom it can be shown has practiced with the oar to an undue extent. The sign of boat builders will not hereafter disqualify such from rowing. Janitors of boat houses, however, are debarred. A resolution requiring that all prizes now in possession of winners be returned to the association to be disposed of to the best advantage, and flags substituted therefor, was lost. A resolution was adopted indorsing the invitation extended to the principal rowing clubs of Europe to participate in the Centennial regatta. Amateur crews from England, Ireland and France will certainly compete, and also professional crews from the Thames and Tyne. A very important resolution was also adopted, the effect of which is to confine oarsmen who may be members of several clubs to enter from but one. The next regatta of the association will be held at Philadelphia, on or about the 21st of August next, and prior to the Centennial regatta. The regatta committee consists of Alex. Kumbaar, Jno. E. Eustis, Marcellus Bailey, E. R. Craft, and H. W. Garfield.

CENTENNIAL NOTES.

PHILADELPHIA, Pa., Jan. 24th, 1876.

EDITOR FOREST AND STREAM:—

The action of the Convention of the Amateur Association on the 20th inst., in New York, meets with very general approval here, as indeed the action of the Philadelphia representatives would show. The feeling against allowing men to row in amateur regattas who receive, indirectly, a remuneration for their services, is very strong. Suspicion has attached itself to a number of men who, having no visible means of support, seem to devote all of their time to the science of rowing. In this country men generally do something for a living, and it is no more than natural that what a man seems to make his occupation should be considered the business by which he secures the necessities of life. Rowing here is a pastime and those who, making it a pastime, can devote but their leisure hours to the sport, feel more than an objection to connecting with quasi professionals. But even the new definition, with its explanatory safeguard, will not avail, unless the Executive Committee of our National Association, and all the committees of amateur regattas, have the pluck to rigidly enforce it.

As was anticipated by the Centennial Regatta Committee, it seems impossible that the English universities should accept the challenge of the American colleges to row July 19th. The date of the Centennial was fixed (or rather was left unfixed) between August 20th and September 15th, to accommodate those crews which must appear at Henley. But the Schuylkill Navy would be glad to have their races here, and would make a place on their programme for them, and would be glad to offer the hospitality of the Quaker City, as far as in their power lies. The Navy, I think, hopes that the College Association will so accommodate the date of their regatta that they will secure a genuine International collegiate race.

Messrs. Eustis & Rees will meet the Centennial Committee here on Friday, and some mutual arrangement will probably be made.

The Treasurer of the Royal Sport Nautique, Brussels, has sent a request for the circular and full particulars of the regatta, and it may be that, besides the assured representation of Great Britain and France, there may be crews here from Belgium and Germany. SCULLS.

BOATING AT PRINCETON.

PRINCETON, N. J., Jan. 19th, 1876.

EDITOR FOREST AND STREAM:—

Sporting matters are exceedingly dull here just now. The University crew have begun some light training in the gymnasium, but will not settle down to hard work for some time yet. Capt. Nicoll hopes that, in spite of the loss of Messrs. Biddle and Hall, and the resignation of Mr. Parmley, we may turn out a very fair crew. We have with us of last year's crew only Mr. Nicoll and Mr. VanLennep. The Freshmen crew are also doing some light work, and promise well. The University ball nine have not yet thought of organizing; but we shall probably have a good team. Of last year's nine we lose only Moffat. Gunners here are looking forward to a good English snipe season in the Spring. LOUNGER.

Billiards.

SLOSSON VS. SEXTON.—The excitement in billiard circles is on the *qui vive* as the date fixed for the youngsters to contend for the supremacy draws near. Both players have been doing tall things in their practice games. Sexton, on the 21st inst., in a game with a gentleman from St. Louis, went out with a run of 248, while Slosson, on the same date, playing Mort. Humphrey 700 points against his 300, won with an average of over 32, and two was over 100. What lends so much interest to this contest is the fact of the extreme youth of the players, neither being twenty-two years of age, and their debut to the public in a regular contest for a money stake, although both participated in the November tournament. Their play is wonderful, and so sanguine is Slosson of his prowess he informs us that in the event of his winning this game he will challenge the world for \$1,500 or \$2,000. Among the knowing ones Sexton is booked for the winner, basing their judgment on his steady, but more particular round-the-table play, while his force and massé shots are executed with that neatness and tone so peculiar to French players. Slosson plays with great rapidity, as if he was confined to a certain time to finish the game, or desirous of seeing the end. His particular forte is nursing; no one can compare with him making fine caroms, and we predict he will keep the referee busy enough watching his play in order to decide count or no count. Through the liberality of H. W. Collender both players have been provided with new cloth, balls, cushions, etc. So that they will be on equal footing as regards the tools used, and in case of defeat no blame can be attached to aught but inferior play. The contest takes place at Tammany Hall, Thursday evening, January 27th.

RUDOLPHE VS. DANIELS.—About three hundred persons were in attendance at Bumstead Hall, Boston, on January 20th, a witness a contest between the above noted players. In a game of 600 points, three-ball, for \$500, Rudolphe conceded Daniels 150. The game was all one-sided, the odds-giver winning by a score of 600 to 276 (exclusive of odds). Rudolphe's best run was 68, while Daniels reached 44. Averages, Rudolphe, 13½; Daniels, 6½. Referee, Luther S. Brooks.

—Corn cobs have of late been extensively used for fire lighters in France. They are steeped in hot water containing two per cent. saltpetre, and after being dried at a high temperature, are saturated with fifty per cent. of resinous matter.

can be attained in going before the wind, as it is necessary to tack away from as well as against it, or otherwise the wind would be left behind. The boat seen in the distance is the Icicle, owned by the Commodore of the Poughkeepsie club, John A. Roosevelt, Esq., claimed to be the largest and fastest ice boat in the world. Her total length is 68 feet. The frame-work is 32 feet in length from mast-step to rudder-post. Width of frame, 6 feet; distance between runners, 26 feet; length of forward runners, 7 feet six inches; length of bowsprit, 25 feet; length of boom, 43 feet; length of mast, 32 feet; carries 1,071 feet of canvas, No. 7 duck, single bited. The following description of the dimensions and mode of building an ice-yacht of about the size of the Haze will give an intelligible idea of their construction:—

The body, or boat proper, is made up of three principal parts—the keel or centre timber, and two side timbers. The keel is 24 feet 6 inches long, 3 inches wide, and 9 inches deep. The two side timbers are each 2½ inches wide and 4 inches deep. They are joined at the stern to a semi-circle of 15 inches radius, and at the mast by means of a curved plank 12 inches wide, 3 inches deep, and 7 feet 4 inches long, which is bolted to them.

The runner plank to which the two forward runners are bolted, and which is bolted to the under side of the side timbers and running under the keel, which projects about an inch below the side timbers.

The runners are three in number, two forward and one

THE AMATEUR OARSMEN.—On Thursday last a meeting of the National Association of Amateur Oarsmen was held at the Metropolitan Hotel in this city. The following permanent officers were elected:—President, Commodore James F. Ferguson, Quaker City Boat Club, Philadelphia; Secretary, Henry W. Garfield, Excelsior Boat Club, Detroit, Mich.; Assistant Secretary, Richard Neville, Nautilus Boat Club, New York. Delegates from twenty-five clubs having presented their credentials, the principal business before the meeting, viz.: the amending of article three of the constitution, relating to the definition of amateur, was proceeded with. A committee of nine having been appointed, the proposed amendment was submitted to them for consideration and finally adopted, as follows:—

An amateur oarsmen is one who does not enter in an open competition, or for either a stake, public or admission money or entrance fee; or competes with or against a professional for any prize; has never taught, pursued, or assisted in the pursuit of athletic exercises as a means of livelihood; whose membership of any rowing or other athletic club was not brought about or does not continue because of any mutual agreement or understanding, expressed or implied, whereby his becoming or continuing a member of such club would be of any pecuniary benefit to him whatever, direct or indirect; who has never been employed in any occupation involving any use of the oar or paddle.

BUY IT Vanity Fair.

It is shaved from the best Natu-
ral Leaf, for Meerschaum and Cigarettes. Does not
make the tongue sore. Sample on receipt of 20
cents. Highest award, Vienna, 1873. Send for cir-
cular. WM. S. KIMBALL & CO.,
PEERLESS TOBACCO WORKS, Rochester, N. Y.

From Seth Green, Supt. N. Y. State Fisheries.

I find Vanity Fair to be the best article of tobacco
adapted to the wants of the sportsman. Have used
your tobaccos for many years, and know them all to
be first-class.

For Sportsmen.

A trusty friend, in weariness or trouble; a solid re-
source in winter and rough weather, is a sweet pipe
with Vanity Fair. Best dealers have it.

From A. B. Lamberton, Rochester.

Having smoked your tobacco, Vanity Fair, by the
camp fire and by the hearth, I believe it in point of
fragrance and taste superior to all brands known to
me. Being in search of a tobacco that would not fire
the tongue and mouth, I was made acquainted with
your Vanity Fair, and found it to be the *ne plus ultra*
of natural leaf.

Does not make the tongue Sore.

SMOKE VANITY FAIR.—It is a wonderful solace,
and the best proof that it works no injury is the re-
freshed feeling you awake with next morning, con-
scious that there is no reasonable task you could not
perform.

For Meerschaums.

It has a permanent existence; again and again does
it serve your turn, and still is ready for a fresh bout.
That pipe is always ready for its fill of Vanity Fair.

For Cigarettes.

A cigarette is an interlude to the serious habit; a
graceful make-believe for spare hours. For cigar-
ettes Vanity Fair has no equal. Best dealers have it.

HURST'S

Stereoscopic Studies

—OF—

Natural History

FOR OBJECT TEACHING IN SCHOOLS

—AND—

PARLOR ENTERTAINMENT.

We are prepared to furnish the first sixty numbers of
the first series of

Animals and Birds of North America.

To these will be added a second series of foreign
specimens, and various Animals and Birds in gro-
tesque attitudes, never, however, violating their natu-
ral instincts.We offer these views not as pictures only, but as
studies from nature. One of the great moving ele-
ments in our modern system of education is object
teaching. The unerring fidelity of the stereoscope
transfers the animals and birds from their natural
habitat to the rooms of the student and the fireside of
our homes, where they cannot fail to have a lasting
impression of the form, color, habits, and locality of
each specimen.An experience of more than twenty-five years as
Taxidermist of the New York State Cabinet of Natu-
ral History, and in gathering his large collection of
native and foreign specimens, enables Mr. Hurst to
combine in every view the locality of the specimen,
with its appropriate rocks, woods or water, and color-
ing from the originals.

1. Wild Cat, or Bay Lynx.....*Lynx rufus*.
2. Snowy Owl.....*Surnia nyctea*.
3. American Wolf.....*Lupus occidentalis*.
4. Wild Pigeon.....*Ectopistes migratoria*.
5. Northern Panther.....*Felis concolor*.
6. Black Crowned Night Heron.....*Ardea discors*.
7. Woodchuck.....*Actomys monax*.
8. Red Necked Grebe.....*Podiceps rubricollis*.
9. Great Blue Heron.....*Ardea herodias*.
10. American Swan.....*Cygnus americanus*.
11. Red Shouldered Buzzard.....*Buteo hyemalis*.
12. American Woodcock.....*Eusticola minor*.
13. White Fronted Goose.....*Anser albifrons*.
14. Long Eared Owl.....*Otus americanus*.
15. Hooded Sheldrake.....*Mergus cucullatus*.
16. Horned Grebe.....*Podiceps cornutus*.
17. Golden Eagle.....*Aquila chrysaetos*.
18. Prairie Wolf.....*Canis latrans*.
19. Spotted Sand Lark.....*Totanus macularius*.

SUBSCRIBE FOR THE

SCIENTIFIC FARMER.

A 16-Page Quarto, issued monthly, and full of origi-
nal reading matter. It is devoted especially to sci-
ence, as applied to agriculture, and is the only journal
in the world published with this avowed object.It records all true progress in agriculture, and the
latest results of scientific research. Chemistry, bot-
any, veterinary practice, natural history, farm me-
chanics, rural art and architecture, rural law and ento-
mology, are all prominently considered in its columns.

AMONG ITS CONTRIBUTORS ARE:

President W. S. Clark, of the Massachusetts Agri-
cultural College, who has few equals as a writer on
scientific matters.Prof. C. A. Goessmann, who is acknowledged to be
the first agricultural chemist of America.E. Lewis Sturtevant, author of the "Ayrshire Cow,"
the "National Ayrshire Herd Book," &c.A. S. Packard, Jr., editor of the "American Natu-
ralist," and State Entomologist of Massachusetts.Prof. N. Cressy, who is one of the foremost of our
veterinarians, and is State Veterinary Surgeon of Con-
necticut.Prof. Levi Stockbridge, whose experiments in crop-
raising, by special fertilizers, have created astonishing
public interest.Jos. N. Sturtevant, Esq., South Framingham.
Richard Goodman, Esq., Lenox.Prof. J. Wilkinson, Baltimore.
Prof. H. W. Parker, Massachusetts Agricultural
College.Prof. S. T. Maynard, Massachusetts Agricultural
College.J. N. Bagg, Member of State Board of Agriculture.

Paper and Metallic Shells

FOR

Breech Loading Shot Guns,

Manufactured by the

UNION METALLIC CARTRIDGE CO.,

BRIDGEPORT, CONN.

THE STURTEVANT SHELLS are the easiest reloaded.
Do not have to unscrew the head nor use an awl to remove
the exploded caps. THE PATENT MOVABLE ANVILS,
made of steel wire, will not bend or break.THE BERDAN PATENT SHELLS, new model, with
Hobbs's patent waterproof primers, never miss fire, and are
highly prized by all that have used them.PAPER SHELLS.—By repeated experiments and great
outlay for improved materials, and machinery made ex-
pressly for the purpose, we can now warrant our BROWN
PAPER SHELLS equal to any imported. They are sure
fire, and will not burst in the gun.Inquire of any of the dealers in sporting materials for
the U. M. C. Co.'s Shells.

Not sold at retail by the manufacturers.

Hart's Sportsman's Favorite Metallic Shells for
Breech Loading Shot Guns.These Shells are easily loaded, and the caps easily extracted from inside. Head solid, and much thicker
than any shell now made, giving a solid seat for cone or anvil, which prevents it from driving through or
springing away, thereby causing missfires. The cone is made of nickel and fastened solid in its place. It
neither rusts or corrodes fast like moveable anvil made of steel. The nickel cone also prevents missfire
when cap has been left on shell for a few days, which is liable to occur either in steel or iron. These shells
are finely finished, and made any length ordered, from 2 1/2 to 3 1/2 inches.Shells and Loaders, and description Price Lists, can be obtained from all the leading sportsmen's houses
throughout the country. GEO. E. HART & CO., 363 and 365 Market st., Newark, N. J.

From Captain Bogardus, Champion Wing Shot of America.

Messrs. GEORGE E. HART & Co.,

Gentlemen—The fifty shells I received from you to-day suit me better than any I have ever used. They
are stronger and better in every respect, and I shall use them in all my shooting hereafter. Yours truly,
may13-ly A. H. BOGARDUS.

THE PAPER STEM PIPE.

Just the Thing for Home
and Camp Use.

Supplies a want which smokers have long felt—a
pipe which shall give simply the taste and odor of to-
bacco smoke. This pipe never accumulates rank
smelling liquid in stem or bowl, but is always clean
and sweet. The bowl and mouthpiece are permanent,
but the stem is of porous paper, to be laid aside after
a few days' use and a new one fitted. Extra stems
accompany each pipe. The price of extra stems,
when not furnished with the pipe, is as follows: Four
and a half and seven inches, 5c.; twelve inches, 15c.
Sold by pipe and cigar dealers generally, or a complete
sample sent by mail for \$1 by

Orange Sporting Powder.

ORANGE LIGHTNING POWDER,
The strongest and cleanest Powder made. Nos. 1
to 7, packed only in sealed 1 lb. canisters. The coarser
sizes (higher numbers) especially are recommended
to owners of fine breech-loading guns, giving great
penetration with very slight recoil.

ORANGE DUCKING POWDER,
For water fowl. Very strong and clean. Nos. 1 to
5. Packed in metal kegs of 6 1/2 lbs. each, and in canis-
ters of 1 and 5 lbs.

ORANGE RIFLE POWDER,
The best for rifles and for all ordinary purposes.
Sizes P. G. F. F. G., the last being the finest.
Packed in wood and metal kegs of 25 lbs., 12 1/2 lbs.,
and 6 1/2 lbs., and in canisters of 1 lb. and 1/2 lb.

All of the above give high velocities and less resis-
tance than any other brands made.
**BLASTING, MINING, AND SHIPPING POW-
DER OF ALL GRADES AND SIZES PACKED IN
WOOD OR METAL KEGS OF 25 LBS.**
**SAFETY FUSE AND ELECTRICAL BLASTING
APPARATUS.**

LAFLIN & RAND POWDER CO.,
21 Park Row, N. Y.

Sole proprietors and manufacturers of the celebra-
ted ORANGE brand of GUNPOWDER. Recom-
mended and used by Capt. A. H. BOGARDUS, the
"Champion Wing Shot of the World."

DITTMAR POWDER

MANUFACTURING CO.

MY NEW IMPROVED POWDER
can now be loaded from an ordinary powder
flask, grains hard. Use it now like Black Powder.
No fear of overloading. Burns slow now. No foul-
ing of the gun. Little or no smoke. Little or no re-
coil. Not very loud report. Less heating of the bar-
rel in rapid firing. Good penetration and good pat-
tern. Safe to keep, as it does not explode if set on
fire, except well confined. Shells furnished loaded
with powder only, if desired. None genuine without
my signature on the can. **CARL DITTMAR,**
NEPONSET, MASS.

THE HAZARD POWDER CO.,

MANUFACTURERS OF

GUNPOWDER.

Hazard's "Electric" Powder.

Nos. 1 (fine) to 5 (coarse). Unsurpassed in point of
strength and cleanliness. Packed in square canis-
ters of 1 lb. only.

Hazard's "American Sporting."

Nos. 1 (fine) to 3 (coarse). In 1 lb. canisters and 6 1/2 lb.
kegs. A fine grain, quick and clean, for upland and
prairie shooting. Well adapted to short guns.

Hazard's "Duck Shooting."

Nos. 1 (fine) to 5 (coarse). In 1 and 5 lb. canisters
and 6 1/2 and 12 1/2 lb. kegs. Burns slowly and very
clean, shooting remarkably close, and with great
penetration. For field, forest and water shooting
it ranks any other brand, and it is equally service-
able for muzzle or breech loader.

Hazard's "Kentucky Rifle."

FFFG, FFG, and "Sea Shooting" FG, in kegs of 25
12 1/2, and 6 1/2 lbs. and cans of 5 lbs. FFG is also
packed in 1 and 1/2 lb. canisters. Burns strong and
moist. The FFG and FFG are favorite brands
for ordinary sporting, and the "Sea Shooting" FG
is the standard Rifle powder of the country.

SUPERIOR MINING AND BLASTING POWDER.
**GOVERNMENT CANNON AND MUSKET POW-
DER; ALSO SPECIAL GRADES FOR EXPORT,**
**OF ANY REQUIRED GRAIN OR PROOF MAN-
UFACTURED TO ORDER.**

The above can be had of dealers, or of the Compa-
ny's agents in every prominent city, or wholesale at
our office.

CHAMPION GUNS OF ENGLAND PAPE'S

Unrivalled Sporting Guns.

Stand unequalled in every contest. Their perform-
ance at the London Trials of 1875 beats the records of
any maker in the world.

1875. 12-Gauge, Choke Boring. Exhibitor.
Maker of Gun. 1st—Greener. Davidson.
2d—Pape. Davidson.
3d—Pape. Davidson.

Out of a class of 68 guns, 3 out of the 5 best were
made by Pape. The Greener gun was protested
against on the spot for having its score false counted,
the fact proven there, and afterwards confirmed by
same gun being shot for two days per week for six
weeks in succession, when its average score only took
24th place, its very best score being greatly below the
scores of the best six guns.

1875. 12-Gauge, Old Sporting Bore. Exhibitor.
Maker of Gun. 1st—Pape. Davidson.
2d—Pape. Davidson.
3d—Pape. Davidson.

1875. Long Range, 60 yards, Choke Bore. Exhibitor.
1st—Pape. Davidson.
2d—Pape. Davidson.
3d—Pape. Davidson.

Those champion Long Range guns, only 7 pound
weight, with a charge of 3 1/2 dr. to 1 1/2 oz. shot, beat the
best 8 bore Greener gun at 60 yards; weight, 15 lbs.;
6 drachms and 2 1/2 oz. shot.

1875. The Sportsman's Sub. Cup, valued at £45,
was also awarded to W. R. Pape, for the original in-
vention of choke boring. Winner of the London Gun
Trials of 1858, 1859, 1866. Address

H. C. Squires, No. 1, Courtlandt st.
New York.

THE GREAT London Gun Trial, 1875.

W. W. GREENER'S Far-Killing Prize Guns.

Winner of Silver Cup, value 40 guineas. Winner
in Class 1, for 8 and 10 bores. Winner in Class 4, for
20 bores. Winner in the Wear and Tear Trials, July,
1875. 2,500 shots fired without deterioration.

W. W. G. is the only maker who has made an ave-
rage pattern of 214 shots in a 30-inch circle, at 40 yards,
with a 12-bore gun, at any public trial either in Eng-
land or America.

I have just received a consignment of these guns,
and shall offer to individual sportsmen, for a short
time, an opportunity to secure one of these celebrated
guns at a popular price, viz: \$75, gold; extra for ex-
treme close shooting, \$10. This will probably be the
last chance to secure one of these guns at these very
low figures. All grades and styles in stock or im-
ported to order.

Attention is also called to my stock of guns, by W.
& C. Scott & Sons, which includes all their latest im-
provements. No old style guns in stock.

Sole New York Agent for Holabird's Hunting and
Fishing Suits. Trade supplied.

MANUFACTORY, PIONEER WORKS,
Birmingham, England.

J. D. DOUGALL'S EXPRESS SHOT GUNS.

(Title registered.)
SHOWN by trials at Wimbledon by Editor
of the Field to possess the GREATEST PENE-
TRATION and therefore LONGEST RANGE—thus:
Circle, 30 inches; 300 pellets; average, 191; pene-
tration, 37. The Editor's trial of Greener guns with 340
pellets of same shot and same charge of powder, gave
180, and penetration 30, although there were 40 more pel-
lets in each charge. Should any controversy arise as
to the durability of these new systems, we herewith
warn all beforehand that our system is our own inven-
tion (though founded on the American idea) and is DU-
RABLE, a fact remarked on by the Field, that the
guns tried had been in use during last season, and re-
ferences permitted to the owners. Send for Illustrated
Circulars to

59 St. James's Street London.

WILLIAMS & POWELL,

Gun and Rifle Manufacturers,
Call the attention of the Sportsmen of America to the
extreme SIMPLICITY, STRENGTH and DURABIL-
ITY of their New Patent "SIMPLEX" Breech loader
and INDEPENDENT EXTRACTOR.

The parts in this new action are so few (only two),
its mechanical soundness so thorough, and the
strength and simplicity of the action so great, that
W. & P. feel sure it will supercede all the complicated
and manifold grips now in use, its one powerful grip
being far stronger than any double, treble or quadruple
grip now used. In this new action LEVER and GRIP
ARE ONE SOLID PIECE OF STEEL and the AN-
GLE of the BODY is left in its ENTIRE STRENGTH.
Drawings of action and extractor will be sent on ap-
plication, and orders may be forwarded through any
of the best houses in the States for execution in the
Spring.

Guns guaranteed to make patterns of from 160 to
230 with No. 6 SHOT AT 40 YARDS, as desired.

NO. 25 SOUTH CASTLE STREET,
LIVERPOOL.
Established 1780.

By CHARLES HALLOCK,

AUTHOR OF THE FISHING TOURIST.

This is a most seasonable book for Sportsmen, Tour-
ists, Invalids, and Settlers, and has been long needed
by Winter tourists to Florida and persons seeking set-
tlement there. It gives a full classification of the game
and fish of the Southern Peninsula, routes of interior
and coastwise travel, the agricultural resources of the
country, and sites for settlement, hints for camping
out, resorts for game, hotels, and such other informa-
tion as will be of great benefit to visitors seeking
Florida for health, pleasure, exploration, or perma-
nent settlement.

348 pp., 12mo. Price, \$1 50.

CONTENTS:

Introductory Chapter.
Birds-eye Glance at Florida.
Outfit for Sportsmen.
Hints for Southern Hunting.
Coastwise Router of Travel.
Game Animals and Birds of Florida.
Game Fish of Florida.
Three Months in Florida for One Hundred Dollars.
Supplementary Hints for Cheap Recreation.
Up the St. John River.
Indian River.
Florida the Promised Land.
Fort Capron.
Fishing at St. Augustine.
Black Bass Fishing on Spruce Creek.
Hunting the Panther.
The Invidious of Tallahassee.
Private Dougherty and the Bass.
Pet Birds of St. Augustine.
Steam Yachting on the St. John
Among the Seminoles.
In the Cypress Swamps.
Cruising Along Shore.
Shooting at Salt Lake.
The Okeechobee Expedition.

THE AMERICAN NEWS COMPANY, AGENTS.

For Florida.

PHILADELPHIA AND SOUTHERN
Mail Steamship Company's line to Savannah,
Ga., sailing every Saturday, from Pier 23, below Pine
street, Delaware River, at 12 o'clock noon, making
close connections through to all points South. The
line is composed of the steamships JUNIATA and WY-
OMING. The Wyoming does not carry passengers.
The Juniata is a favorite ship with the traveling pub-
lic, having passenger accommodations of the most
superb character. She has recently been refitted and
elegantly furnished with everything requisite to the
comfort and convenience of passengers.

Families en route for FLORIDA, Georgia, Alabama,
and even as far as New Orleans, will find the Savan-
nah route the most desirable for comfort, as well as
the most economical. Through trains of the Central
Railroad of Georgia, and Atlantic and Gulf Railroad,
Florida, leave Savannah every morning and evening.
The Florida steamers leave Savannah three days in the
week for all points on the coast.

For through passenger-tickets and bills of lading to
all points in Florida, Georgia, Alabama and Tennes-
see, apply to WM. L. JAMES, General Agent, 416
South Delaware avenue, Philadelphia.

Stereoscopic Studies of**Florida Scenery.**

Embracing views of the most interesting portions
of the State. Scenery, vegetation peculiar to this semi-
tropical peninsula, and of cities, towns, and rivers
having historic interest.

Only views in existence of Lake Okeechobee and
Indian River.

Faithful studies of St. Augustine, the St. Johns,
Ocklawaha, the North Coast and the Gulf.

Sets of twelve selected views enclosed in an illus-
trated envelope.

For catalogue and prices, address

McBride Flies.

HAVING BEEN FOR THE PAST
twelve years associated with my father, John
McBride, in the manufacture of fishing tackle, I feel
competent to continue the business and supply the
custom with the same quality as heretofore. Parties
supplied with casting lines and artificial flies for
Pennsylvania trout streams, Adirondacks, the Maine
Woods, Lake Superior, Thousand Islands, Canadian,
and other waters. Anglers not acquainted with the
nomenclature of these flies, by mentioning the local-
ity where they intend fishing, will have the varieties
best suited to those waters sent to them. Flies copied
from any natural insect or pattern desired. SARA

For Forest and Stream.
THE WINTER KING.

WHAT ho! make way for the ermined king,
Mid his aureole of glory.
Clearer the blast of his bugles ring,
Forward his glittering cohorts spring,
From coverts, on mountains hoary.

What ho! give way to the king's array;
From the forest glens defiling.
With a victor's tramp in the sun's pale ray,
Crushing the blossoms that yesterday,
In the broad fair fields were smiling.

But oh there's a snare for the chaste, cold king,
In the sun-land's ardent glances.
Over beds of roses, the love birds sing,
And the tangled vines will clasp and cling,
Enfolding his broken lances.

T. W. A.

turesque. It consists of wheat fields, vineyards, etc., surrounded by prettily wooded hills. Some gentle undulations, some rougher and more irregular in formation. It was quite dark when we arrived at Cloverdale at 6:30, and were soon safely deposited with our baggage within the walls of a rough-looking little country inn, but, though rough, good enough for a couple of fishermen. We met at dinner a German of about 50 years, evidently a geologist visiting the quicksilver mines in the vicinity. After dinner we took our places among the rough group of countrymen around the big log-fire. Queer groups these California assemblies are! Singular mixtures of nationalities! In the present instance, for example—first (and thus placed out of respect for age) sat my uncle, E. Hooper, with his silvery locks, the patriarch of this motley group; next the German geologist; then the keeper of the tavern, a true

red, and golden leaves of autumn. The journey, which occupied ten hours and a half, seemed by no means long, and we neither of us suffered from fatigue. Our first stopping place was 16 miles from Cloverdale. The next was at a comfortable roadside farmhouse, 32 miles from our starting point, where we arrived at about noon. The good lady of the house set before us an admirable lunch—the best of farmhouse fare. Delicious home-made bread, tender meat, preserved fruits, and everything a hungry soul could desire. It was enough to give us an appetite for our food to catch a glimpse of the old lady's good-tempered sunny countenance, so full of jollity and merriment. She seemed one of those happy creatures of light and joyous temperament to whom, looking on the bright side of all things, the world is all sunshine and pleasure. Feeling greatly invigorated, we started on our journey, as giants

RED IRISH SETTERS BESS AND DASH, THE PROPERTY OF N. SALTUS, ESQ. (See Page 405.)

For Forest and Stream.
**A Trip Into Mendocino County,
California.**

THE following description of the above excursion is from the pen of my nephew, P. F. Hooper, sent to his father in England and copied by me. Although somewhat personal in its character, I think it may perhaps be interesting to the numerous piscatorial and other readers of your valuable paper. I enjoyed the pleasure of accompanying him on the trip.

E. J. HOOPER.

I left San Francisco on the 30th of October last by the new bay steamer James M. Donahue, accompanied by my uncle. The day was exceedingly brilliant, with a gentle breeze from the southeast. The above steamer is by far the finest in the Bay of San Francisco, and the fastest and most commodious in these waters. We arrived at Donahue Landing at about 4 o'clock P. M., and then took train along the Sonoma Valley to Cloverdale. The valley is very pic-

native of the Emerald Isle, from Bantry Bay; a rough English miner, whose H's were conspicuous by their absence when most required, and singularly abundant prefixed to words requiring them not. There were, besides, a dozen local celebrities of anything but intelligent appearance. Thus we sat cracking our jokes, telling anecdotes, and smoking our pipes and cigars till bed time. We rose next morning at 6, and, after a fair breakfast, started by stage at 7, en route for the timber regions. The morning was dark and cloudy. At about 8 (one hour after starting), the clouds gathered thickly overhead and rain commenced, increased, and hardly abated before dark; one steady down-pour from 8 A. M. till 6 P. M. The country through which we passed, when seen to advantage, must be some of the finest in California. On leaving Cloverdale the road begins a very steep ascent, and as the road winds round and round the hillsides we could often catch a glimpse of the village, most charmingly surrounded by a framework of magnificently-wooded hills of every form and size, surmounted by an almost endless variety of foliage, partly of evergreen, partly of trees loaded with their brown, and

refreshed with grub. Soon we reached the regions of the great redwoods. The whole journey is one continuous series of vast wooded heights, the road passing through most lovely valleys, rich with the great variety of undergrowth, wide-spreading oaks, madronio, laurel, bay, buckeye, arbor vitae, and many others. Through the thicker redwoods the road becomes exceedingly rough; indeed a rougher piece of road I never traveled over. I thought if the stage should turn a somersault occasionally it would vary the monotony of the thing, or perhaps leave the so-called road and make a short cut along the bed of some stream. Owing to the soaking rain there were singularly intense effects of coloring in the woods, the stems of many of the trees being covered by a moss of intensely vivid color and prolific growth. As we approached our destination for the night, the bumping and rolling became incessant, and to any body suffering from dyspepsia I would strongly recommend the journey.

Darkness had closed upon us by the time we arrived at the "North Fork Hotel," a queer rough roadside inn. The bar room, or general public parlor, was filled with a crowd

of wood-choppers and such like. A large bright log fire was burning, a sight very acceptable to us all coming in from the rain. A very cosy room was allotted to uncle and myself. After supper we called in an intelligent young fellow, who volunteered lots of information about deer shooting and trout fishing. A regular young country sport, whose leisure time, when absent from the saw-mills, is devoted to that delightful pastime. He informed us of the great abundance of deer, a considerable number of small bears, and of any amount of small game to be found around that locality. The rain continued to fall heavily all night. Next day we rose at 5, and dressed by candle-light; at 6 we left in another stage, the rain pouring down as before. The road was very rough, and, owing to the heavy rain, difficult to travel over. Soon after starting the driver coolly asked us to get out and walk about five or six miles, as the roads were so heavy and the horses incapable of dragging so great a load up the steep ascent of the Navarra Ridge. I should have mentioned before that the North Fork Hotel (our previous night's resting place) is so called from being situated on the north fork of the Navarra River, which flows a long distance through these great forests. This stream abounds in trout, and in the proper season affords excellent sport with worm and fly. Our route now lay through a dense mass of redwoods, the trees being of gigantic growth—some as high as 300 feet, and many 13 and 14 feet in diameter. Uncle, the old gentleman of the party, was allowed to remain in the vehicle. The rest of us footed it up the long road through the forest. The fine rain fell incessantly, but notwithstanding this, and the fearfully muddy walk before us, we none of us complained, or felt otherwise than refreshed by the tramp. There is a peculiar fragrance emitted by these redwood trees, which, to my taste, is peculiarly delicious—this, too, in rainy weather is more perceptible. We at length arrived at the summit of the great ridge of pine woods, after which the descent was continuous almost all the way to the coast. Just as we emerged from the forest a peep of blue sky appeared, then another and another, till at length the storm clouds dispersed, and the sun shone forth once more with all his genial warmth, truly gladdening our hearts. We arrived at the Navarra Ridge Hotel, 16 miles from North Fork, a very respectable roadside inn, at noon, and there we took lunch. From this hotel there is a fine view of the ocean and the estuary at the mouth of the Navarra River.

And thus we emerged from these mighty forests (the redwoods), which extend on this Pacific coast for hundreds of miles north and south. How wonderful is the contemplation in passing beneath the shade of those mighty giants, whose crests have waved through ages past; whose heads have bowed before the storms of centuries. Large saw-mills abound along the coast of Mendocino. Wood-choppers' settlements are seen in plentiful abundance, and yet, while this has been going on for years and years, where is the perceptible diminution? Where the gaps in this vast sylvan region? Barely noticeable. Man, with all the means at his command, with all the conveniences of modern travel, the appliance of human ingenuity, has but gathered a few stray faggots, as the gleaner from the woodland cot. We continued on our way along the coast with every now and again a peep at the ocean to refresh us on our journey. The day was indeed lovely, after the copious rain, and all nature seemed rejoicing with us in the sudden change from darkness to light.

We passed by several large saw-mills on Little River, Casper Creek, Salmon Creek, and Albion River. We arrived at Big River, 80 miles from Cloverdale, at 3 o'clock. This is quite a settlement, with several streets, and two apologies for churches. There is, a little south of Big River, an immense cave in the cliff, into which a brig was driven by a storm some years ago, and never again seen. Men have entered this cave a short distance in small boats, in calm weather, but none have ventured far lest they might share the fate of those on board the brig.

At 5 o'clock we were rejoiced by the first peep of the Noyo mills and river. We alighted at the door of the little hotel on the river banks, right glad that our rather hard journey was ended. What a welcome sight met our gaze! Salmon in great abundance leaping out of the water close to the bridge. We were delighted to find our little inn quite comfortable; rough, of course, for city folks, but having the advantage of perfect cleanliness. As to the cooking it was exceptionally good, indeed the house has the reputation of being the best north of "Frisco." The table was spread with everything one's heart could desire. Salmon, quail, duck, and delicious pastry. I presented my letters of introduction to Mr. McPherson, the owner of the mills, and lord of the country adjacent for many a wooded mile. I found him an agreeable Scotch gentleman of about 50 to 55 years of age. He expressed a desire to do all in his power to make our stay in Noyo as pleasant as possible. The following day we rose fairly before daylight. We had the use of the boat belonging to our landlord, John Byrnes. Being anchored, or rather tied to a post 20 yards from the hotel door, nothing could have been more convenient; and having put our tackle together, we deemed it the best plan to fish and row alternately. Uncle expressed a desire to see me kill the first fish, so he took hold of the oars. Very soon a grab was made at the spoon by a small fish of three pounds, which, after the usual leaps, was duly landed. In a few minutes, both of us having missed a fish, the spoon was again seized, and, after a very exciting contest, a nine-pounder was netted. After this we could do nothing till afternoon, when I killed a handsome ten-pound fish. Uncle was unfortunate, killing no fish the first day. We, however, had the opportunity of looking well around us. Our favorite haunt was up the river by the woods, where the scenery is truly magnificent. The woods slope to the water's edge, the undergrowth is varied, rich, and prolific. Great varieties of fir abound, growing to the greatest perfection. As far as the eye can reach, away into the interior of the State, is seen one vast panorama of wooded mountains, completely covered with these colossal redwoods towering in awful majesty toward the skies. After a most enjoyable day, spent entirely upon the river, we returned to our hotel to enjoy an admirable supper. Total bag only 22 pounds—three fish.

Next day we had not been on the water long before Uncle was into a lumper. The spoon-bait was seized near the bridge and hotel, and the sport was therefore witnessed by several persons, from those points. The fish proved very strong, and fought "like a Trojan" for half an hour, making long runs up and down stream, and leaping many times into the air. At length he was successfully netted, and being weighed, turned the scale at 13 pounds; besides this, Uncle killed a nine-pounder, and I three fish, nine,

nine, and seven and one-half respectively; our total catch being five fish, weighing 47½ pounds. On that day we visited the extensive saw mills at the mouth of the river and took a walk along the seashore, but could not go far, owing to the steep cliffs, which proved quite inaccessible. We also rowed some distance up the river among the woods, and this was afterwards a favorite excursion. Rounding the two first bends, we came upon a great "boom," or log barrier. This consists of an enormous mass of gigantic logs built up one over the other, and fastened together with massive chains, thus blocking up the river, and preventing the logs from escaping down stream. There are openings through which a limited number of logs can pass when necessary. After a series of very heavy rains, when the rivers are swelled into mighty rushing torrents, the pressure becomes enormous; thousands and thousands of great logs coming down with tremendous force, and, of course, accumulating all the time above the dam. One of the most beautiful features of interest in that truly wonderful country, is the log-shoot, down which the logs descend from the top of the hill into the river. I had occasion to describe these in my account of my trip up the valley of the Truckee River two years ago. It was but a short distance from where our boat was moored that we witnessed this most fascinating spectacle. We were first attracted by a sound as of distant thunder over the woods; then, looking up to the top of the steep incline, we could perceive the end of a massive log being pushed by steam power on to the shoot. Once started the impetus became tremendous. When about twenty feet above the water the log leaves the shoot and plunges headlong into the deep river, the snow-white spray rising into a mighty fountain of often 150 feet. These logs follow each other in rapid succession. But description, however graphic, can convey but a faint idea of the wonderful effect produced by these mighty plunges. I have never witnessed the fall of one of these mighty redwood. I am told by the wood-choppers that this is literally awful. Large trees, when falling from any eminence, unless coming in contact with those of their own size and growth, carry everything before them, finally burying themselves in the ground at the bottom of the valley.

Our third day (Thursday, Nov. 4th), proved a poor one, as far as sport went. There was, however, no lack of amusement on the river. I took a small Ballard rifle (breach loader), with which I diverted myself firing at ducks, cormorants, divers, etc., making several very successful shots. Uncle caught a ten and a half pounder, I a six-pound fish; total, 16½ pounds. Following day (Friday, Dec. 5th), we had our hands full indeed. We started to fish after breakfast, *i. e.*, about 8 o'clock. The salmon were unable to resist our spoons, as the result at the end of the day proved: Uncle killed six fish, ten, ten, seven, eleven, twelve, and eleven and a half pounds. I killed nine fish, nine and a half, nine and a half, six and a half, seven and a half, ten, ten and a half, and nine pounds; total, fifteen salmon, weighing altogether 140 pounds. Knowing how lively fresh-run salmon from the ocean are it will be seen that we had our hands full nearly the whole day.

The next day our bag was again remarkable. Uncle killed eight fish, eleven, six, eight and a half, six, ten, nine and a half, and twelve pounds; I killed eight, eleven, twelve, seven, eight, eight and a half, eleven, eleven, ten, and eight pounds; total, sixteen salmon, weighing together 147 pounds. That night (Saturday), the clouds gathered and the rain fell heavily, continuing all next day almost without intermission. The pleasantest locality that day was the corner by the big log fire which blazed cheerfully, and proved highly attractive to the weather-bound crowd indoors. Many were the stories we listened to, described by several old hunters of their encounters with grizzly and other bears, panthers, and California lions. Small bears are plentiful in these woods, and panthers are occasionally seen, but, as a rule, they steer clear of civilization. They say that in the berry season large numbers of bears may be seen feeding on the banks of the Noyo River.

On Monday I started before dawn accompanied by a wood-chopper as a guide, with the hope of being able to bag a deer. We crossed the hills and followed the course of the river for a number of miles, passing through a very rough country, densely wooded all the way. The scenery is exceedingly grand far up the Noyo, and the views from the summits of the woods looking down upon the water is beyond all power of description. After following a trail for about eight miles, we entered the forest to walk wherever we could find an available opening. The work was tremendously laborious, the mountains being exceedingly steep, and the woods dense and full of fallen trees, over and under which we had to make our way. At one point my guide came to a sudden halt, and, beckoning to me, pointed out a magnificent deer standing still at a distance of about 120 yards. I fired, but without effect, the bush being very thick, and thus preventing a clear view. She turned round broadside, and I fired again, this time with decided effect. On receiving the shot, she leaped six feet into the air and dashed into the thicket. We followed, but alas, having no dogs, we entirely lost sight of her. This was the only shot all day. We saw any quantity of tracks, but to no purpose. My guide, while walking some distance ahead of me, fired his revolver at a bear which he saw bolting along at the bottom of the hill. I rushed forward on hearing the shot, and could hear the beast making off through the dense thicket, but though we hunted for a long time, we failed to turn him out. From dawn till sunset we fought our way through the thickest forests, finally passing down the valley of Pudding Creek, so named from its perpetual state of moisture. This valley is so situated, so shut in, that at this time of the year the sun never shines there. From some cause or other the trees and bushes are ever dripping, and nothing can exceed the chilling effect of the atmosphere. In consequence of this perpetual moisture the foliage is marvelously prolific in growth. Ferns and mosses seem to revel in the soft damp ground. Every tree, and especially the many fallen trees are completely covered with beds of the deepest moss, and ferns of extraordinary size and beauty. But the result of the absence of the sun for a long season is, that the ferns, mosses, and general plants are pale and lacking in brilliancy of color.

Our ramble extended over a distance of at least 25 miles and lasted twelve hours. During that time I only sat down for half an hour on a tree in the forest to eat my lunch. During my absence, Uncle enjoyed excellent sport on the river among the salmon, killing no fewer than twelve fish. Of course he had a man to manage the boat, otherwise he could have done but little. His fish ran as fol-

lows:—One and a half pounds, seven, eight, nine, seven and a half, nine and a half, ten and a half, five, nine, nine, and eight pounds; total twelve salmon weighing together 91 pounds. The following day (Tuesday, Dec. 9th), was the greatest triumph of all. Our days' sport turned out as follows:—Uncle killed ten fish, ten, nine, eight, ten, eight and a half, eight, eight, eight, nine, and twelve pounds; I killed eight fish, nine, nine, eight and a half, seven and a half, seven, twelve and a half, and eight pounds. This was actually our last days' fishing. The following day (Wednesday) we devoted to packing up our traps for the journey south on the morrow. We could not, however, resist the temptation of taking another short spin under the bridge, when I succeeded in killing two fine fish, one ten and a half pounds, the other nine and a half pounds; total, 20 pounds, just by way of a wind-up to our sport. The result, then, of our eight days' fishing in the Noyo River, may be considered eminently satisfactory, indeed I doubt whether much finer sport can be obtained in any part of the world. Our total bag in eight days amounted to 73 salmon, weighing in all 644½ pounds, thus giving an average of about 8½ pounds per fish.

It will be observed that our fish ranged generally about the same size. The largest weighed 13 pounds, the smallest 1½ pounds. By the above lists it will be seen that only two grilse were taken. I endeavored perseveringly to attract the lordly salmon to the surface with a fly, but to no purpose, I never rose a fish. I am informed, however, that in the spring time and early summer these fish rise to a fly up the river in the fresh water. We enjoyed our best sport in the vicinity of the bridge by the hotel, just above and below, also a short distance up the river near an old stump in a very deep bend. It was in the latter hole that we almost invariably killed male fish, mostly hook-bills, as they are generally termed. These fish have ugly noses, curved round like a large hook, hence their name "hook-bills." Of course these being fresh-run fish, the sport they offered was great. Many were the exciting contests, as the lively fellows darted up and down stream, sometime leaping a dozen times several feet into the air before they would finally turn over and show signs of distress.

Our journey back to Cloverdale, and from thence to San Francisco was but a repetition. We had been very desirous of varying the trip by going south by the sea, but were recommended by Mr. McPherson not to attempt it, as, at this time of the year, many of the schooners become becalmed, and often occupying three weeks on the down trip. When we arrived at the North Fork hotel—our sleeping place—we found our young friend the sportsman. Such is the abundance of deer in that part of Mendocino that in early morning on the ridges sport is a certainty. The night was fine and bright, so I took a long walk of ten miles or a dozen miles along the high "opens" above the woods. During our walk (the young sport being my guide), I saw far away on a high ridge a band of some fifteen or sixteen magnificent deer running in line. The distance was, however, too great and the light too defective to attempt a shot. I much regretted now that we did not leave Noyo two days earlier to give me the opportunity of bagging my first deer. If, next year, or the following, I take my holidays at the same season, I shall devote the time to hunting exclusively. At Cloverdale we slept soundly. We rose next morning (Saturday) at 5, and left by the 6 train for the steamer, which carried us back to San Francisco, December 19th, 1876. P. F. HOOPER.

For Forest and Stream.

"CALE" LORING.

TO those who knew Caleb G. Loring will these few reminiscences prove interesting I trust, and bring to the minds of many surviving friends pleasant memories of dear old "Cale," and happy days gone by. His heart was tender and kind as that of a woman, but his physique enabled him to undergo the most severe exposures and fatigue incident to hunting, being extremely powerful; he was at one time known as the "Iron Man." Possessing a great fund of wit and humor, and wonderful power of imitation, he would have won fame as a comedian equal to Charles Mathews had he adopted the stage as a profession. A keen observer of nature, his knowledge of the habits of birds and animals was extensive and accurate. On one occasion when at "the shanty" I called his attention to a flock of birds flying high in air over the marsh at such a distance as to be just discernible. "Cale" watched them a moment and exclaimed "brant." Those accustomed to seafowl shooting know how difficult it is to distinguish, at a distance, if a flock of fowl be brant geese, white-winged coots, or cormorants; but from his knowledge of every peculiarity of the flight of birds he distinguished the species, and brant they proved to be, although very rarely are they seen flying over the marshes of Scarborough, Me. Cale's wonderful power of imitation served him well in decoying game, especially the marsh birds.

Sitting on the piazza of the "shanty," one day of the Indian Summer, we heard a faint whistle, so faint, indeed, at first none among us recognized the bird, excepting Cale, and he answered in exact imitation of the whistle of a curlew, given with a power rivaling a steam engine. After many calls, and occasional faint replies from the bird, it was seen approaching, and as it came nearer Cale gradually softened and modulated his call in proportion to the distance, and the curlew was finally shot from the house, while hovering, anxious to alight by the side of the calling one. When first seen the bird was near the mouth of the Nonesuch River, a half mile distant, it being calm and clear, and just before sunset. Ere dark a duck flew down the river, and had passed without noticing the decoys anchored in front of the house, when a quack from Cale attracted the attention of the duck; it immediately turned and came back, and fell a victim to deception and the right barrel. Not unfrequently several sportsmen would return to the "shanty" after a day's shooting down the river to find that Cale had made a better bag than any of them by shooting the birds that had "come around the house;" nearly all such birds came into the house, and not a few they were. Nearly every morn and eve the song of a robin might be heard among the pines in the rear of the house, and one morning, after a remark by S. "how sweetly that robin is singing," one of the party exclaimed "I'll wager a bottle of wine that it is not a robin." S. stepped into the kitchen, where stood Cale watching the broiling of some birds, with not a muscle of his face moving; and the robin's song still continuing. S. returned to the adjoining room, accepted the wager, and all went out to find the bird; but being un-

successful, returned, and were undeceived by hearing Cale repeat, at request, the ventriloquial notes that were so deceiving. During the day, when not in use, the guns were placed together on gun-rests on the piazza, and by imitating some plover whistle, Cale had not unfrequently called out all hands, for the amusement of seeing the rush for guns; but now a general wager was made that Cale could not again decoy any of the party out of doors if there should be no game in sight. After this every one was on the *qui vive* at the sound of a plover's whistle to know of Cale's whereabouts, or else see some game from the windows ere rushing to the piazza for guns. But a few days after this, Cale being out putting the boats in order, began whistling plover calls, but as no birds could be seen from the house no one therein ventured out until after some time had elapsed, when the report of a gun brought them to the door, to see Cale picking up dead birds. "I waited for you to come out," said he, "until the birds started, and then shot to wake you up." All then went into the house, including Cale, who went up stairs to his chamber, and thence, after a few minutes, stepped out on the upper piazza and gave the shrill whistle of a "yellow-leg" that appeared to those below to come from high in the air above the house, and there was a grand rush for the guns on the lower piazza, where they were greeted by a second whistle from Cale, and the enjoyment "don't shoot yet." The bell was rung, and Cale came down to hear the verdict.

His powers were well shown in his original story known as the "Schoolboy Story." After explaining the circumstances of being appointed a member of the school committee of the town, and going to a school exhibition, he gives a rendering of the whole exercises; the declamations, etc., by the boys, and the Yankee conversation of the farmer who sat by him making aside remarks, and giving a history of each performer and his individual peculiarities.

Those who have heard Cale tell this story will long remember it.

Many times have I seen him call ducks, giving exact imitations of all their notes, from the contralto quack of the duck to the bass of the drake, and the soft, courting notes; and many times have I made my throat sore endeavoring to correctly imitate him. After dining at my home, one day, he accompanied me to my chamber, which is a sort of museum of stuffed birds, guns, etc.; and being pleased at the many evidences of my taste similar to his own, asked me if I made a will, to leave the contents of that room to him. I called his attention to festoons of different varieties of birds' legs hanging in a corner; taking one of them in his hand, he exclaimed "Is this a leg-I see? (legacy)." At one time he took part in a shooting match in which a man opposed to him was supposed to be a wonderful marksman, from the stories told (principally by himself) of the shots made by him "at the Redhouse in England." And in the preliminary arrangements of the match everything was compared by him to the superior manner in which such affairs were managed "at the Redhouse in England, you know." When the trial came, Mr. Bragadocio suffered a most signal defeat, but would not acknowledge that his opponent shot extraordinarily well, and gave profuse explanations, known as "gunners' excuses," of the causes of his poor shooting, and had "oft beaten the field at the Redhouse in England, when every one there shot far better than the best shooting of to-day." At the supper following this match Mr. B., in answer to interrogation, acknowledged that Cale shot "very well—very well." "But," addressing Cale, "but, Mr. Loring, you should see the shooting at the Redhouse in England." Cale asks, "I understand you to say that you have shot at the Redhouse in England?" "Oh, frequently! frequently!" "Allow me to ask *did you hit it?*"

One of the farmers residing near the "shanty" related in good faith as a fact that he "saw three old squaws (long-tailed ducks) flying up river one day as Mr. Loring was coming down in his gunning-boat, and as they flew by the boat Mr. Loring killed one with each barrel, turned a back-somersault, picked up another gun and dropped the third. Now, that's quick shooting, I call it, for they say that old squaws fly ninety miles an hour. He always has three double-barreled guns in his boat when out gunning, and fires them all about as quickly as most men can fire one."

Some of Cale's friends hearing this story, asked of him the particulars. He had not until then heard the farmer's version, and explained, that as the ducks neared him they divided and he killed one each side of him, but the third one going directly over his head he was unable to turn entirely around in the boat quickly enough to cover it with his second gun, but threw himself on his back and shot with the gun held firmly in both hands above him, thus killing the last bird.

Frequently, as on this occasion, when inconvenient to turn quickly to shoot birds passing each side of him, he would shoot on one side, and, changing the gun to the other shoulder, shoot with the same unerring aim, always shooting with both eyes open. Although able to distinguish birds so readily he was "color-blind." I first became aware of this through taking to him for identification a sandpiper, of a species then new to me, although very familiar with most of the genus. He examined the bird, told me that it was a "buff-breasted sandpiper," and asking me to describe its color, said that all birds appeared gray to him, although he could detect marked differences in shades. He added that this specimen was somewhat rare, and, although he had shot several on different occasions, he had never seen them in numbers. I afterwards compared it with the plate and description in Audubon's "Birds of America," which confirmed its identity. I regret that I did not preserve the skin, for the species appears to be now extremely rare. To the ordinary observer, depending as he does, to a great degree, upon color in distinguishing the different species of birds, color-blindness might seem a great obstacle; but this defect would render one much less liable to be deceived by varieties of plumage, or colors of eyes, bills, and feet, incidental to the same species of different ages, sexes, seasons, localities, etc.

It was rarely that any one but Cale's most intimate friends had opportunity to see him show his skill in shooting, except it were by accident. In 1853 a wager was made among some of his friends that he could not kill ninety woodcock in one hundred shots; the conditions requiring him to shoot at every woodcock that his dog pointed or flushed. Of course not enough birds could be found in one day, and the shooting extended over seven days, and at several places, in Maine and in Massachusetts. It will be remembered by those who witnessed it (Messrs. Pratt, Morse, Tilton, and others), and by many others

among his friends to whom these facts are known; but I believe that the score has never before been published:—

Day.	Shots.	Birds.	Day.	Shots.	Birds.
First day	11	10	Fifth day	10	10
Second day	7	7	Sixth day	27	26
Third day	8	8	Seventh day	20	20
Fourth day	17	16			
Total.		100			94

Missed second, fortieth, forty-third, forty-fourth, forty-eighth, and fifty-third shots.

By the score it will be seen that forty-one birds were killed consecutively; as were also thirty-eight. One of the birds shot was brought to hand by the dog, and instead of taking it from the dog's mouth as was his custom, Cale told him to drop it; but the bird, being only wounded, fluttered off and was knocked over again with the second barrel. This was counted as two shots, one bird. Sportsmen accustomed to shoot woodcock will appreciate this wonderful score, for wonderful it must appear to even the best of crack sportsmen of the day, or other days. Mr. Loring enjoyed the friendship of many distinguished gentlemen, and widespread was the sadness caused by his death. He died of kidney disease August 28th, 1868; and, to quote from an obituary, "we all knew him, all loved him, and we all feel sad that his pleasant jest will never again 'set the table in a roar.'"

I write these few reminiscences in the hope that through the columns of FOREST AND STREAM many more will be given from an abler pen than that of THE BOX.

For Forest and Stream.

A WOLF HUNT FIFTY YEARS AGO.

I HAD just risen from the breakfast table one winter morning, when a farmer from an adjacent settlement drove into the door yard and informed me that the night previous a wolf had entered his fold and killed several sheep, and requested me to go and hunt the animal down. I needed no urging, as from early boyhood hunting and trapping had been my chief pursuit. My home was among the green mountains, and bear, lynx, wolf, and smaller game were quite abundant. Devoting, as I did, my whole time to the pursuit, it was common for the farmers, when suffering from the depredations of wild animals, to call upon me to rid them of the pests.

In the present instance I was soon ready, my knapsack packed with food and blankets, prepared for a long chase, as wolf hunts usually were, and ten o'clock found me with hound on the trail, the latter soon rounding far up the mountain side. Ere long the wind had died away, but about noon, on arriving at the summit, it was again heard on a ridge beyond. I was descending towards the intervening valley, when the voice of the hound struck peculiarly upon my ear. On listening, I plainly discerned that, instead of pursuing, the hound was pursued. In lieu of the long-drawn, clear-ringing tones there came an occasional ki-ing and whimpering. Blucher was a powerful, courageous fellow, as had been often proved in encounters with the bear, lynx, and wolf, so that at first I was loath to credit my sense of hearing; but as the sound drew near I was forced to accept the situation, and prepared for it. Removing my knapsack and snow-shoes, I took a position beside a large tree a little way from the trail, ready for a shot. The hound came first in view, as I feared, the wolf close upon him. The latter had not detected my presence, and when at fifty paces I drew up for the shot. At that instant he turned, and received the charge in his hind legs, breaking both off below the gambel joint. He was crippled for an instant, but was soon out of sight on the back track. Feeling sure of my game, I was in no hurry to pursue. My poor hound was in a sorry plight. His rump and flank were literally scarified by the fangs of the wolf, and not until his wounds had been a long time bathed with snow did they cease to bleed. After a lunch of raw salt pork and brown bread, I took up the trail, now doubly flecked with blood. But on old Blucher's part the fight was over. Neither threats nor entreaties would make him go, except at heel. Night was approaching, and I had not once sighted the wolf. It seemed marvelous that he could proceed so fast, dragging himself by the fore legs alone. I had for some time been looking for a place to camp. A giant hemlock that had been blown over down the steep side hill, and resting on the roots for some distance, leaving an open space between it and the ground into which the snow had not penetrated, was just the place. With my hatchet I soon made a bed of boughs, then a thick screen was set up of the same on each side, the tops resting against the body of the tree, against which, with a snow-shoe, I piled the snow. The thick, dry bark and limbs of the same tree afforded plenty of good fuel, and with my tinder-box I soon had a roaring fire, where I broiled my pork spitted on the steel ramrod. After a hearty supper and a pipe I turned into my fragrant couch, where, with hound to feet, and well wrapped in blankets, I slept the sweet sleep of a weary hunter. Daylight found me astir, and after a hearty meal, which emptied the commissary department, I took up the trail. It was noon ere I reached the lair of the wolf—a shallow cave near the summit of the mountain, where he lay cowardly subdued, casting his eyes furtively around, but never once looking me in the eye. Another charge of BB, this time in the head, and I soon had his shaggy coat off over his muzzle. Ascending a tall spruce, I got the bearings to a shingle camp, which I reached ere sunset, and met with hearty welcome, tarrying over night and returning home next day. On stretching the pelt it proved much larger than any I had previously captured, besides being the last wolf ever seen in that section.

C. L. WHITMAN.

DRIED EGGS.—A new industry, that of drying eggs, which is represented in this country, has been set on foot at Passau, on the Danube, and the Prussian military authorities are about to give the product a fair trial for soldiers' rations. The London *News* says several German chemists, and Prof. Pettenkofer in particular, are very sanguine as to the success of the experiment, and they pronounce dried eggs to have lost none of their valuable properties by the gradual evaporation of the water contained by them in their original state.

—Southern California is subject to terrific sand storms, the sand being lifted in such masses as to resemble fog, and so dense as to render objects invisible at only a few feet of distance. One of these storms recently visited Bakersfield, blowing up from the Mohave desert through the Tejon pass. At Wilmington, or old San Pedro, the seaport of Los Angeles, the sand can sometimes be seen piled up behind the fences like snow-drifts.

Fish Culture.

ABSTRACT OF THE REPORT OF THE COMMISSIONERS OF FISHERIES OF MARYLAND.

THE Commission which was appointed in 1874, although without reliable statistics as to the yield of their waters, have yet become satisfied that the most valuable fisheries of the State are becoming less and less productive, and are being depleted of their supplies of fish food to an alarming extent. The natural geographical advantages of Maryland are so great that no effort should be wanting to make her waters, one-fifth the whole area, yield their utmost abundance. We cannot agree, however, with the Commissioners in their statement that the "rivers of the more southern States are year by year becoming more and more depleted, and their unhappy condition, both pecuniarily and politically, renders it improbable that they will be able for many years to do anything towards the restoration of their fisheries. The spring fishes of the Chesapeake Bay, being the earliest in market, will command the most remunerative prices." Her immediate neighbor, Virginia, is doing nobly in the cause of fish preservation, and the fish business of Norfolk is scarcely exceeded by that of Baltimore itself, while Savannah is the point of shipment for the catch as far south as Key West.

The shad being the most important of the food fishes of their waters, the Commissioners paid immediate attention to their propagation, and for this purpose put themselves in communication with Prof. Baird and Seth Green. Their first efforts at procuring spawn were frustrated through the sudden and deeply-regretted death of Dr. Slack, which indeed put an end to operations for 1874. The following Spring, in order to select proper localities for operations, the Commissioners, in company with Prof. J. W. Milner, Deputy U. S. Commissioner, representing Prof. Baird, and two members of the Virginia Commission, examined the fisheries of the Potomac, and then ascended the Patuxent as far as Bristol, examining the fisheries on that river. They found Freestone Point, lying between Powell's and Neabasco Creeks, admirably adapted for shad hatching, being an excellent shad fishery, the ripe fish apparently selecting the extensive flats at this point for spawning, with a safe harbor for the hatching boxes. An arrangement having been made with Mr. Seth Green for the use of his hatching apparatus, Mr. Orin Chase, of Rochester, reported for duty on the 2d of April. Mr. Chase being provided with a complete outfit, with facilities for hatching a half million of eggs daily, was located on the Patuxent, and Mr. Alex. Kent was sent to Coppages Landing, on the Chester, similarly equipped. In the copy of the Report received by us, the appendix, which was to contain the report of Messrs. Chase and Kent, was not attached, and we are therefore in the dark as to the extent of their operations. There appears, however, to have been great mortality among the eggs, which probably was attributable to the heat of the surface of the water and the increased power of the sun. This, Mr. Ferguson thinks, might be remedied by submerging the hatching boxes, and he so suggested.

The books of the owner of one of the largest fisheries on the upper bay show that, in 1824, with a seine of 500 fathoms, his catch of shad during the season ending May 24th, amounted to 52,617 fish, whereas, in that of 1871 he took with a seine of 1,150 fathoms only 17,800. At least twenty-three fisheries above the mouth of the North East that were in operation some forty years since, have disappeared—another evidence of the marked diminution in the number of shad.

It was observed that the ripe males or milts made their appearance in advance of the ripe females, and were much more abundant early in the season. Quite frequently, towards the close of the season, numbers of ripe females were found, and after taking the eggs, were abandoned for want of milt to impregnate them. In some cases the milt from the herring was used, and also one or two lots of eggs were impregnated with the milt from the rock. After hatching, as they had no means to keep them that their development might be observed, they released these hybrids.

The herring (*Promolobus pseudo harengus*) is scarcely less important than the shad, and should receive the fostering care of the State. The fecundity of the herring is so wonderful and their numbers so immense, that it would seem only necessary to protect them so that they might reach proper spawning beds. The eggs are more adhesive than those of the shad, and more difficult to handle. Fishing with the herring net should be discontinued earlier in the season.

The striped bass or rock, (*Roccus lineatus*), both for its game and table qualities, deserves to be placed among the most important of our native food fishes. They are taken of great size in the shad and herring seines, and are called "herring rollers" by the fishermen, who make war upon them, believing that they consume a great many shad and herring; a great mistake, as even if they were worthless as food, their predatory instincts cause them to follow the schools of shad and herring, consuming only the least strong and vigorous, while the strongest are left to perpetuate their race. The Commissioners experienced great difficulty in finding ripe females, although many ripe male fish were taken. Regarding this fish the Commissioners say:—

"We deem it of the greatest importance that the time of spawning be accurately determined, and, if possible, the character of the spawning beds, etc. To enable us to procure the ova and increase this fish, we propose to select a suitable locality, procure the fish in their first abundance in February, and confine them until their eggs are developed. Although impracticable for shad, this can be accomplished at no great cost. At the Bucksport establishment the salmon are taken in the shore seines in the Spring, transferred

to a fresh water pond, and kept until ripe in the Fall, when the eggs are taken and hatched. In this way we confidently hope to be able to procure and develop many millions of rock during the coming Spring."

Successful experiments were made in hatching the white perch, and the Commissioners are satisfied that they can greatly be increased by artificial propagation.

Though of recent introduction into the waters of Maryland, the black bass has become so plentiful as to be worthy of mention among the native fishes. There are hundreds of families residing in the region drained by the upper Potomac, who are saved thousands of pounds of meat annually by the introduction of this wholesome change of diet. The Commissioners have stocked many of their rivers, and expect excellent fishing in four or five years in the streams so stocked, if the fish are protected.

They have received constant applications from all parts of the State for trout for streams and ponds fed by cold springs, so they have made preliminary arrangements, should the necessary means be placed at their disposal, to distribute from fifty to seventy thousand trout immediately. Their hatching facilities are such that they can, at little or no additional cost, turn out hundreds of thousands fry yearly, should they be enabled to procure storage ponds for the breeding trout.

A few eggs of the *Salmo indica* have been received from California and hatched by Mr. Ferguson in his library, after which they were placed in a pond in Druid Hill Park, where those remaining are doing well. The State has received 80,000 eggs of the salmon (*Salmo salar*) from the Bucksport breeding establishment, presented by Professor Baird. They were placed in charge of Mr. Kent at his hatching house at Green Spring and disposed of, but how we are not informed, as our report contains no appendix. The Commissioners are not hopeful of success with this fish, as he is an inhabitant of much colder waters. A few thousand eggs of the salmon or lake trout were procured and hatched out, and placed, some in Druid Lake and others in the small streams tributary to the Gunpowder, in Baltimore county. Forty thousand ova have been obtained from Seth Green, and are now in the hatching house in Druid Hill Park.

A large portion of the appropriation at the disposal of the Commissioners has been devoted to introducing the California salmon (*Salmo gairdneri*) to their waters, a general distribution having been made through the waters of the State, and with fine prospects of success. As the San Joaquin valley is about isothermal with the Savannah, they believe that the salmon will not suffer for want of cold water in the Potomac, Patuxent, Gunpowder, and Susquehanna. 144,000 of these valuable fish have been placed in the waters of the State. Prof. Baird having procured the services of Mr. Rudolphe Hessel to proceed to Germany to procure carps for the purpose of introducing them into America, that gentleman returned to this country with 25 fish out of 300 and more with which he started. There were placed in Druid Hill Park, three common carp (*Cyprinus carpio*) one of that variety which is without scales and so highly valued; twelve tench (*Cyprinus tinca*), and seven golden tench (*Tinca auratus*). Of these only six tench and two golden tench survive.

The well-known diamond-back terrapin comes in for notice, and it is suggested that there are hundreds of localities admirably situated in the terrapin producing regions which could be made more productive, acre for acre, than the best surrounding land, by the establishment of terrapin ponds. To construct these it is only necessary to fence off the head of an inlet, or throw fences out into the creeks by driving boards some eight feet into the mud, so as to prevent the possibility of the terrapin burrowing under them. The bottom of the pond should shelve off to a depth of six or eight feet, and the fence should enclose a portion of sand bank, extending some dozen or more feet beyond high water mark, in which the adult terrapin can deposit their eggs. During the Summer, floats should be anchored out in deep water, on which the terrapin could enjoy the sun, and there should be also a smaller pond for a nursery. The female excavates a hole in the sand above high water mark and deposits her eggs, carefully covering them. In two months they are hatched, but for some time the young terrapins show no disposition to take to the water. At this period they are very vulnerable, as they are encumbered with an umbilical sac, which presents a salient point of attack to small fishes; they should be carefully protected from these casualties, and provided with soft mud in which to bury themselves during their hibernation.

The Report goes into the subject of netting, and makes some valuable suggestions on this point. Fishways are also discussed, and the Commissioners visited the great falls of the Potomac to investigate the possibility of surmounting or overcoming that obstruction. The Report concludes with a summary, by which it appears that the Commissioners have distributed 4,340,000 young shad, in addition to the 4,975,550 liberated in the Potomac by Prof. Baird; 144,000 California salmon, 8,000 Maine salmon, 2,000 salmon trout, and 500 black bass; also, within two weeks of the date of the Report, 91,500 California salmon, and they have now in the Druid Hill Hatching House over 400,000 two months' old fish for distribution. There are also excellent suggestions for the protection and increase of the fish supply, which are worthy of the attention of the State authorities. The Commission has now been established but two years, and the amount of work completed in that time is enormous. Mr. T. B. Ferguson has been particularly energetic, and the State of Maryland is under great obligations to that gentleman, not only for the beautiful Druid Hill Park establishment, but for his services generally.

FISH CULTURE IN KENTUCKY.—To a few of her energetic citizens, among whom may be mentioned Gen. W. J. Landram, Messrs. W. H. Kinnaird, W. C. Price, John M. Duncan, Lieut. W. C. McFarland, Col. J. Henry Bruce, and Maj. G. H. McKinney, acting upon the suggestion of Hon. James B. Beck, President of the Kentucky State Sportsmen's Association, of which they are members, Kentucky is indebted for a probable large increase in her fish supply. Within a short time past there have been placed in the waters of Dix River thirty thousand California salmon, procured from the U. S. Fish Commission at no expense beyond that of transportation. This was the result of a correspondence with Prof. James W. Milner, who is now stationed at Northville, Mich. It is said that three hundred thousand salmon have been put into the tributaries of the Mississippi during the past three weeks.

Natural History.

[This Department is now under the charge of a competent Naturalist, Indorsed by the Smithsonian Institution, and will henceforth be made a special feature of this paper. All communications, notes, queries, remarks, and seasonal observations will receive careful attention.]

THE RATTLESNAKE.

THE Rattlesnake, though repulsive to most persons, is interesting to the naturalist. It may be considered as truly belonging to North America, as it is found in almost every part of this continent, but more are found in the Southern States than in the Northern States. Texas has a large number of poisonous reptiles, and that section of low, barren country lying between the Rio Grande and Neeces Rivers, during the summer months, literally swarms with such as the rattlesnake, moccasin, centipede, tarantula, scorpion, and alligator. The rattlesnake is the most sluggish of the snake family. It never strikes, unless in self-defense, excepting just before and after its winter sleep. The chief danger then lies in accidentally treading on it, which a person may do in walking where it abounds. To strike it must be in close coil, with its head erect. They often strike several times in quick succession, as may be frequently seen by the marks of their hooked fangs upon the legs of white pantaloons. It is capable of springing only a little more than half its length, unless lying on an inclined plane, when it can then, by supporting itself entirely upon its tail, spring much farther. The remembrance of the first rattlesnake ever encountered by the writer has left a vivid impression. It lay in the middle of a well-traveled road, which ran over a steep hill. The saddle horse was secured at a safe distance, and with a slender pole of considerable length its capacity for springing was tested. This specimen contained fourteen rattles, was nearly three feet long, and was as large around its body as the wrist of a large man. When teased its rattles were set rapidly in motion. Its glossy skin indicated that it had just emerged from its dormant state. A few touches with the rod caused it to spring about three times its length down the hillside, while on a level it could spring but little more than half its length. After making the necessary observations its life was sacrificed and possession gained of its fangs and rattles. The rattlesnake is said to possess a strong odor when irritated.

There are several kinds of rattlesnakes described; but two have come under the observation of the writer—one the inhabitant of the mountain region, and the other of the prairie, the difference being chiefly in vividness of coloring of the mountain variety. The snake of the plains carries the rattles parallel with the ground when crawling, which is not the case with the other. It has been asserted that the rattlesnake is never found at an elevation higher than 6,000 feet above the level of the sea, but recent explorers have found this statement incorrect. A gentleman connected with an exploring party has recently written that he has killed rattlesnakes at an elevation of 8,000 feet.

The common Eastern rattlesnake and its rattles have so often been described, that it is unnecessary to repeat the description here. Persons having the curiosity to refresh their memory can do so by referring to any standard work on Natural History, such, for instance, as Baird and Girard's Catalogue of Reptiles, published by the Smithsonian Institution. The end of the tail in poisonous reptiles always terminates bluntly, while in the case of those that are not poisonous, the tail tapers gradually to a slender point. The prevailing opinion is, that the first joint of the rattle, or the "button," requires two years for its maturity; it is also believed that a rattle is formed for each succeeding year—that is, a snake having fourteen rattles is sixteen years old.

Hogs which roam at large in Texas destroy many snakes, which they attack with savage ferocity. They are sometimes bitten, but the thick layer of adipose tissue which protects the circulation in the hog, prevents the bite proving fatal. It may be that the fat neutralizes the effect of the poison. The writer once during the late war lay concealed in the underbrush near the enemy, when not far from him he heard distinctly the sound of a snake's rattle. Imagine his nervous impression and the relief experienced when he saw a wild porker advance, with bristles erect and eyes flashing fire, and quickly dispatch the reptile. This scene only required a few seconds for its enactment. The writer was compelled to lay quietly, for if his position had been known, the sharp crack of the enemy's rifle would have settled the question. It has been asserted that serpents do not travel at night, but this statement does not accord with the writer's experience; for he has frequently seen them gliding through the grass when riding by moonlight. The venom of the rattlesnake is also deadly to the brute creation. Cattle, when feeding, are often bitten in the jaws, and death is inevitable, though the poison does not appear to be disseminated as speedily as in the human subject. Various remedies are suggested for the bite of poisonous snakes, some of which are to be relied on, if the poison is not communicated directly to the circulation; but in this case all remedies prove unavailing. The unprofessional apply directly to the wound mud or a freshly killed chicken, split open through the back and its warm flesh applied to the wound. The latter is certainly effective, for in more than one instance in a few minutes I have seen the flesh of the chicken turn green and putrid where it had come in contact with the virus from the snake. The remedy which is most certain in its relief is whisky or brandy, used in large quantities immediately. It is estimated that, to counteract the effect of a severe bite, it requires at least one quart of Bourbon whisky, and that nothing short of intoxication will insure immunity. Drunkenness is never exhibited until the poison is counteracted, and when this condition is manifest the patient is considered safe. The use of sweet oil is deservedly popular in the treatment of a snake bite, but it must be taken in doses of several ounces. Its action is mysterious, and cannot well be explained, yet according to practical experience there is not much difference between the potency of the whisky and the oil, though to one not afflicted the whisky would be preferred. Sportsmen, in camping, are accustomed, after pitching their tents, to stretch around it a hair lariat. If a snake should attempt to cross a hair rope, it will instantly retreat. The short hairs on the rope, which are always abundant, impart a disagreeable sensation, which causes the snake to retreat.—JAMES W. BAILEY, M. D.

Albany, N. Y.

RED-LEGGED PARTRIDGES.—A correspondent, an officer of the U. S. Navy, now with his ship at Port Royal, writes us that he has on board two pairs of red-legged African partridges, two cocks and two hens, and wishes to know of some gentleman in that vicinity who would be likely to take proper care of them, with a view to breeding them. We have referred him to Mr. Hallock, who is now at Port Royal, the guest of Mr. C. G. Kendall, an ardent sportsman, who would doubtless gladly undertake the task of propagating these rare birds. From our correspondent's description we are unable to learn whether these birds are the common red-legged partridge (*Caccabus rufus*) of Europe, a strong bird distinguished by a black bar over the forehead, behind the eye and around the breast, and which, since its introduction into England from this continent, has almost driven away the original breed in places, or the francolin of Asia. Baker alludes repeatedly to the francolin in his Abyssinian travels, and Wood mentions another, the Sanguine francolin, (*Ithaginis cruentus*), which inhabits the Himalayan range, and is thought to be peculiar to that region.

A VORACIOUS FISH.—Within a month I caught a small pike (*Esox reticulatus*) which seemed unusually corpulent; so I dissected him, and found that he had swallowed a large mud-minnow (*Melanura limi*). This minnow I opened, and found that it had within it a pike about two inches long, and within the pike was a still recognizable minnow of the species above mentioned. To find a pike with one of its own species in its stomach is a common occurrence, but to match this "four-in-one" instance, I think will be found a difficult thing to do. This mud-minnow is a very ravenous fish, and consumes an incredible number of newly hatched fishes. I have found that it is a common habit of the species to haunt the spawning beds of many species and gobble up the fry as it makes its appearance, and it has learned or rather knows from inherited experience, that the fry of some fishes are not palatable and so seeks the ova. This is particularly the case with the catfish, and it will follow the female fish and devour the eggs in spite of all the efforts of the latter to drive the minnow away. This curious fish is specifically the same as the umbra, of Europe, according to Dr. Gunther; but the habits of the two species differ considerably, so far as I can determine.—CHAS. C. ABBOTT, M. D.

RED FOXES VERSUS GRAY FOXES.

EDITOR FOREST AND STREAM:—

ELIZABETHTOWN, Ky., January 17th, 1876.

Your doubt in regard to the popular theory that red foxes drive out the gray, attracted my attention a short time ago. I have always held that it was a fact, but being rather uncertain as to whether my conclusion was founded on experience or popular theory, I have consulted some old fox hunters, and will give you the benefit of their ideas. One tells me that thirty years ago, when he commenced hunting foxes, he never saw a red fox in this country, while the gray fox was in great abundance; but after the red commenced coming in, the gray disappeared in the same proportion as the red increased. Now-a-days to bag a gray is an exception to the rule, the catch being wholly red. This has been the experience of all the hunters I have questioned, and my own experience is that the gray have almost disappeared since I can remember. I have had both kinds as pets, and they lived amicably together; but the same can be said of dogs and pet coons which I have seen play together, as well as pet rabbits and cats. There must be some reason for the exodus of the gray fox from this country, and the most tangible one is, that the influx of the red fox has had the same effect upon the gray, as that of the Norway rat had upon the native rat. There being an incompatibility, the weak gray had to give way to the red fox, which is the largest and strongest, as well as the fleetest of the two. I know it to be a fact that they never have their dens in the same place, and it is rare that a gray and a red fox are started in the same woods. They will not in a tame state breed across, as was demonstrated to me by my own pets, and I never saw a cross in a wild state. Their habits are somewhat different, the gray being the hardest to tame, but much inferior in cunning, when wild, to the red. Boys frequently catch the grays in snares set for rabbits. I have, however, yet to hear of a red fox being trapped in that manner.

NICASIO, Marin Co., Cal., Jan. 6th, 1876.

EDITOR FOREST AND STREAM:—

It may be of interest to your readers to know how many birds I have noticed during the past season, which have built their nests and reared their young in a live oak tree which stands in the centre of a corral, where thirty cows are milked daily under its shade. About half-way up the trunk of the tree is a small hollow extending into the heart of the tree, which a Bewick's wren (*Thryothorus bewickii*) has chosen for her home and laid her five little eggs, which are white, with fine brown specks. When the young birds had taken their flight, a yellow-bellied flycatcher (*Empidonax flaviventris*, var. *difficilis*) chose to build her nest in the same hollow. Her eggs are there in number, and are creamy white, with reddish brown and purplish markings at the larger end. A little to the right of this hollow, in the overhanging branches, a California house finch (*Carpodacus frontalis*) has made her nest and deposited her five eggs, which are pale blue, with dark brown spots. In another part of the tree, about twenty feet from the ground, is the nest of the brown towhee (*Pipilo fuscus*) containing three eggs, which are robin blue, and are spotted with shades of purple. A little to one side of this is an old dead limb, in the hollow of which the Parkman's wren (*Troglodytes Eden* var. *Parkmanni*) has taken up her abode and built her nest. She also laid five eggs, which are pinkish white, thickly spotted all over with pink specks. Then, on an old dead stump of a limb, a turtle dove (*Zenaidura macroura*) has put a few sticks together and called it a nest, and laid two white eggs; and last, but not least, a buff Cochon hen goes regularly every morning and lays her egg on one of the limbs, but they fall to the ground, and, strange to say, often escape unbroken. After a box had been placed for her she continued to lay and hatch her chickens. This wonderful tree stands on the ranch of the Estey Brothers. If any of the readers of FOREST AND STREAM can give a description of a more prolific tree, I should be happy to hear of it.

MRS. CHAS. A. ALLEN.

Yachting and Boating.

All communications from Secretaries and friends should be mailed no later than Monday in each week.

HIGH WATER, FOR THE WEEK.

NEW YORK YACHT CLUB.—The election of officers of the New York Yacht Club takes place to-day. There are two tickets in the field—one headed by the name of Mr. W. T. Garner, present Vice Commodore, with Mr. C. A. Minton for secretary, and the other advocating Mr. G. A. Kingsland, present Commodore, for another term, and Mr. W. B. Bend for secretary. The contest promises to be a close one.

BOSTON YACHT CLUB.—A regular meeting of this organization was held on Wednesday of last week at the Parker House, Commodore Benjamin Dean in the chair, and Thos. Dean, secretary. There were thirty members present, representing the yachts Alice, Contest, Eva, Edith, Elaine, Fannie, Ivy, Kelpie, Maud, Queen Mab, Sunbeam, Tempest, Una, Volante, Violet, Wraith, and Wanderer.

The subject of the proposed amendments to the constitution being in order, changes were made which provide for the annual election of two measurers instead of one, the province of one to be south of Cape Cod.

The time for the annual meeting for the election of officers was changed from the last Wednesday in April to the last Wednesday in January.

A circular from Captain Henry W. Hunt, Special Commissioner of the United States Commission, concerning yacht representation at the Centennial Exhibition was read, and the subject was referred to individual members of the club, with authority to act as members of said club.

The committee on the annual dinner reported that they considered it expedient to indulge in such a re-union, and it was voted to have a dinner, the arrangements and time being referred to the committee in charge.

Several of the yacht clubs are moving in the matter of securing a representation of the marine interests of Massachusetts at the Centennial Exhibition. The Eastern, Beverly, and East Boston Clubs have already held meeting, and appointed committees, and the Boston, Haverhill, and Bunker Hill, and South Boston Clubs will probably follow suit. A large variety of models have already been received by Capt. Henry W. Hunt, the agent of this department for Massachusetts; and they are of all kinds and descriptions. The response to the request for specimens for the grand fleet of models exceeds anticipation.

—Mr. R. L. Ogden, of San Francisco, has just launched a new steam yacht, which is being fitted up for his use about the Bay of San Francisco, where there is a great and varied scope of wide water and river navigation of very varied and interesting character, embracing many good starting points.

STEAM LAUNCHES.—A correspondent writes us from Louisville, Ky., regarding the practicability of having a steam launch not over 16 on 17 feet in length, and about three feet, drawing but little water, and with boiler and engine on such a scale as to permit of the whole craft being lifted bodily over a dam. Does any of our readers know of such a craft? Who can build one, and the expense? Why have the small Ericsson coloric engines never been adapted to steam launches? They do away with the boiler and water contained therein, which constitute the greatest portion of the weight. A light steam launch suitable for our inland waters could be sold by the thousand.

THE HARVARD AND YALE RACE.—The race between eight-oared crews of these colleges, for which Harvard was challenged by Yale, will be rowed on the Connecticut River, opposite Springfield, on Friday, the 30th of June next—at least Capt. Otis, of the Harvard crew, who has been examining the course at this place and at New London, has decided to report favorably as regards the former place. The course chosen is the one used by the Ward brothers and the St. John crew in their famous contests, and by Scharff and the late champion, George Brown, of Halifax, in their five-mile, single-scutt contests, and which they all praised so highly. It begins directly opposite the city and extends down the river for four or five miles.

It is said that the Springfield Club and the Rod and Gun Club will both interest themselves to furnish whatever assistance and courtesies in the way of providing accommodation, a steamer to follow the crews, etc., such as the college boys may desire.

INTERNATIONAL ROWING.—A meeting of the Oxford University boatmen was to have been held yesterday for the purpose of considering the New York Association's challenge. Cambridge will also answer next week. There is little prospect of either of the universities accepting. The *Evening Standard* says that Oxford may send a crew to contest in the Philadelphia regatta. The regular annual university boat race between the Cambridge and Oxford crews, has been fixed for Saturday, the 8th of April. The course will be the usual one from Putney to Mortlake, or vice versa, a distance of four and a quarter miles, and will take place at about the turn of the tide from high water.

—Lee Belk, recently murdered in Mississippi, had some queer adventures during his life. Once at a show in Austin, Texas, he was beset by roughs with revolvers and Bowie knives, and took refuge in the lion's cage seeking safety there, which he knew he could not find outside. He rode in the lion's cage seventeen miles, and the noble brute—nobler than the human brutes who pursued—treated him with kind indifference. It is doubtless the only instance on record wherein mortal sought and obtained safety from his infuriate fellows by taking refuge in a lion's den.

Sea and River Fishing.

FISH IN SEASON IN JANUARY.

SOUTHERN WATERS.

Pompano, *Trachynotus carolinus*. Grouper, *Epinephelus nigritus*, Drum (two species), Family *Sciaenidae*. Trout (black bass), *Centropomus niger*. Kingfish, *Menticirrhus nebulosus*. Striped Bass or Rockfish, *Roccus taylori*. Sea Bass, *Sciaenops ocellatus*. Tailorfish, *Pomatomus saltatrix*. Sheephead, *Archosargus probatocephalus*. Black bass, *Micropterus salmoides*; Snapper, *Lutjanus caesus*. *M. nigricans*.

[Under the head of "Game and Fish in Season" we can only specify in general terms the several varieties, because the laws of States vary so much that were we to attempt to particularize we could do no less than publish those entire sections that relate to the kinds of game in question. This would require a great amount of our space. In designating game we are guided by the laws of nature, upon which all legislation is founded, and our readers would do well to provide themselves with the laws of their respective States for constant reference. Otherwise, our attempts to assist them will only create confusion.]

FISH IN MARKET.—The continued mild weather is favorable for fishermen, and a plentiful supply continues to ornament the market slabs. Indeed, we notice that cod fishing excursions to Sandy Hook are advertised. We quote:—Striped bass, 3 to 8 pounds, 25 cents; Smelts, 15 cents; bluefish, 3 to 8 pounds, 15 cents; salmon, frozen, 50 cents; mackerel, large, 20 cents; small, 12½ cents; South Carolina shad, 60 cents; white perch, 18 cents; Spanish mackerel, 50 cents; green turtle, 23 cents; terrapin, per dozen, \$15; frost fish, 8 cents; halibut, 20 cents; haddock, 8 cents; codfish, 10 cents; blackfish, 15 cents; herring, 8 cents; flounders, 15 cents; eels, 18 cents; lobsters, per lb, 10 cents; sheephead, 25 cents; scollops, per gallon, \$1; soft clams, per 100, 30 to 60 cents; whitefish, 18 cents; pickerel, 18 cents; salmon trout, 20 cents; black bass, 18 cents; ciscoes, 12 cents; smoked haddock, 15 cents; smoked salmon, 22 cents; smoked mackerel, 8 cents; hard crabs, per 100, \$4; soft crabs, per dozen, 75 cents; pompano, \$1 per pound.

—Among a lot of very fine pompano received from Pensacola by Mr. Blackford, of Fulton Market, were about fifteen fish that resembled the pompano so closely that, to the unpracticed eye, there was no difference. Color, same, shape, same, except being considerably broader; taste and flavor the same; dorsal fin and anal fin very much larger than in the pompano. Specimens have been sent to Prof. Baird at the Smithsonian Institution.

CORRECTION.—In the excellent article of our correspondent "Archer," on Fish and Fishing in the Great Lakes, in last week's issue, the types made him say that off the Fox Islands nets are set in fourteen feet of water, whereas it should have been *fourteen hundred feet*.

A FISHING OUTFIT.—We had the pleasure of inspecting, on Monday last, at the store of Messrs. Conroy, Blissett & Malleson on Fulton street, an outfit of fishing tackle prepared for his Majesty, the King of Siam. A handsome silver mounted case contains everything necessary for sea and inland fishing; an elegant bass rod with reel, linen line, floats, leaders, and everything requisite for catching the red-fish found on the coast, and also a lighter outfit, comprising fly-rod, reel, waterproof line, fly book, etc., for interior fishing. We are rather ignorant as to the fish supply of Siam, and also as to the capabilities of P. B. S. P. B. M. Chulalongkorn in casting the fly, but it is certain that Messrs. Conroy, Blissett & Malleson are sending him an outfit "fit for a prince."

—A mascalonge weighing 18½ pounds, and measuring 42 inches in length was taken through the ice on Saratoga Lake last week.

—A brook trout twenty-five inches in length, and weighing four pounds and twelve ounces is reported as having been recently caught through the ice, with a hook and line, in one of the brooks in the vicinity of Binghamton, N. Y.

—A Correspondent writes from West Meriden regarding trout fishing in that portion of Connecticut, as follows:—

"Our trouting is on a par with our bird hunting. Streams that once knew trout, know them no more. The speckled beauties have departed; villainous midnight prowlers with nets have swept them away, and when we hear a man talk of going after trout, we know he is going out of the State, to the Adirondacks perhaps, the Mecca of many a Meriden tourist, since the days when their Prophet, Rev. W. H. H. Murray, preached here. VON G.

NEW TROUT.—A lake a mile and a half long by a mile wide is said to have been discovered in Idaho which is so densely inhabited by trout that they appear along the shores in immense numbers. It would be interesting to know what they feed upon. At the same time we learn that Mr. J. M. Hutchings, of Yosemite, has discovered in the headwaters of Kern River, 10,500 feet above the sea, a new and beautiful fish, which he named the "golden trout." Its color was like that of the gold-fish, but richer, and dotted with black spots a quarter of an inch in diameter, and with a black band along its sides.

FISHING IN THE DELAWARE.—A bill has been introduced into the New Jersey Legislature making it lawful to fish in the Delaware from the 1st of April until the 20th of June each year (Sunday excepted) at any point between the mouth of the Penn Shawkin Creek and the City of Trenton.

MOVEMENTS OF THE FISHING FLEET.—During the past week there have been 20 arrivals from the Banks, and 4 with frozen herring. Total receipts of codfish, 415,000 pounds; halibut, 240,000 pounds. Sales of the latter at 7 and 3½ cents per pound. The Georges fleet will soon be underway, which will give employment to a large number of fishermen.—*Cape Ann Advertiser*, January 28th.

CASTING THE FLY.—Mr. Geo. Dawson, whose letters on Salmon Fishing on the Cascapedia, published in the *Albany Evening Journal*, have been read with such interest, claims that in trout as well as salmon fishing success is always

with the angler who makes the longest cast, owing to the fish when alarmed at the glint of a paddle or the shadow of a rod changing their positions to perhaps fifty, eighty, or a hundred feet from where you are anchored. He says:—

"But some never acquire this art. Most novices start out with the idea that it simply requires the exercise of great muscular exertion to get out a long line. They lift their eight or ten ounce trout rod as if they were lifting a sledge-hammer, and push it out with as much force as they would use to render the blow of a beetle effective. But no long cast was ever secured in that way. A quick but gentle movement, requiring scarcely more muscular exertion than the natural swing of the arm, is all that is necessary—taking care, however, that the line extends its full length backward before you force it to its forward movement. This is the simple single rule, by adhering to which, after reasonable practice, any one may make as long casts as are ever profitable. The same rule holds good in winding the heavy double-handed salmon rod except that its greater weight requires greater exertion. But even here length of line follows regularity of movement rather than muscular force; and yet without springy and well-balanced rods neither skill nor muscle will be of any avail. It is easier for me to cast eighty feet with one of my salmon rods than fifty with another. In this one, every fibre, from tip to reel, seems instinct with life, while the other is as rigid and irresponsible as a hoop-pole. But, given a good rod and ordinarily skilful manipulation, no angler is excusable who cannot easily cast his trout line sixty and his salmon line ninety feet, where there are no obstructions within the radius of the cast.

THE GRAYLING IN ENGLAND.—The *London Sporting Gazette* says that this delicate fish (which is as common in Norway and Sweden as gudgeon and minnows are in other waters) does not flourish in England in such prodigious quantities as it might, probably owing to the scarcity of waters suitable to its peculiar tastes. It describes its habits and preferences as follows:—

"It is the veritable fine dandy of British fishes, and is as fastidious as possible about its food and its habitation. Clear, rapid water running over a bright gravelly bed, and an epicurean diet of dainty flies, are its delights, and it generally behaves itself in an orderly and becoming manner, never eating up anybody else's children, nor indulging in the rude pastimes of other fishes. On one occasion, however, the grayling leaves its gentlemanly nature, and becomes as unrestrained as the ill-bred perch or pike. This is when its eye catches sight of that mysterious bait known as the 'grasshopper,' so called in spite of its resembling that lively insect as little as it does a potato. The 'grasshopper' is an artificial bait of green and white wool or worsted, worked round a medium-sized fly-hook, and resembles, as nearly as anything, a bloated caterpillar. What it is intended to represent no one seems to know, notwithstanding that various conjectures have been made. I don't know what the fish may think, but if I were one of the finny persuasion I should certainly take it for a fat caterpillar, and act on that impression. Anyhow, whatever it is meant to be, or is taken for, one thing is certain, and that is that no grayling, with an infinitesimal amount of appetite remaining, can resist its allurements. Worked on the system of 'sinking and drawing,' it is most deadly, the baskets made by its means being simply huge. On one grayling river its destructiveness was so great that the bait was prohibited except on stated occasions, which were only instituted as a species of angler's gala day, and not from any remorse on the part of the proprietor, whose wisdom in instituting the prohibitory measure he did I cannot too highly commend. The 'grasshopper' is now in full swing on the Teme, whose fortunate anglers seem to be rejoicing at the captures made, but the best I can wish them is that they may not in a few years' time stand on the banks, as did Lord Ullin, and find their jubilee

"'Chang'd to wailing.'"

Good sport is one thing, wholesale slaughter is another. 'Sinking and drawing' with the 'grasshopper' is wholesale slaughter."

The Kennel.

MR. SALTUS' DASH AND BESS.—We present in this issue a highly meritorious engraving of Mr. Saltus' famed red Irish setters Dash and Bess. This picture is engraved from an oil painting by Mr. A. H. Thayer, of Brooklyn, and the likenesses, especially of Bess, are very striking and lifelike. These dogs were exhibited for the first time at the Watertown Bench Show last year, and each took the first prize in their class.

Bess was imported by Mr. Saltus in 1875, and was very finely bred, being by Hallian's Pat. Her dam by Hutchinson's famous Bob. She was in color a dark clear red, with a fine flat coat and blood-like shape. She had an excellent nose, and had had, before leaving England, "a cart load of game killed over her." Poor Bess died from premature delivery of a litter by her picture companion.

Dash, the dog on the right of our picture, is one of the best and most useful setters in this part of the country. He comes of a famous strain of red setters, and his pedigree will be read with interest by the many warm friends and admirers of that stock of dogs. He was sired by Gubner's, afterwards Bob Robinson's Jack, a superior dark red dog, and a valuable sire; he by Putnam's Dan, who was one of the handiest and best dogs in America—a brother to Rodman's Dash, both being sired by Paul Meade's old Dash. Jack's dam was Belle, imported from Major Hutchings' Irish stock. The dam of Saltus' Dash was his Frisk, a fine fielder, sired by Louis Schwartz's Irish dog, also of the Paul Meade stock. It is no exaggeration to say that the excellence of this last named stock of dogs was the origin of the great repute accredited to red setters in this country.

Dash, as shown in his portrait, is handsomely formed, stoutly built, and is of a rare dark red. He is as agile and supple as a cat, and for staying powers has never been beaten. He is very superior on quail and snipe, and a reliable and most delicate retriever.

It is as a sire that Dash proves the great excellence of his breeding, and his get are most highly prized by their owners. His whelps out of Dr. Strachan's Belle are in possession of Messrs. Sewell, Staples, Van Vechten, Strachan, Vanderhoff, and Shipman. He was twice bred to Raymond's Djype, and the strains "nicked" happily. Some of the product are owned by Messrs. Foote and Whitney, of Morristown, Waldo, of New York, and Capt. Taylor, of Virginia. From Bess Mr. Saltus has had a fine litter, some of which are held by Judge Pratt, of Brooklyn, Dr. Crane, of Newark, N. J., and Mr. James, of New Hampshire.

Mr. Tilly's Flirt, sister to Romp and Rake, is in whelp to Dash, as is also Mr. Saltus' imported Irish bitch Lill III., she by Shamrock, lately sold to the King of Italy, and her dam was Kathleen, by Barton's Larry, out of Lill II. by Cooper's Ranger. She is a first-class prize winner.

Dash is just in his prime, four years old, and may he live long and go down famous to a famed posterity.

THE CENTENNIAL.—We are requested by Mr. Burnet Landreth, Chief of the Bureau of Agriculture, to advise our readers that he will attend the Bench Show of dogs, to be held at Newark on the 26th February next, for the purpose of conferring with sportsmen as to the exhibition of dogs to be held in connection with the Centennial. In the mean time, as there are many sportsmen at a distance who will be unable to be present at Newark, we gladly place out columns at their disposal for a discussion of this matter, believing that by this means we shall learn the general sentiment of sportsmen as to how this great event should be conducted. One leading importer and breeder suggests a Field Trial, and afterwards a Bench Show, including as a distinct feature one of the stud dogs and brood bitches in which a pedigree of at least five generations shall be required, and in which performances and progeny shall be considered, and progeny shown, as well as other records, if they have any. This will let in all classes, "blue," and "red" blood, foreign and domestic. It would not be a bad idea to have some of the judges appointed from abroad. We think, in spite of the views of some of our well-known kennel critics, that the visitors would admit that we had some good dogs as well as horses native to this country.

—Mr. J. J. Snellenburg, of New Brighton, has an orange and white pup out of Brook's Bismarck; dam, H. Hess' Gildersleeve; bitch, Flora, which, for his age, (nine months on January 22d), is an uncommonly large dog, being 26½ inches at shoulder, 30 inches around chest, and 46 inches from tip of nose to root of tail; his head is 9½ inches in length, and he weighs 68 pounds.

COCKERS.—Mr. S. J. Bestor's, of Hartford, Conn., imported cocker spaniel bitch Juliette has a fine litter of eight whelps, sired by Hon. F. W. Russell's imported Snip. This, we believe, is the fourth litter Juliette has presented her owner since her importation in 1873, and we are informed that Mr. Bestor finds ready purchasers for the whelps from his sportsmen friends.

STILL ANOTHER.—The Rhode Island Poultry Society will hold a Bench Show of dogs on February 11th and 12th in Howard Hall, Providence, the entries being confined to pointers and setters, and also to dogs owned in the State. This show is held at the suggestion of the Rhode Island State Association for the Protection of Fish and Game, and is only a prelude to what may be done another year.

—The fine Irish bitch Bess, by Ajax's Dash, out of Dr. Strachan's Belle, winner of first prize at Watertown, and owned by T. A. Diffenderffer of Lancaster, Pa., has visited Plunket. As Bess has a reputation as a field performer, second to none in that vicinity, the produce should be first-class.

—Mr. Jesse Sherwood, of Edina, Mo., has lost his fine setter Jack, from the effects of poison. Jack was well known throughout that section of the country as a fine field performer. He unfortunately got hold of some poison put out for sheep-killing dogs, and paid the penalty of another's sins.

DISTEMPER IN DOGS.

JACKSON, Mich., January 24th, 1876.

EDITOR FOREST AND STREAM:—

I have bred, raised, and broken dogs for the past sixteen years, and I will tell you how I have treated distemper for the past twelve years with almost miraculous success, never having lost but one case, and that when the animal had small-pox as well. When I see the first symptoms of the approaching disease, I give a mild physic, such as olive oil, from one to four ounces, according to the size and strength of the patient. In a great many cases this, with a good comfortable kennel, and light but nourishing food, will be sufficient; the food being a porridge of oat meal and plenty of good rich milk. After a lapse of two days, if you see no improvement in the condition of your patient, clip the hair off close from within a quarter of an inch of the end of the animal's nose to well up between the eyes. Then take a porous plaster and after having cut it to fit the spot, from which you have removed the hair, put on a thick coating of shoemaker's wax as the preparation on the face of the plaster will not stick where there is a particle of hair. Put this plaster on as hot as the animal can bear it. After it has been on for a day or two pick the holes clear with an awl, or any other small pointed instrument; if this does not do its work in, say two or three days, then I give from four to twelve grains arsenic, according to the size of the dog. Ten or twelve hours after having given the arsenic, give physic as above. You need not be afraid of giving too much, as I think it would be impossible to kill a dog with this poison, as it acts directly on the disease. Any one observing its action will notice that if the discharge of mucous from the nose and eyes be yellow, or even black, before the arsenic is administered, it will become white in from ten to twelve hours after the arsenic is given.

CANINE.

[We would advise caution in the use of arsenic, as we have in mind a case wherein this poison was recommended by a contemporary, and we believe the bill for the value of that dog still remains unsettled.—ED.]

THE GREAT CHICAGO BENCH SHOW.

THE greatest Bench Show ever held in this country is a thing of the past. The three hundred dogs are scattered again to their various kennels, exhibitors, satisfied and disappointed, are once more at their homes, and the great Exposition building no longer resounds with bark and yelp. The portion of the building assigned to the dogs was the art gallery, arranged with small stalls for each dog with beds of sawdust and hay, and with railings to keep visitors at a respectful distance. The feature of the exhibition, as far as the prizes were concerned, was the magnificent cup presented by this paper, and manufactured for us by the Meriden Britannia Company. This was offered for the best display of sporting dogs or bitches of any one breed and variety by one exhibitor. The judges appointed to award the cup, Messrs. P. H. Bryson, of Memphis, John Davidson of Monroe, Mich., E. Sterling, St. Louis, E. O. Greenwood, of Cincinnati, and M. Copeland, of Boston, decided that it was impossible to determine between the excellent families exhibited, and the cup would therefore have reverted to the association, but after a consultation between the judges and exhibitors it was decided to present the cup to Mr. J. H. Whitman, not only on account of the excellence of his family of Irish water spaniels, but also for his untiring exertions in making the show a success.

On Tuesday morning of the 24th January we reached the building appropriated for the Bench Show. Before we left home we felt convinced that the enterprising citizens of Chicago who had the matter in hand were capable of carrying out anything they would undertake, and then, too, we are well acquainted with Mr. J. H. Whitman, a skillful energetic field sportsman and breeder of fine dogs, with whom we had about two weeks' grouse, duck, and snipe shooting last autumn in Wisconsin, and who had worked faithfully for many weeks in behalf of this Bench Show. We went there especially to see a great show, but our anticipations were by no means equal to the reality, as it was far ahead of anything of the kind ever gotten up in this country. We found upon our arrival two hundred entries had been made, and during the day about one hundred more fine dogs were added to the catalogue. And what astonished us mostly was the vast array of stylish thoroughbred looking dogs, and so very few which could be called indifferent. Nearly every dog on exhibition showed evidence of careful breeding, and we were agreeably disappointed in finding such a splendid array of imported setters, having within the past year or two met with so many inferior dogs sent out from England and Ireland. But, when we came to look over those entered by Mr. Luther Adams, of Boston, Mr. C. H. Raymond, of N. J., Mr. Turner, of St. Louis, Mr. Smith, of Strathroy, Canada, Mr. Knox, of Pittsburg, Mr. Burges, of Kentucky, and many others, we found a large number of full sized, well-formed stylish dogs; yet, in our opinion, there was a very large number of American bred setters on exhibition quite equal in all respects to their illustrious contemporaries from abroad.

In regard to pointers, let us say that before we saw those on exhibition at the great show we began to feel that they were depreciating in this country. Many years ago, when we did most of our shooting in central and northern New Jersey, and Pennsylvania, we did much shooting over pointers, having at that time a strain of full sized, rugged, well-formed handsome dogs. But when game became scarce in those localities we were obliged, in order to find game, to go to other sections of the country, and since then we have done much shooting in Delaware, Maryland, and in the southern parts of New Jersey where the cat-brier, and other rough cover abounds, such as no pointer will continue to face day after day; consequently we were obliged to give up pointers, and make the breeding of setters a specialty. And then, too, we found that setters were taking the place of pointers in nearly all sections of the country, and consequently, of late years, the old-fashioned, serviceable, stylish pointers are rarely met with. But in this exhibition quite a number of extra fine pointers, both of the large and small classes were entered, and those entered by Mr. S. B. Dilley, of Lake City, Minn., and many others were quite equal to any we have seen. Among the entries of small pointers, under 50 pounds in weight, was Lilly, a very beautiful specimen from the kennel of W. A. Wheatly, Esq., of Memphis, Tenn., illustrated in our paper a few weeks since, which we think was worthy of the first premium of her class, but all judges cannot see alike, and said bitch took third premium. There was, however, an array of extra fine pointer bitches from other sections of the country. Besides acting as one of the judges of the classes of large and small pointers, we also acted as one of the judges of Russian setters, and five or six specimens were on exhibition, but our experience with this strain of setters has been limited, never having met with but three or four, and shot over but one, and that one was no better than the usual run of American, English, or Irish setters; yet if we intended to shoot in a section of the country where grizzly bears and panthers abound we would secure a Russian setter, as their appearance indicates their ability to whip their weight in wild-cats.

For some unaccountable reason the documents forwarded us from Chicago containing the list of entries, awards, etc., have not come to hand, although up to Monday the latter had not all been reported. We shall give in our next what is omitted in this. The prizes awarded, as far as received, are as follows, a portion of the report of

which we copy from our contemporary, the Chicago Field:—

CLASS 1.—Imported English setters, or their progeny, over 1 year old. For best dog. Premium Cup. Value, \$35. Offered by L. H. Smith, Strathroy, Canada. Second best cup, \$25; Third best, \$10. For best bitch. Premium Cup. Value, \$35. Offered by proprietors Tremont House, corner Lake and Dearborn streets. Second best cup, \$25; Third best, \$10.

Judges.—Messrs. E. F. Stoddard, John Davidson, and C. H. Turner. **Dogs.**—7 Entries.—1st. Rock, entered by Luther Adams, Boston; breeder, R. Grath, England. Rock is a magnificent lemon and white dog, with the finest head we ever saw. He is of the true Field Trial blood, being by Barclay Field's Bruce out of Grath's (now Llewellyn's) Daisy.

2d. Leicester, entered by L. H. Smith, of Strathroy, Canada; breeder, Mr. Llewellyn. A very elegant lemon and white dog, with immense chest and shoulders, but rather loose loin. He is also of the Field Trial breed, and got by Llewellyn's Dan out of Llewellyn's Lill 2d.

3d. Paris. Entered by L. H. Smith, of Strathroy, Canada. Imported in *ultero* from the Llewellyn kennel. Paris is a blue Belton Field Trial by Leicester out of Smith's Dart. He has a fine head, but a heavy body.

Bitches.—6 Entries.—1st. Queen Mab. Entered by Arnold Burges, Maysville, Ky.; breeder, Mr. Llewellyn. Mab is 17 months old, black, white and tan, very finely formed, and hard to fault. Her blood is of the most celebrated prize winning strain, she being by Llewellyn's Dan out of Llewellyn's Nelly.

2. Dart. Entered by L. H. Smith, Strathroy, Canada; breeder, Mr. Llewellyn. She is a blue Belton Field Trial bitch, very fine in form and quality, by Llewellyn's Prince out of Llewellyn's (now Adams) Dora.

3. Victress. Entered by L. H. Smith, Strathroy, Canada; breeder, Mr. Llewellyn. A very fine lemon Belton, of the true Laverack type. She is full sister to the celebrated bitches Countess and Nelly, being by Laverack's Dash, 2d out of Laverack's Moll 3d.

CLASS 2.—Imported Red, or Red and White Irish Setters, or their Progeny, over one year old. For best dog. Premium Cup. Value, \$35.00. Offered by Arnold Burges, Maysville, Ky. Second best cup, \$25.00; Third best, \$10.00. **Judges.**—E. Orgill, Luther Adams, John Knox.

Dogs.—9 Entries.—1st. prize, Elcho; entered by Chas. Turner, St. Louis. A very fine, richly colored dog, lately imported by his owner. He was the second prize winner at the late Dublin show. Pedigree not reported. 2d. Erin, entered by Chas. Turner, which has a decided black tinge. Pedigree not reported. 3d. Rufus; entered by Arnold Burges, Maysville, Ky.; breeder, Capt. Trench, Ireland.

Bitches.—6 Entries.—1st. Lou 2d; entered by Chas. Turner, St. Louis. Pedigree not reported. 2d. Ruby 2d; entered by Gen. Ducat, Chicago. Pedigree not reported. 3d. Rose, entered by Chas. Turner, St. Louis. Pedigree not reported.

CLASS 3.—Imported Black and Tan Gordon Setters, or their Progeny. For best dog over one year. Premium Cup. Value, \$35.00. Offered by Proprietors Matteson House, Corner Washburn and Jackson street, Chicago. Second best cup, \$25.00; Third best \$10.00. For best bitch. Premium Cup. Value, \$35.00. Offered by Proprietors Gardner House, corner Michigan avenue and Jackson Street, Chicago. Second best cup, \$25.00; Third best \$10.00. The following received the prizes: Nora, owned by A. F. Copeland, of Boston, was awarded first prize as best bitch; Shot, owned by D. T. Elston, Chicago, second prize. Mike, owned by D. T. Elston, third prize, as best dog.

CLASS 4.—Native English Setters. For best dog, over one year old. Premium Cup. Value, \$35.00. Offered by E. C. Waller, 24 Wabington street, Chicago. Second best cup, \$25.00; Third best \$10.00. For best bitch. Premium Cup. Value, \$35.00. Offered by Proprietors Tremont House, corner Lake and Dearborn streets, Chicago. Second best cup, \$25.00; Third best \$10.00. Sport, owned by H. J. Edwards, Chicago, the first prize Don, owned by F. G. Sheldon, Hudson, Mich., second, and Spot, owned by H. J. Edwards, third. The bitch owned by John Dason, Monroe, Mich., first prize; Belle, owned by J. B. Welch, Hudson, Mich., second, and Gipsy, owned by H. J. Edwards, Chicago, third.

CLASS 5. Native Black and Tan Setters (called Gordons).—First prize cup for dogs (offered by Commercial Hotel) awarded to Dash, owned by John Davidson, Monroe, Mich.

Third prize for dogs awarded to Max, owned by Geo. B. Dougan, Richmond, Ind.

Same Class and Breed.—First prize cup for bitches (offered by Chas. E. Felton, Chicago) awarded to Belle, owned by Benjamin Cornwell, No. 41 Thirty-ninth street, Chicago.

Second prize cup for bitches, awarded to Lulu, owned by Benjamin Cornwell, as above.

Third prize for bitches awarded to Flora, owned by George B. Dougan, Richmond, Ind.

CLASS 6. Native Red or Red and white Irish Setters, (called Irish setters).—First prize cup for dogs (offered by Sherman House, Chicago) awarded to Ponto, owned by Richard Valentine, Janesville, Wis. Second prize cup for dogs awarded to Patsey, owned by William P. Harrison, Geneva, Ill.

Third prize cup for dogs awarded to Trent, owned by W. A. Miller, New Buffalo, Mich.

Same Class and Breed.—Second prize cup for bitches awarded to Fannie, owned by Alexander White, No. 884 West Madison street Chicago.

CLASS 9. Irish Water Spaniel.—First prize cup for dogs (offered by Charles H. Turner, St. Louis, Mo.) awarded to Sinbad, owned by J. H. Whitman, Chicago.

Second prize cup awarded to Bruce, owned by Charles H. Turner, St. Louis.

Third prize for dogs awarded to Pat, owned by Charles H. Turner, St. Louis.

Same Class and Breed.—First prize cup for bitches (offered by J. H. Whitman, Chicago) awarded to Queen, owned by J. H. Whitman, Chicago.

Second prize cup for bitches awarded to Liffey, owned by J. H. Whitman, Chicago.

Third prize for bitches awarded to Bridget, owned by J. H. Whitman, Chicago.

CLASS 10. Cocker Spaniels (dog or bitch).—First prize cup (offered by Chicago Gun Club) awarded to bitch Nell, owned by E. T. Martin, No. 43 Clark street, Chicago.

Second prize cup awarded to bitch Queen, owned by J. W. Munson, St. Louis.

Third prize awarded to dog King, owned by J. W. Munson, St. Louis.

CLASS 12. Black Retrievers.—First prize cup (offered by W. F. Milligan, Chicago) awarded to Jet, owned by W. F. Milligan, Chicago.

CLASS 13. Retrieving Spaniels, other than pure Irish.—First prize cup (offered by Kennicott Club, Chicago) awarded to dog Schneider, owned by F. A. Lowe, Chicago.

Second prize cup awarded to bitch Vic, owned by Robert Burt, Bradwood, Ill.

Third prize awarded to dog Charlie, owned by J. J. Gillespie, No. 48 South Clark street, Chicago.

CLASS 15. English Beagles.—First prize cup (offered by Southern Sportsman) awarded to entry by Charles H. Turner, St. Louis.

Third prize awarded to entry by Charles H. Turner, St. Louis.

CLASS 16. English Greyhounds and Scotch Deerhounds.—First prize cup awarded to entry by E. O. Greenwood, Cincinnati.

Second prize awarded to Dexter, owned by G. C. McLean, Janesville, Wisconsin.

Third prize awarded to Fleet, owned by Gen. D. S. Stanley, Detroit, Michigan.

CLASS 17. Newfoundland and St. Bernards.—First prize cup awarded to Bross, owned by Joseph Harvey, Oak Park, Ill.

Second prize awarded to Fidelity, owned by the Fidelity Safe Depository, No. 143 Randolph street.

Third prize awarded to Carlo, owned by J. A. Kanffman, No. 198 W. Chicago avenue, Chicago.

CLASS 20. Shepherd Dogs.—First prize awarded to Dan, owned by W. F. Milligan, Chicago.

Second prize awarded to Shep, owned by S. H. Wood, Union Stock Yards.

Third prize awarded to Sheppy, owned by N. A. Paaren, No. 650 Wabash avenue.

CLASS 21. Pomeranian or Spitz.—First prize awarded to Cuff, owned by S. G. Myers, Geneva, Ill.

Third prize awarded to Julia, owned by W. S. Eden, Tremont House barber shop.

CLASS 25. Pointer Pup under one year.—First prize cup awarded to Da-h, owned by Stephen R. Dilley, Lake City, Minn.

Second prize awarded to Don, owned by R. M. Baker and J. C. Hatch, Detroit.

Third prize awarded to Joe, owned by R. A. Turtle, 112 Loomis st., Chicago.

CLASS 23. Irish Water Spaniel Pup under one year old.—First prize cup awarded to entry by J. H. Whitman, Chicago.

Second prize awarded to King of the River, owned by J. H. Edwards, 362 Lake street, Chicago.

Third prize awarded to entry by J. H. Whitman, Chicago.

CLASS 28. English Setter Bitch (over one year old) with two of her pups (under one year old).—Special prize (offered by Chicago Field) awarded to Fairy and two pups, owned by C. H. Raymond, Morris Plains, N. J.

CLASS 24. Irish Setter Bitch with two pups (under one year old).—Special prize awarded to Gypsy and pups, owned by J. H. Whitman, Chicago.

CLASS 29. Pointer Bitch (over one year old) with two of her pups (less than one year old).—Special prize cup (offered by Rod and Gun, N. Y.)

awarded to entry with three pups, owned by Stephen B. Dilly, Lake city, Minn.

CLASS 20. Irish Water Spaniel Bitch (over one year old) with two pups (less than one year old).—Special prize (offered by FOREST AND STREAM, N. Y.) awarded to entry by J. H. Whitman, Chicago.

CLASS 34. Russian Setters.—Special prize (offered by W. F. Milligan, Chicago,) awarded to Tom, owned by W. F. Milligan, Chicago.

CLASS 35. Red Irish Setter Dog for stock purposes, to be shown with not less than two of his get.—Special prize (offered by the *Western Sportsman*) awarded to Erin, owned by Charles H. Turner, St. Louis.

CLASS 40. Black Spitz.—Special prize (offered by S. G. Myers, Geneva, Ill.,) awarded to Cuff, owned by S. G. Myers, Geneva, Ill.

BLACK AND TANS, ETC.

ST. LOUIS, Mo., January, 1875.

EDITOR FOREST AND STREAM:—

I noticed "Amateur's" article in your paper of 20th, on the black and tan decision of the Baltimore Dog Judges. Wont some of those gentlemen be good enough to let us know through your paper, why such an animal as "Amateur's" seems to be, was passed by unnoticed? A very humorous account reaches me from Baltimore of some of the other decisions of the judges. I am informed that a *split-nose* pointer took first prize. My informant asked one of the judges why the dog got first prize, and was told that the judge once owned a pointer with a split-nose that was *good*, and so he thought this split-nose dog ought to have it. Another judge gave as *his* reason, that the dog was white and could be seen farther in the field than the others. When asked why Stromberg's liver-colored pointer did not get first prize, a judge said he was *too finely bred*. A red Irish pup, "Pat," the property of Joe Turner, of Baltimore won the first prize, a silver collar. His dam, an imported black Irish bitch, was passed by unnoticed, *because* she was *black*. J. A. Smith won first prize for a dog entered as "Field Trial," and the premium ticket tacked on read "first for Liverack setter." Perhaps Mr. B. W. Jenkins was right in not entering his fine dogs. J. W. M.

KENNEL PRODUCE.—Mr. Wm. M. Boyle's black setter bitch dropped six handsome pups, five gyps and one dog, at New Brighton, on the 22d, ult., to J. W. Knox's new dog, Belton. Daisy is out of Knox's Lavack bitch Dimple, by Theo. Gray's Gordon dog Don. S.

Rational Pastimes.

—On January 26th, the inter-State match between the curling clubs of New York and New Jersey, took place on the curling lake at Haledon—Gen. Haxey's estate—near Paterson, and to the surprise of the New Yorkers their rink had to succumb to their Jersey adversaries, the Paterson club bearing off the honors, as John Smith, of that club, won the medal of the day. The New Jersey clubs defeated those of New York by 262 to 250. This has been the only curling event in the metropolitan district this Winter. The day following, the Caledonian Club, of Brooklyn, played their annual "point" match at Prospect Park, Messrs. Hugh Pollock and Galloway tying each other—9 to 9—and on playing off, the latter won. Since that day there has been no ice for curling purposes, even for a practice game.

—The Press Base Ball Club members have gone into training at McQuade's Racket Court, where they play practice games at racket every other morning. Brasher promises to be quite an expert.

—Freeman, of Shuffleboard fame, won the championship series of matches between New York and Brooklyn, last week. The game is being revived in the metropolis. It was quite popular here forty years ago.

—Bowling clubs are being organized in New York and Brooklyn. In the Eastern District of the latter city there has been a ten-pin *furor* this season. McAuslan, of the Eastern District *Times*, is running bowling now in good style.

—It is stated that John Hatfield, well known in base ball circles for his skill in throwing, is to be the left fielder of the Mutual nine this season. With Hicks in his old place and Nelson and Higham in their's in the nine, and "Captain Jack" to assist, what a happy family the Mutuals will be!

—The base ball season for the Centennial year promises to be one marked by a regular *furor* for the game. Even at this early period of the year clubs are organizing to take the field in March next.

—The Centennial year editions of Mr. Chadwick's base ball books are now being prepared. They are to be illustrated with cuts, and marked by special chapters on the new points of play.

—Mr. George Newhall has been successful in his cricket mission to England, and the result is that a grand International cricket *jete* will take place in August next, on the grounds of the Germantown Club, near Philadelphia, in which two representative twelve of English and American gentlemen players—professionals barred—will play a grand match for the cricket championship of the American continent.

—The St. George Club of this city are negotiating—with promises of success—for the advent of an all-Ireland twelve this Summer, to play against a selected twenty-two of New York. Such a match would draw a large crowd to Hoboken.

—Messrs. Bird and McKenzie were in Philadelphia this week, consulting with members of the Philadelphia Chess Club in reference to the proposed Centennial International tournament to be held in Philadelphia.

—The old cricketer and bowler, Alfred Marsh, has become quite a chess player. He and Labore, the old wicket keeper of the Long Island Cricket Club, are playing a match at chess now.

—The Staten Island Club are going in to play base ball on the Knickerbocker plan next season. They have a good ground and plenty of members, and socially rank with the best clubs in the land.

—The Excelsior team for 1876 will probably include Dean, Chauncey, Milton, Sweet, Sackett, Geo. Chauncey, Dahrman, Earle, Benner, Maxwell, Mitchell, Whiting, and Murtha.

—The Press Club ten for the coming season will be—Crosby, c.; Blodgett, p.; Hamilton, 1st b.; Laughlin, 2d b.; Brasher, 3d b.; Carpenter, s. s. and captain; Martin, l. f.; Rankin, c. f.; and Joy, r. f., with Malone, r. s. Mr. Chadwick is captain of the Press Club muffin team, which will be ready to meet any press club team in the country in June. Chadwick's muffins will include James Gordon Bennett of the *Herald*, Chas. A. Dana of the *Sun*, Captain Rufus Coffin of the *World*, Chas. Hallock of the *FOREST AND STREAM*, Frank Queen of the *Clipper*, Kenward Phelps

of the *Brooklyn Eagle*, Joe Howard of the *Star*, Mr. Carey of the *Times*, Mr. Shanks of the *Tribune*, and Captain Chadwick. Mr. Dana will pitch—he can't be beat at pitching—in—and Mr. Bennett will be the first baseman, and Joe Howard will catch—he being used to "catching it" all round. Mr. Hallock will cover ground in the out field, and the captain will make a "short stop" of all balls coming within reach. A supper of buttered muffins, well toasted, will conclude each match. Dr. Wood of the *Sun*, will score the games, and he will "boil down" the details to the smallest item in his usual style. Mr. Crolev of the *Graphic*, has promised to illustrate each contest of the season, and Frank Leslie has instructed Gulic to make a specialty of the Press Club muffin matches in the *Days Doings*.

Billiards.

SLOSSON VS. SEXTON.—Tammany Hall, on Thursday evening, Jan. 27th, was the scene of a very interesting contest between the celebrated young experts, George F. Slosson and William Sexton. The attendance was large, the ladies being well represented. The game throughout was one of special merit, and the most interesting to old-time billiard patrons that has occurred in this city for years. We append the summary:—

SUMMARY.

TAMMANY HALL—January 27th, 1876.—Contest for \$1,000 between William Sexton and Geo. F. Slosson, both of New York city. Game, three-ball; 600 points up on a 5x10 ft. W. Collender table, the rules of the three-ball championship of the world to govern. Score—Sexton, 600; Slosson, 482. Averages—Sexton, 15 15 39; Slosson, 12 14 39. Best runs—Sexton, 73; Slosson, 110. Umpires—For Sexton, Charles Effler; for Slosson, Cyrille Dion. Referee—Dudley Kavanagh. Marker—Robt. Willmarth. Time of game, three hours.

ALL SORTS.—Louis Shaw, of Indianapolis, has challenged Wm. Burleigh, of Chicago, for the championship of the northeast and southwest.... John Fawley, of Cleveland, has backed T. J. Gallagher against Eugene Carter, the friends of the latter wagering \$500 against \$200. The game is set down for February 16th, at Toledo, Ohio.... Ned Bryan, failing to cover Clarke Wilson's forfeit of \$50, the latter withdrew the money last week.... A fifteen-ball match would prove of much interest now. Cyrille Dion says he will play anybody.... Charles Bessell, of St. Louis, is in this city.... Messrs. Stuber and Sandt contended on the 17th inst., at Allentown, Penn. The game was four-ball, 1,500 points up, Sandt winning by 291.... John Derry has a half interest in a billiard room at Oakland, Cal.... N. Goulette, of Pembroke, Can., in a recent match with J. Burette, ran 104. The game was three-ball, 600 points up. Burette, who, receiving the odds of discount, losing by ten points.... Of the Centennial tournaments, which have been in embryo for sometime back, one has developed itself. The field of action is New York, and the entries thus far are four in number. The purse is said to be \$5,000.... Joseph Vermeulen and George Stone were announced to play a match at Galveston, Texas, January 20th, for \$500.... The last game of the Canadian tournament at Toronto, was to have been played on Monday afternoon. At last advice the first prize lay between James G. Bennett and William Jacques.

T. B. Peterson & Brothers, Philadelphia, have in press and will soon issue a new work by Mrs. Catharine A. Warfield, author of "The Household of Bourverie" entitled "Monfort Hall," which will be followed by another by the same author entitled "Miriam's Memoirs." They will be issued in uniform style with the "Household of Bourverie," published by the same firm, and will no doubt prove to be immensely popular.

Answers To Correspondents.

No Notice Taken of Anonymous Communications.

Will "Amateur," of Utica, N. Y., who has sent us a communication please forward his name and address.

INQUIRER, Philadelphia.—Where in this city will the International Rifle Match be held? Ans. The range has not yet been definitely determined upon.

E. B. S., Syracuse, N. Y.—Will you please tell me through your paper the best preparation with which to varnish a fly-pole? Ans. Dissolve shellac in alcohol and use it.

T., Taunton, Mass.—What is the best oil to use on the lock of a gun, also the best for oiling the barrel? Ans. Belmontyle oil for barrels, and a single drop of pure sperm oil for locks.

H. M. A., South Haven.—At Creedmoor and in shooting galleries, does a hit count, or must centre of bullet come inside the rings? Ans. A hit counts for the highest score if it breaks the line.

B. G. D., Galveston, Texas.—Can bullets for Express rifles, 450 bore, be had ready moulded in New York. If so, where, and at what price? Ans. No. You will have to order them from England.

J. C. W., Danville, N. Y.—Our sportsmen's Club here wants a pair of "plunge traps." Where can we get the best, and price? Ans. From H. C. Squires, No. 1 Courtland street, this city; price \$15 per pair.

E. D.—I am about to purchase a breech-loading shot gun. Is a \$75 American gun as good as an English gun at the same price. Which would you advise me to purchase? Ans. The latter by all means.

H. W. C., Boston.—Can you inform me where I can obtain a Charles Murphy fly rod, or can you give me Mr. Murphy's address? Ans. Send your order to Charles Murphy, 40 Halsey street, Newark, N. J.

F. W. P., Greenpoint.—What is the price of the "Traveler's Guide," and where can I get it in New York? Ans. Fifty cents per copy. For sale by all newsdealers, or the publishers, 233 South Fifth street, Philadelphia.

C. P. J., Chicago.—Can you tell me whether there is any firm in New York which deals in steam road wagons, or where a second hand one could be obtained? Ans. Messrs. Cooke & Beggs deal in steam road wagons. They have written to you.

J. L. E. Jr., Memphis, Tenn.—Will it injure a shot gun (muzzle loader) to use the same weight of quicksilver as the same weight of shot? Ans. A few discharges would certainly not injure the gun, and we would like to hear the result of your experiment.

F. W. L. Jacksonport, Ark.—Is there any market for swan down, and what is a skin worth? I know where twenty-five to fifty can be killed in a night. Ans. Yes; a constant demand. Address Messrs. Mellen & Co., No. 142 and 144 Worth street, this city.

W. H. N., Valparaiso, Ind.—Will you kindly give me a receipt for making lines water-proof. Ans. Stretch your line taut and paint it neatly with shellac; then placing a piece of oil silk in the palm of the hand draw the line through it so as to distribute the varnish evenly.

C. S., Hudson, N. Y.—Will you please inform me where I can buy the fish called pompano, also how large is the fish? Ans. You can buy the fish, dead of course, from Mr. Eugene S. Blackford, of Fulton Market. They weigh from one to six pounds and the last received are from Pensacola.

J. H. A., Beloit.—Can you tell me about taking up land in Florida under the Homestead Act? Ans. For information to settlers and immigrants, send to C. H. Walton, publisher, Tallahassee, Fla., for Annual Report of the Commissioner of Lands and Immigration, about 300 pages octavo.

B. C. H., Dangerfield, Texas.—Please inform me if the cat-fish will do well in ponds? Ans. If you mean the common cat-fish, or horn-pout, which has a geographical range extending from New Hampshire to Florida, it will, if there is food enough for them. They increase and multiply in favorable waters with wonderful rapidity.

A. S. B., Sodus, N. Y.—Is there any good hunting anywhere near Sodus? 2. Where can I get a good fox-hound? 3. Where can I get the game laws of New York? Ans. We believe there is good duck shooting at Sodus Point on the lake. 2. Address Peter Knox, Newton, Sussex County, N. J. 3. "Fur, Fin and Feather," published by Charles Suydam, No. 149 Chambers street, contains the game laws of all the States.

W. H. C., Ludlow, Pa.—We have a fine stream which we propose to stock with one hundred thousand trout-fry; when ought they to be put in the stream, before the umbilical sack is off or after? Ans. Young brook-trout should be deposited in the stream as soon as the umbilical sack is off. They should be placed in the little rivulets that flow into the stream and not deposited all in one place, but distributed all along in the stream.

ENQUIRER, Warren, P.—Will you be so kind as to inform me through your paper where, and at what price I can obtain five or six pairs of English sparrows. I have a fine place to keep them here. Will they kill worms on fruit? Ans. Chas. Reiche & Bro., No. 55 Chatham street, can supply you. Opinions vary as to their worm-eating qualities, and many contend that they will eat worms—only when they can get nothing else. They are undoubtedly pugnacious and will drive away other birds.

W. J. W., New York.—1. Will you inform me what work on Taxidermy would be best for one to purchase who is desirous of learning how to mount birds? 2. I would like to know also the way in which to construct a "running deer" target. Any information in regard to such a target and the manner of putting one up will be very acceptable. Ans. 1. Coates Field Ornithology, or the Taxidermist's manual. 2. Address the Winchester Arms Co., New Haven, Conn., for information regarding target.

C. W. McML., Philadelphia.—My gun, 10-bore Remington, leads considerably. Is there anything which will remove this better than a wire brush? Do you think the use of a wire brush continually will injure the gun? What is the best way to keep a gun from rusting inside the barrels when not in use? Ans. If you clean your gun immediately after using, with a piece of flannel and bristle brush it will not lead. A wire brush will wear the barrels. Benzine will remove the leading, and Belmontyle oil prevent rusting.

COLLEGIAN, New York.—I am interested in your effort to promote intercollegiate rifle matches. Please tell me if the civil guard model Remington rifle would be excluded in them; also, if you consider it accurate at 500 yards? Where can I get a regulation U. S. Army rifle, and the price? Ans. The civil guard model Remington is perfectly admissible, being a National Guard weapon. It is as accurate as any military rifle at that distance. The new Springfield U. S. rifle cannot be purchased. The old 50-calibre rifles can be had for \$20 each.

F. R. B., New York.—You will confer a favor by stating your objections to rubber boots, and also your advice as to best substitutes as to imperviousness to water and snow, and warmth in Winter. Ans. Our correspondent will remember that the question was asked with regard to Florida. A cut in a rubber boot cannot be repaired there; a patch can be put on a leather boot by the nearest cobbler. A pair of good leather knee-high boots will outlast half a dozen pair of rubber ones. A thorough soaking with castor oil renders them perfectly impervious to water, and soft to the feet. Under a hot sun, to walk in rubber boots is simply torture, even if they are large.

C. L. J., Philadelphia.—Can you give me any information in regard to a couple of shot guns that I am about to describe. 1st. A laminated steel gun, 12-gauge, 30 inch barrels, Renkins Brothers, Liege, the makers. 2d. A twist gun, 12-gauge, 30-inch barrels, inscribed on the plate, "Joseph Bourne, maker, No. 5, Whitehall street, St. Mary's Square, J. W. Baden." Are they celebrated makers, and are they in business yet? Ans. We don't know the Leige gun maker. Some very good barrels are made there but the manufacturers make no effort to establish a reputation. We do not know if the London maker is still in business. The name Baden is that of the person, dealer or otherwise, for whom the gun was made.

F. H. R., Norristown, Pa.—I have a Scott breech loader, weight 7 11-16; 12 bore, 2½ across the breech. How should I load it for duck? 2. What kind of boots would you advise me to wear in hunting for woodcock or snipe; my feet are rather tender? 3. What do you think of Goode's moccasins? Ans. 1. ¾ to 4 drachms coarse powder, 1½ to 1¼ oz. No. 4 or No. 6 shot. Much depends upon the gun. 2. We have always found a loose, comfortably-fitting boot the best; but in snipe shooting, unless water-proof thigh boots are worn, we prefer common army shoes, with holes at the toes to let the water out as fast as it runs in. For wet walking we cannot recommend moccasins; in the woods they are excellent. Mr. Goode, however, makes knee moccasins, which, we are told by those who have used them, answer very well.

NOVICE.—In a recent issue of your paper your Field Editor states that he had probably killed as much game as any sportsman in the country, with the exception, perhaps, of Capt. Bogardus. Will you kindly inform me if this gentleman follows the modern practice of shooting at birds with "both eyes open?" I have over a half dozen of sporting works, and but one author recommends the shutting of one eye. Ans. Snap shooting is only resorted to by *skilful* shooters in dense covers, and at long driving shots. In such shooting there is no time to take anything like deliberate aim, consequently there is no necessity to close an eye; at all events we do not. But to make snap shots when the game is near enough, and the cover open enough to take deliberate aim, would show a want of skill. We cannot say how Capt. Bogardus shoots; but any man of his skill would close an eye in shooting when there is necessity for it, and such necessity frequently arises.

D. A. F., Albany.—Do fish which die naturally always float to the surface of the water? I find an occasional dead one in my pond floating, but can see many more dead at the bottom. Ans. Seth Green says that about one trout in twenty which die in his pond float to the surface. He followed fishing on the great lakes for twenty years, and scarcely ever saw any dead fish floating; but when fishing in deep water during heavy storms, which caused a current at the bottom of the lake, his nets would be filled with fish bones, and dead fish in all stages of decomposition. Our own experience is, that fish taken from the waters alive and allowed to die in the air, will float when returned to the water. We have seen thousands of moss-bunkers floating on the surface of the Great South Bay, thrown overboard by the fly-netters, and last Summer thousands of young shad were seen floating on Lake Ontario, which had been taken in nets and thrown back into the water. We think this can be explained from the fact that when fish are taken suddenly from the water, their air bladder remains filled with air, as any one may have seen in cleaning their fish. When death arises from natural causes, this organ would probably be the first to cease its office, and the fish would remain at the bottom.

A large number of answers are unavoidably left over until next week; also, owing to the absence of our Kennel Editor, several kennel queries.

A WEEKLY JOURNAL,

DEVOTED TO FIELD AND AQUATIC SPORTS, PRACTICAL NATURAL HISTORY, FISH CULTURE, THE PROTECTION OF GAME, PRESERVATION OF FORESTS, AND THE INOCULATION IN MEN AND WOMEN OF A HEALTHY INTEREST IN OUT-DOOR RECREATION AND STUDY:

PUBLISHED BY

Forest and Stream Publishing Company.

—AT—

17 CHATHAM STREET, (CITY HALL SQUARE) NEW YORK,
(Post Office Box 2832.)
128 SOUTH THIRD STREET, PHILADELPHIA.

Terms, Five Dollars a Year, Strictly in Advance.

A discount of twenty-five per cent. allowed for five copies and upwards.

Advertising Rates.

In regular advertising columns, nonpareil type, 12 lines to the inch, 25 cents per line. Advertisements on outside page, 40 cents per line. Reading notices, 50 cents per line. Advertisements in double column 25 per cent. extra. Where advertisements are inserted over 1 month, a discount of 10 per cent. will be made; over three months, 20 per cent; over six months, 30 per cent.

NEW YORK, THURSDAY, FEBRUARY 3, 1876.

To Correspondents.

All communications whatever, whether relating to business or literary correspondence, must be addressed to THE FOREST AND STREAM PUBLISHING COMPANY. Personal or private letters of course excepted.

All communications intended for publication must be accompanied with real name, as a guaranty of good faith. Names will not be published if objection be made. No anonymous contributions will be regarded.

Articles relating to any topic within the scope of this paper are solicited.

We cannot promise to return rejected manuscripts.

Secretaries of Clubs and Associations are urged to favor us with brief notes of their movements and transactions, as it is the aim of this paper to become a medium of useful and reliable information between gentlemen sportsmen from one end of the country to the other; and they will find our columns a desirable medium for advertising announcements.

The Publishers of FOREST AND STREAM aim to merit and secure the patronage and countenance of that portion of the community whose refined intelligence enables them to properly appreciate and enjoy all that is beautiful in Nature. It will pander to no depraved tastes, nor pervert the legitimate sports of land and water to those base uses which always tend to make them unpopular with the virtuous and good. No advertisement or business notice of an immoral character will be received on any terms; and nothing will be admitted to any department of the paper that may not be read with propriety in the home circle.

We cannot be responsible for the dereliction of the mail service, if money remitted to us is lost.

Advertisements should be sent in by Saturday of each week, if possible.

CHARLES HALLOCK, Editor.

WILLIAM C. HARRIS, Business Manager.

SOUTHERN FLORIDA.—The Florida *Agriculturist*, in commenting upon the fact that while expeditions are continually being sent from this country, as well as Europe, to investigate unknown portions of Africa and the Arctic Zone, remarks that there is still within 200 miles of Jacksonville a country as little explored as any part of the first mentioned continent. As regards the mounds, canals, and intrenchments discovered by Dr. Kenworthy and others, and also as to the superior land on the Caloosahatchee River availing settlers, it says:—

"This is a subject we are much interested in, and one that we intend fully to investigate, and write on from time to time. The FOREST AND STREAM is doing a good work for our State. To them we are indebted for all we know at present about this section. They have been at the expense of all the explorations hitherto. Cannot other enterprising mediums be found to assist?"

ART.—The ninth annual exhibition of water color painting is now open at the Academy of Design. On Saturday evening a private view was afforded members of the press by the association. The exhibition, judged as a whole, was equal, if not superior, to any of previous years. In addition to the numerous artists whose work is familiar there are many who are making their first steps in this branch of art; a move warranted by its rapidly-increasing popularity. We are still a long way behind the foreign schools. The difference, both in drawing and coloring between, say, French artists and our own, can be decided at a glance. To an unpracticed eye works of the former sometimes appear to have the color laid on with a white-wash brush, but it strikes the right spot every time, and sandpaper is ignored. Mr. Wakeman Holberton has one of his fine fish pictures on view, and Mr. R. M. Shurtliff contributes several scenes of out-door study, the result of summers in the Adirondacks. The coloring of this rising artist is particularly good—his trees look like trees with bark on them, not like peeled specimens around a lumber camp. The pictures on Saturday were seen by gaslight, and that dimmed by a smoky atmosphere. We defer further comment until after another inspection.

—A correspondent writes us that "the Rhode Island Club has fitted up an old mansion, 171 Broad-st., Providence, in the most substantial and elegant manner, and it will be opened for social service on the 26th inst. Its parlors, ante, and reception rooms, its billiard and wine rooms, cannot be excelled, while its *cuisine* department, under this able management, might excite the envy of Delmonico."

GAME PROTECTION.

AMENDING THE GAME LAWS OF NEW YORK.—The following is an amendment to the game laws of this State, which has been introduced in the present session of our Legislature at the instance of the New York Association for the Protection of Game. If any of our readers can suggest anything supplemental thereto, or any alteration, we shall be glad to place their ideas before the society:—

AN ACT

To further amend Chapter Seven Hundred and Twenty One of the Laws of Eighteen Hundred and Seventy one, entitled "An Act to amend and consolidate several acts relating to the preservation of Moose, Wild Deer, Birds, and Fish," passed April 26th, 1871.

The People of the State of New York, represented in Senate and Assembly, do enact as follows:—

SECTION 1. Section Two of Chapter Seven Hundred and Twenty-one of the Laws of Eighteen Hundred and Seventy-one, entitled "An Act to amend and consolidate the several acts relating to the preservation of Moose, Wild Deer, Birds, and Fish," passed April 26th, 1871, is hereby further amended so as to read as follows:—

§ 2. No person shall kill or expose for sale, or have in his or her possession after the same has been killed, any Wild Duck, Goose, or Brant, between the first day of May and the 1st day of September, nor any Wood Duck between the 1st day of January and the 1st day of September, under a penalty of twenty-five dollars for each and every one killed or had in possession; and no person shall at any time kill any of said birds between sunset and sunrise, nor pursue or fire at any of said birds with the aid of any light or lantern, under the same penalty for each bird so killed, or pursued, or fired at.

SEC. 2. Section Seven of said Acts is hereby further amended so as to read as follows:—

§ 7. No person shall kill, or expose for sale, or have in his or her possession after the same has been killed, any Quail between the 1st day of January and the 20th day of October, under a penalty of twenty-five dollars for each bird.

SEC. 3. Section Fourteen of said Act is hereby further amended so as to read as follows:—

§ 14. No person shall, at any time or place within this State, take or kill any Ruffed Grouse, commonly called partridge, any Pinnated Grouse, commonly called Prairie Chicken, or any Quail, with any net, trap, or snare; nor set any such trap, net, or snare for the purpose of taking or killing any of said birds, nor shall any person sell or expose for sale, or have in his or her possession after the same shall have been so taken or killed, any of said birds, knowing the same to have been so taken or killed, under a penalty of twenty five dollars for each bird. And it shall be lawful for any person to take and destroy any such traps, nets, or snares wherever found set.

SEC. 4. Section Thirty of said Act is hereby re-enacted and amended so as to read as follows:—

§ 30. No person shall kill, or expose for sale, or have in his or her possession after the same has been killed, any English or other Snipe, Plover, Curlew, or other wading birds, commonly called shore birds, between the 1st day of January and the 1st day of July, in each year, under a penalty of five dollars for each bird.

SEC. 5. Section Forty-one of said Act is hereby amended so as to read as follows:—

§ 41. No person shall place in any fresh water stream, lake, or pond, without the consent of the owner, any lime, or other deleterious substance, or any drug or medicated bait, with the intent thereby to injure, poison, or catch fish, nor place in any pond or lake stocked with or inhabited by trout, any bass, pike, pickerel, or sunfish, or any drug or other deleterious substance, with the intent to destroy such trout. Any person violating the provisions of this Section shall be deemed guilty of a misdemeanor, and shall in addition thereto, and in addition to any damage he may have done, be liable to a penalty of one hundred dollars.

SEC. 6. Section Forty-three of said Act is hereby re-enacted and amended so as to read as follows:—

§ 43. No person shall kill, or expose for sale, or have in his or her possession after the same has been killed, any Hare or Rabbit, between the 1st day of January and the 20th day of October, nor shall any person at any time kill or hunt any Hare or Rabbit with Ferrets, under a penalty of ten dollars for each Hare or Rabbit.

SEC. 7. This Act shall take effect immediately.

The first amendment is intended to prohibit the shooting of ducks, etc., at night, commonly called "dusking." This is deemed essential to preserve the shooting on the South Side of Long Island. It is said that last fall the birds, although quite numerous, were for a while completely driven out of the Great South Bay, and the shooting nearly ruined for the season by this unsportsmanlike manner of shooting them, which gives them no opportunity either to rest or feed. It is understood that the amendment has the approval of the bay shooters, and others most interested in the matter.

The amendment in relation to quail simply restores the law to what it has been for several years until changed for some reason or other last winter. The former law is said to have given general satisfaction, but we are of the opinion that the majority of sportsmen would desire to see the closed season extended to November 1st.

The third amendment gives the game birds a further chance for their lives by prohibiting their being netted, trapped, or snared. This will, no doubt, meet with violent opposition from small boys in the country, but ought, we should think, receive the support of every sportsman in the State.

The amendment for the protection of snipe, etc., is an innovation in this State. Heretofore it has not been deemed expedient to restrict the killing of these birds in any way, owing to the fact that they are mere birds of passage which seldom, if ever, breed here; but their growing scarcity and dearth in the market seems to render some legislation of the kind proposed necessary.

The amendment in relation to "drugging" ponds, etc., is only intended to correct a clerical error in the original act. That in relation to hares and rabbits is substantially the same as the act passed last winter, which was tacked on to the section in relation to quail where it had no business to be.

Provincial Associations for Canada.

The formation of game protective societies in the various Canadian provinces, which shall embrace within their organization the local clubs, is a matter now receiving the attention of the sportsmen of the Dominion. If carried out it will probably lead to the formation of a Dominion Association to which these Provincial bodies will be tributary and coöperative. To be effective in producing these modifications and changes in the game laws which experience has taught them to be necessary, these Provincial associations should correspond with our State associations. By making them purely representative bodies to which members should be elected by the local clubs, the interest is more widely diffused and the coöperation assured. In townships where no local clubs exist, a certain number of individuals could be eligible until clubs are formed,

members of which could subsequently be substituted for individual delegates. With us five members of each club are usually appointed to attend the State convention. Meetings of the Provincial as well as the Dominion Associations could be held as frequently as seems necessary, at stated or irregular intervals, the local clubs being notified to send delegates, who should serve for one year. The functions of a Dominion association would be purely executive; those of the Provincial associations executive as respects their own Provinces, and advisory in their action and relations to the Dominion association. The result would be a grand machine with all the parts perfect, and it can be seen how easily local abuses could be reached and remedied through its ramifications.

In Toronto a society with the title of Provincial Association has already been formed but, we learn, without consultation with existing county associations, or giving them representation or a voice in the matter. One of the objects claimed for this organization is to do the work of local clubs as efficiently and more cheaply than they themselves can do it. But here we think they err. It is proposed that when any member throughout the country becomes cognizant of an infraction of the law he shall notify the Secretary at Toronto, who will send a detective to arrest the offender and employ counsel to prosecute. But here will be the detectives' and counsels' fees, and traveling expenses to be paid, all of which might be avoided, as county societies can always have among their members a lawyer who would act in his professional capacity without charge. The result of a Provincial association on the Toronto plan would be precisely the same as now holds in the State, where the New York City Association, through its activity, in prosecuting infractions of the game laws (more particularly as applied to dealers) is confounded with the State Association, and we are constantly being written to from country districts where there are no local clubs, asking why they do not take cognizance of infractions of the law a hundred miles away. Where a corporate body like a Provincial association is expected to do police duty for a State an apathy in the formation of local clubs is sure to exist, and pot-hunters and poachers will carry on their nefarious practices without interference.

Wild Fowl in Canada.

That the Games laws of the Dominion of Canada are more rigidly enforced than our own, the convictions which repeatedly reach our eyes in the Canadian papers, would seem to place beyond a doubt, and yet we hear a note of warning from that quarter to which it behooves us, as having equal interests, to also give heed. If we except, perhaps, the brant, who find their breeding places on the more distant shores of Labrador, the majority of the ducks that pay us a regular autumnal visit, are bred on the numerous lakes and sunken lands which are scattered about the northern portions of the provinces of Ontario and Quebec. Here, among almost inaccessible morasses, the young ducks are hatched and nurtured upon the luxuriant growth of wild rice, until the approach of Winter drives both young and old to a more moderate climate.

Probably there is no spot in existence which to day affords such excellent sport as Long Point, in Lake Erie. And yet here, only a few years ago, the incessant pursuit of the ducks which seemed to make this a last resting place before winging their longer flight across the lake and to southern waters, had almost entirely diverted the flight to other and widely scattered points. Now, however, under the fostering care and strict system of espionage of the Long Point Company, the old condition of affairs has been restored, and the great flocks of ducks which are to scatter themselves over the whole United States, make Long Point their point of departure. After leaving Long Point, the ducks appear to divide. One body bears to the westward and following the lakes finally scatter themselves along the Mississippi and its tributaries as far south as the Gulf of Mexico. The other body follows the lakes system of our own State, and striking the coast, follow it down until their favorite feeding grounds on the various sounds, formed by the sandy islands that line our shores are reached. The close season for ducks closes in Ontario on the 15th of August, at least a fortnight too soon, and a correspondent of the Toronto *Globe* mentions the fact that while shooting on that date, in that vicinity, he saw many young broods yet clothed in the soft down of young duck-hood, and had an uncomfortable conviction that many of the birds he shot were mothers rising out of the reeds to reconnoitre, and distract the attention of the enemy from the ducklings still under her care. The same writer argues that but two courses are open to prevent so great a calamity as the total extermination of their game—more especially of wild ducks. They are as follows:

1. Either to put a stop altogether to shooting for a term of years, as was done on the Western Peninsula, to prevent the extermination of quail; or,

2. To encourage by Legislation, and the granting, if necessary, of powers of expropriation by arbitration, the formation of companies, such as the Long Point Company, for the preservation of breeding grounds wherever they can be found of sufficient magnitude to make it worth while, and, at the same time, to promote the formation of game protection societies in every section of the Province, to protect not only ducks, but all kinds of game; by supplementing by Government aid any sum over a certain amount which such societies may raise by subscription among its members for the purpose of prosecuting parties who shoot out of season; and by facilitating in every possible way known to the law-makers, the summary punishment of such offenders.

The first proposition is untenable as far as this country is concerned; the second has our fullest sympathy and co-

operation where possible. In fact our interests in this matter are identical with those of our Canadian friends; indeed, greater, for probably, putting the sporting question on one side, there are a much larger number of persons who follow wild-fowl shooting as a means of livelihood in this country than in Canada. Yet we must look to them to preserve the birds for us during the breeding season. This is one of the points we have had in view in advocating the formation of the International Society, a system of co-operation, by which the intelligent sportsmen as well as the scientific men of both sides could meet, and by an exchange of information and ideas ascertain the real wants of both, and by suitable and united action obtain such legislation as would operate to the advantage of all.

If there is, indeed, this alarming decrease in the number of wild-fowl that the writer alluded to claims, we would be inclined to advocate, for a term of years at least, the abolition of Spring shooting, that a larger number of ducks might return to their breeding grounds to come to us again with augmented numbers in the Fall. Unquestionably they should have the fullest protection while on the breeding grounds, as well as in other places to which they may resort during the close season. The example of the Long Point Company is well worthy of imitation. They have the satisfaction of knowing that by their exertions they have to-day the finest duck-shooting in the Dominion, if not on the continent, all through a careful protection which has restored the confidence of the birds and brought them back to their old feeding grounds.

The experience of many Canadian sportsmen, however, who would fain follow the example, of the above company is very similar to that of many of our own in their endeavors to obtain possession of favorable "points." Lands utterly worthless and unproductive now, become of untold value when any one proposes to buy or lease them. The *Globe's* correspondent suggests that game protective societies should be assisted from the public purse. We have urged the same thing here, by the appointment of game constables and detectives. First, however, our game laws require a careful over-hauling. Those of Massachusetts and Connecticut are particularly faulty in permitting snaring during certain months, a license which is most grossly abused. Those of this State, particularly in the clause which permits the sale of quail and grouse until March 1st, when the close season commences on the 1st January, are equally as bad. But above all, let us co-operate with our Canadian neighbors in preserving and protecting the wild-fowl in which we have an equal interest, before the policy of extermination has been carried so far as to place it beyond the reach of a remedy.

—A powerful association has been formed in London, Ontario, under the title of the London District Fish and Game Protective Society, with the following officers:—President, Dr. Woodruff; first Vice, Col. John Walker; second Vice, James S. Niven, M. D.; Secretary, B. C. Marshall; Treasurer, James A. Mahon; Solicitor, John Taylor, Barrister; Committee, W. C. L. Gill, W. Hudson, J. A. Smith, Thomas Smallman, J. V. Thompson, I. C. Merritt, Henry Bruce. The society starts with a membership of over one hundred, and the County of Middlesex will doubtless soon feel the effects of their labors in the cause of game protection.

WISCONSIN.—At a meeting of the Wisconsin State Association for the Protection of Fish and Game, held at Madison, January 19th, 1876, Hon. W. W. Corning introduced the following resolution, which was adopted:—

Resolved, That in the opinion of the Wisconsin State Association for the Protection of Fish and Game, the artificial cultivation of fish is worthy of State aid, and to this end we respectfully ask the Legislature now in session to make suitable provision therefor, and as asked by the Fish Commissioners in their second annual report.

The following resolution was introduced by Col. R. M. Strong, and adopted:—

Resolved, That Messrs. Bailey, Mayars, and Welch be and they are hereby appointed a committee to codify the game and fish laws of Wisconsin, general and local, and to report the same to the association at the next adjourned meeting thereof.

On motion of Mr. Burdick, the Secretary was instructed to notify members and clubs, and other sportsmen of the adjourned meeting.

An amendment to the game laws of Wisconsin intended more particularly to preserve waterfowl from sneak-boat and battery shooting has already been introduced into the Legislature. It now rests with sportsmen throughout the State to shake off their apathy, and to interest themselves in the matter by urging upon members the importance of passing the bill.

—An exchange says that the Florida game law was passed only for the purpose of preventing cattle stealers from Georgia coming into the State under pretense of hunting, and that it will probably be repealed at the next session of the Legislature, when it is to be hoped that another may be passed which, while protecting the game and the true interests of the State, will not act as a bugbear to frighten people away.

—Mr. Graham has introduced a bill in the Legislature of this State to prevent duck, brant, and wild-geese shooting, from floating batteries, on the ponds, rivers, and lakes of Monroe County.

—The Pennsylvania State Association for the Protection of Fish and Game, which met recently at Harrisburg, passed a resolution favoring the proposed amendment to the game and fish laws of 1873. The resolution will be submitted to the Legislature.

—A very successful meeting of the Dansville (N. Y.)

Sportsmen's Association was held on the evening of the 21st inst. Committees were appointed among others to correspond with the State Commissioners relative to stocking the public streams with brook trout, and the FOREST AND STREAM relative to the introduction of prairie chickens.

SPORTSMEN OF TWENTY-FIVE YEARS AGO.

IT has been truly said that "shooting has been time out of mind the gentleman's amusement," but how many can imagine the changes in the manner and mode of sportsmanship, since the days of Nimrod. Nay, I will not put the period so far back, but simply to the times of Forester, the acknowledged authority on all that pertains to shooting or fishing, if you may except for the latter, the grand master, Izaak Walton.

Twenty-five years is a long space of time, and takes in the greatest inventions in the line of sporting for the last century. Nor is the change in this greater than the change of manners among sportsmen themselves. A quarter of a century ago the brotherhood of sportsmen, although not nearly so large, contained a greater majority of hardy, chivalrous, generous, and out-spoken gentlemen than at the present day. First in the grand rank of brilliant, whole-souled sportsmen of that "elder day" was the renowned Henry Wm. Herbert. Plain, unassuming, and of unbounded popularity, with a common dress of the backwoodsman, a firm manly bearing and generous loyal heart, he enjoyed as seldom a man ever did before, the respect of all his acquaintances. His writings for brilliancy and tone have never been equalled by any other authors or writers of the style of literature which his versatile pen was so well adapted to, *i. e.*, of shooting, fishing, and kindred sports. Samuel Swan, editor of the *Southern Military Gazette*, of 1855, gave the credit to "Frank Forrester" of being the best living writer on sporting subjects, and Johnson J. Hooper, author of that admirable little work entitled "Dog and Gun," thus eulogised his writings:—"Mr. Herbert's descriptions have never been excelled; no living literary artist equals him, in my opinion, in that sort of limning which is accomplished by a few dashing strokes."

As a writer of high merit in *humor*, combined with a touch of the sublime, Wm. P. Hawes, ("J. Cypress, Jr."), undoubtedly was without an equal. The chief interest of his sketches is in the inimitable piquancy and wit, with the characteristic flow of unheard of quotations and adventures. His aim was to amuse, and in this matter he was particularly successful. "Fire Island Ana" is generally considered his masterpiece, as it embraces the full scope of his various moods—humorous, sentimental, and sublime. This work was published in "The American Turf Register and Sporting Magazine" of thirty-five years ago, and republished in book form, together with his other productions, in a book entitled "Collideomania," a small edition of which is now extant. The description of Oliver Paul, Ned Locus, and other characters of that sketch must be read to be appreciated.

Another grand light in the phalanx of sportsmen of that period, the editor of *Porter's Spirit of the Times*, well known as "Yorks Tall Son," was a kindly, generous man, whom the *Southern Military Gazette* thus described under the title of "The Spirit and its Editor." The following is but a brief extract:—

"And still unchanged art thou, amidst the change of all around us, dear old Bill. Dear Bill, serious or merry, solemn or sentimental, still so calm and serene and softly smiling, in thy ruby-colored waistcoat, with thy soft, silky hair, coolly disparted from thy high, white, unwrinkled forehead; with the luxuriant flow of that grand beard, which a Mussulman might envy; with that mild, clear blue eye; that almost effeminately sweet smile, singularly contrasting the athletic frame; the six foot four in the stockings feet; the chivalrous, gallant spirit; the free, open speech; the high soul, made up all of honor, the simple-minded, straightforwardness of thought and action, which go together in thee to make up that noblest of God's work—a real man."

"Loyal and firm and kind and true,
That fear or falsehood never knew."

"Long mayst thou flourish, dear Bill, the spirit of the *Spirit of the Times*, the glory of not yet utterly degenerated Gotham, the best, as the tallest 'son of York.'"

In the initial number of *Porter's Spirit* is an excellent life-like picture of its tall editor, William T. Porter, and never did likeness show more plainly than this the impress of one of Nature's noblemen.

Col. Wm. T. Stockton, known to the readers of sporting literature twenty-five years ago as "Cor-de-Chasse," proved a very fascinating and lively writer; his best productions, which were published in the New York *Spirit of the Times*, and *Porter's Spirit of the Times*, commanding wide-spread attention. One of his first sketches, entitled "The Big Talugie Buck," is a marvel of ingenious thrilling adventure, resembling somewhat "J. Cypress" highly-wrought stories.

Among the host of other gentlemen of that day who were well known under their *noms de plume*, were "Hal-a-Dacotah," of the then territory of Minnesota, a dashing writer of far more than moderate ability; "Omega," whose stronghold was a humorous vein of literature, with an occasional touch of brilliant thoughts; Weston Fisher, H. P. Leland, and others long since departed, or forgotten by the new generation springing up. And of all those glorious old sportsmen there now remain but a few who are known as either literary men or authors. Among those now living who once knew and admired "Frank Forrester" as a friend, and themselves contributed not a little to the sporting press, are Genio C. Scott, the venerable and talented

angler, and author of "Fishing in American Waters;" Isaac McLellan, the poet sportsman, of Greenpoint, L. I., who still contributes his glowing poetry to the journals of to-day; and George Wilkes, late editor of the *Spirit of the Times*. Others undoubtedly there are of that old school, but not so far and widely known as these three I have mentioned.

Gen. H. H. Sibley, ("Hal-a-Dacotah"), still resides in Minnesota, (at St. Paul), the foremost man of all in public esteem, and time has touched lightly the vigorous athletic frame. With his sixty-three years, the General is still erect, his step as firm and buoyant as the majority of men at twenty-five. The people, prizing him rightly as the suppressor of the terrible Sioux war, and as the first and most fitly-chosen Governor of the State upon its admission to the Union, hold him to-day in their estimation as second to none of the many public benefactors. He is still a most ardent and enthusiastic sportsman, but in place of the chase of deer, elk, and bear, which was his pride of yore, he now takes his recreations in the less exciting, but still exhilarating sport of grouse and duck shooting. Long may he live, and may his fame never grow less as a sportsman, a writer, and a man.

And poor "Tom Draw!" (Ward), he has long since passed "that bourne," but his memory still lives revered and strengthened through the mediumship of those unparalleled sporting tales, the "Shooting Box," "Deer Stalkers," and "Warwick Woodlands." "Tom Draw," the original, quaint, and humorous host of Warwick; the true friend of lamented "Frank Forester," what a multitude of incidents are connected with his life.

To compare the standard of shooting and fishing literature of that day with the average of the present day would be to find a superiority for the latter on one point, *viz.*: less allusions to the free use of spirits in all anecdotes of hunting or fishing tours. Though the use of whiskey may be, and oftentimes is, beneficial in times of exposure to rains, etc., it should not be extolled by any writer as an indispensable article on such occasions, as this gives a wrong example to young sportsmen, and a worse impression to the reading public, which, judging the class of gentlemen anglers and gunners by the sketches of their exploits with the bottle, imagine them a class of carousing toppers whose chief aim in seeking the field or stream is to enjoy a drinking bout with their companions. We of the fraternity all know that this is a very erroneous impression, and the least written on using spirits will add to the right by raising the standard of true sportsmen in the opinion of the public to what they really are, a class of gentlemanly courteous men.

FRED.

FLORIDA ITEMS.—A correspondent writes us from St. Augustine, under date of January 25th, as follows:—

"The hotels are filling, new amusements, more hops, and, in fact, everything is lively, while the hunting is improving with the continuance of mild weather. The various salt water birds are numerous, while the quail and alligators are very plentiful. The weather for fifty-two days has been sunshine and almost rainless, as but two very meagre descensions of rain have occurred during this period. The St. Augustine Yacht Club is gradually going ahead, and they supply the city with much entertainment. A pigeon shooting club has organized, composed of sportsmen from the North, and a range and trap have been selected on the north beach, near the "Lunch Basket." The "Lunch Basket," by-the-way, is also something original, and has just been opened. It consists of three tents—one 60x32 feet, used as a resting place and restaurant for pleasure and hunting parties. The little steamer May Flower is now making daily trips to the beach, and affords a great convenience. We are in receipt of information to the effect that Mr. Charles Mallock, your venerable (?) editor, will be here with us by the 1st of February. We are impatient to welcome him among us, and will endeavor to characterize his stay with pleasure and contentment. There will be a grand yacht race here next Saturday, instituted by the yacht club. The Indians are attracting considerable attention, as usual. A number of them are now at Matanzas (a hunting ground) with the sportsmen Geo. W. Fox of Philadelphia, H. C. Caruthers of Tarrytown, N. Y.; Joe Cowdrick, Toms River, N. J.; and Dr. Lathrop, Kingston, N. Y. There are a number of sportsmen here, including Dan and N. Edgar, Mr. H. C. Meinell, Dr. Caruthers and others, besides a number of excellent northern dogs, setters and pointers. "Fred Beverly" was here last week, and has left for the Ochlawaha River. Also Dr. De M., "Al Fresco's" companion during his last expedition, is here, and will remain the entire winter."

—The number of miles of railroad built in the United States during the year 1875, was 1,483, against 1,025 miles in 1874, 3,833 miles in 1873, and 7,340 miles in 1872. The first of the railroad States is now Illinois, with 6,931 miles. Pennsylvania is second with 5,805 miles, New York third with 5,450, and Ohio fourth with 4,405.

—Tom Moore compares love to a potato "because it shoots from the eyes." "Or rather," exclaimed Byron, "because it becomes all the less by pairing."

—A steamer which lately arrived at San Francisco from Yokohama brought the materials for a Japanese temple and the men to put it up in the Centennial Exhibition grounds.

—Suggestive of poker-playing—"ante" rooms in a club house.

Fur, Fin and Feather. Mr. Suydam has just issued a new edition of his capital compilation of game and fish laws of the various States and the Dominion Provinces. This book is a necessity to every sportsman, and is now arranged with such care that it may be relied on for accuracy. It costs but 50 cents and can be had at this office, or of the publisher, No. 149 Chambers street.

THOMPSON & SON, 338 Broadway, use no sugar of lead in waterproofing their suits. Sugar of lead will not stand washing, and amongst old sportsmen is considered detrimental to health, making them liable to rheumatic attacks. Thompson's suits are guaranteed to be thoroughly waterproof, even after being washed, and are as good and cheaper than any other suits in the market.—Advertisement

Jan 27-77

The Rifle.

THE INTERNATIONAL MATCH.

A DISPATCH from London informs us that the Scottish National Rifle Club has resolved to accept the challenge to come to this country and shoot for the championship of the world next summer; this resolution being the result of favorable answers received from a majority of the small bore shots of Scotland. The competitions for the selection of a team of eight, with two reserves, will begin forthwith. Welcome as it is to know that a team of such prowess as Scotland can send forth will visit us, we trust that the International match will in no ways be endangered thereby. If we remember aright, the National Rifle Association in accepting the challenge to shoot an International match, stipulated that no "outside" teams should be admitted to the match, and Sir Henry Halford, in a letter to our contemporary the *Volunteer Service Gazette*, stated, that "the team which will shoot in America this year will be selected from the best shots in Great Britain and Ireland, and will not be restricted to Great Britain alone." Now this was a direct invitation to the riflemen of Scotland to compete for places on the team, so that the action of the Scottish National Rifle Club seems to call for some explanation.

That Sir Henry Halford "means business" there can be no doubt, and it behooves our riflemen to be on the alert and not fall into a state of apathy or over confidence. To repeat the victories of the last two years will require some hard work and preliminary practice. There is one thing that our cousins have learned by the visit of Col. Gildersleeve and his companions, and that is, the necessity of team organization. Major Drake, who has been appointed adjutant for the English party, writes "It is to be hoped that we shall get a very strong team, thoroughly determined to shoot as a team," adding the significant words, "We shall want it." That this object will be carried out is evident from the stringent regulations to which each member of the team is supposed to subscribe before competing for a place, and which are as follows:—

"It is my intention to compete for a place in the team which will shoot in the match in America next year, and in the event of my being selected as one of the eight, or accepting a place as one of the four men in waiting, I hereby bind myself to the following:—

1. To proceed to America at the time and in the vessel selected by the Captain of the team.
2. To conform to all regulations laid down by him; and in the event of my not doing so, to forfeit my right to shoot in the team.
3. To defray my own expenses throughout.
4. To make no engagements in America, for business or pleasure, without the consent of the Captain, until after the match shall have been shot."

There is no reason, however, why two teams should not visit us, although, of course, but one could act as the representative in the International match. The other would find plenty of occupation, particularly in off hand or mid-range shooting. The shooting at 500 yards of some of our riflemen, both East to West, has never been equalled across the water. It would be worth while for some of the British riflemen to shoot for a while with our rifles and demonstrate whether the superiority was in the rifles or in the men.

AMERICAN RIFLE ASSOCIATION.—Maj. Gen. J. Watts De Peyster was visited on Saturday evening, Jan. 22d, 1876, by the officers of this association. The object was to present to the General handsomely engrossed and framed resolutions, which constitute the General an honorary director for life. Col. J. T. Underhill was to have made the presentation speech, but was detained at home by a serious accident. It therefore devolved upon Capt. F. Whittaker, the Vice President, who did it nicely. Gen. De Peyster responded in a few eloquent and interesting remarks. The officers left at a late hour, well pleased with the interesting visit.

CONLIN'S GALLERY.—The ninth contest for the FOREST AND STREAM badges was shot Thursday, January 27th. Mr. Cheever was the victor of the first badge for the second time. The winners of the badges are as follows:—C. A. Cheever, 42; J. B. Blydenburgh, (second badge, 30), 40; H. D. Blydenburgh, (third badge, inners), 30. The *Turf, Field and Farm* badge will be shot for Thursday, February 3d, 1876, commencing at four P. M. All comers are invited.

On Friday evening last a match was shot at this gallery between Messrs Hayes and Cheever, resulting in excellent scores and a very close contest, Mr. Hayes winning by one point. Conditions—Five targets, ten shots per target, 200 yards target, (reduced in proportion to the range, 110 feet), Wimbledon rules. Highest possible score, 250:—

HAYES.		CHEEVER.	
1st. target.....	39	1st. target.....	40
2nd. target.....	42	2nd. target.....	47
3rd. target.....	42	3rd. target.....	40
4th. target.....	43	4th. target.....	41
5th. target.....	45	5th. target.....	42
Grand total.....	211	Grand total.....	210

Average per target, 42. Another match will be shot soon.

CREEDMOOR, JR.—The fifth competition for the Union Metallic Cartridge Company's badges came off Tuesday, Feb. 1st. Mr. Backofen was the winning man again, on a score of 45, and as this was the third time he has won it, the first badge was duly delivered to him as his property, and we believe that among the many trophies this reliable off-hand shot will wear as evidence of his skill, the U. M. C. badge will be conspicuous for its size and beauty. The winning scores were as follows:—

Name.	Score.	Total.
F. Backofen.....	4 5 4 5 5 5 4 4	45
W. H. H. Sabin.....	4 4 4 4 4 4 4 4	39
G. O. Starr.....	3 4 4 4 4 0 3 2 4	36

The remaining two prizes will be shot for on conditions which will be published in next week's paper.

Next Tuesday, Feb. 8th, will be the fifth subscription match day. Open to all comers, one-half entrance money divided between first, fifth, tenth, fifteenth, and twentieth best scores.

HELLWIG'S GALLERY.—The ninth weekly competition, in lying position, for a gold medal, a double barrel shot gun, a rifle and revolver, took place at Hellwig's shooting gallery, 271 and 273 Eighth avenue, January 26th. The winners were M. L. Riggs, first prize, 49; Fred Kessler, second prize, 45; F. N. DeWitt, third prize, 40; D. E. Vannett, fourth prize, 30. The winners of the several competitions at Hellwig's are as follows:—

WINNERS OF FIRST PRIZE.		WINNERS OF SECOND PRIZE.	
Name.	Total.	Name.	Total.
Capt. Wm. Lindsay.....	46	F. N. De Witt.....	43
Capt. Wm. Lindsay.....	47	Major D. L. Beckwith.....	46
A. B. Van Hensen.....	41	Donald Cameron.....	45
M. L. Riggs.....	48	Fred Kessler.....	45
John Tregesser.....	47		
Charles Morris.....	46		
M. L. Riggs.....	47		
P. C. Banks.....	45		
M. L. Riggs.....	49		
WINNERS OF THIRD PRIZE.		WINNERS OF FOURTH PRIZE.	
Name.	Total.	Name.	Total.
Major D. D. Beckwith.....	39	R. G. Chambers.....	29
M. L. Riggs.....	39	J. McGlensy.....	30
Major D. L. Beckwith.....	40	J. McGlensy.....	30
Capt. Wm. Lindsay.....	40	Henry Ellinger.....	29
J. McGlensy.....	40	Geo. Grentzer.....	28
T. C. Banks.....	40	Louis Chiker.....	21
J. McGlensy.....	40	C. L. Nixon.....	25
D. E. Vannett.....	40	M. L. Riggs.....	30
P. N. DeWitt.....	40	D. E. Vannett.....	20

Mr. M. L. Riggs, it will be seen, secures the first prize, having won it the third time, as provided in the conditions of the match. The shot gun, heretofore offered as second prize, will be substituted for the first. The competitions will be continued every Wednesday evening, as usual.

NEW YORK STATE.—The *Ogdensburg Journal* says in a recent issue: "There is a very decided improvement in the shooting of the members of the Ogdensburg Rifle Club. There are at least a dozen who are now good for 40 points off-hand at 200 yards. Several have made scores of 41, 42, 43, and 44. With fair weather and steady improvement we expect to see some shots developed here that may be considered worthy to shoot in a State or national contest. The West Side team, Wednesday, made a splendid general average.

SYRACUSE.—The new rifle range of the Sixth Division, N. G., at East Syracuse, is rapidly approaching completion. A storm-house is in preparation, from which shooting can be done on the range during the Winter.

—The Amateur Rifle Club, of Rochester, has challenged the amateur riflemen to a friendly team gallery match, to be shot with rifle .32 calibre, 15 shots each man off-hand.

Shot Gun and Rifle.

GAME IN SEASON IN JANUARY.

Hares, brown and gray.	Wild duck, geese, brant, &c.
FOR FLORIDA.	
Deer, Wild Turkey, Woodcock, Quail, Snipe, Ducks, and Wild Fowl.	

GAME IN MARKET.—It seems singularly inappropriate to be obliged to report prices of game that is long out of season in our own State. This is owing to the present law which enables dealers to sell grouse and quail to the uttermost date permitted by any other State. The time for selling venison expired on the 31st ult., hence this variety is eliminated from our quotations. Ruffed grouse are worth \$1.25 to \$1.50 per pair, and prairie chickens the same. Quail are very scarce, and well they may be, as Long Island and Connecticut have been pretty well snared out; they sell for \$5.50 to \$6 per dozen. Canvas-back ducks are scarce at \$3.25 to \$3.75 per pair; red-heads, \$1.25 to \$1.50; mallards, the same; widgeon, black ducks and sprig-tails are worth \$1 per pair; teal, 75 cents to \$1; broad-bills and whistlers, 60 to 75 cents; rabbits 50 to 60 cents; hares 40 to 50 cents.

A DOG FOLLOWING A DEER INTO WATER.—A correspondent wrote us some time since that he feared losing a hound from his proclivity for following deer into water. We now hear that Mr. John M. Perkins, of Jackson, N. H., started a deer on the 15th ultimo, which took to the water, followed by a valuable dog. The deer was secured, but the dog was drowned.

—A lad of fifteen shot a bear weighing 400 pounds in New Hampshire recently, and resolved to remain by his game until help came, which he did. "How long would you have stopped?" he was asked. "Until I had eaten enough of the bear to have been able to carry the rest home." And he would have done it.

—Over 10,000 rabbits have been shipped from Jonesport, Maine, the past season.

CONNECTICUT—*West Meriden, January 24th, 1876.*—Game in this part of the State has been very scarce for the past ten or twelve years. One of our best sportsmen, with two fine dogs, hunted for several hours the other day without finding a bird. We have a game club, the members of which are anxious and willing to do all in their power to restock our fields and woods, but the game law is such a miserable failure in this State that it is almost impossible to convict and punish the innumerable pot-hunters with which the community is afflicted. VON G.

NEW JERSEY.—A friend of mine scared up six English snipe as he was crossing the meadows near Hackensack last Tuesday, the 25th of January. I note a number of woodcock have been seen in that region within the last week or two. Is not this a very unusual occurrence for this time of the year in this part of the country? R. W.

[Yes; particularly as far as the woodcock are concerned, and is to be accounted for only by the unusually open Winter and absence of ice and snow.—ED.]

SOUTH CAROLINA—*Columbia, January 26th, 1876.*—We had quite a cold snap here last week, and ducks were plentiful. I was out partridge shooting, and flushed twenty mallard ducks, of which all were drakes except one. They were feeding in mud puddles, caused by a freshet in the river. Woodcock are plentiful on the Hampton place, five miles below, also partridges. Rabbits and swamp hares can be found almost anywhere, squirrels are abundant in the swamp, and geese are plentiful in the river.

H. S.
Port Royal, January 28th, 1876.—The unprecedented warm weather has retarded the southward movement of flight birds, so that, notwithstanding the attractions which the intricate channels of the Sea Islands here present, there are no wild fowl to speak of. A few straggling waders, with an occasional bunch of teal and broadbills, are all that are afforded to the sportsman. A long drouth has made everything very dry at present. Deer can be had in abundance near here. The Hunting Islands, ten miles away, are a famous resort for curlew and snipe, and an hour's ride by rail will carry us up the Combahee to good duck shooting, when ducks are flying. To amuse ourselves we take an early morning shot at the quail and gray squirrels, while as to rabbits, they are destruction to the young orange trees, and so numerous that the surface of some of the abandoned cotton-fields, is absolutely covered with "signs" of the most distinctive character, as widely strewn as on the floor of a warren. The weather is too warm to make long tramps comfortable. Doubtless we shall have blustering weather before the spring asserts itself. While sportsmen are expectant, growers are apprehensive about their orange buds.

MISSOURI—*Hannibal, January 22d, 1876.*—Col. Buchanan, Cornelius Voorhis, and J. H. Worthington, in two days' shooting last month, bagged 95 quail, 3 grouse, and 14 rabbits, one of the party not shooting on the second day. Mr. Voorhis did some remarkable shooting, killing 45 single birds in fifty shots, and that in corn-fields, timber, and "rag threads." He shot over his pointer Judge, who made some two or three beautiful points while returning with a dead bird in his mouth, which he has done before on several occasions. Is this or is it not an uncommon feat?

J. H. W.
[We have frequently had old dogs point with a dead bird in their mouth. Herbert mentions an instance in one of his books, and, where birds are very abundant, we believe it would not be uncommon with first-rate dogs.—ED.]

DAKOTA—*White Swan, Jan. 25.*—There are a great many black-tail deer slaughtered here every day. The weather has been so fine that antelope stay back on open ground. During the big snow of last Winter there were sixty-four antelopes killed by two men in one week, at Bijou Hills forty-five miles up river.

—On Wednesday last a well-contested pigeon match took place near Jamaica, L. I., under the rules of the Long Island club, and was numerously attended by the sporting men of Long Island. The weather was unfavorable to the match, however, and the well-known participants did not score as well as on former occasions. The match was at 27 yards rise, 80 yards boundary. The following is the score:—

Name.	Total.	Name.	Total.
Geo. H. Creed.....	11	S. Jones.....	9
Thos. Lloyd.....	7	J. Wilkinson.....	6
J. T. Brush.....	7	A. J. Wilkinson.....	11
C. J. Stewart.....	9	L. R. Juggar.....	9

—The Long Island Shooting Club shot on January 28 for the Club cup. There were twenty-two entries at seven birds each; club rules. The report is received at so late an hour that we are unable to print more than a few of the best scores:—

Name.	Total.	Name.	Total.
R. Robinson.....	7	T. Broadway.....	6
H. P. Thomas.....	6	C. Wingate.....	5
B. Talbot.....	6		

Mr. Robinson, the Treasurer and a veteran pigeon shooter, was also the recipient of a handsome pair of silver soup ladles presented by E. Thomas, Esq., gunmaker of Chicago, to whoever should win the cup that day. This shoot was the first in which the new rule of the club, in regard to birds was enforced, which is as follows: That the mutilation of birds shall not be allowed on the grounds of the Long Island Shooting Club under any circumstances, by any person whatsoever, and that this resolution be conspicuously placed on the club grounds. Hereafter no shooting either by members or others, will be allowed on the club grounds, unless the above resolution is strictly carried out. B.

—A match was shot on Saturday at Deerfoot Park between Captain Bogardus and William King, the conditions being fifteen double rises, 21 yards rise, from spring traps ten yards apart, each man to pull his own traps; stakes, \$125 a side. Bogardus was the favorite at long odds, and won easily by the following score:—

Bogardus.....	2 1 1 1 2 1 1 0 0 2 2 2 2 20
King.....	1 0 0 1 0 2 1 1 2 1 1 1 1 10-12

Several sweepstakes were afterwards shot, in which Messrs. Paine, Bogardus, Johnson, King, Gildersleeve, and Connor entered.

—To-morrow there will be a match of double rises at Dexter Park between Ben West and Dr. Talbot, followed by sweepstakes. An interesting sweepstakes match of double rises is in preparation, to come off at the same place, between ten well-known shooters, \$20 to enter. The time will be fixed this week.

TOURNAMENT AT NEW ORLEANS.—A grand pigeon-shooting tournament will be held at New Orleans commencing on the 26th instant, with class-shooting for all amateurs, for a \$1,500 purse, divided into three prizes of \$700, \$500, and \$300. On the 27th there will be shooting for similar prizes, and on the 28th there will be a grand contest, open to all pigeon-shooters in the world, for a \$1,000 purse, to be divided into \$500, \$300, and a diamond badge. On the same day there will be an amateur match for a \$500 purse. On the 1st of March there will be a match for the amateur championship of the United States, and a diamond badge. The sports will close on the 3d with a match for the amateur championship of Louisiana, and a diamond badge. In all matches, save that open to the world, and in all, save the match for the United States amateur championship, the shooting will be at ten single birds. In the latter match there will be ten single and five double rises. In all matches the entrance money will be \$20.

—A match took place on the 26th ultimo at Ashford, Westchester county, between the city of Yonkers and Greenburgh, five men on a side, five birds each, Long Island rules, 21 yards rise, 80 yards boundary. Referee, A. Atchison; Judges, S. Laurence and J. Willsea. The following is the score:—

GREENBURGH.		YONKERS.	
Name.	Total.	Name.	Total.
Emmett.....	1	Jos. O'Brien.....	1
Roberts.....	1	Bronson.....	5
Caperon.....	4	Jas. O'Brien.....	3
Hauptman.....	0	Williams.....	2
Lang.....	5	Austin.....	1

Total.....14 Total.....12
On the same day and ground a sweepstakes was shot, three birds each. Score:—

Name.	Total.	Name.	Total.
Jos. O'Brien.....	2	Austin.....	3
Jas. O'Brien.....	2	Lang.....	2
Williams.....	2	Bronson.....	0
Emmett.....	2	Deitzel.....	2
Caperon.....	2		

James O'Brien and Austin divided first and second money, Joe O'Brien took third, and Williams fourth.

A CHANCE FOR THE CHAMPION.—The *Illustrated Sporting and Dramatic News* contains the following challenge:—

"A gentleman will bet £600 to £500, or £300 to £250, no one can kill thirty pigeons out of fifty; to shoot on any fair ground in England, 30 yards rise, 80 yards boundary five traps, both barrels, 1½ ounces of shot. He bars neither nation, kindred, nor color. Further particulars can be obtained of H. M., 33 Coldbath square, or of Mr. J. Gardener, at the shooting at Winchmore hill on Monday next. What a chance for Captain Bogardus!"

LIVE GEESE DECOYS.

January, 1876.

EDITOR FOREST AND STREAM:—

As the result of considerable experience in the use of live geese decoys at Monocary and Currituck, I submit the following observations:—

In bar shooting they should not be stalked out, for the following reasons: Very few Canada geese or brant used for decoys become properly reconciled to their captivity. They remain more or less wild, and when fettered, are apt to lose their footing, on account of sudden frights, etc., and fall forwards all in a sprawl. There they remain prone, tagging and straining for hours until relieved. If wild geese are in the vicinity where this occurs, good bye to the game; it will not be deceived. Moreover, the gunner should retain control of his decoys, in order to be able to get them away, when necessary, from the spot towards which the wild birds are heading. No one wishes to shoot his own birds, and many a time have I seen my decoy brant completely surrounded by the wild ones. In such emergencies, a strong line running into the box or blind is the only means of extricating the decoys from the line of fire, and with me it was always successful. To prevent twisting up and other entanglements, put a strong swivel at the junction of the two leather fetters. To the other end of the swivel attach a piece of cord, say six feet long. Fasten your geese in pairs to a third swivel, to which attach your decoy line, which must be large and strong in proportion to the size of the decoys. In bar shooting always locate your sunken box, the only admissible kind of ambush, within easy range of some tongue or spit of sand extending into the water, and forming a natural landing-place for the fowl to get their footing. Then, give your decoys just scope enough to keep them well short of the spot where you are morally certain the quaries will land. If two pairs are worked, which are quite enough, place one pair to the right and the other to the left, when practicable, and keep them there. The fettered geese, as a rule, prefer to stand just at the edge of the water, and get as far away from the shooter's position as the line will allow them to go. They soon learn not to throw themselves down by vain struggles, and when this by chance occurs a little slackening up of the coy line enables them to recover their feet. Where two pairs of geese are to be placed out in the same direction, keep one materially shorter than the other, to avoid tangling. The decoy geese may be advantageously accustomed to the restraint of the fetters at home weeks before using on the bar. RUSTICUS.

QUAIL IN MISSISSIPPI.

CORINTH, Miss., Jan. 18th, 1876.

EDITOR FOREST AND STREAM:—

I have just had a glorious day's sport after bob white, for which I thank the immortal gods. There was never a brighter sky in winter. A light frost covered the ground, and the breath of boreas came as softly and mildly as an April breeze—just enough wind to take the scent to the dogs. Le N and I rose early, and after stewing away some breakfast, prepared for the day's work. Taking a big lunch and a small bottle marked "aqua Babcockii," albeit we are kinder temperance folk; but the snakes have not hibernated up to date, and they do say that "sperirts" will make 'em fly straight—not the snakes, but the quail. We had L's setter and two of my pointers. We went on horseback. Soon after getting out of town Old Nora climbed up on top of a high fence, head up, taking the wind. "We had just as well get down," said L, "they are in there." The dogs all went in, and in a moment were as stiff as poker. The birds were feeding in a corn-field, and got off wild. Each got in a shot and bagged one bird. We marked them down in the woods, where they lay like stones in the dead leaves, and eleven more were added to the bag.

Leaving only enough for seed, we went on after another covey. These we found in a meadow and bagged three, the rest getting so near a house that we would not go after them. Then, in a strip of woodland, Pete, the setter, found a big covey, as I was in the field with the other dogs. We got them well scattered in an old ledge field, where I bagged six, L following some that went in the woods; got only a few shots, the birds getting up wild. We then went into a field where the corn had not been gathered, and where the pea vines were knee high and loaded to the top with peas. Here we found several coveys, and getting them well scattered along a hedge and in some old stubble, we had some as fine shooting as a man could wish. L is a big man, and shoots a big Tolley "challenge," and it would do any one good to see him knock them. After eating our lunch we moved on, and shot until late in the afternoon. When we reached home and counted out our bag we had forty-eight quail and one hare—could have killed a dozen, if we had tried.

But perhaps we were not tired! The mud in the fields was just stiff enough to hang on to our boots, and L said he did not have a piece of skin as big as a postage stamp on either foot. We were in a condition to enjoy our pipes, our slippers, and our suppers, and afterwards a glorious night's sleep, such as comes only to the blessed, and to the tired hunter. GUYON.

MARYLAND NOTES.

MUIRKIRK FURNACE, Md., Jan. 21st, 1876.

EDITOR FOREST AND STREAM:—

I noticed in your paper of week before last an inquiry in regard to J. Tonks, of Boston. Mr. Tonks is a maker of good guns. I have one—a 7-pound breech-loader—made by him, that will, with a load of 2½ drs. orange lightning powder, 1 oz. Balto., No. 7, make in six shots an average pattern of 150 pellets in 30-inch circle, at forty measured yards. This it will do right along. It has made as high as 176 pellets, same circle, distance, and load. Here let me say, while not claiming to be a good

shot, I perfectly agree with you that we do not need a close shooting gun for most of our shooting. In our partridge (quail) shooting most of the birds are killed in the open, within thirty yards, and very few in the cover over twenty-five yards, mostly under that distance. For this shooting I consider even the above gun shoots too close, and prefer to use my 10-bore Holbis & Sheath gun, altered by Messrs Clark & Snider to a breech-loader, with their double bolt top action, which I think the strongest and best motion I have ever seen. This gun makes a pattern of 130 pellets No. 7 at forty yards, with 1½ oz. shot, with 3½ drs. of powder. It has more penetration than the lighter gun. It, I find, shoots plenty close enough for me, and I am convinced that a choke-bore would be useless in such cover as we have. The birds would be either cut to pieces or missed. My advice to sportsmen who want a gun for general shooting is, to be careful how they invest in choke-bores, but to get a gun of about 130 pellets. The testimony of actual use in the field, as given by different correspondents of the *Field*, of London, is decidedly against choke-bores. My dogs have done well this season for the little practice that they have had, as I have had them out but little. Partridges are very plenty now, and as it is the close season I hope that the season may continue favorable for them, and that we shall have no snows to enable the pot hunters to lay a covey at one shot, as they will do, if they get a chance. The prospects now are good for an immense number of birds next year, as comparatively few have been killed. I believe that every year the birds are harder to find, as they seem to frequent the woods more, and to be more wary, fly further, and lay closer than ever. In fact, they are becoming educated, and by the selection of the fittest, as only the slowest and least wary birds are killed, it will soon require one to be an extra good shot to make any bag at all. The weather here is quite warm, and I notice to-day that my maple trees are in bloom. CHAS. E. COFFIN.

SCAFFOLD SHOOTING IN WISCONSIN.

MARINETTE STATION, Wis., Dec. 27th, 1875.

EDITOR FOREST AND STREAM:—

Scaffold shooting is resorted to during the Summer and Fall months on the Peninsula. The deer go north from Central and Northern Wisconsin in the Spring, and are then called "spring poor." Though the game law prohibits it, I believe they commence floating for deer in July, and also shooting from scaffolds. Scaffolds are generally built from ten to thirty feet high, with a place on top for the hunter to sit. They generally take advantage of small trees close together, and nail slats on them to serve as ladders. They are placed along the deer trails, which here run nearly due north and south, unless there should be streams or lakes near, when they diverge to them. For the month of July they place salt licks early in the Spring, and shoot from scaffolds when they come to the salt licks. From Escanaba to Negaunee the Chicago and Northwestern Railroad runs northwest and southeast. As these deer trails are, in some places, close together, some are called main trails and some branches. They generally go back from the railroad track fifty to one hundred rods, as it is nearly all woods along the line, and run a deer fence, consisting of small and medium trees, lapped over in one direction, with the interstices filled with small branches, etc. As this fence is built parallel with the track, it cuts across several deer trails in a diagonal direction, so when deer are traveling south they reach the fence and turn east to find an opening. This takes the travelers over several trails, all down the fence, to the lower or southeast end, where the scaffold is placed. By cutting several small avenues through the brush, the hunter can get a good range on the deer. They travel mostly from day-break to nine o'clock, few crossing from eleven o'clock to dark, as they then stop to feed. As the road runs in the direction northeast and southwest, the deer cross the track going south earlier on north end than on the south end. From Little Lake south to Day's River are good hunting points. They commence crossing at Little Lake about August 5th; Helena Switch, about August 8th to 10th; McFarland's Hill (half-way between Helena and Centreville), 10th to 12th; Centreville, about 15th to 18th, and so on.

There is good deer hunting along the line between Menominee and Escanaba in August and September. Though the law does not allow it, hunting is done in these months. As the deer leave the peninsula so much earlier than they go south in Lower Michigan, it is a manifest injustice to sportsmen to be prevented by the law from shooting them when they are in their best condition, particularly as deer are abundant in this section. I believe they have started a petition to the Legislature to amend the game law, as applied to the peninsula or part of the State, and they will no doubt succeed. In the meantime the law seems to be a dead letter. Deer are so plenty no prosecutions are made. There is a good winter hunting spot eight to ten miles north of Day's River, and on Red Division (twelve miles north of Escanaba) on the Smith River. On Bay de Noquet the deer congregate in a section of heavy timber, and winter there. Splendid hunting may be had here in the months of October, November, and December. Guides may be had here at about two dollars per day. Guides make their headquarters here, and this, without doubt, is the best point to fit out with everything necessary for the trip, with exception of arms and accoutrements. A half-breed, who lives at Thunder Lake, on the Pesutigo River, tells me this lake abounds in trout, and also the river. JONES.

SHOOTING NEAR PORT ROYAL, S. C.

EDITOR FOREST AND STREAM:—

PORT ROYAL, S. C., January, 1875.

With your approbation I will try and give your readers some idea of the coast region of South Carolina, presuming that I know of no region healthier than this from the time Autumnal frosts set in up to mid-Summer. August and September are the months most likely to bring sickness to unacclimated persons, and these are just the months when our residents can best get away for their annual visits to Saratoga and other northern watering places. Change of air is always beneficial, whether from North to South in cold weather, or vice versa. A little investigation will show that the coast region of South Carolina possesses one great advantage over Florida whether for sporting or agricultural operations. With but little difference in climate, and that difference a positive benefit in my way of thinking, with abundant game, and in great variety, the sportsman, visitor, or settler still maintains sure and easy communication with family and friends at home. Steam and electricity are both at his service. Moreover, in comparison with most points further South, his destination is quickly reached and no time wasted en route, as is always the case where change of cars, steamer, or stage, is called for. In chess the best judge of position wins the day, and the time is not far distant when the unrivalled position of South Carolina, and especially of the noble harbor of Port Royal, will challenge and attract the attention of the world to its manifold merits. At present the tide of travel rushes by, thinking to find its El Dorado in the Land of Flowers. Yet I have letters in my possession from agriculturists located in Middle Florida, who are desirous of changing their base of operations to this point, for the reason that they are too far from their markets to be sure of paying returns. Fruits and vegetables must reach consumers sound and fresh, or the labor of producers is wasted.

I believe I am safe in saying that the common varieties of ducks abound on all the South Carolina rivers where rice is cultivated. Mallards, black ducks, widgeon, pin-tails, gadwalls, teal, and shovellers ring-necks, greater and lesser scaups, buff-heads, ruddies, and mergansers. All the foregoing will be found abundant. The Chesapeake, or Currituck habitue will miss the accustomed canvas-back, red-head, and Canada goose. This latter is here replaced in some localities by the white-fronted goose. To get at this kind of game the gunner must make his headquarters at the nearest house he can find to his field of operations, with a full outfit of boat, decoys, &c. January and February are the best months, as they are the coldest and roughest months of the year. I take this occasion to remark, that if a party of gentlemen would like to visit these parts and test the shooting of the Bull River

and Cembrahee region, or of any other region in the vicinity, I will assist them so far as may be in my power, with information, as also with boats, decoys, &c., of which I have a supply, but quite rusty withal for want of use. Should other varieties of game be desired, partridge are at present abundant on my premises, not having been shot at the whole season. Deer can be had on the Hunting Islands, about twelve miles distant. An hour's ride by rail will take them to a locality where partridges are very numerous; also snipe and some woodcock, but if I mistake not, these latter migrate about the end of February. The same locality will also yield wild turkeys to the persevering sportsman, and ducks in variety. I have a boat on the spot, or at least had one there last Winter. I have forgotten to enumerate rail among our game, which are very numerous in the salt marshes, and can easily be bagged twice a month when the spring tides occur. Their flight being slow and heavy, they are just the birds for novices to practice upon. The families of waders are always well represented, especially in April and May, in which months I often have excellent shooting over decoys at such birds as jack curlew, black-breast plover, godwits, willits, &c., and this just at my very doors. RUSTICUS.

NOTES FROM TEXAS.

WHITE ROCK P. O., January, 1876.

EDITOR FOREST AND STREAM:—

The following extract from a letter written by William Boutwell, living near the north line of Hunt county, Texas, though not intended for publication, has much of the genuine ring of "Old Daniel Boone" in it, and will doubtless be read with pleasure, since it presents very forcibly several points of general interest to many of your readers. This place is near Dennison and the Missouri, Kansas and Texas Railroad, and is within four days of New York city. The country has open oak timber lands, with turkeys and plenty of other small game in it, not deemed worthy of particular mention by the writer. He says: * * * "I was pleased to have the privilege of reading another letter from you. It always gladdens my heart to have the fond recollection of the early days of Texas called to remembrance, when we 'old Texans' enjoyed ourselves, being in those days entirely free from fashion and pride, and from any political troubles, and when game of every description was plenty, and peace and quietude prevailed. But alas! those days are gone, and our country is wild on fashion, and distracted on politics, and is in a general strife for wealth. Our vast prairies that were once covered with buffalo and wild horses, &c., are now all dotted over with farms, from ten to five hundred acres each; the first settlers have most all gone farther west (to the frontier), and now we have another class of people in these parts, who live under different customs, and hunting has almost played out, although game is tolerably plenty in my section. The other day I saw eleven deer in riding two miles, and if I had some 'old Texan' to hunt with me, I could enjoy the old Texas custom again to a high extent.

Wild bees are tolerably plenty here. There is no person in this part of the country who follows hunting for profit, and but very few for pleasure, consequently deer and bees go unmolested. The farmers have tame bees from which they get plenty of honey.

Texas is in a prosperous condition at this time. We have flush times in money, a lively trade, abundant supplies, and good health. There has not been a case of sickness in my neighborhood during the Summer and Fall. * * * Lands are advancing in value. * * * We are all very hopeful of better times politically under the new constitution. I cultivate two hundred acres and live near the timber. The weather, for the season, is extremely mild; there has been no snow and but very little ice as yet. People are killing very fine beef off the range; cattle are standing in the shade for comfort; the grass is beautiful and green, &c."

This letter is dated January 6th, and shows what sport a man can expect to find in this wild and beautiful country. The scene of "Old Scout's first buffalo hunt" is laid in this county, wherein the country is more fully described. H. W. M.

A TEXAN HUNTRESS.

January, 1876.

EDITOR FOREST AND STREAM:—

A few years ago, when traveling with my wife in Texas, we were told by some young ladies of the equestrian feats of a Mrs. McKinney, whose husband owned a large stock rancho on Onion Creek, about six miles from Austin. She was said to often ride a very fast horse, so fleet that when mounted she could run down and capture a mule rabbit on the open prairie. Having repeatedly seen dogs chase these rabbits in vain on the prairies of Texas, I had little faith in such reports, because there are few dogs (excepting greyhounds) which can overtake a mule rabbit in a large prairie, and not even the greyhound can do it if the rabbit gains woods or chapparal.

A few days ago I went with a party of ladies and gentlemen of Austin a fishing at the McKinney place. There Onion Creek runs over and between huge limestone rocks, making rapids, falls, and deep pools, giving fine scenery and good fishing—trout, perch, etc. These fish are excellent, but differ from those of like names at the North. Having known Mrs. McKinney many years ago, when she was a girl in her teens, since which I had not seen her, accompanied by my wife and daughter I went to see her at her house, pleasantly located amid trees on a rocky bluff. Mrs. M. is now a widow past her prime, yet erect, hale, and hearty. Never having had any children she used often to go with her husband over the prairies to look after the stock and hunt. I spoke of her reputation for skill in riding on horseback, and inquired if she had ever run down a mule rabbit in the chase. She said that by running over them with her horse she had, at different times, captured two.

She then told me of a still greater feat. One fine day, when with her husband, on horseback, they saw a large gray wolf on the prairie. Mr. McKinney told her to give the wolf a little chase. She hesitated, saying it would do no good; but he urged her, saying that he would follow on with the dogs, and she might as well give the wolf a "little brush." She started. The wolf at first looked incredulous, but apparently convinced that she was in earnest, away he went. She became excited and continued the pursuit over hill and prairie, leaving husband and dogs far behind—so far that he lost all traces of her. After searching for hours he went home without her. The chase was continued, until finally the wolf, exhausted, lay down and feigned death. With one pair of the reins of her bridle she made a slipping noose, and cautiously placed it over the wolf's head and around his neck. Then tying the other end of the rein to the saddle, she jumped on the horse and started, thus dragging the wolf home, the animal having soon been choked to death. Mrs. M. is a well educated lady, of great energy of character. She is a native of Boston, Mass., has lived South since her girlhood, and at her present home for twenty-five years. S. B. BUCKLEY.

WHAT'S IN A SNOWFLAKE?—The *Chemical Review* states that in a drop of water obtained from a single snowflake and magnified 500 times, were found pieces of coal, fragments of cloth, grains of starch, sandy matter, and an immense variety of other substances, not a fragment of which exceeded in diameter the three-thousandth part of an inch.

—Over 300 trees and more than 800 woody species of plants are believed to be embraced in the flora of the United States, and of the trees 250 species are tolerably abundant in one region or another, 120 of them growing to a large size.

—The length of a seal's intestine is 50 feet, or more.

TENTH ANNUAL STATEMENT

OF THE

New Jersey Mutual Life Insurance Company,

Home Office, 189 Market Street,

NEWARK, N. J.

JANUARY 1st, 1876.

BUY IT Vanity Fair.

It is shaved from the best Natural Leaf, for Meerschaum and Cigarettes. Does not make the tongue sore. Sample on receipt of 20 cents. Highest award, Vienna, 1873. Send for circular.

WM. S. KIMBALL & CO.,
PEERLESS TOBACCO WORKS, Rochester, N. Y.

From Seth Green, Supt. N. Y. State Fisheries.

I find Vanity Fair to be the best article of tobacco adapted to the wants of the sportsman. Have used your tobaccos for many years, and know them all to be first-class.

For Sportsmen.

A trusty friend, in weariness or trouble; a solid resource in Winter and rough weather, is a sweet pipe with Vanity Fair. Best dealers have it.

From A. B. Lamberton, Rochester.

Having smoked your tobacco, Vanity Fair, by the camp fire and by the hearth, I believe it in point of fragrance and taste superior to all brands known to me. Being in search of a tobacco that would not fire the tongue and mouth, I was made acquainted with your Vanity Fair, and found it to be the ne plus ultra of natural leaf.

Does not make the tongue Sore.

SMOKE VANITY FAIR.—It is a wonderful solace, and the best proof that it works no injury is the refreshed feeling you awake with next morning, conscious that there is no reasonable task you could not perform.

For Meerschaums.

It has a permanent existence; again and again does it serve your turn, and still is ready for a fresh bout. That pipe is always ready for its fill of Vanity Fair.

For Cigarettes.

A cigarette is an interlude to the serious habit; a graceful make-believe for spare hours. For cigarettes Vanity Fair has no equal. Best dealers have it.

Wm. R. Schaefer,
Manufacturer only of first-class Breech-loading
Shot Guns,
And Dealer in
Guns of all Descriptions.Guns bored to shoot close and hard, warranted,

Paper and Metallic Shells

FOR

Breech Loading Shot Guns,

Manufactured by the

UNION METALLIC CARTRIDGE CO.,

BRIDGEPORT, CONN.

THE STURTEVANT SHELLS are the easiest reloaded. Do not have to unscrew the head nor use an awl to remove the exploded caps. THE PATENT MOVABLE ANVILS, made of steel wire, will not bend or break.

THE BERDAN PATENT SHELLS, new model, with Hobbs' patent waterproof primers, never miss fire, and are highly prized by all that have used them.

PAPER SHELLS.—By repeated experiments and great outlay for improved materials, and machinery made expressly for the purpose, we can now warrant our BROWN PAPER SHELLS equal to any imported. They are sure fire, and will not burst in the gun.

Inquire of any of the dealers in sporting materials for the U. M. C. Co.'s Shells.

Not sold at retail by the manufacturers. dec23 tf

Hart's Sportsman's Favorite Metallic Shells for
Breech Loading Shot Guns.

These Shells are easily loaded, and the caps easily extracted from inside. Head solid, and much thicker than any shell now made, giving a solid seat for cone or anvil, which prevents it from driving through or springing away, thereby causing misfires. The cone is made of nickel and fastened solid in its place. It neither rusts or corrodes fast like moveable anvil made of steel. The nickel cone also prevents misfire when cap has been left on shell for a few days, which is liable to occur either in steel or iron. These shells are finely finished, and made any length ordered, from 2 1/4 to 3 1/2 inches.

Shells and Loaders, and description Price Lists, can be obtained from all the leading sportsmen's houses throughout the country. GEO. E. HART & CO., 363 and 365 Market st., Newark, N. J.

From Captain Bogardus, Champion Wing Shot of America.

Messrs. GEORGE E. HART & CO.,

Gentlemen—The fifty shells I received from you to-day suit me better than any I have ever used. They are stronger and better in every respect, and I shall use them in all my shooting hereafter. Yours truly,
may13-ly A. H. BOGARDUS.

THE PAPER STEM PIPE.

Just the Thing for Home
and Camp Use.

Supplies a want which smokers have long felt—a pipe which shall give simply the taste and odor of tobacco smoke. This pipe never accumulates rank smelling liquid in stem or bowl, but is always clean and sweet. The bowl and mouthpiece are permanent, but the stem is of porous paper, to be laid aside after a few days' use and a new one fitted. Extra stems accompany each pipe. The price of extra stems, when not furnished with the pipe, is as follows: Four and a half and seven inches, 5c.; twelve inches, 15c. Sold by pipe and cigar dealers generally, or a complete sample sent by mail for \$1 by

Orange Sporting Powder.

ORANGE LIGHTNING POWDER,
The strongest and cleanest Powder made. Nos. 1 to 7, packed only in sealed 1 lb. canisters. The coarser sizes (higher numbers) especially are recommended to owners of fine breech-loading guns, giving great penetration with very slight recoil.

ORANGE DUCKING POWDER,
For water fowl. Very strong and clean. Nos. 1 to 5. Packed in metal kegs of 6½ lbs. each, and in canisters of 1 and 5 lbs.

ORANGE RIFLE POWDER,
The best for rifles and for all ordinary purposes. Sizes F.g. F.F.g. F.F.F.g. the last being the finest. Packed in wood and metal kegs of 25 lbs., 12½ lbs., and 6½ lbs., and in canisters of 1 lb. and ½ lb. All of the above give high velocities and less resistance than any other brands made.

BLASTING, MINING, AND SHIPPING POWDER OF ALL GRADES AND SIZES PACKED IN WOOD OR METAL KEGS OF 25 LBS. SAFETY FUSE AND ELECTRICAL BLASTING APPARATUS.

LAFLIN & RAND POWDER CO.,
21 Park Row, N. Y.

Sole proprietors and manufacturers of the celebrated **ORANGE** brand of **GUNPOWDER.** Recommended and used by Capt. A. H. BOGARDUS, the "Champion Wing Shot of the World."

DITTMAR POWDER

MANUFACTURING CO.

MY NEW IMPROVED POWDER can now be loaded from an ordinary powder flask; grains hard. Use it now like Black Powder. No fear of overloading. Burns slow now. No fouling of the gun. Little or no smoke. Little or no recoil. Not very loud report. Less heating of the barrel in rapid firing. Good penetration and good pattern. Safe to keep, as it does not explode if set on fire except well confined. Shells furnished loaded with powder only, if desired. None genuine without my signature on the can. **CARL DITTMAR,** NEPONSET, MASS.

The Hazard Powder Co.,

MANUFACTURERS OF

Gunpowder.

Hazard's "Electric" Powder.

Nos. 1 (fine) to 5 (coarse). Unsurpassed in point of strength and cleanliness. Packed in square canisters of 1 lb. only.

Hazard's "American Sporting."

Nos. 1 (fine) to 3 (coarse). In 1 lb. canisters and 6½ lb. kegs. A fine grain, quick and clean, for upland and prairie shooting. Well adapted to short guns.

Hazard's "Duck Shooting."

Nos. 1 (fine) to 5 (coarse). In 1 and 5 lb. canisters and 6½ and 12½ lb. kegs. Burns slowly and very clean, shooting remarkably close, and with great penetration. For field, forest and water shooting it ranks any other brand, and it is equally serviceable for muzzle or breech loader.

Hazard's "Kentucky Rifle."

FFFG, FFG, and "Sea Shooting" FG, in kegs of 25, 12½, and 6½ lbs. and cans of 5 lbs. FFFG is also packed in 1 and ½ lb. canisters. Burns strong and moist. The FFFG and FFG are favorite brands for ordinary sporting, and the "Sea Shooting" FG is the standard Rifle powder of the country.

SUPERIOR MINING AND BLASTING POWDER.

GOVERNMENT CANNON AND MUSKET POWDER; ALSO SPECIAL GRADES FOR EXPORT, OF ANY REQUIRED GRAIN OR PROOF MANUFACTURED TO ORDER.

The above can be had of dealers, or of the Company's agents in every prominent city, or wholesale at our office.

**CHAMPION GUNS OF ENGLAND
PAPE'S****Unrivalled Sporting Guns.**

Stand unequalled in every contest. Their performance at the London Trials of 1875 beats the records of any maker in the world.

1875. 12 Gauge, Choke Boring.

Maker of Gun. Exhibitor.

1st—Greener. Greener.

2d—Pape. Davidson.

3d—Pape. Pape.

Out of a class of 68 guns, 3 out of the 6 best were made by Pape. The Greener gun was protested against on the spot for having its score false counted, the fact proven there, and afterwards confirmed by same gun being shot for two days per week for six weeks in succession, when its average score only took 24th place, its very best score being greatly below the scores of the best six guns.

1875. 12-Gauge, Old Sporting Bore.

Maker of Gun. Exhibitor.

1st—Pape. Davidson.

2d—Pape. Davidson.

1875. Long Range, 60 yards, Choke Bore.

1st—Pape. Davidson

60 yards, Long Range, Sporting Boring.

1st—Pape. Davidson

Those champion Long Range guns, only 7 pound weight, with a charge of 3½ dr. to 1½ oz. shot, beat the best 8 bore Greener gun at 60 yards; weight, 15 lbs.; 6 drachms and 2½ oz. shot.

1875. The Sportsman's Sub. Cup, valued at £45, was also awarded to W. R. Pape, for the original invention of choke boring. Winner of the London Gun Trials of 1858, 1859, 1866. Address

Third Edition.**Camp Life in Florida.**

By CHARLES HALLOCK,

AUTHOR OF THE FISHING TOURIST.

This is a most seasonable book for Sportsmen, Tourists, Invalids, and Settlers, and has been long needed by Winter tourists to Florida and persons seeking settlement there. It gives a full classification of the game and fish of the Southern Peninsula, routes of interior and coastwise travel, the agricultural resources of the country, and sites for settlement, hints for camping out, resorts for game, hotels, and such other information as will be of great benefit to visitors seeking Florida for health, pleasure, exploration, or permanent settlement.

348 pp., 12mo. Price, \$1 50.

CONTENTS:

Introductory Chapter.
Birds-eye Glance at Florida.
Outfit for Sportsmen.
Hints for Southern Hunting.
Coastwise Routes of Travel.
Game Animals and Birds of Florida.
Game Fish of Florida.
Three Months in Florida for One Hundred Dollars.
Supplementary Hints for Cheap Recreation.
Up the St. John River.
Indian River.
Florida the Promised Land.
Fort Capron.
Fishing at St. Augustine.
Black Bass Fishing on Spruce Creek.
Hunting the Panther.
The Environs of Tallahassee.

THE AMERICAN NEWS COMPANY, AGENTS.

For Florida.

PHILADELPHIA AND SOUTHERN Mail Steamship Company's line to Savannah, Ga., sailing every Saturday, from Pier 22, below Pine street, Delaware River, at 12 o'clock noon, making close connections through to all points South. The line is composed of the steamships JUNIATA and WYOMING. The Wyoming does not carry passengers. The Juniata is a favorite ship with the traveling public, having passenger accommodations of the most superb character. She has recently been refitted and elegantly furnished with everything requisite to the comfort and convenience of passengers.

Families en route for FLORIDA, Georgia, Alabama, and even as far as New Orleans, will find the Savannah route the most desirable for comfort, as well as the most economical. Through trains of the Central Railroad of Georgia, and Atlantic and Gulf Railroad, Florida, leave Savannah every morning and evening. The Florida steamers leave Savannah three days in the week for all points on the coast.

For through passenger tickets and bills of lading to all points in Florida, Georgia, Alabama and Tennessee, apply to WM. L. JAMES, General Agent, 416 South Delaware, avenue, Philadelphia.

Stereoscopic Studies of**Florida Scenery.**

Embracing views of the most interesting portions of the State. Scenery, vegetation peculiar to this semitropical peninsula, and of cities, towns, and rivers having historic interest.

Only views in existence of Lake Okeechobee and Indian River.

McBride Flies.

HAVING BEEN FOR THE PAST twelve years associated with my father, John McBride, in the manufacture of fishing tackle, I feel competent to continue the business and supply the custom with the same quality as heretofore. Parties supplied with casting lines and artificial flies for Pennsylvania trout streams, Adirondacks, the Maine Woods, Lake Superior, Thousand Islands, Canadian, and other waters. Anglers not acquainted with the nomenclature of these flies, by mentioning the locality where they intend fishing, will have the varieties best suited to those waters sent to them. Flies copied from any natural insect or pattern desired. SARA J. McBride, (Successor to John McBride) Mumford, Monroe county, N. Y. Dec2-1y
